**Report of the mycologist for the year 1932.** C. H. Gadd. *Tea Research Inst. Ceylon, Bull.* 10, 17-26 (1933).—**Wood rot.** Blocks of wood painted with white lead and exposed to attack by the wood-rot fungus *Irpex destruens* under various conditions suffered no deterioration in 12 months; Carcilin B and Solignum also gave good protection. **Microorganisms and tea manufacturing.** A marked decrease in the no. of fungi on tea leaves occurred during the rolling and fermentation processes; the bacterial count was not decisively affected. Mincing the withered leaves greatly decreased the nos. of fungi and bacteria; this decrease could not be traced to any sp. antiseptic action of the tea-leaf constituents. Enormous increases in the yeasts and bacteria, but not of fungi, occurred within 24-48 hrs. after the fermentation of the leaves. Fermenting tea leaves show 2 temp. maxima, the 1st resulting from enzymic changes and the 2nd from microbial activities; the 2nd max. does not occur in chemically sterilized leaves, and neither max. occurs in boiled leaves. In general, microorganisms deleteriously affect the quality of tea leaves. K. D. Jacob

**A nematode disease of potatoes caused by *Heterodera schachtii* (Schmidt).** D. G. O'Brien and E. G. Prentice. *West Scotland Agr. Coll., Research Bull.* 2, 63 pp.—The disease, which is caused by the attack of *H. schachtii* on the potato roots, is characterized by the slow growth of the potato haulm, the small no. of thin, spindly stems, the unhealthy appearance of the foliage, and the withered areas on the leaves, which appear 1st at the tip of the terminal leaflet. No definite relation existed between the severity of the disease and the reaction of the soil, although there were indications that plants growing on soils having  $pH$  values less than 4.2 and greater than 5.0 tended to suffer more when attacked by *H. schachtii* than those growing on soils of intermediate  $pH$  values. There was no relation between the  $pH$  of the soil and the no. of *H. schachtii* cysts present. Promising results in the control of the disease were obtained by the application of farm-

yard manure (15 tons per acre) in the drill just before planting the tubers. Seventy-seven references.

K. D. Jacob  
**Helminthosporium disease of oats.** Dept. of Plant Husbandry. West Scotland Agr. Coll., *Research Bull.* 3, 74 pp. (1933).—The leaf-stripe disease of oats is caused by *Helminthosporium avenae*. Satisfactory growth of the fungus was obtained on oatmeal agar at  $pH$  values between 5.0 and 6.75. At  $pH$  4.76 there was a preliminary retardation of growth extending over the 1st 3 days and followed by almost complete recovery; no marked recovery in rate of growth occurred at  $pH$  3.6. The fungus was not acclimatized to the more acid media in 2 successive generations. Optimum growth was obtained in the dark at 100% relative humidity and approx. 20° temp. Good control of the disease was obtained by soaking the seed in hot water (preliminary soaking for 5 hrs. at 15°, followed by 15 min. at 54°) or Uspulun ( $1/4$ - $1/2$ % soln. for  $1/2$  hrs.) or Germisan ( $1/2$  1% soln. for  $1/2$  hr.) or formalin (1:240 for 20 min.). Dusting the seed with Tillantin R also gave good results, but I dusts were ineffective. Germination of the seed was reduced 9% by the formalin treatment; the other treatments had a smaller effect. Seventy references.

K. D. Jacob  
**The influence of the reaction of the medium on the growth of tea.** N. B. Kargopol'tzev. *Trans. Sci. Inst. Fertilizers* (Moscow) No. 113, 55-7 (1933).—Const. drip culture expts. with tea bushes has shown that the  $pH$  of 7.5-7.8 is very injurious to tea and that the danger point varies within narrow limits, from 7.0 to 7.5. On the acid side, however, the range to injury is wider. At a  $pH$  4.5-4.0 the tea bushes suffered, but not as severely as with a shift toward more alk. The optimum  $pH$  was found to be 5.5-6.0.

J. S. Joffe  
**Calcium and magnesium absorption of rice plants during growth in water culture.** Yoshiaki Ishizuka. *J. Agr. Chem. Soc. Japan* 9, 1022-35, 1064-76; *Bull. Agr. Chem. Soc. Japan* 9, 110-11 (1933).—The presence of Ca in the nutrient soln. was absolutely necessary till the 13th week after germination. Thereafter lack of Ca had no effects on the growth. Mg is essential till the 17th week. If there is lack of Ca before the 5th week a supply of Ca leads to recovery. Lack of Mg before the 6th week does not affect development. Ca is utilized most rapidly from the 5th to the 7th week and Mg from the 4th to the 8th week. The ratio of CaO to MgO absorbed was about 3:1 at the early period of the growth and gradually approached to 1:1.

Y. Kihara  
**Formation of phosphoglyceric acid from galactose and hydrolysis of phosphoglyceric acid by galactose yeast.** Carlo Cattaneo. *Biochem. Z.* 267, 456-9 (1933).—Yeast trained to ferment galactose produced phosphoglyceric acid apparently identical with that produced in the fermentation of other sugars. Pyruvic acid was a product of the action of *Saccharomyces cerevisiae* on phosphoglyceric acid.

S. Morgulis  
**Studies on the micrometabolism of yeast cells.** Earnest A. Pribram and Louis Kotler. *J. Bact.* 27, 24 (1934).—*Saccharomyces cerevisiae* and *S. lactis* grown on dextrose media absorb more dextrose than galactose or lactose under similar conditions. *S. lactis* absorbs more galactose and lactose than does *S. cerevisiae*. The presence of  $CaCl_2$  decreases, while  $KCl$  and  $FeCl_3$  increase the absorption capacity of yeast cells,  $FeCl_3$  less than  $KCl$ .

John T. Myers  
**The ability of a mold or its metabolic products to inhibit bacterial growth.** Roger D. Reid. *J. Bact.* 27, 28 (1934).—Filtrates of a mold closely related to *Penicillium notatum* could inhibit the growth of certain bacteria. The inhibitory substance is not identical with, but closely related to, the pigment which develops simultaneously. It is relatively thermostable. It is volatile under certain conditions. It contains enzymes, notably amylase and catalase. The  $pH$  increases in parallel with it, but when once formed, alterations in  $pH$  do not affect it. It does not cause a change in the charge on the bacterial cell. It is adsorbed on charcoal. It does not affect the oxidation-reduction potential.

**The effect of the oxidation-reduction character of the medium on initiation of yeast growth.** J. J. Reid and I. L. Baldwin. *J. Bact.* 27, 29-30 (1934).—The character of the medium exerts a decisive influence on the ability of *Saccharomyces cerevisiae* to initiate growth. J. T. M.

**The fixation of nitrogen by germinating seeds of leguminous plants.** F. S. Orcutt, A. M. Shannon and P. W. Wilson. *J. Bact.* 27, 55-6 (1934).—There is no evidence of the fixation of atm. N by peas exposed to such substances as  $MgSO_4$ ,  $K_2SO_4$ ,  $MnSO_4$ , or strychnine nitrate.

John T. Myers  
**The chemistry of mold tissue. III. Composition of certain molds with special reference to the lipid content.** L. M. Pruess, E. C. Eichinger and W. H. Peterson. *Zentr. Bakt. Parasitenk.*, II Abt. 89, 370-7 (1934); cf. *C. A.* 27, 1378.—The lipide, protein, carbohydrate and sterol contents of 24 molds were studied, when grown both on synthetic and org. media. On synthetic medium, the lipid content varied from 1.1 to 19.9%, the av. being 6.0. The protein content ranged from 13.7 to 43.7, the av. being 31.6%. On the org. medium the lipides varied from 1.5 to 24.4, the av. being 8.8%. The protein ranged from 12.5 to 36.3 with an av. of 22.5%. The lipides contained considerable free fatty acid. Calcd. as oleic, the content fluctuated from 8 to 70%. Other constituents, as phosphatides, are indicated by the presence of P and N.

John T. Myers  
**Possible chemical nature of tobacco mosaic virus.** John Caldwell. *Nature* 133, 177 (1934).—If the  $K_2HPO_4$  eluate from healthy tobacco tissue is acidified and 2 vols.  $Me_2CO$  added, a cryst. as well as a colloidal ppt. is obtained. The presence of virus in the crystals has been detd. by the *N. glutinosa* method. N-free virus-contg. crystals have not been sepd.

W. J. Peterson  
**The effect of the length of day upon the chlorophyll apparatus of plants.** M. Kh. Chailakhyan. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], I, 37-9 (in English 40-2) (1934); cf. *C. A.* 28, 1739.—A short-day period of exposure to light decreases the chlorophyll content of plants shortly after sprouting, but after a week the chlorophyll content is increased.

F. H. Rathmann  
**The effect of ultra-violet light on photosynthesis.** Wm. Arnold. *J. Gen. Physiol.* 17, 135-43 (1933).—An unidentified unit in the mechanism of the photosynthesis of the green alga, *Chlorella pyrenoidosa*, is inactivated by the absorption of 1 quantum of ultra-violet light (2537 Å.), the same radiation has no effect on the normal respiration of this plant. The chlorophyll extd. from irradiated cells has undergone no chem. change. The order of the Blackman reaction in photosynthesis. *Ibid.* 145-9; cf. *C. A.* 26, 3822; 27, 1657.—The photosynthesis of *Chlorella pyrenoidosa* involves a photochem. reaction of the 1st order which is not appreciably affected by temp., and a dark reaction (Blackman reaction) dependent on temp. On the assumption that photosynthesis is a cyclic process, and that ultra-violet light does not change the reaction const., it is shown that the Blackman reaction is of the first order. A math. treatment of the theory and exptl. data is given.

C. H. Richardson  
**The conversion of fat to carbohydrate in the germinating castor bean. I. The respiratory metabolism.** John R. Murlin. *J. Gen. Physiol.* 17, 283-302 (1933).—The R. Q. of germinating castor beans varies from 0.30 to 0.58, an indication of the transformation of oil to carbohydrate. It reaches its lowest value when the new growth (hypocotyl) measures 20-35 mm. in length. The R. Q. of the young plant (cotyledons and hypocotyl) varies from 0.78 to 1.00, an indication of considerable combustion of sugar. The R. Q. of the endosperm alone is low but usually somewhat higher than that of the entire germinating tissue. The young plant produces 2.6 times as much  $CO_2$  (moist wt. basis) as the endosperm although it absorbs only 1.3 times as much  $O_2$ . II The combustion respiratory quotient as determined by a modified oxy-calorimeter. Ray G. Daggs and H. S. Halco-Wardlaw. *Ibid.* 303-9 (1934).—After germination of the castor bean is well started, the R. Q. of the combusted seed in-

creased with increase in stage of germination. This indicates a change from an O-poor to an O-rich substance, probably fat to sugar. The O-rich substance is formed in the endosperm. The oxycalorimeter and method are described. Accuracy of the method was checked by org. combustions. III. The chemical analysis, and correlation with respiratory exchange. H. B. Pierce, Dorothy E. Sheldon and John R. Murlin. *Ibid.* 311-25(1933).—Up to a hypocotyl length of 80-140 mm. in the germinating castor bean, there is a continual decrease in fat ( $\text{Et}_2\text{O}$  ext.) and a continual increase in sugar, after which the fat decreases as the crude fiber (cellulose) increases. The most rapid decrease in fat coincides roughly with the most rapid increase in sugar. The C balance between fat loss and carbohydrate (sol. and crude fiber) gain is not close except at the beginning of growth. There is an undetd. residue which increases with the total carbohydrate and accounts for increasing amts. of C. The protein content ( $\text{N} \times 6.25$ ), about 26% in the ungerminated seed, undergoes a primary decrease, then rather steadily increases to nearly 35% (dry wt.). This is explained on the basis of the occurrence of more and more volatile material which is lost in drying. The ash increases irregularly, finally reaching about the same ratio as the protein. The R. Q. (cf. above) can be accounted for by assuming that 2 out of 6 mols. of ricinoleic acid are converted to sucrose and one to cellulose, whereas 3 are oxidized. It is suggested that the undetd. substance is an oxidation product of pentose. C. H. Richardson

Influence of temperature and light intensity on photosynthesis and respiration and an explanation of "solarization" and "compensation point." N. R. Dhar. *J. Indian Chem. Soc.* 10, 541-61(1933). This is a discussion of the reasons why, in plant physiology, the Arrhenius equation for effect of temp. on rate of chem. reaction is more accurate and applicable than the van't Hoff rule. In energy exchange in plants the following reaction obtains:  $n\text{CO}_2 + n\text{H}_2\text{O} \rightleftharpoons \text{C}_n\text{H}_{2n}\text{O}_n + n\text{O}_2$ . The following explanations are offered for the inapplicability of the van't Hoff rule: (1) Photosynthesis is proportional to light intensity, there being no photosynthesis in the dark. (2) Respiration takes place in the dark, but is appreciably accelerated by light. (3) An increase in temp. affects respiration more markedly than photosynthesis. The data used are taken from the literature. J. J. Willaman

Absorption of Mn by wheat seedlings (Davidson) 15.  
Two kinds of saponins of soy beans (Okano, Ohara) 10.  
Rubixanthin (Kuhn, Grundmann) 10.

## E—NUTRITION

PHILIP B. HAWK

Vitamin G potency of purified liver preparations. Erwin Brand, Randolph West and Charles J. Stucky. *Proc. Soc. Exptl. Biol. Med.* 30, 1382-4(1933).—Purified liver exts. (P. A. factor), prepd. from the Lilly ext. No. 343 and of known potency in pernicious anemia, failed to induce growth in rats deficient in vitamin G. C. V. Bailey

Blood regeneration in anemic rats on a vitamin G-deficient ration. Charles J. Stucky and Erwin Brand. *Proc. Soc. Exptl. Biol. Med.* 30, 1404 5(1933).—Young anemic rats were fed a ration contg. Fe and deficient in vitamin G for approx. 1 month; the anemia was cured in 3-4 weeks; growth was not restored. C. V. Bailey

High-carbohydrate and high-fat diets. Esther M. Guttsheimer, Edith Goldsworthy and Gertrude Thomas. *Proc. Soc. Exptl. Biol. Med.* 30, 1420-8(1933).—In a woman, the fasting blood sugar was const. for 7 days on a balanced diet; it was slightly increased after a high-carbohydrate diet and considerably decreased after a high-fat diet. The extent and duration of hyperglucemia after the ingestion of 1 g. of glucose per kg. of body wt. was practically unchanged by the high-carbohydrate diet; after 7 days on a high-fat diet the findings were similar to those in diabetes mellitus. The urea N and total non-

protein N varied markedly with the diet. The findings are of importance in the clinical application of these tests. C. V. Bailey

Pathologic changes in the organs of scorbutic guinea pigs. Otto A. Bessey, Maud L. Menten and C. G. King. *Proc. Soc. Exptl. Biol. Med.* 31, 455-60(1934).—The most characteristic changes in the organs of scorbutic guinea pigs were depletion of fat and cholesterol from the adrenal cortex, fatty degeneration of the myocardium, marked degeneration of testicular germinal epithelium and spermatozoa and swelling of connective tissue. C. V. Bailey

Infection and vitamin A in man. Robert Debré and André Busson. *Bull. mfm. soc. méd. hôp. Paris* 49, 1431-8(1933).—It appears impossible to consider vitamin A as an anti-infectious substance, playing a role in protecting the organism against puerperal infection. F. L. Dunlap

Role of unsaturated acids (linoleic acid) in the nutrition of rats. Jenő Becker. *Méregadasi Kutakok* 6, 363-71(1933).—Rats need small amts. of fats contg. linoleic acid. Ether exts. of walnuts of different degrees of ripeness were fed to rats in doses of 5 mg. The 1 nos. of the samples indicated different contents of linoleic acid. The more acid there was present, the better the growth obtained. As the feeding of only 5 mg. of walnut oil (2-3 mg. of linoleic acid) cured the new deficiency disease reported by Burr, *et al.* (*C. A.* 22, 2395; 23, 4601), it seems that linoleic acid acts as a vitamin. S. S. de F.

Photochemical activation of adenine. B. C. Guha and P. N. Chakravorty. *Nature* 132, 447(1933).—Irradiated adenine failed to cure polyneuritis in pigeons, even in 5 mg. doses, but the same daily dose supported growth in 36 young rats which had ceased to grow on a diet of starob, caseinogen and McCollum's salt mixt. supplemented by cod-liver oil and an aq. ext. of ox kidney. Irradiated solenine gave no response in 31 young rats receiving ox-liver extracts or autoclaved marmite as the source of vitamin B<sub>1</sub>. Irradiated guanine chloride, cytosine chloride and uracil did not resemble in action irradiated adenine in preliminary tests; the latter could not replace vitamin B<sub>1</sub> in the diet. A. L. Henne

Unlocking another door to nature's secrets vitamin C. Wm. A. Waugh. *J. Chem. Education* 11, 69-72(1934). This paper is a review dealing with the recent isolation and identification of vitamin C. The chem. properties of the vitamin are described and the methods of assaying it and its physiol. effects are given. The formulas that have been suggested for the constitution of the vitamin are reported and the natural sources of the antiscorbutic substance described. R. H.

The metabolism of healing in celiac rickets. Findlay J. Ford. *Arch. Disease Childhood* 8, 355-9(1933). The rickets of celiac disease appears to be of the same nature as ordinary infantile rickets. During antirachitic treatment the Ca and P metabolism in the rickets of celiac disease is similar to that of infantile rickets. E. R. Main

The relation of vitamin A and vitamin D to urinary calculus formation. A. Richard Bliss, Jr., Geo. R. Livermore and Ellsworth O. Prather, Jr. *J. Urol.* 30, 639 52(1933).—The development of urinary calculi in albino rats appears to be related to a lack of vitamins A and D. Calculi were formed in 61.8% of the rats maintained on diets deficient in vitamins A and D and in 57.1% of those on diets deficient in vitamin A only. The calculi were composed chiefly of Ca and Mg phosphates. E. R. M.

Nutrition and child-bearing. Edward Mellanby. *Lancet* 1933, II, 1131 7. A discussion of the relation of dietary deficiencies in Ca, P, I, Fe and vitamins A and D to the toxemias of pregnancy. E. R. Main

Nutritive value of boiled and raw milk in infant feeding. Noah Morris and Stanley Graham. *Lancet* 1933, II, 1314-15. The absorption of N, Ca, P and fats does not appear to be diminished when boiled milk is used in place of raw milk in the diets of infants. E. R. Main

Neuromuscular irritability in relation to the biochem-

- istry of mineral matter. III. Mineral composition of blood serum and muscle press juice as well as of their ultrafiltrates in relation to the neuromuscular irritability. Influence of parathyroidectomy on the calcium-magnesium ratio of the blood serum. B. Sjollema and L. Seekles. *Biochem. Z.* 264, 316-33(1933); cf. *C. A.* 27, 5103.—On a diet contg. too little Na and too much K the mineral compn. of the blood serum is very little altered, although as the expt. is prolonged the values for K and Cl tend to increase, and the muscular elec. response changes in the direction of latent tetany. On diets contg. too little Ca and too much P, alone or in combination with a similar alteration in the Na/K ratio, the total Ca content of the serum may diminish 20-30% and the elec. response of the muscles indicates a condition either of latent or of manifest tetany. While the total Ca diminishes the ultrafilterable fraction may actually show a small relative increase. The inorg. P generally increases definitely, but the P remains entirely diffusible. The Mg drops about 40%, but the ultrafilterable fraction is unaffected. Similarly, the K, Na and Cl contents of the serum or of its ultrafiltrate are not appreciably altered. On a diet with abnormal Ca/P or Na/K ratio the Ca/Mg ratio of the blood serum does not vary in any regular manner with the increase in elec. irritability of the muscles but the Ca/P ratio diminishes. During tetany parathyreopriva in the dog the Ca/Mg as well as the Ca/P ratio in the serum decreases, but in grass tetany in cattle the former ratio is greatly increased and the Ca/P variable and only exceptionally lowered. The condition in rabbits resembles more closely that found in the dog. It follows, therefore, that the Ca/Mg ratio does not vary in the same direction in different types of tetany or with the changes in the elec. irritability of the muscles. On diets with abnormal Ca/P and Na/K ratios the total Ca of the muscle press juice increases, 2 to 3 times, with increasing neuromuscular irritability, but the changes in the ultrafilterable fraction were not definite, and the diffusible P decreased. The total Mg showed no relation to the irritability, although the diffusible portion of the Mg was highest on diets with abnormal ion ratios. The K values were unchanged, the Na tended to increase and the Cl increased markedly, except for the ultrafilterable Cl, which remained the same. The Ca/Mg ratio in the muscle press juice is greater where the neuromuscular irritability is higher, but there is no parallelism between the two. The Ca/P ratio, contrary to expectation, increases with the increase in irritability. These results indicate that neuromuscular irritability is associated with a different mineral compn. in the serum or the muscle press juice, but the reason for this difference is not clear. In fasting rabbits the mineral compn. of the serum and muscle juice undergoes changes similar to those obtained on a diet of abnormal compn., except that the serum P is higher. The latter condition is responsible for a rise in irritability. No relation was found between the excess of base and irritability. S. Morgulis.
- Magnesium in animal diets.** I. J. Cunningham. *New Zealand J. Sci. Tech.* 15, 191-8(1933).—The concn. of Mg in the blood serum and in the bones of rats was increased by increasing amts. of Mg in the diet. Mg carbonate produced the greatest effect of the different salts used. The total proportion of Ca in the dried bodies was not greatly affected by the Mg feeding. There was a general tendency to a lower blood Ca. At the higher levels of Mg carbonate and sulfate, the ash content of the bones decreased and moisture increased, but the interpretation was confused by diarrhea in the animals. P. S. R.

- Relation between mouse- and rat-unit of the estrus-**
- 1** producing hormone. H. Kreitmair. *Arch. expul. Path. Pharmacol.* 169, 578-84(1933).—The ratio mouse unit: rat unit for any estrin prepn. depends on the medium in which the prepn. is suspended or dissolved. Thus for aq. sols (with lecithin as protective agent) the ratio is 1:1, while for sols. in oil it is 1:4. B. C. A.
- Theory of muscular contraction.** Philippe Fabre. *Compt. rend. soc. biol.* 106, 951-3(1931).—H and lactate ions diffuse with different velocities into the contractile element, forming an elec. double layer and producing a change in surface tension. Relaxation takes place when the more slowly diffusing ion has neutralized the other. B. C. A.
- Inorganic constituents of nerve tissue.** K. Hayashi. *Japan. J. Med. Sci. II, Biochem.* 2, 1-5(1933).—The spinal cord of the whale is richer in inorg. P than any other nerve tissue examd. and has a higher ash content, but only traces of S are present. The lingual nerve is the richest in Na and Cl, and the brain in K. All nerve tissue in the whale is richer in Na and Cl than that of land mammals. B. C. A.
- Muscle extractives.** Teijiro Yazawa. *Japan. J. Med. Sci. II, Biochem.* 2, 37-41(1933).—The following were obtained from an aq. ext. of finback-whale muscle: lactic acid, xanthine (or adenine), hypoxanthine, histidine, creatine and a substance (m. 259-61°; N 20.05%) similar to lysine. B. C. A.
- Cetacea. XLIII. Nitrogenous substances of the liver** Teijiro Yazawa. *Japan. J. Med. Sci. II, Biochem.* 2, 43-6(1933).—Tyrosine, guanine and xanthine, but not hypoxanthine, were isolated. Autolysis increased the (arginine + histidine) N and the N not pptd. by phosphotungstic acid. Free sugar increased. B. C. A.
- Sugar of amniotic fluid. Observations in chick embryos.** Kichinosuke Yamada. *Japan. J. Med. Sci. II, Biochem.* 2, 47-69(1933).—Fructose was identified. Creatine and creatinine are not present after incubation for 12 days, but lactic acid can be detected. A summary of the general phys. and chem. properties is given. B. C. A.
- Fructose in the amniotic fluid of chick embryos** Kichinosuke Yamada. *Japan. J. Med. Sci. II, Biochem.* 2, 107-13(1933).—With the cryogenin color reaction (cf. *C. A.* 28, 992<sup>a</sup>) fructose was detected. B. C. A.
- Conversion of urinary folliculin into an ether-extractable form.** B. Zondek. *Klin. Wochschr.* 11, 812(1933). A claim for priority. B. C. A.
- The digestibility of milk in vivo as affected by certain physical treatments.** Francis N. Mortenson. *Iowa State Coll. J. Sci.* 8, 211-12(1933).—Calves with gastric fistula were used in one set of expts. Sometimes the milk was introduced through the fistula. Samples were taken at intervals of 1 hr. Boiled and autoclaved milk left the stomach faster than raw milk because their curd offered more surface to the gastric juice. X-ray photographs with or without BaSO<sub>4</sub> do not give satisfactory information of the stomach contents. A calf without a fistula, was fed and autopsied 8 hrs. later. The stomach contents were similar to those of the calves having fistula. Expts. on a human subject by means of a stomach pump produced similar results. The time for digestion is variable because of fatigue, state of health and individuality. F. E. Brown.
- The influence of ultra-violet radiation on the metabolism of muscular work and on the capacity of man for work.** Gunther Lehmann and Alexander Szakáll. *Arbeitsphysiol.* 5, 278-341(1932).—The effect of ultra-violet radiation from 2 quartz Hg lamps on 6 subjects at weekly intervals was to lower the basal metabolism 10 to 15%, increase the capacity for work up to 60% and decrease the O debt. The various effects were similar to those found as the result of training. T. M. Carpenter.
- Further investigations on the influence of ultra-violet radiation on the metabolism of work and on the capacity of man for work.** Gunther Lehmann and Alexander Szakáll. *Arbeitsphysiol.* 6, 84-9(1932).—To det. whether the results in the earlier investigation (cf. preceding abstr.)

were due to psychic influences, the same subject was studied when a screen impervious to ultra-violet rays was placed between him and the rays without his knowledge. The increase in capacity for work did not take place. Another subject treated at the same time showed a fall in wt., a lowering of the basal metabolism, a rise in the daily R. Q. when treated in contrast to a daily fall in the week when not treated, and a slight increase in the alkali reserve.

T. M. Carpenter

**The influence of radiant heat on the human circulation.** Irvin L. Fisher. *Arbeitsphysiol.* 6, 384-410(1933).—The effects of radiant heat from 10 reflecting lamps of 500 w. each were detd. on 4 workers in the Fe industry and P. The subjects stood 130 cm. from the lamps, at which distance the radiation was 2 calories per sq. cm. per min. Exposures of 75-90 min. led to the following changes: +46% in arterial-venous  $O_2$  difference, -21% in the min. vol. of the blood circulation, -44.5% in the stroke vol., +43% in the pulse rate and +16% in  $O_2$  absorption.

T. M. Carpenter

**The energy expenditure of agricultural work.** J. L. Kahn, W. W. Kotschegina and T. A. Zwinogrodskaja. *Arbeitsphysiol.* 6, 585-94(1933); cf. *C. A.* 23, 887; 24, 5352; 25, 1563; 26, 5908.—The output of energy in several kinds of farm work was detd. by the Douglas-Haldane method with 3 men and 2 women during 3 min. of work and the first 3 min. of recovery. The increase in heat production was as follows: with men, heavy plowing, 4.1-6.5 kg. calories per min., light plowing, 2.9-4.7, tending a steam thresher, 2.7-3.9; with women, binding of sheaves of rye or oats, 2.0-4.3 and weeding turnips, 2.1-2.6. The ratio of recovery  $O_2$  per min. to  $O_2$  per min. during work varies from 0.33 to 0.59.

T. M. C.

**A study of the energy expenditure of scrubbing.** End 1 Weatherhead and D. B. Thomson. *Arbeitsphysiol.* 6, 595-606(1933).—The net energy cost of scrubbing in the standing position was about 80 cal. per sq. m. per hr. with 2 untrained subjects and about 95 cal. per sq. m. per hr. with a trained subject. In the kneeling position both averages were 100 calories per sq. m. per hr.

T. M. C.

**Changes in the character of breathing at varying  $O_2$  concentrations.** Rodolfo Margaria and Cesare Talenti. *Atti accad. sci. Torino, Classe sci. fis., mat., nat.* 68, 183-91(1933). Subjects breathing air contg. from 98.6% down to 15%  $O_2$  for  $\frac{1}{2}$ -hr. periods do not show any marked change in rate of respiration. With  $O_2$  down to 12%, the rate increases for a time but soon returns to normal. At 9.6%  $O_2$ ,  $p_H$  detn. of the blood shows a slight change toward alk. of 0.03-0.10%. It does not, therefore, seem probable that change in  $p_H$  and rate of respiration are closely related.

A. W. Contieri

**The preparation and demonstration of the parathyroid hormone in the blood in pregnancy.** F. Hoffmann. *Arch. Gynakol.* 153, 181-200(1933).—A substance sep'd. from the blood of pregnancy increased the blood Ca in the dog. This substance could be detected as early as the third month of pregnancy, rising each month thereafter. It disappeared in the puerperium, and was never found in fetal blood.

L. Eichelberger

**Carbohydrate metabolism during and after pregnancy.** Sugar and diastase in blood. P. Goldschmidt-Fürstner. *Arch. Gynakol.* 153, 417-33(1933).—The diastatic activity of the blood declined during pregnancy but increased after parturition. The blood sugar rose during parturition. Exts. of pituitary injected caused a rise in the diastatic activity and the blood sugar. Glucose or adrenaline injected caused a fall in diastatic activity but later there was a rise as the blood sugar fell.

L. Eichelberger

**The change in liver function during pregnancy.** Minoru Kojima. *Arch. Gynakol.* 154, 119-21(1933).—The urine of two pregnant rats fed on a const. diet was analyzed during the progressive stages of pregnancy for C, N and vacant oxygen, and their ratios were computed. Menthol was given orally at definite intervals. After labor a gradual decline in the quotients was found, thereby indicating a change in liver function.

L. Eichelberger

**Thyroid secretion and blood formation.** S. Thaddeus.

*Arch. expl. Path. Pharmacol.* 166, 276-89(1932); *Physiol. Abstracts* 18, 205.—Repeated injection of 0.5 mg. thyroxine per kg. into rabbits causes an increase in the hemoglobin and the red blood corpuscles, reticulocytes and thrombocytes, accompanied by a relative neutrophilia in a relatively leucopenic blood. The bone marrow shows increased activity. Removal of the thyroid leads to an aplastic type of anemia which can be compensated for by giving thyroxine. This anemia is accompanied by a leucopenia with a relative lymphocytosis and diminution of neutrophile cells; the bone marrow activity is decreased. Phenylhydrazine anemia is more rapidly compensated in the hyperthyroid than in the normal animal, and much more rapidly than in the thyroidectomized animal. The regeneration of the white cells is similarly accelerated.

G. G.

**Nutritive vascular regulation. I.  $CO_2$  and  $O_2$  lack as stimuli.** A. Fleisch, I. Sibul and V. Ponomarev. *Arch. Ges. Physiol. (Pflügers)* 230, 814-34(1932); *Physiol. Abstracts* 18, 182; cf. *C. A.* 27, 3509.—The posterior extremities or intestine of anesthetized cats was perfused with blood (clotting prevented by Liquoid); a perfusion app. which included a lung was used. The ventilation of the lung with 2 to 10%  $CO_2$  in air usually causes a small primary vascular contraction followed by dilatation. Occasionally  $CO_2$  has a pure dilatator effect. In sensitive preps. 0.5 to 1% of  $CO_2$  may cause an increase of 30% in the perfusion rate. The administration of  $CO_2$  causes a mean change in the  $p_H$  (venous blood) of 0.17;  $p_H$  alterations of 0.05 may be effective. The ventilation of the lung with N also causes vasodilatation. The  $p_H$  of the venous blood is shifted toward the alk. side; the effect usually consists of a small contraction followed by dilatation. The neg. findings of other investigators with  $CO_2$  are discussed.

G. G.

**Fat metabolism of the chick embryo under standard conditions of artificial incubation.** A. L. Romanoff. *Biol. Bull.* 62, 54-62(1932); *Physiol. Abstracts* 18, 65-6; cf. *C. A.* 27, 3246.—The amt. of fat in the growing embryo and egg yolk gives a comprehensive idea of the change in fat content occurring in the egg during incubation. The relative increase of fat in the embryo and the decrease of it in the yolk can be well demonstrated by curves plotted from the data on the percentages of fat in dry wt. The curve of consumed fat is quite similar to the curve of the growth of embryo. Iodine value, sapon. no. and % of the fat from the yolk sac of the developing egg are almost const. throughout the incubation period. Iodine value and % of the fat from the developing embryo are increasing and decreasing, resp., during the latter part of incubation.

G. G.

**Histochemical localization of cholesterol in hen egg. Methods and results.** V. D. Marza and E. Marza. *Bull. Histol.* 9, 313-40(1932); *Physiol. Abstracts* 18, 155.—The eggs were studied from the earliest stages up to 1.5 cm. in diam., by either the digitonin method or the saponin method for detecting free cholesterol, and then by converting the cholesterol and lipid ethers into the free substances by first fixing in formal saline and then treating with digitonin. The refractivity of the lipid bodies is unaffected by a temp. of 60°, but that of the cholesterol bodies is destroyed. Treatment with Sudan III or Nile blue gives very inconstant results. The cholesterol of eggs is derived from the blood, and enters the ovoplasm slowly during the initial periods of slow growth, but rapidly during the last rapid growth period. The different layers of the egg are not equally rich in cholesterol, and the ratio between free cholesterol and total cholesterol varies in different parts.

G. G.

**Function of denervated kidney after section of the splanchnic nerve.** P. Demant. *Compt. rend. soc. biol.* 110, 1090-9(1932); *Physiol. Abstracts* 18, 125.—After denervation of a kidney by stripping the arterial outer coat the urine formed was more abundant on the following day than on the other side. The content of chlorides remained the same. The N content was less on the denervated side. The total quantity of Cl on the denervated side was greater for the time of observation. The total

amt. of N was equal on both sides. In other expts. both splanchnic nerves and pneumogastric nerves were cut, and the artery was denervated on one side. In this case more urine was formed by the kidney of which the artery was left intact. The secretion of urine depends in the 1st instance on the parasympathetic system, the influence of which is capital even in presence of intact sympathetic nerves. The secretion of N is regulated by the parasympathetic nerves and is independent of the sympathetic system. G. G.

Internal secretion of the prostate. M. Sergievskii and I. Bakhromeev. *Z. ges. expil. Med.* 81, 6-12(1932); *Physiol. Abstracts* 18, 143.—Stimulation of the hypogastric nerves (secretory nerves of the prostate) leads to a rise in blood K, but no change in Ca content occurs. The blood of the animal (cat or dog) after stimulation of these nerves has an inhibitory influence on the perfused frog heart, diminishing its amplitude and frequency. G. G.

Sugar cerebrospinal fluid after ingestion of carbohydrate. M. Dobrev and Tr. Saprianov. *Z. ges. expil. Med.* 81, 128-32(1932); *Physiol. Abstracts* 18, 131; cf. C. A. 27, 3980.—The administration of 100 g. glucose in 300 cc. water to 28 patients with nervous diseases led in the majority of cases to an increase in sugar of spinal fluid. The sugar in the spinal fluid was nearly always less than that in the blood, but in some cases the rise in the former after the glucose was negligible even when the blood-sugar rise was very marked. The rise is a normal physiol. process. G. G.

Chemical constitution of the follicular ovarian hormones. Armando Novelli. *Anales quim. farm.* (Chile) 3, 8-13 (1934); cf. C. A. 27, 4842.—Discussion. L. E. G.

The pancreas and the formation of muscle glycogen from glucose. V. G. Foglia and R. Fernandez. *Compt. rend. soc. biol.* 115, 330-2(1934).—After intravenous injection of glucose the muscle glycogen shows an increase in 1 hr. in normal, but not in pancreatectomized dogs. Giving insulin to the latter or grafting a pancreas to the blood vessels of the neck permits the normal synthesis of muscle glycogen. Role of the vagus nerves in the formation of muscle glycogen from glucose. *Ibid.* 333-4.—Section of the vagus has no effect on the formation of muscle glycogen. The adrenal cortex and the formation of muscle glycogen from glucose. R. Fernandez, V. G. Foglia, L. F. Leloir and A. Novelli. *Ibid.* 334-7.—The adrenal cortex or its ext. is necessary for the formation of muscle glycogen. L. E. Gilson

Role of the endocrine glands in the resynthesis of muscle glycogen after fatigue. R. G. Dambrosi. *Compt. rend. soc. biol.* 115, 344-5(1934).—Dogs were used. The pancreas, liver and adrenals are necessary for the resynthesis. Removal of the thyroid, parathyroids, hypophysis or gonads has no effect on the rate of resynthesis. Large doses of thyroid ext. cause a slight decrease in the rate. L. E. Gilson

Determination of vaginal mucification in the guinea pig. I. Desclin. *Compt. rend. soc. biol.* 115, 439-41 (1934).—The injection of urine of pregnant women, deprived of folliculin by extn. with  $\text{Et}_2\text{O}$ , caused mucification. Ext. of corpus luteum had the same effect. Corpus luteum ext. injected simultaneously with folliculin inhibited the action of the latter. Mucification during gestation depends upon the specific action of the corpus luteum hormone. L. E. Gilson

Respiratory exchanges of bantam hens and cocks. G. Nichita and G. Iftimesco. *Compt. rend. soc. biol.* 115, 661-3(1934); cf. C. A. 27, 4287. Respiratory exchanges of several breeds of hens during starvation. G. Nichita and I. Mircea. *Ibid.* 664-7. Respiratory exchanges of starving pigeons. G. Nichita and G. Iftimesco. *Ibid.* 667-70. L. E. Gilson

The sulfur metabolism of the dog. XII. The preparation and metabolism of *d*-acetylcysteine. Norman W. Pirie and Thomas S. Hele. *Biochem. J.* 27, 1716-18 (1933); cf. C. A. 27, 3245.—*d*-Acetylcysteine (I) is prepd. by the action of ketene on cystine in alk. soln.

1 The feeding of I to a dog causes an excretion of 48% a. sulfate and 32% as neutral S. Benjamin Harrow

Vapor pressure isotherm of muscle. J. Brooks. *Proc. Roy. Soc. (London)* B114, 258-72(1934).—Change in wt. of the sartorius muscle (in rigor) of the frog was detd. at different vapor pressures of  $\text{H}_2\text{O}$ . The muscle was permitted to come to equil. by suspension in a closed space over  $\text{H}_2\text{SO}_4$  of definite concn. The vapor pressure of the water was designated *a*; this was the quotient obtained by division of the vapor pressure of the  $\text{H}_2\text{SO}_4$  soln. by the vapor pressure of pure  $\text{H}_2\text{O}$  at the same temp. A const. wt. was obtained except at *a* = 0.994. The wt.-vapor pressure curve was reversible within values of *a* between 0 and 0.955. In muscle at rigor at *a* = 0.994, only a small portion of the  $\text{H}_2\text{O}$  was in the bound state (0.3 g.  $\text{H}_2\text{O}$  being assocd. with 1 g. total solids). The amt. of bound  $\text{H}_2\text{O}$  decreased with its activity below *a* = 0.80, the value probably being 0.15 g.  $\text{H}_2\text{O}$  per g. total solids at low activities of  $\text{H}_2\text{O}$ . Joseph S. Hepburn

Gas exchange of "natural" and artificial nerve impulse. R. W. Gerard and H. K. Hartline. *Naturwissenschaften* 21, 882-3(1933).—The conclusions of Winterstein (*Handb. norm. path. Physiol.* 18, 246(1932)) on differences between natural and artificial excitation of nerves, with accompanying respiration or  $\text{NH}_3$  evolution are discussed. Highly accurate expts. (1 mg. tissue) were made on the eye and optic nerve of horseshoe crab (*Limulus polyphemus*) with either type of excitation. On illumination of the eye (outside the respiration chamber), i. e., natural excitation waves, the  $\text{O}$  consumption of the nerves increases occasionally over 50%, av. 41%. Similar increases (44%) are obtained by elec. induction impulses. The increase in both cases lasts 15-40 min.; likewise in both cases  $\text{NH}_3$  seems to be evolved initially. B. J. C. van der Hoeven

Calcium optimum and blood coagulation. I. v. Zárday. *Wien. Arch. inn. Med.* 24, 283-92(1933).—Expts. *in vitro* show that an increase of Ca-ion concn. at first hastens the coagulation of blood, until a certain optimum concn. is reached. Further increases of Ca-ion concn. decrease and finally prevent the coagulation of the blood. Blood rendered incoagulable by high Ca-ion concn. can be made to coagulate by the addn. of Na citrate soln. For the citrate soln., as regards its effectiveness in producing coagulation, there are also min., optimum and max. concns. Harriet F. Holmes

Remarks on the work of O. Meyerhof and D. McEachern. "The anaerobic formation and disappearance of pyruvic acid in muscle." Amandus Hahn. *Z. Biol.* 94, 97-8(1933); cf. C. A. 27, 3513.—Note regarding priority for the discovery of pyruvic acid during the digestion of muscle in vacuum without the addn. of H acceptors. Frances Krasnow

Central blood-sugar regulation. IX. The fasting blood sugar after brain section. F. Hägler and F. Zell. *Z. ges. expil. Med.* 92, 193-210(1933); cf. C. A. 28, 2411. X. The effect of exclusion of the central nervous system on alimentary hyperglucemia. *Ibid.* 211-21. XI. The effects of removal of various parts of the central nervous system on pyramidone acid magnesium hyperglucemias. *Ibid.* 222-33. XII. Reflex blood-pressure control and sugar metabolism. *Ibid.* 234-40. M. L.

Significance of the liver in the metabolism of the lipid bodies. Change in the amounts of lipoids in the blood and the bile in parenteral administration of lecithin to normal rabbits. Y. Osoda. *Japan. J. Gastroenterol.* 5, 115-23(1933).—Purified lecithin was injected subcutaneously or into the ear veins of rabbits by means of 3-5 cc. per kg. of 3% lecithin emulsion. The lipoids of the blood and bile were detd. at intervals of 1 hr. The no. of repetitions of these injections and the no. of rabbits employed are not stated. The total fatty acids, lecithin and cholesterol increase in both the bile and blood after such injections. The metabolism of lipoids in hepatic disturbance in rabbits. *Ibid.* 124-31.—The livers of rabbits were injured either by feeding  $\text{CCl}_4$ , injecting India ink or ligation of the bile duct. After the injection of lecithin intravenously the blood lipoids remain at 4

higher level than normally if the liver has been injured by blocking the parenchymatous cells. The blood lipid changes are normal if only the hepatic stellate cells are blocked. The liver functions in regulating the level of blood lecithin. The lecithin may be excreted in the bile or removed from the blood by the reticulo-endothelial cells.

C. M. McCay  
The relation between the chemical constitution and the excretion of dyes by the liver and kidneys. Y. Tada and K. Hishikawa. *Japan. J. Gastroenterol.* 5, 187-90 (1933).—The rate of excretion after intravenous injection of 7 monoazo dyestuffs in the urine and bile was detd. Dyes with 1 sulfone group are excreted chiefly through the kidneys. With 2 of these groups more is found in the urine and with dyes contg. 3 such as Scharlach 6 R 41.9% was excreted in the urine and only 6.4% in the bile.

C. M. McCay  
The excretion of dyestuffs by the liver. Y. Tada. *Japan. J. Gastroenterol.* 5, 191-200 (1933); cf. *C. A.* 28, 1753. —The removal of dyestuffs from the blood is a function of the parenchymatous cells of the liver. Dyes are secreted by these cells into the bile. C. M. M.

The excretion of dyestuffs after the liver is injured experimentally. R. Wakabayashi. *Japan. J. Gastroenterol.* 5, 201-35 (1933).—The excretion of dyestuffs is influenced by the degeneration of the parenchymatous cells. It seems to matter little whether this degeneration is caused by chem. agents as  $\text{CCl}_4$ ,  $\text{CHCl}_3$ , and P, or such liver parasites as *Schistosomum japonicum* and *Distomum spulatum*.

C. M. McCay  
The influence of bacterial toxins upon the liver function. I. Kizu. *Japan. J. Gastroenterol.* 5, 236-78 (1933). Necrosis of the liver cells follows the injection of bacterial toxins especially diphtheria. The decreased ability to excrete dyes corresponds to this destruction by toxins.

C. M. McCay  
Bicarbonate content of living muscle. N. Brookings. *Biochem. Z.* 267, 349-56 (1933).—Resting muscle at equil. in serum contains about 30% less bicarbonate, and its reaction is about 0.13  $p_{\text{H}}$  more acid. S. Morgulis

Influence of the adrenal cortex hormone on the chemistry of the active muscle. Roberto Indovina. *Biochem. Z.* 267, 383-8 (1933).—Rats can run until complete exhaustion sets in 50% longer (6 hrs. instead of 4) when they are injected with the adrenal cortex hormone. This effect of the hormone is attributed to the fact that under its influence the glycogen content of the muscles does not drop so greatly nor does their nonprotein N content rise nearly as much at the time of exhaustion as without the hormone.

S. Morgulis  
Chemical composition of pig thymus. Eisei Kataoka. *J. Biochem. (Japan)* 19, 21-4 (1934).—A large amt. of pig thymus contained 64.1%  $\text{H}_2\text{O}$ , and the dry substance consists of 26.6% fat free and 9.3% fatty material. Of the latter about  $\frac{1}{10}$  was acetone-insol. The residue of the ether ext. extd. with cold acetone yielded at 0° crystals, which were recrystd. from warm alc. and constituted 11% of the thymus. This cryst. substance, sol. in ether, petr. ether, benzene, toluene,  $\text{CHCl}_3$  and  $\text{CS}_2$ , m. 63.5°, was identified as pure  $\alpha$ -palmitodistearin. In the protein fraction no glycine was demonstrable, but leucine and the diamino acids were in preponderance. S. M.

Comparative studies on the chemical composition of the pancreas. Eisei Kataoka. *J. Biochem. (Japan)* 19, 25-32 (1934).—No difference has been found in the protein compn. of pig and cow pancreas, in either case leucine and the basic diamino acids being predominant quantitatively. But from the cow pancreas pure cryst.  $\beta$ -stearo-dipalmitin was obtained which was not present in the pig pancreas, where another glyceride is present, probably  $\beta$ -laurio- $\alpha$ -distearin. S. Morgulis

Sex differences in the oxidation-reduction capacity of the tissues. V. Influence of the gonads on the oxidation-reduction capacity of the tissues. Sakae Kagiya. *J. Biochem. (Japan)* 19, 45-58 (1934); cf. *C. A.* 27, 2184. —The oxidation capacity was detd. on samples of blood and the reduction capacity on the gastrocnemius muscle by the methylene blue method. The oxidation

capacity is higher and the reduction smaller in male than in female rabbits. In the castrated male the oxidation capacity diminishes and the reduction shows a slight tendency to increase. In the castrated female no change has been observed in the oxidation capacity but the reduction capacity has decreased. In feminized male rabbits there is a fairly strong decrease in the oxidation but only a slight increase in the reduction capacity. In masculinized female rabbits, on the contrary, the oxidation is somewhat increased but the reduction is markedly diminished. These sex differences in oxidation-reduction activity are observable not only in the adult animals, but also in the young or even in the embryo. These functional differences are attributed to the gonads.

S. Morgulis  
Tissue respiration and indophenol-oxidase reaction of serous membranes. K. Kiyohara and S. Kagiya. *J. Biochem. (Japan)* 19, 59-68 (1934).—The  $\text{O}_2$  consumption per mg. of various serous membranes (omentum, mesenterium, mediastinum, pericardium, pleura, peritoneum) from different animals (dog, rabbit) and the distribution of oxidase granules in these membranes have been detd. A parallel relationship has been found between the degree of  $\text{O}_2$  consumption and the no. of granules. S. M.

Change of the oxidation-reduction potential of Ringer solution on passage through an isolated working heart. A. Ju Kharit and I. I. Fedorov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 68-71 (in German 71-3) (1934). A Ringer or a Ringer-Locke soln. after passage through the heart of *Rana* shows a reduction of potential against a smooth Pt electrode of 26-61 mv. while the  $p_{\text{H}}$  remained const. A 0.0002M KCN soln. addn. reverses the oxidation process and the potential decreases by about 20 mv. Addn. of CO at first increases the potential and then decreases it below normal. F. H. Rathmann

Biological activators and inhibitors. Hans v. Euler. *Arkiv Kemi, Mineral Geol.* 11A, No. 12, 7 pp. (1933). A short review of the catalytic action of metals on biol. systems and the nature of biol. catalysts such as vitamins, hormones and enzymes. The antagonistic behavior of vitamin A and thyroxine in regard to growth was studied and a balance was achieved between the two in feeding expts. E. W. Scott

Action of cardiac hormones on lactic acid and dextrose content in blood. J. A. Collazo, J. Puyal and Isabel Torres. *Arch. med. cirugia espec. (Madrid)* 36, 599; *J. Am. Med. Assoc.* 101, 329-30 (1933). —The action of org. exts. on the circulatory mechanism is due to their content in cardiac hormones. These may be true cardiac hormones which have a cardiac, muscular or visceral origin and the active principle of which is adenylophosphoric acid or they may be arterial hormones which are of pancreatic origin and of unknown compn. To det. the significance of adenylophosphoric acid in muscular metabolism the glucemia and blood lactic acid of 2 groups of normal rabbits were detd. One group of animals was injected with one cc. per kg. of body wt. of a cardiokinetic muscular ext. while the other group received a similar dose of a pancreatic ext. The blood sugar and lactic acid were detd. at 30, 60 and 120 min. Only the hormone in the muscular ext. can be identified with adenylophosphoric acid, since it produced a const. drop in blood lactic acid and a slight elevation of blood sugar. The action of pancreatic hormone, deprived of insulin, on blood sugar and lactic acid is less marked than the hormone contained in muscular ext., either because its active principle is a specific hormone and not adenylophosphoric acid or because its content of the latter is not equal to that of the muscular exts. The action of cardiac hormones is primarily on carbohydrate and phosphorus metabolism of peripheral muscles, cardiac muscles and mostly muscular layers of vessels. Louis J. Soffer

Hippuric acid. IV. Hippuric acid synthesis in the animal body. Isao Kanzaki. *Sei-i-kwai Med. J.* 52, No. 1, 85-90 (English Abstract 4-5 (1933)); cf. *C. A.* 27, 114. —From detns. of hippuric acid (I) in the blood by K.'s

method (C. A. 27, 117), K. concludes that the kidneys cannot be the only organs concerned with the synthesis. Normal rabbits contain no I, nor does the blood of the normal rabbits after 3-9 hrs. after BzONa injection. If the injection is made in nephrectomized animals, I appears. The spleen also cannot play the role, for splenectomy and nephrectomy together give the same results as does nephrectomy alone. When the reticuloendothelial system of nephrectomized rabbits is blocked with India ink and then injected with BzONa, I shows a decrease as compared with that of the non-blocked animal, followed by an increase; this is due probably to the acceleration of the cell activity. The results of P or CHCl<sub>3</sub> poisoning show that the liver must be concerned with the synthesis in the rabbits. S. Tashiro

**Effect of the pituitary body on nitrogen metabolism.** Yo Takeuchi and Yoshio Tokizaki. *Sei-i-kwai Med. J.* 52, No. 3, 25-50 (English Abstract 5-4) (1933).—The daily analysis of urinary non-protein N (I), creatine and creatinine (II), blood N (III), blood non-protein-N (IV), and blood creatine and creatinine (V) was made for 1-4 weeks with dogs (about 7 kg.). Hypophysectomy produces a slight decrease in I, II and III, but increase in IV followed by a decrease. The daily injection of pituitrin (1. cc.) to the normal dog causes a decrease in all except III, while a similar injection of hypophysectomized dogs causes an increase in all. The antuitrin gives the same results as pituitrin. With pituitary and normal dogs, all decrease, while with hypophysectomized dog, I, II and III decrease, but IV and V show no change. S. T.

**Influence of the spleen upon sulfur metabolism.** Kaname Iwabuchi. *Sei-i-kwai Med. J.* 52, No. 4, 59-83 (English Abstract 3) (1933).—The results of estn. of daily urinary excretion of total N, total S, neutral S, total sulfate, inorg. sulfate and ethereal sulfate of the normal and splenectomized bitch for 2 weeks with and without subcutaneous daily injections of 3 com. products show that the spleen plays an important role in S metabolism. Its activity depresses S metabolism and its absence accelerates it. An injection of opostatin reduces the S metabolism accelerated by splenectomy. Both adrenalin and oophormine accelerate S metabolism, especially of splenectomized animals. S. Tashiro

**The nature of the depressor substance of the blood.** Cyrus H. Fiske. *Proc. Natl. Acad. Sci.* 20, 25-7 (1934).—It has been able, by a modification of the method of Fiske and Subbarow (C. A. 24, 389), to sep. from a protein-free blood filtrate, 2 substances, adenosine triphosphate (I) and diphosphoglyceric acid (II). I can be adsorbed on charcoal (norite) and thus be sep. from II. The reactions of I are analogous to the adenosine triphosphate obtained from the muscle. Julius White

**Factors influencing the secretion of tracheal mucus.** Julian Johnson. *Am. J. Med. Sci.* 187, 298 (1934).—Stimulation of the peripheral or central end of the superior laryngeal nerve will cause a secretion of mucus. Also when an irritating substance comes in contact with the tracheal mucosa, mucus is secreted, as a result of both direct irritation and reflex stimulation of the mucous glands. R. C. Willson

**Glutathione in hibernation and in reawakening.** Filippo Dulzetto. *Z. vergleich. Physiol., Abt. C of Z. wiss. Biol.* 16, 218-27 (1932).—The glutathione content of the tortoise increases during hibernation. The increase was greatest in the heart, smaller but very pronounced in the liver and blood and very small in the striped muscle. B. C. B.

**Evans, Herbert M., Meyer, Karl, Simpson, Miriam E., Szarka, Alex. J., Pencharz, Richard I., Cornish, Robert E. and Reichert, Frederick L.: The Growth and Gonad-Stimulating Hormones of the Anterior Hypophysis. Mem. Univ. of California. Vol. 11. Berkeley: Univ. of California Press. 446 pp. \$10. Reviewed in Nature 133, 401 (1934).**

## G—PATHOLOGY

H. GIBSON WELLS

**Distribution of sugar in the blood of diabetic and non-**

**diabetic Indians.** J. P. Bose. *Indian Med. Gaz.* 67, 415-35 (1932).—In normal persons the plasma sugar (I) is slightly less than the whole blood-sugar (II) and slightly greater than the corpuscular sugar (III), whereas in diabetes I is significantly greater than II and III to an extent depending on the severity of the disease. Hence the ratio III:I is a criterion of the gravity of diabetes. Administration of glucose and of insulin gives values for I, II and III which indicate that the hormone increases the permeability of the corpuscles to sugar and facilitates its storage and utilization. B. C. A.

**The application of Ruckert's lipocrite in the study of lipemia.** B. Bisbini and G. Canali. *Diagnostica tec. lab. (Napoli) Riv. mensile* 4, 377-88 (1933).—Ruckert's lipocrite (*Klin. Wochschr.* No. 40 (1931)) is suitable for the study of variations in alimentary lipemia only to follow fat absorption. The lipemic level varies from subject to subject. Since there are many uncontrollable factors, the method is not of diagnostic value. L. W. B.

**The sedimentation of blood.** Andrea Colarusso. *Diagnostica tec. lab. (Napoli) Riv. mensile* 4, 553-627 (1933).—A crit. review of work on blood sedimentation including its clinical value. A bibliography of 449 references is given. Lewis W. Butz

**Clinical and experimental hypoglycemia.** Piero Lavraga. *Diagnostica tec. lab. (Napoli) Riv. mensile* 4, 729-42 (1933).—A review with large bibliography. Lewis W. Butz

**Action of the diabetogenic substance of the anterior hypophysis in various physiological conditions.** B. A. Houssay, A. Biasotti and C. T. Rietti. *Compt. rend. soc. biol.* 115, 323-5 (1934); cf. C. A. 27, 534. —In dog, the alk. ext. of the anterior bovine hypophysis produces a diabetic effect in the absence of pancreas, hypophysis, thyroid, ovaries, testicles or adrenal medulla. The effect is also produced in dogs after injury of the tuber or section of the splanchnic or lumbar sympathetic nerves. After thyroidectomy the action is a little weaker. Diabetogenic properties of extract of the anterior hypophysis in diverse species and with different diets. *Ibid.* 325-7. —The diabetogenic effect is produced in cats, dogs, pigeons, guinea pigs, rats, mice and rabbits but not in toads or snakes. The hyperglucemia, and especially the glucosuria, are more intense in dogs on a carbohydrate diet than in those on a meat diet. The diabetogenic effect is specific for the anterior hypophysis; it is not produced by exts. of muscle, kidney, liver, spleen, thyroid or posterior hypophysis. Properties of the diabetogenic substance of the anterior hypophysis. *Ibid.* 327-9. The diabetogenic substance is stable if heated to 50° for 15 min., but is almost totally inactivated at 80°. It is partially sol. in 50% EtOH. It does not pass through ultrafilters or parchment membranes. It is pptd. by 30% satn. of the soln. with Na<sub>2</sub>SO<sub>4</sub>. It is not adsorbed by blood charcoal or glaucomaceous earth. L. E. G.

**Analytical study of Monilia albicans antigen.** P. Negroni. *Compt. rend. soc. biol.* 115, 342-4 (1934). L. E. Gilson

**Phenyl isocyanate protein compounds and their immunological properties. II. The gelatin compounds** Sydney J. Hopkins and Arthur Wormal. *Biochem. J.* 27, 1706-15 (1933); cf. C. A. 27, 5402. —Phenylureido (I) and p-bromophenylureido-gelatin (II) give marked precipitin and complement-fixation reactions with antisera to phenylureido-horse-serum-globulin. I and II injected into rabbits over a long period fail to produce antibodies which are detectable by precipitin and complement-fixation tests. Benjamin Harrow

**Chemo-immunological studies of pneumococcal infection and immunity.** Oswald T. Avery. *Naturwissenschaften* 21, 777-80 (1933).—A review.

**Ultra-violet absorption spectra studies in malarial sera.** N. D. Kehar. *Rec. Malaria Survey India* 3, 171-3 (1932).—Absorption is greater in malarial than in normal serum of human beings throughout the ultra-violet spectrum; as compared with normal serum, malarial

serum shows no selective absorption in this region.

**Studies in immunity in malaria. I. An intradermal reaction in malarial infections in monkeys.** J. A. Sinton and H. W. Mulligan. *Rec. Malaria Survey India* 3, 323-45 (1932).—A disintegration product of a malarial parasite occurring in the blood, liver, spleen and bone marrow of monkeys was prepd. by digesting the finely divided parasitic material with papain for 4 hrs. at 60° and filtering the digest through paper. When the filtrate was added to a 10-fold quantity of abs. alc. a copious yellowish or whitish ppt. that was almost completely sol. in normal saline soln. was formed. Antigens prepd. from the pptd. material that had been in contact with alc. for 24-48 hrs. remained sterile for long periods and were as active as those prepd. from the original filtrate. The prepn. causes an immediate skin reaction when it is injected intradermally into normal monkeys, and the reaction seems to be of the type assocd. with atopic hypersensitiveness. Intradermal injection into monkeys infected with the same strain of parasite gives rise to a delayed reaction similar to that occurring in hypersensitiveness of infection. As yet, there is no proof that these reactions are sp. for malaria in general or even for infection with the special strain of malarial parasite used.

**Sedimentation reaction in acute cholecystitis and in uncomplicated cholelithiasis.** Nils Liedberg. *Acta Chir. Scand.* 74, 19-40 (1934).—In acute cholecystitis there is generally no increase in the sedimentation rate during the first 24 hrs., but during the next 24 hrs. there is an increase in 90% of the cases studied, the av. rate per hr. being 29 min. During the 3rd, 4th and 5th day the sedimentation rate rises to an av. of 48, 57 and 61 mm. per hr. The presence of icterus has no effect on this sedimentation rate. The sedimentation rate in uncomplicated cholelithiasis is normal.

**Diastasic conditions in cases of jaundice due to malignant tumors.** Erik Millbourn. *Acta Chir. Scand.* 74, 47-87 (1934).—Jaundice due to tumor is accompanied by increased diastase activity of the urine in about 1/4 of the cases studied. The increased diastase is greater when the tumor is located on the duodenal papilla or the extrahepatic bile ducts, but was absent in cases of cancer of the pancreas.

**Diazo urines. III. Chemical composition of diazo urines in scarlatina.** Sadajiro Nakayama. *J. Biochem. (Japan)* 19, 33-8 (1934); cf. C. A. 28, 1758<sup>7</sup>.—Urine from scarlatina patients is acidified, evapd. to a thin syrup and treated with Pb(AcO)<sub>2</sub> until no further ppt. is formed. The filtrate is reduced in vol. at 40° in *vacuo*, treated with dil. H<sub>2</sub>SO<sub>4</sub> and freed from the ppt. The excess H<sub>2</sub>SO<sub>4</sub> is removed with baryta and the excess Ba with CO<sub>2</sub>, and the final filtrate is greatly reduced in vol. On adding abs. alc., drop by drop, a ppt. of antoxy- and oxyproteic acid is obtained. The antoxyproteic acid is sep'd. from the oxyproteic acid by Hg(AcO)<sub>2</sub>. The substance gives a strong S but no biuret or xanthoproteic test, nor does it give a red color with Millon's reagent. It gives a strong pos. reaction with Ehrlich's diazo reagent. The oxyproteic acid gives neither the biuret nor the diazo reaction, but a pos. S test. From about 10 l. scarlatina urine were obtained 7.18 g. antoxyproteic acid, 1.07 g. oxyproteic acid and 0.35 g. of histidine, arginine and lysine. **IV. Chemical composition of diazo urines in measles.** *Ibid.* 39-43.—From about 7 l. of measles urine were obtained 6.5 g. antoxyproteic acid, 4.5 g. oxyproteic acid and 0.95 g. hexone bases (histidine, arginine and lysine).

**Availability of fructose in the bodies of normal and diabetic animals.** Minoru Abe. *J. Biochem. (Japan)* 19, 69-110 (1934).—Fructosuria is caused in the dog with a smaller amt. than is required to produce glucosuria with glucose, and the hyperglucemia with fructose is also lower, indicating a lower renal threshold. Partial pancreatectomy which has not affected the glucose tolerance of the dog was assocd. with fructosuria when 2 g. fructose per kg. was administered. With a more

strongly diabetic tendency and a lowering of the glucose tolerance dogs do not respond with fructosuria to this dose, but 3 g. fructose per kg. produces a slight glucosuric response. Glucose in these animals always causes a high hyperglucemia and glucosuria. In severe diabetic dogs with high hyperglucemia even during the post-absorptive stage, the administration of fructose causes increased hyperglucemia but to a smaller degree than does glucose, and a smaller amt. is lost in the urine. Successive administration of fructose elevates its renal threshold so that the hyperglucemia from fructose also tends to be elevated. Repeated daily administration of fructose or glucose had little effect on the glucose tolerance of mildly diabetic animals, though the glucose excreted is less after fructose than glucose injections. In the Japanese the oral consumption up to 0.5 g. fructose per kg. is tolerated well, but with amts. above 0.8 g. there is fructosuria.

**The influence of liver degeneration and recuperation on the acid-base equilibrium of the blood.** Wm. de B. McNider. *J. Pharmacol.* 50, 108-22 (1934).—Where liver degeneration occurs there is a definitely correlated decrease in alkali reserve.

**Reduced glutathione content in the organ tissue of rabbits immunized with typhoid bacilli.** Fumio Murata. *Sei-i-kwai Med. J.* 51, No. 10, 63-91 (English Abstract 3-4) (1932).—The reduced glutathione contents (I) of liver, spleen, kidney, suprarenal, testicles, lungs, heart, bone marrow and muscle increase when the rabbit is immunized with typhoid bacilli. This increase begins to fall as the titer of agglutination falls, reaching a normal level after about 2 months. If the rabbit, whose reticulo-endothelial cells were previously damaged by pelican, is immunized with the organisms, I increases greatly in suprarenals, but not in any other tissues. The results obtained with splenectomized animals under similar conditions led M. to conclude that the spleen shares in the agglutinin production.

**Landsteiner, Karl:** Die Spezialität der serologischen Reaktionen. Berlin: J. Springer. 123 pp. M. 8.80; cloth, M. 9.80.

## H—PHARMACOLOGY

A. N. RICHARDS

**The effects of sodium hyposulfite on intoxication by potassium cyanide.** Ch. Achard and Leon Binet. *Compt. rend.* 198, 222-4 (1934).—Na hyposulfite prevents and has some curative action on intoxication of carp (*Cyprinus carpio* L.) by KCN. Added to a perfusion soln. it prolongs respiratory movements of the isolated head of the fish (*Gobius lota*) from 27 to 48 min.; KCN arrests them in 2 min.; both together maintain them 32 min. Sodium hyposulfite does not restore the movements after cessation due to perfusion of KCN.

**The neuro-muscular action of amides and ammonium salts.** R. Bonnet. *Compt. rend.* 198, 284-5 (1934).—The amides (acetamide, oxamide, succinamide) and urea are toxic to muscle and without action on nerve excitability. They are to be classed as curarizing poisons. NH<sub>4</sub> salts (acetate, carbonate, oxalate, succinate) are both muscle and nerve toxins. The pharmacodynamic action of urea favors the diamide constitution.

**Variations in blood cholesterol on injection of adrenaline.** E. Benhamou and R. Gille. *Compt. rend. soc. biol.* 107, 1546-7 (1931); cf. C. A. 27, 2214.—Injection of adrenaline increases the blood cholesterol in normal, but not in splenectomized, persons. Blood fat is unaltered.

**Metabolism of alcohol.** H. E. Himwich, L. H. Nahum, N. Rakieten, J. F. Fazikas, D. Du Bois and E. F. Gildea. *J. Am. Med. Assoc.* 100, 651-4 (1933).—Ingestion of 10 cc. of 19% EtOH (I) per kg. body wt. by man and 50 cc. by dogs was followed by a slight rise in blood sugar, a marked rise in blood lactic acid and a decrease in blood CO<sub>2</sub> and p<sub>H</sub>. (I) acts as a glycogenolytic agent on liver and muscle glycogen. The fall in p<sub>H</sub> due to accumulation of lactic acid and lag in CO<sub>2</sub> excretion varied with the

concn. of (I) in the blood. In patients suffering from the effects of excessive ingestion of alc. the lactic acid of the arterial blood was increased. Intraperitoneal injection of 50 cc. of 19% (I) per kg. of rat lowered the R. Q. of the cerebral cortex from 0.98 to less than 0.9, this indicating an oxidation of (I) and lactic acid.

B. C. A.

**Hyperfunction of the thyroid in pregnancy. Effect of adrenaline on blood iodine in pregnancy.** W. Scheringer. *Klin. Wochschr.* 12, 107-8(1933).—During the second half of pregnancy intravenous injection of 0.005 mg. of adrenaline resulted in a marked fall in blood I within 30 sec. After 30 min. the values reached, or even exceeded, the original level.

B. C. A.

**The action of santonin on isolated blood vessels.** Stefano Bertino. *Arch. farmacol. sper.* 56, 579-82 (1933).—See C. A. 27, 2217. **The action of santonin on the uterus.** *Ibid.* 593-600.—See C. A. 27, 2217. **Santonin and alimentary hyperglucemia from glucose.** *Ibid.* 601-6.—Santonin (0.15 g. per kg.) given intramuscularly in  $C_2H_5(OH)_2$  (3 cc. per kg.) to rabbits produced an exaltation of the hyperglucemia (245 to 328 after 1 hr.) because of administration of 8 g. glucose per kg. by mouth. A similar increase was not observed after 0.01 g. per kg. of santonin and 3 g. per kg. of glucose.

Lewis W. Butz

**The antidotal relationship between semicarbazide and mercuric chloride in the rabbit.** Luciano Battistoni. *Arch. farmacol. sper.* 56, 583-92(1933); cf. C. A. 27, 1676.—Administration of semicarbazide hydrochloride (I) by ear vein separately but immediately after  $HgCl_2$  (0.0375 mg. per kg.) by the same route did not prevent intoxication and death in the rabbit. If lethal doses of I were given the intoxication resembled that from I in addn. to the symptoms caused by  $HgCl_2$ .

L. W. B.

**The hemopoietic action of copper.** Giulio Dolfini and Calogero Casuccio. *Rass. clin. terap. sci. affini* 32, 291-318(1933).—Administration of  $KCu(CN)_2$  raised the hemoglobin level in normal guinea pigs and stimulated blood regeneration in those rendered anemic by hemorrhage.  $KCu(CN)_2$  is less toxic than the other Cu salts usually given.

Lewis W. Butz

**Toxicological investigation of the poisonous constituents of *Ryania acuminata*.** S. Nakarai and T. Sano. *Arch. Pharm.* 272, 1-4(1934).—In addn. to an anatomical examn. of the root, a chem. ext. of the finely comminuted product was effected which yielded after repeated extrn. with  $CHCl_3$  a colorless residue m. 100°. This substance on hydrolysis reduces Fehling soln. and is probably identical with the product ryanin already isolated and described by LaCointe. The toxicological examn. shows it to be highly poisonous. Thus in the case of frogs of 10 g. body wt. the M. L. D. is 0.00001 g.; with mice of 10 g. body wt. the M. L. D. is 0.000005 g.; with rabbits of 1 kg. body wt. the M. L. D. is 0.00025 g. The toxicity of ryanin toward cats, dogs and fishes was likewise studied, and showed its high potency. Its effects on mice when injected alone and with chloral and with curare was investigated. Ryanin acts first as excitant and then as a paralyzing poison on the respiration. Death appears to result chiefly from cramp of the respiratory muscles, which precedes paralysis of the respiratory centers. It is highly significant that the convulsive action of strychnine, injected simultaneously with ryanin, is without effect on the action of ryanin.

W. O. E.

**Adrenaline and diastase in phosphorus poisoning.** G. Rosenfeld. *Arch. expil. Path. Pharmacol.* 166, 205-10 (1932); *Physiol. Abstracts* 18, 223.—Sufficiently large doses of adrenaline prevent the fatty infiltration of the liver and the complete disappearance of the liver glycogen found in P poisoning in dogs. The injection of a series of doses of diastase with the final production of anti-diastatic activity in the serum also prevents the fatty infiltration of P poisoning. Since adrenaline antagonizes the effect of diastase on the blood sugar it would seem that the abolition of excessive diastatic activity was synonymous with the restoration of a normal liver carbohydrate metabolism.

G. G.

**Acetylcholine contracture of striated muscle after treatment with moniodoacetic acid.** J. F. von Ledebur. *Arch. ges. Physiol. (Pflügers)* 230, 394-400(1932); *Physiol. Abstracts* 18, 102; cf. C. A. 26, 3581, 4870.—The sartorius, ileo-fibularis and rectus abdominis of the frog still react to acetylcholine (1:100,000 to 1:10,000) after treatment with moniodoacetic acid (in concns. sufficient to inhibit the lactic acid production). The height of contraction in treated muscles is appreciably smaller than in untreated control muscles. Acetylcholine brings about the typical rigor in muscles treated with moniodoacetic acid.

G. G.

**The polarization capacity ["permeability"] of frog muscle in relation to metabolism.** W. Quensel. *Arch. ges. Physiol. (Pflügers)* 230, 423-33(1932); *Physiol. Abstracts* 18, 104.—Creatine and phosphates cause "tightening of the muscle membrane, while lactate ion causes a loosening. Lacarnol (adenylic acid) has a loosening effect in very small concns. Treatment with  $CH_3BrCO_2H$  brings about tightening of the membrane together with contracture. Addn. of lactate inhibits this effect of the drug. KCN or replacement of the ( ) by N has no direct action on permeability.

G. G.

**The effect of adrenaline on the blood pressure of the elasmobranch, *Squalus acanthias*.** L. C. Wyman and B. R. Lutz. *Biol. Bull.* 62, 17-22(1932); *Physiol. Abstracts* 18, 40.—Intravenous injection of adrenaline, in doses as low as 2 cc. of 1:500,000, produced long-sustained pressor effects in *Squalus acanthias*, together with marked increase of pulse pressure and a tendency toward decrease of heart rate. Subsequent doses of adrenaline following doses stronger than 1:500,000 were ineffective. This is interpreted as being due to already existing max. pressor action. Doses subsequent to a dose of 2 cc. of 1:500,000 were effective. The pressor effect is interpreted as being due to extracardiac factors, peripheral to the gill capillaries, but the region of action of the adrenaline was not located.

G. G.

**Antagonistic action of cephalin and calcium salts on the isolated frog heart.** H. Scheiner. *Compt. rend. soc. biol.* 115, 232-5(1934).

L. E. Gilson

**Role of the adrenals in nicotine hyperglucemia.** L. L. Leloir. *Compt. rend. soc. biol.* 115, 319-23(1934).

**The hyperglucemic action of nicotine is due essentially to hypersecretion of adrenaline. The action does not occur in adrenalectomized dogs or in dogs from which the medulla of the adrenals has been removed. It is due to a direct excitation of the adrenals since it occurs after sympathetic innervation.**

L. E. Gilson

**The thyroid and the diuretic action of extract of the anterior hypophysis.** A. Biasotti. *Compt. rend. soc. biol.* 115, 329-30(1934).—The diuretic action of the ext. is indirect and is due to stimulation of the thyroid. The action does not occur in thyroidectomized dogs.

L. E. Gilson

**Action of extract of adrenal cortex on the endocrine glands.** E. B. del Castillo, L. F. Leloir and A. Novelli. *Compt. rend. soc. biol.* 115, 338-40(1934).—The ext. produced no significant effects in normal rats.

L. E. Gilson

**Inhibition of anaphylactic shock by Congo red.** Otto G. Bier. *Compt. rend. soc. biol.* 115, 347-8(1934)

**In guinea pigs the intraperitoneal injection of Congo red did not prevent shock when anaphylotoxin (prepn *in vitro* by Bordet's method) was injected intravenously 30-60 min. later.**

L. E. Gilson

**Action of intravenous injections of hydrochloric acid on the proteins, lipides and alkali reserve of the blood and the lipides of the kidney tissue of dogs.** C. Achard, J. Verne, M. Bariety and E. Hadjigeorges. *Compt. rend. soc. biol.* 115, 355-6(1934); cf. C. A. 27, 1938.

L. E. Gilson

**Experiments with some circulatory and respiratory analeptics.** P. Régniers and G. de Vleeschouwer. *Compt. rend. soc. biol.* 115, 428-9(1934).—The effects of Solu camphre, Camphostyl, Hexetone, Coramine, Cardiazole, Oetine and Icoral on narcotized dogs, cats and rabbits are described.

L. E. Gilson

**Variations in blood composition produced by intra-**

venous injections of sodium chloride or glucose [in dogs]. A. de Moraes Sarmiento and M. J. Bruno da Costa. *Compt. rend. soc. biol.* 115, 454-5(1934) L. E. G.

Action of tricaline on the blood of fish. L. Baudin. *Compt. rend. soc. biol.* 115, 510-12(1934); cf. C. A. 26, 3842. L. E. Gilson

Effects of insulin and adrenaline on the amino acid content of blood. James M. Luck and Stanley W. Morse. *Biochem. J.* 27, 1048-54(1933).—The amino-nitrogen (A-N) content of the blood of normal rabbits is reduced by insulin. The A-N contents of liver and muscle are reduced alike by insulin, adrenaline or balanced injections of insulin and adrenaline together. Hypoglycemia is prevented by the use of balanced injections of insulin and adrenaline, but hypoamino-acidemia is still observed. Adrenaline is as effective as insulin in reducing blood A-N. Benjamin Harrow

Determination of the binding of therapeutic chemicals by spirochetes and trypanosomes. Ernst Singer and Viktor Fischl. *Naturwissenschaften* 21, 787(1933).—By accurate As detn. (Sanger and Black method), 0.5 to 0.9  $\gamma$  As was found in the recurrens spirochetes of from 0.13 to 0.45 g. blood of mice after intramuscular injection of  $1/100$  g. neosarphenamine at the height of the infection. After  $1/100$  g. atoxyl, 3  $\gamma$  As was found in the trypanosomes of nagana Prowazek of 0.33 g. blood. Further studies have included the absorption of the chemicals by the microorganisms and the behavior of resistant species. Results with other metal derivs. confirmed those with As. B. J. C. van der Hoeven

The inactivation of insulin by normal and diabetic blood. P. T. Black. *Brit. J. Exptl. Path.* 14, 318-22 (1933).—Insulin incubated with serum or with laked cells or with cytolized leucocytes loses some part of its power to lower the blood sugar and produce convulsions in fasting rabbits when the mixt. is injected subcutaneously. Insulin incubated with laked cells loses some part of its power to lower the blood sugar when injected intravenously into rabbits. This is probably due to destruction of the insulin by an enzyme other than trypsin. The inactivating substance does not readily pass from the cells to the plasma. Insulin incubated with heparinized whole blood retains its power to lower the blood sugar when injected intravenously into rabbits. This is also true of insulin incubated with intact red cells or leucocytes. Blood from diabetic patients, even from those displaying resistance to insulin, had no more than normal power to destroy insulin in any of these expts. This investigation therefore does not support the view that the symptoms of diabetes are due to destruction of insulin in the circulation. Harriet F. Holmes

The influence of histamine and pilocarpine on the human gastric secretion. A. P. L. Blakely and J. F. Wilkinson. *Brit. J. Exptl. Path.* 14, 349-54(1933).—A study was made of 43 normal individuals, 13 with achlorhydria and 32 with other gastrointestinal disturbances. Histamine is nearly inactive in all cases of achlorhydria, entirely so in the achlorhydria of pernicious anemia. Pilocarpine caused marked increase in secretion in the former group, some action in the latter. Both drugs were effective in all other cases studied; the effect of the two given together is greater than of either alone. In cases in which the effect was noted, HCl and pepsin were increased more by histamine than by pilocarpine. Harriet F. Holmes

Parenteral versus oral administration of quinine. P. V. Karamchandani. *Res. Malaria Survey India* 3, 445-73(1933).—After 17 hrs. 80% of the quinine injected as quinine acid hydrobromide into the gluteal muscles of a rabbit was recovered from an 8.3 g. portion of the injected muscle. Little or no loss of quinine or change in color of the solns. was caused by boiling quinine acid hydrobromide (10 grains in 10 cc. water) for 3-5 min. Quinine administered orally along with alk. mixt., if it be retained, is as efficacious therapeutically as quinine administered by injection. Parenteral injections of quinine are very likely to produce local necrosis and

suppuration of the tissues. Ninety-nine references.

K. D. Jacob

Chronic hydrogen cyanide poisoning. Nuri Refet. *Gasmaskes* 6, 19-20(1934).—Two cases are described of chronic HCN poisoning due to long-continued breathing of HCN. The symptoms were loss in wt. and appetite, headache, nausea, occasional collapse, numbness in the limbs, muscle pains. In one patient a characteristic skin acne appeared on the hands. Both subjects recovered when proper precautions were observed. A. L. K.

Substances that decrease blood pressure. III. Decrease of blood pressure by alcoholamines. Masao Toki, Tokichi Miyoshi and Nagao Ueda. *J. Agr. Chem. Soc. Japan* 9, 1187-92(1933); cf. C. A. 27, 5347.—Ethanolamines were generally nontoxic for the animals; HCl salts of these bases caused marked decrease in blood pressure. Y. Kihara

Evipan, a new general anesthetic applied to dental surgery. John Bunyan. *Brit. Dental J.* 56, 23-4 (1934).—The drug is contraindicated in liver and gall-bladder disorders. Its use may entail respiratory embarrassment which can be overcome by administration of lobeline or CO<sub>2</sub>. The period of recovery varies from one half to one hour, depending upon the individual. Frances Krasnow

Evipan as a general anesthetic for dental operations. F. R. P. Williams. *Brit. Dental J.* 56, 25-6(1934).—Report of two cases showing excellent results. F. K.

Montanin poisoning. M. Flamm. *Deut. Z. ges. gericht. Med.* 22, 21-7(1933).—Montanin is a by-product of the ceramic industry, contg. about 30% of hydrofluosilicic acid, used in breweries to combat vermin and molds. The lack of color and odor often causes mistakes and leads to fatal poisoning. Several case histories are given, as well as exptl. evidence of the effect of F salts on human beings and animals. Immediate irrigation of the stomach, use of O<sub>2</sub> inhalation and heart remedies may arrest the sickness. Autopsy shows a dark purple spotting of the skin, especially of the face, hyperemia of the mucous membrane. Both lungs are enormously edematous. On the stomach membrane, particularly on the back wall and the great curvature are many bright red extravasations and inflammations. The kidneys show the picture of acute, toxic, hemorrhagic nephritis. The brain was edematous and hyperemic. F. K.

The physiology of alcohol oxidation after beer and meals. G. Jungmichel. *Deut. Z. ges. gericht. Med.* 22, 153-66 (1933).—After drinking beer on a fasting stomach the alc. concn. curve in the blood is flatter than after drinking pure alc., which is dissolved in water but is more concd. Essential differences in the combustion power of the body after drinking various alcohol-contg. beverages exist only when pronounced addiction to one particular beverage exists. Even on drinking alc. after meals, the values given by Widmark can be computed; however, they do not then represent comparative values for nutrition expts. Frances Krasnow

Action of thymus extract on isolated frog muscle. Hans U. Rosemann. *Z. Biol.* 94, 74-7(1933).—Stimulation with thymoglandol at the rate of 20-30 times per minute gave increased efficiency. More rapid stimulation did not yield these results. Frances Krasnow

Behavior of cyanamide in the animal organism. Fritz Horn. *Z. Biol.* 94, 159-70(1933).—The data presented show differences between cyanamide and guanidine reactions. The former leads to hyperglucemia and temporary tremors, whereas the latter provokes definite tetanic spasms but no marked increase in blood sugar. Frances Krasnow

Chemotherapy of experimental tuberculosis of guinea pigs with gold compounds and Pregl's solution of iodine. John A. Kolmer and Herman Brown. *J. Chemotherapy* 10, 73-6(1934).—The following Au compds. had no therapeutic value in the treatment of tuberculosis in guinea pigs: moniodide, thiosalicylate, guaiacol, quinine sulfate, thiourea, Na thiosulfate and *p*-thiocresol. Pregl's soln. of I was likewise without value. W. D. Langley

Toxicity of various compounds of bismuth used in the

therapy of syphilis. George W. Raiziss, M. Severac and J. C. Moetach. *J. Chemotherapy* 10, 77-87(1934).—Tested intramuscularly on rabbits, K Bi tartrate and Bi salicylate were among the least toxic of Bi compds. Doses contg. up to 80 mg. of Bi per kg. of body wt. were tolerated. W. D. Langley

Central blood-sugar regulation. VIII. The effects of various drugs on alimentary hyperglucemia after galactose. F. Höglér and F. Zell. *Z. ges. expil. Med.* 92, 181-92(1933); cf. *C. A.* 28, 829<sup>1</sup>.—Ergotamine, atropine, phenobarbital, barbital and chloral hydrate each alone and in combination were used. M. L.

Action of ephedrine on the portal circulation. C. Pak and B. E. Read. *Chinese J. Physiol.* 7, 199-214(1933).—Ephedrine and pseudoephedrine cause a rise in the portal venous pressure of dogs but this effect is less marked than that of adrenaline. Adrenaline always gives a decreased liver vol. while ephedrine is variable. Ephedrine and pseudoephedrine cause a prolonged rise in the venous pressure. C. M. McCay

The mechanism of the mydriatic action of ephedrine. C. Pak and T. K. Tang. *Chinese J. Physiol.* 7, 229-42(1933).—A difference exists between the peripheral actions of adrenaline and ephedrine. The mydriatic action of adrenaline is augmented by denervation and by cocaine while that of ephedrine is altered little. Ephedrine sensitizes the mydriatic effect of adrenaline in rabbits. Ephedrine acts on the sympathetic nerve endings in rats and on the muscle directly in rabbits. C. M. McCay

The effect of adrenaline and acetylcholine on the heart rate of the chick embryo. Fong-Yen Hsu. *Chinese J. Physiol.* 7, 243-52(1933).—Adrenaline and acetylcholine can act on embryonic hearts independently of the nerve elements. Hearts or fragments of hearts of embryo chicks of 37-480 hrs. incubation are accelerated by adrenaline and inhibited by acetylcholine. C. M. McCay

A comparison of the action of the isomers of amyl nitrite. Bernard E. Read, K. Y. Yu and T. M. P'eng. *Chinese J. Physiol.* 7, 253-68(1933).—Pure tertiary  $\text{AmNO}_2$  is the best for therapeutic purposes because of lower toxicity, more const. effects and its greater potency. The path of administration shows phenomenal differences in comparative effects of the isomers of  $\text{AmNO}_2$ . Intravenously the order of potency is iso, normal, secondary and tertiary. By inhalation the order is secondary, tertiary, normal and iso. C. M. McCay

Relation of the metabolic effect of the thyroid secretion to the condition of the central nervous system. Roberto Indovina. *Biochem. Z.* 267, 389-99(1933).—Thyroxine administered together with therapeutic doses of strychnine causes a much greater rise in the metabolic rate than when acting alone, but cocaine does not affect the thyroxine action. Likewise, when the secretion of the thyroid gland is stimulated by the thyrotropic hormone from the anterior lobe of the hypophysis, the effect is greater if the nervous system is at the same time also stimulated by strychnine. S. Morgulis

Relation of different sugars and sugar-forming substances to the blood lactic acid level. Tatsusaburo Kolke. *J. Biochem. (Japan)* 19, 111-43(1934).—Intraperitoneal administration of lactose, arabinose or xylose causes no rise in the blood lactic acid level in rabbits, whereas glucose, fructose, mannose, galactose or maltose produce a great increase. Injections of galactose and maltose produce a more prolonged hyperglucemia than those of glucose, fructose and mannose, but the rise in lactic acid level is practically the same, lasting about 1-2 hrs., and only when the hyperglucemia exceeds 200 mg. %. The peak of the hyperglucemia and of the lactic acid level is practically always coincide. With sorbitol or glycerol, however, the 2 curves no longer follow such a course and the lactic acid level may remain high when the hyperglucemia is below 200 mg. %. Furthermore very high values for lactic acid are thus obtained. After adrenaline injection the condition is still more different in that the peaks of 2 curves no longer coincide, the

hyperglucemia preceding the lactemia, and the lactic acid levels attained are much lower than in the other expts. Injections of lactate bring about marked hyperlactemia with insignificant hyperglucemia. It is pointed out that studies of the alk. reserve of the injected animals leave no doubt that the hyperglucemic responses were not attributable to the mobilization of the liver glycogen through acid action. S. Morgulis

The use of glycine in the treatment of myasthenia gravis. Earl O. G. Schmitt. *Ann. Internal Med.* 7, 948-59(1934).—There was clinical recovery in two cases. There was an increase in elimination of creatinine and preformed creatinine N and a decrease in creatine. The ratio of creatine N to preformed creatinine N in the urine was decreased. John T. Myers

Action of cathartics on isolated dog colon. I. Secretory activity. Lawrence M. Larson and J. Arnold Barger. *Arch. Surg.* 27, 1120 9(1933).—Cathartics given orally or by enema did not effect the amt. or rate of secretion. During defecation from any cause, secretion of mucus was increased. II. Motor activity. *Ibid.* 1130-45. John T. Myers

Experimental obstruction of the jejunum. Effect of administration of water on length of life and changes in chemical composition of the blood. Hjalmar E. Carlson and Thomas G. Orr. *Arch. Surg.* 28, 292-5(1934).—The upper part of the jejunum was obstructed in 12 dogs. Six were deprived of both water and food and six of food only. The animals deprived of water showed relatively little change in the blood chlorides,  $\text{CO}_2$ -combining power and sugar as compared to those which received water freely. Animals showing great blood chem. changes lived longer than those showing little change. The loss of body wt. was less in animals receiving water, an indication of upper gastrointestinal water absorption. John T. Myers

The effect of morphine on obstructed intestine. Alton Ochner, I. M. Gage and R. A. Cutting. *Arch. Surg.* 28, 406-16(1934). John T. Myers

Intoxication by carbon tetrachloride. M. Duvour, Guibert and H. Desoille. *Ann. méd. légale criminol. police sci.* 13, 533 40(1933).—A description of the symptomatology of  $\text{CCl}_4$  poisoning, illustrated by observations of such intoxications which occurred recently in Paris. A. Papineau-Couture

Carbon monoxide poisoning: value of the intoxication coefficient. Balthazard and Méliissinos. *Ann. méd. légale criminol. police sci.* 14, 1-13(1934).—The intoxication coeff. in CO poisoning is defined as the ratio of hemoglobin combined with CO to total hemoglobin in the blood. In 65 fatal cases the coeff. varied from 0.42 to 0.81, of which 43 cases varied from 0.58 to 0.70. The causes of, and deductions that may be drawn from, abnormally high or abnormally low values of the coeffs. are discussed, they do not invalidate the theory that attributes death in CO poisoning to anoxemia. Chem. detn. of the coeff. is a delicate operation and may give too high rather than too low results. CO-hemoglobin is much more resistant to putrefaction than hemoglobin, so that the apparent coeff. increases with the degree of putrefaction, and may in such cases approach 1.0. As the time which elapses between removal of the person from contact with CO and death increases, the coeff. decreases; in such cases death may be due not to anoxemia, but to secondary accidents. The higher the CO content of the atm. the shorter the time required for complete asphyxiation and the higher the intoxication coeff. The toxicity of other gases, which may be present simultaneously with CO, is not likely to have any action, as CO acts much more rapidly than any of the others (except HCN, which is not likely to be found in practice in conjunction with CO in cases of acute intoxication). A decrease in the amt. of O entering the lungs (either by reduction of the O content of the air or by reduction of the atm. pressure) lowers the intoxication coeff. required to produce death; conversely, increase in the amt. of O raises the coeff. The lethal coeff. can vary according to the condition of

the individual or as a result of assocd. intoxication (e. g., alc., atropine, etc.). A. Papineau-Couture

Toxic action of barium carbonate towards gallinaceans. Jean Olbrycht and Jean Robel. *Ann. méd. légale criminol. police sci.* 14, 135-43(1934).—The min. lethal dose for hens was found to be 0.6-0.8 g.  $\text{BaCO}_3$  per kg. body wt. The symptomatology is described. A. P.-C.

The action of certain ethers of  $\beta$ -alkyl choline derivatives. André Simonart. *J. Pharmacol.* 50, 1-14(1934); cf. C. A. 27, 138.— $\beta$ -Methylcholine ethyl ether and  $\beta$ -propylcholine ethyl ether exhibited some muscarine-like action but were inferior in potency. The actions of other  $\beta$ -alkylcholines are discussed, none resembling muscarine

Comparison of the pharmacologic action of atropine and its optical isomers, *l*- and *d*-hyoscyamine. W. F. v. Oettingen and I. H. Marshall. *J. Pharmacol.* 50, 15-20(1934).—The relative activities of atropine, *l*- and *d*-hyoscyamine of 1:2:1/20 detd. by Cushny hold true only for certain species. Rabbit serum destroys the *l*-isomer more rapidly than the *d*-, the racemate being intermediate.

Effect of cyanide on primary muscle types. Carroll J. Bellis. *J. Pharmacol.* 50, 21 7(1934).—After CN administration frog skeletal muscle showed little change in contraction curve other than a slight lengthening of contraction phase; rectal muscle showed less relaxation with shortening of latent and contraction periods; equiv. doses killed the frog heart but stimulated the turtle heart; the rabbit heart was first stimulated, then slowed, temporary revival being produced by glutathione or adrenaline, and finally stopped in extreme rigor.

The action of cinchophen on nitrogen metabolism. G. P. Grabfield and M. G. Gray. *J. Pharmacol.* 50, 28 31(1934).—The administration of cinchophen to dogs on a submaintenance diet was followed by increased urinary excretion of N, S, allantoin and uric acid, the effect on N excretion resembling the effect produced by salicylates.

The absorption of methyl salicylate by the human skin. Ernest W. Brown and W. O. Scott. *J. Pharmacol.* 50, 32 50(1934).—Salicyl recovery from urine up to 96-8% was obtained by the following method. To 100 cc. of urine was added 20 cc. of sirupy  $\text{H}_2\text{PO}_4$ . Distn. was carried out until the liquid temp. reached 122° after which steam distn. was carried out up to 135° until the distillate contained no salicyl. The distillate was tested for freedom from phosphate, then made up to 1 l. and an aliquot acidified with 1 cc. 0.1 N NCl, and treated with ferric alum for colorimetric detn. according to Thoburn and Hanzlik (C. A. 10, 618). Variations in absorption according to different methods of application are discussed. Greatest absorption was obtained from a 11.8% aq. suspension.

The effect of pathologic states on the minimum lethal dose of procaine intracardially. Frank Wang CoTui. *J. Pharmacol.* 50, 51-60(1934).—Pneumonia, marked post-operative infection and hypotensive states produced by hemorrhage,  $\text{AmNO}_2$  and histamine all reduced the lethal dose of procaine. There is probably a relationship between this reduction of lethal dose and anoxemia.

Pharmacologic actions of glycine ethyl ester hydrochloride. J. H. Weatherby and H. R. Hulpieu. *J. Pharmacol.* 50, 61-9(1934).—The action on smooth muscle from different species or on different types of smooth muscles from the same animal showed differences, indicating that all smooth muscles do not show the same qual. results. The action was independent of the autonomic nervous system. There were also demonstrable effects on the central nervous system.

Contributing factors to the pulse changes resulting from injection of adrenaline in rabbits. Wm. F. Allen. *J. Pharmacol.* 50, 70-8(1934).

The reversal effect of chorda tympani stimulation. Geo. W. Stavsky. *J. Pharmacol.* 50, 79-87(1934).—The reversed vascular effect of chorda tympani stimula-

tion under the influence of  $\text{AmNO}_2$  is confirmed. Possible mechanisms are discussed.

Narcotic potency of the aliphatic acyclic acetals. P. K. Knoefel. *J. Pharmacol.* 50, 89-92(1934).—Of a representative series of aliphatic acetals and related compds. none equals paraldehyde as a hypnotic. There is good correlation between resistance to acid hydrolysis and effectiveness by mouth, but high oral activity is obtained only with a reduction in the margin of safety. In this order the b. p., sp. gr., and acid hydrolysis consts. are given for  $\text{CH}_3(\text{OCH}_2)_3$ , 41°, 0.86, 0.00038;  $\text{CH}_3(\text{OC}_2\text{H}_5)_3$ , 85°, 0.85, 0.00234;  $\text{CH}_3(\text{OC}_3\text{H}_7)_3$ , 137°, 0.83, 0.00360;  $\text{CH}_3(\text{OCH}(\text{CH}_3))_3$ , 118°, 0.83, 0.01810;  $\text{CH}_3(\text{OC}_4\text{H}_9)_3$ , 179°, 0.84, 0.00358;  $\text{CH}_3\text{CH}(\text{OCH}_3)_2$ , 63°, 0.86, —;  $\text{CH}_3\text{CH}(\text{OC}_2\text{H}_5)_2$ , 104°, 0.82, 15.0;  $\text{C}_2\text{H}_5\text{CH}(\text{OC}_2\text{H}_5)_2$ , 123°, 0.82, —;  $(\text{CH}_3)_2\text{C}(\text{OC}_2\text{H}_5)_2$ , 114°, 0.87, 33,800.0;  $\text{CH}_3\text{OH}(\text{CH}(\text{OC}_2\text{H}_5)_2)_2$ , 165°, 0.89, —;  $\text{C}_2\text{H}_5\text{OH}(\text{CH}(\text{OC}_2\text{H}_5)_2)_2$ , 167°, 0.89, —;  $(\text{C}_2\text{H}_5)_2\text{CH}(\text{CH}(\text{OC}_2\text{H}_5)_2)_2$ , 180°, 1.10, —;  $\text{CH}(\text{OC}_2\text{H}_5)_4$ , 146°, 0.94, 7800.0;  $(\text{C}_2\text{H}_5)_4\text{C}$ , 128°, 0.99, —.

Toxicity of  $\alpha$ - and  $\beta$ -nicotines and nicotines. Chemopharmacodynamic relationships. David I. Macht and Mary E. Davis. *J. Pharmacol.* 50, 93 9(1934).—Toxicity data in 9 test subjects indicate as the only const. relationship between activity and structure the fact that all beta compds. were more potent than the corresponding alpha compds.

Pharmacologic action of the alkaloids of fumaraceous plants. I. Isocorydine. R. A. Wand. *J. Pharmacol.* 50, 100-7(1934).—Isocorydine is similar in action to bulbocapnine.

The denervated kidney. I. The action of cinchophen on the uric acid and allantoin excretion in dogs and its effect on the nitrogen and sulfur excretion. G. P. Grabfield and Mildred G. Gray. *J. Pharmacol.* 50, 123-30(1934).—Section of renal nerves slightly enhances the effect of cinchophen (I) on allantoin excretion but reverses the effect of I on uric acid excretion for a variable period which may mark regeneration of the nerves. Nerve section does not influence the effect of I on the urinary excretion of N and S.

The relationship between chemical constitution and physiological action. The comparative effects of benzyl- $\beta$ -phenylethyl-, and di-( $\beta$ -phenylethyl) amines and some of their derivatives. Axel M. Hjort. *J. Pharmacol.* 50, 131-50(1934).—Tabulation of pharmacol. data on 26 related compds. The only general conclusions are that the replacement of a benzyl group by a phenylethyl group decreases toxicity and that the substitution of hydroxyl groups for H and methoxy groups decreases toxicity markedly.

The influence of insulin-free pancreatic extract on the gaseous exchange of the white rat. C. Jelleff Carr, Jacob E. Schmidt, Wm. Harve and John C. Krantz, Jr. *J. Pharmacol.* 50, 151-6(1934).—Insulin-free pancreatic ext. increases the R. Q. of the white rat, shows hypoglucemic properties after intravenous injection in the rabbit and does not significantly antagonize the increased O consumption produced by adrenaline.

The action of nucleic acid derivatives on the coronary flow in the dog. Alfred M. Wedd and Alan N. Drury. *J. Pharmacol.* 50, 157-64(1934).—Yeast adenylic acid and yeast cytidylic acid and to a lesser extent adenosine increased coronary flow in dogs regardless of simultaneous fall in mean blood pressure after intravenous injection. Chlorazol served as a suitable anticoagulant for dogs without adverse effect.

The actions of pituitary preparations (posterior lobe) upon the intestines of the dog. K. I. Mcville and R. L. Stehle. *J. Pharmacol.* 50, 165-79(1934); cf. C. A. 28, 1070<sup>3</sup>.—Pressor and oxytocic fractions obtained from the posterior lobe of the pituitary by a method different from that of Kamm, *et al.* still showed that the pressor substance showed the only effect on the intestines indicating that this effect is due to the pressor substance itself, not to a possible third substance.

The combined effects of digitalis and quinidine on the

heart. Nathaniel T. Kurt and Harry Gold. *J. Pharmacol.* 50, 186-97(1934).—Quinidine (I) produces auricular acceleration through vagus depression both in normal and digitalized dog hearts. I relieves the block produced by digitalis. Other combined actions are discussed in detail. T. H. Rider

Mapharsen (3-amino-4-hydroxyphenyl arsine oxide) as an antisyphilitic agent. A. L. Tatum, G. A. Cooper, H. M. Kelly, V. A. Benn and C. C. Pfeiffer. *J. Pharmacol.* 50, 198-215(1934).—3-Amino-4-hydroxyphenyl arsine oxide is a drug which can be prepd. pure, and the purity of which can be tested chemically. It becomes less toxic on oxidation and has a greater therapeutic index than neoarsphenamine in exptl. syphilis. Its clinical trial is recommended. T. H. Rider

The action of drugs on the isolated intestine of certain teleost fish. Fred. Bernheim. *J. Pharmacol.* 50, 216-22(1934); cf. *C. A.* 28, 216<sup>1</sup>.—Acetylcholine, pilocarpine and Ba produce contractions which are relaxed by atropine but further contracted by adrenaline or nicotine. Adrenaline relaxes intestines contracted by mech. stimuli. Histamine and physostigmine are practically without action. Ca is necessary for contraction. T. H. R.

The comparative effects of various diuretics in dogs with special reference to the excretion of urine, chloride and urea. Marshall N. Fulton, Howard A. Van Auker, Robt. J. Parsons and Lowrey F. Davenport. *J. Pharmacol.* 50, 223-39(1934).—Various diuretics were tested with a view to throwing further light on their mode of action. The results are discussed in some detail although no generalized conclusions were reached. T. H. R.

Further reports on the use of tribromoethanol (avertin). Dorothy A. Wood. *Anesthesia and Analgesia* 12, 38-42(1933). Louis J. Soffer

The diffusion of nitrous oxide, ethylene and carbon dioxide through human skin during anesthesia, including a new method for estimating nitrous oxide in low concentrations. Fred S. Orcutt and Ralph M. Waters. *Anesthesia and Analgesia* 12, 45-7(1933).—Samples of gas diffused through the skin of the hand and forearm during anesthesia were obtained by collecting the gas in a plethysmograph attached so as to enclose the hand and forearm. The gas thus obtained was passed through a porcelain tube of unglazed interior, heated to a constant bright red heat and bubbled through a 10% soln. of KOH. The resultant alkaline soln. gave a positive test for nitrites and these were determined by the sulfanilic acid and alpha-naphthylamine acetate method. It was found that a decided loss of nitrous oxide through the skin occurs during anesthesia and that this diffusion is considerably greater than that of CO<sub>2</sub> and about 20 times as much as ethylene. Louis J. Soffer

Short surgical anesthesia with intravenous sodium evipan: a new barbiturate. Walter Sebening. *Anesthesia and Analgesia* 12, 213-15(1933). L. J. S.

The relation between the chemical constitution and vasomotor action of pyrazole derivatives. Kwanichi Horiuchi. *Sei-i-kwai Med. J.* 51, No. 9, 1-20(German Abstract 1)(1932).—The action of pyrazole derivs. on the blood vessel of the toad leg was measured by the Hosaka-Nishimura modification of the Trendelenburg method. Pyrazole and pyrazolone have no action, but pyrazoline causes a vasoconstriction. N-Phenyl derivs. of these 3 compds. are vasoconstricting. 3-Me derivs. of pyrazolone and pyrazole produce a vasodilation. S. Tashiro

Studies in phlorizin. IV. The effect of phlorizin on carbohydrate metabolism. Toranoshin Onodera. *Sei-i-kwai Med. J.* 51, No. 9, 21-47(English Abstract 2-3)(1932); cf. *C. A.* 28, 532<sup>1</sup>.—A repeated subcutaneous injection of phlorizin to the rabbits increases the blood sugar in 2-3 hrs. after the last injection, and the intravenous likewise after 2 hrs. A similar injection lowers the sugar tolerance. In nephrectomized rabbits, a single injection produces no effect, but the second injection raises the blood sugar after 1-2 hrs. In rabbits injected with pelican, a single phlorizination produces no effects,

but if phlorizinized rabbits are blocked with pelican and then injected intravenously with phlorizin, the blood sugar rises after 2 hrs. The pelican blockade gives no change in glycogen contents of liver and muscle, but when phlorizinized, the glycogen decreases somewhat. VI. The effect of phlorizin upon the permeability of the red blood corpuscles. *Ibid.* 52, No. 2, 1-26(English Abstract 1-2)(1933).—Phlorizin accelerates the entrance of H<sub>2</sub>O, urea and chloride to the red corpuscles of rabbits, but inhibits that of the dextrose. This inhibitory action is counteracted by NaCN. The rate of diffusion of dextrose and water through collodion membrane is not altered by phlorizin. S. Tashiro

The effect of pituitary products on basal metabolism. Yuzaburo Ishikawa and Mitsuo Takahashi. *Sei-i-kwai Med. J.* 51, No. 10, 1-22(German Abstract 1-2)(1932).—The basal metabolism of mice was detd. by Ikenuma's app. (*Ibid.* No. 454, 91) after subcutaneous injection of 3 com. products in 0.05 cc. and 0.1 cc. doses. In control animals (0.1 cc. 0.85% NaCl injected), there were no appreciable changes in CO<sub>2</sub> production, and O<sub>2</sub> consumption, but there was an increase in the respiratory quotient, with return to the normal in 2 hrs. Injection of a small quantity of pituitrin reduces CO<sub>2</sub> and O<sub>2</sub>, but increases R. Q. of both sexes, while the larger amt. increases all three. The effect of a small quantity of pituitandol on both sexes, and that of a large quantity in the male is the same as that of pituitrin, but in the female, a large quantity shows no effect on CO<sub>2</sub> but a decrease in O<sub>2</sub> and an increase in R. Q. A still larger injection (0.2 cc.), increases CO<sub>2</sub>, R. Q. but decreases O<sub>2</sub>. The action of hypohorin in small quantity in the male is the same as that of other drugs, but in the female there is not much effect on CO<sub>2</sub> and O<sub>2</sub>, but an increase in R. Q. With a larger quantity, CO<sub>2</sub> and O<sub>2</sub> are decreased in both sexes, but R. Q. is decreased in the male, and increased in the female. S. Tashiro

Cerebrospinal fluid. II. The occurrence of lead in cerebrospinal fluid. I. M. Rabinowitch, Andrew Dugwall and F. H. Mackay. *J. Biol. Chem.* 103, 725-32(1933); cf. *C. A.* 28, 2027<sup>1</sup>.—Chem. and spectrographic methods showed good agreement in 41 analyses. In all cases of Pb poisoning, Pb was found in the cerebrospinal fluid. In 5 out of 20 neurotic cases in which Pb was absent, exptl. acidosis, brought about by NH<sub>4</sub>Cl feeding, led to the appearance of about 10<sup>-4</sup> mg. Pb per 6 cc. cerebrospinal fluid. Pb in amts. greater than this is therefore a definite indication of Pb poisoning. K. V. Thimann

Experiences with divinyl ether. S. Goldschmidt, I. S. Ravdin and B. Lucké. *Am. J. Med. Sci.* 186, 888-9(1933).—The material used had added to it a small amt. of absolute EtOH and an "inhibiting" substance. In the dog the anesthetic concn. in jugular vein blood averaged 28 mg.% and the lethal concn. 68 mg.%. In man the anesthetic concn. in blood drawn from a vein in the antecubital fossa averaged 18 mg.%. The anesthetic was 4 times as potent as Et<sub>2</sub>O. The "margin of safety" is as 1 to 2.1. Administration of the anesthetic for 3 hrs. produced liver necrosis in 8 of 27 well-fed dogs. Even 6 hrs. of consecutive anesthesia did not produce liver necrosis in the *Macacus rhesus* monkey. The effect on blood pressure and respiration of the dog was similar to that produced by Et<sub>2</sub>O. Respiration failed before circulation in both dog and monkey. The anesthetic has been used clinically in 758 cases. Induction and recovery are rapid. Vomiting occurred in 9% of the patients. No liver changes were observed. R. C. Willson

Effect of adrenalectomy on salt metabolism in rats. Mitchell I. Rubin and Elizabeth T. Krick. *Am. J. Med. Sci.* 187, 148(1934).—Balance studies of Ca, Mg, Na, K, P, Cl and N showed that during adrenal insufficiency there was a marked loss of these elements from the body, resulting in most instances in a neg. balance. A salt mixt. contg. the chlorides of Ca, Mg, Na and K caused signs of adrenal insufficiency to disappear when it was substituted for the distd. H<sub>2</sub>O of the control periods.

Some animals died spontaneously of insufficiency after 2-3 months in spite of this salt mixt. R. C. Willson

Derivs. of acridine [in treatment of malaria] (Monti, Procopio) 10.

Moore, Joseph E.: The Modern Treatment of Syphilis. Springfield, Ill.: C. C. Thomas. Over 500 pp. \$5. Reviewed in *J. Chemotherapy* 10, 107(1934).

## I—ZOOLOGY

R. A. GORTNER

Relation of inorganic salts to growth and reproduction in *Amoeba proteus*. D. M. Pace. *Arch. Protistenk.* 79, 133-45(1933).—A stimulatory effect on reproduction is shown by  $\text{FeCl}_3$  in concns. less than 0.0001 *N* and by  $\text{SO}_4^{++}$  less than 0.0007 *N*. Above these limits inhibition occurs. The stimulatory action of  $\text{SiO}_4^{++}$  was very marked. Increasing concns. of chlorides of Na, K, Ca and Mg or of  $\text{Na}_2\text{SO}_4$  and  $\text{Na}_2\text{SiO}_3$  have at first a stimulatory and at higher concns. an inhibitory effect. In still greater concns. a 2nd optimum is reached. Similar effects are produced by solns. of mixed salts. The action of salts is ascribed to electrolytic effects rather than to sp. ionic properties. B. C. A.

Digestion in selachians. H. Beauvalet. *Compt. rend.* 196, 1437-9(1933); cf. *C. A.* 27, 2733.—An ext. of the anterior portion of the stomach of *Scylium canicula* hydrolyzes fibrin (I) in acid medium to albumoses and peptones, while the ext. of the posterior portion hydrolyzes (I), starch (II) and olive oil (III) in alk. media. The pancreatic ext. hydrolyzes (II) and (III), while the liver ext. and bile hydrolyze (I) (to peptones), (II), and (III). B. C. A.

Function and chemical differentiation in the nervous system of *Coeloplana boeckii*. A. R. Moore. *Science Repts. Tôhoku Imp. Univ., 4th Ser.* 8, 201-4(1933).—The nervous system of *Coeloplana* resembles that of the coelenterates in structure, but in its reactions to strychnin, atropine, nicotine and phenol it resembles that of the worms. Chemical differentiation is not, in *Coeloplana*, associated with morphological complexity. M. L. C. B.

The relative values of cations in protecting the membrane-forming capacity of the eggs of the echinoids *Clypeaster japonicus* and *Temnopleurus hardwickii*. A. R. Moore. *Science Repts. Tôhoku Imp. Univ., 4th Ser.* 8, 249-53(1933); cf. *C. A.* 27, 3009.—Bivalent cations are about fifty times more effective than univalent ones in protecting the membrane-forming capacity of echinoderm eggs in urea solns. Univalent cobaltamine chloride having a univalent cation shows no effect, while the cobaltamine chlorides having bivalent, trivalent and quadrivalent cations showed increasing effect with each added valency, though the increments are not regular. M. L. C. Bernheim

An acid lake in an old mountain formation. Lake Lispach in the Vosges. Hydrobiological study. E. Hubault. *Ann. écol. eau. for St. rech. exp. for.* 4, No. 2 (1932); *Current Sci.* 2, 114.—The fauna of an acid lake in France was studied. The  $\text{pH}$ , the O content, temp., total quantity of electrolytes, phosphate and silicate contents of the water are recorded. The fauna studied is largely restricted to the zooplankton. At a depth of 5 m. the  $\text{pH}$  varied from 5.3 to 5.7. Near the surface the  $\text{pH}$  was 5.8 to 6.5. *Ceratium hirundinella* common in other lakes is absent in this acid lake. Rotifers are represented by very few species. Of the insects and fishes, only *Chironomid larvae* and *Salmo fario*, respectively, were found. E. J. C.

Studies in mass physiology: The effect of numbers on the oxygen consumption of fishes. Frank Schuett. *Ecology* 14, 106-22(1933). E. J. C.

Cell metabolism. I. The oxygen consumption of Nereis eggs before and after fertilization. E. S. Guzman Barron. *Biol. Bull.* 62, 42-5(1932); *Physiol. Abstracts* 18, 107.—The total O consumption from the initiation of fertilization to the 2-cell stage is no greater than the O consumption for a similar period of time before fertiliza-

tion. There is a small increase of about 25% during the first 18 min. after fertilization. It is suggested that the enormous increase in O consumption of fertilized sea-urchin eggs may be considered exceptional. G. G.

Physical and chemical constants of the egg of the sea urchin, *Arbacia punctulata*. E. N. Harvey. *Biol. Bull.* 62, 141-54(1932); *Physiol. Abstracts* 18, 21.—The consts. given include dimensions, densities, viscosity, surface tension, osmotic pressure, permeability, elec. resistance and cataphoretic potential,  $\text{pH}$ , metabolism, oxidation-reduction potential, compn., development, anesthetic and lethal concns. of various substances. G. G.

Influence of lecithin on the cytolytic action of saponin. B. S. Levin and I. Magat. *Compt. rend. soc. biol.* 115, 142-7(1934).—The survival period of paramacia placed in dil. solns. of saponin was prolonged by the addn. of small quantities of lecithin to the solns. But paramacia which had been grown in a 0.3% solu. of lecithin were more sensitive to the action of saponin alone than were ordinary cultures. L. E. Gilson

Surcharge of glycogen in the reproductive organs of some invertebrates at the time of spawning. M. Chaigne. *Compt. rend. soc. biol.* 115, 174-6(1934); cf. *C. A.* 28, 1410.—The phenomenon was observed in *Asterias rubens*, *Paracentrotus lividus*, *Maja squinado*, *Sepia fillicoxi* and *Helix pomatia*. L. E. Gilson

Muscle phosphagen of frogs after total destruction of the adrenals. A. Moschini. *Compt. rend. soc. biol.* 115, 215-18(1934); cf. *C. A.* 27, 535.—Frogs lived 2-5 days after total adrenalectomy and remained practically immobile. The muscle phosphagen decreased from a normal of 50-55 mg.% fresh muscle to 4-30 mg.% at the time of death. Action of Eucortone on the phosphagen of normal and adrenalectomized frogs. *Ibid.* 218-21.—Eucortone is a commercial ext. of adrenal cortex prepd. by Swingle and Piffner's method. It had little or no effect on the muscle phosphagen of adrenalectomized frogs, and very little effect on the survival period. L. E. Gilson

Expansion of erythrocytes of *Phoxinus laevis* caused by non-hypophyseal substances. F. Stutinsky. *Compt. rend. soc. biol.* 115, 241-3(1934). In males of *Phoxinus laevis* erythrocyte expansion was produced by injections of exts. of hypophysis, testicles, ovaries, placenta, thyroid, thymus and myocardium. The reaction is not specific for intermedin (contrary to Zondek and Krohn, *C. A.* 26, 4306). The reaction seldom occurs in the female fish. L. E. Gilson

Physicochemical experiments on the amphibian organizer. Joseph Needham, C. H. Waddington and Dorothy M. Needham. *Proc. Roy. Soc. (London)* B114, 393-422 (1934).—A secondary embryonic axis may be induced in amphibian gastrulae by implantation of (a) cell-free exts. of neurula, (b) ether and petr. ether exts. of neurula, (c) adult amphibian tissues and (d) ether ext. of adult amphibian viscera. The evocator (producer of an embryonic axis as such) probably is a definite chem. compd. sol. in  $\text{Et}_2\text{O}$  and petr. ether. A bibliography is appended. Joseph S. Hepburn

Chemical studies on coccids produced in Japan. IV. Inorganic matters, carbohydrates and enzymes of *Cerococcus muratae* Kuw. Michio Kono. *J. Agr. Chem. Soc. Japan* 9, 775-82(1933); cf. *C. A.* 27, 4312.—Ash of the shell of *Cerococcus muratae* Kuw. consists of  $\text{SiO}_2$  87.84,  $\text{Al}_2\text{O}_3$  0.84,  $\text{P}_2\text{O}_5$  2.09,  $\text{Fe}_2\text{O}_3$  4.15,  $\text{MgO}$  0.79,  $\text{CaO}$  4.13 and  $\text{K}_2\text{O}$  4.13%. The insect contains cellulose, lignin, mannann, galactan, dextrin, *d*-mannose and *d*-galactose. Chitin and glucose could not be detected. The insect was treated with the mixt. of ether and alc. and then extd. with  $\text{H}_2\text{O}$ . In the aq. ext. cellulase, mannase, amylase, invertase, maltase and lactase were detected. V. Nitrogenous compounds and wax of *Cerococcus muratae* Kuw. *Ibid.* 1276-83.—The shell of *Cerococcus muratae* Kuw. contained 15% of a scleroprotein insol. in  $\text{H}_2\text{O}$ . The wax was extd. with  $\text{C}_6\text{H}_6$  and  $\text{CHCl}_3$ . The residue, digested by pepsin in 0.1%

HCl soln., was evapd. to a sirup. The N distribution of the sirup was: ammonia N 8.90%, humin N 4.49%, cystine N 8.78%, arginine N 14.11%, lysine N 4.09%, amino N 12.67% and non-amino N 44.87%. Guanidine, cystine, lysine, glutamic acid, arginine, alanine and hydroxyvaline were isolated from the sirup after total hydrolysis. The wax is a dark reddish brown resin; it m. 77-8°, has  $d_4^{20}$  0.906, acid value 25.17, sapon. value 212.79, ester value 187.02, I value 15.65, Ac value 110.40, neutral fat 72.96, unsaponifiable matter 15.79. Cerotic acid, m. 78°, and ceryl alc., m. 78°, were isolated from the hot alc. ext. of the wax. Cerotic acid, isoceryl alc., m. 82° and an unknown hydrocarbon, m. 47.5°, were obtained from the portion insol. in hot alc. An unidentified acid  $C_{15}H_{31}O_4$ , b<sub>p</sub> 145°, m. 12-12.5°, was isolated from the portion sol. in cold alc. Y. K.

Physiological investigations of living salivary glands from ringed snakes. J. V. Hattinberg and W. Hartoch. *Z. Biol.* 94, 99-107 (1933). -Narcotized "snakes" were examined by the method of intravital microscopy with luminescent light. Fluorescein staining revealed a delicate, imperfect network of "cracks" in the intercellular substance. Trypaflavine treatment revealed a coarse granulation of the cell substance but no nuclear demonstration. After pilocarpine administration the splitting of the intercellular substance was shown very clearly by subsequent fluorescein treatment. The cracks were filled with secretion. When trypaflavine was used the cell nucleus and cytoplasm were differentiated.

Frances Krasnow

The fibrin content of the plasma of fish blood. E. Zunz. *Arch. intern. physiol.* 37, 274-81 (1933). -The fibrin in the blood of four teleosts varied from 172 to 431 mg.%. The means for 4 species were 273-355. For 2 species of selachii the means were 109.0 and 263.

C. M. McCay

The coagulation of fish blood. E. Zunz. *Arch. intern. physiol.* 37, 282-7 (1933). -The muscles of *Scylliorhinus stellaris* and *Conger vulgaris* can furnish cytozyme to coagulate oxalated plasma of rabbit blood.

C. M. McCay

The surface tension of the blood plasma and serum of marine animals (fish, crustacea and cephalopods). E. Zunz. *Arch. intern. physiol.* 37, 288-303 (1933). -In the selachii the surface tension of plasma is higher than that of water and in fish it is lower.

C. M. McCay

Relation between the heat evolved and the respiratory exchange of insects during post-embryonic development. N. Balzam. *Arch. intern. physiol.* 37, 317-28 (1933).

C. M. McCay

A cytological study on the hibernating toad. I. Changes in the Golgi apparatus. Chi-Hsiun Chu. *Chinese J. Physiol.* 7, 269-85 (1933). -The Golgi material found in the columnar epithelial cells of the duodenum seems to be formed from absorbed food and not to be a permanent structure. The amt. of this material was influenced by the diet.

C. M. McCay

The control of respiratory movements in Crustacea by oxygen and carbon dioxide. H. M. Fox and M. L. Johnson. *J. Exptl. Biol.* 11, 1-10 (1934). -The respiratory movements of the barnacle *Balanus* and of the phyllopod *Cheirocephalus* are not accelerated by decreased  $O_2$  or increased  $CO_2$ . Crayfish are affected by decreased  $O_2$  and not increased  $CO_2$ . The movement of the pleopods of *Asellus* is accelerated by decreased  $O_2$  but not increased  $CO_2$ . The seashore isopod *Ligia* is affected only by an increase in  $O_2$  tension above that when sea water is in equil. with air. In *G. pulex* the changes that accompany  $O_2$  and  $CO_2$  variations in water are permanent, in the marine form, *G. locusta*, these changes are transitory.

C. M. McCay

The osmotic pressure of the colloids in fish sera. Ancel Keys and R. M. Hill. *J. Exptl. Biol.* 11, 28-33 (1934). -The osmotic pressures in mm. of  $H_2O$  for 4 fish species were 104-128 for *Pleuronectes platessa*, 94-114 for *Tinca vulgaris*, 104-116 for *Gadus morhua* and 87-91 for *Esox lucius*. The serum chlorides were

detd. on 2 species. They were 373-378 mg.% for *Tinca vulgaris* and 558-577 for *Pleuronectes platessa*. No attention was given to the state of nutrition or seasonal variations. Rel blood from *Anguilla vulgaris* had an osmotic pressure of 253-283 after 7 days of fasting and 110-145 after 60 days of fasting. Fasting was more important than the water, since sea water gave only slightly higher values in each case.

C. M. McCay

Kinetics of the oxidation processes in fertilized eggs. I. Rate of oxidation during embryological development of *Trutta iridea* (rainbow trout). W. Schlenk, Jr. *Biochem. Z.* 267, 424-37 (1933). -A complete description of the all-glass app. used in these expts. is given together with the method of its employment. The rate of  $O_2$  consumption of the developing egg seems to be independent of whether or not oxidation is partial or goes to  $CO_2$ . The total utilization increases logarithmically with time although the  $O_2$  for partial oxidation drops from 16.9% in the first stage to 7.9% in the second stage. The oxidation rates are calcd. from the formula  $-dO_2/dt = e^{4.015 + 0.0022t}$ , and  $dCO_2/dt = e^{4.028 + 0.0022t}$ , where  $t$  = no. of days. The doubling of the rate of respiration is 8 days for the  $O_2$  and 7.4 days for the  $CO_2$ .

S. Morgulis

Activation of proteolysis in the regenerative organs. V. N. Orekhovich. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 27-32 (in German 33). -Glutathione present in the thioenolic form in axolotl caudal tissue rises to 46.4 mg.% on the 5th day, then falls to 45.6 on the 10th and to the normal 19.6% on the 20th day. The surrounding tissue also is high in glutathione at this period. The cause is an interference with normal respiration. The result is a favorable condition for proteolysis.

F. H. Rathmann

Investigation of the chromosome morphology of some Pisces and Amphibia. A. A. Prokof'eva. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 80-3 (in English 81) (1934). -The best compn. of fixing soln. to reveal chromosome structure varies with the species. Solns. used were: 41% formic acid and 1% chromic acid for *Trilon* and *Rana*; 7% formic acid and 0.3% chromic acid for axolotl, and 25% formic acid and 2.5% chromic acid for fish.

F. H. Rathmann

Effects of ultra-violet radiations on the bean weevil, *Bruchus obtectus* Say. G. F. MacLeod. *Ann. Entomol. Soc. Am.* 26, 603-15 (1933). -Eggs and 1st instar larvae of *B. obtectus* were killed by light from a quartz-Hg arc of wave length shorter than 3126 Å.; adults exposed to the same light showed no visible effects but their eggs were largely sterile. Sublethal doses of ultra-violet light produced weevils defective in metabolic processes (they consumed excessive amts. of food but failed to build greater body wt.). Irradiation of eggs and adults led to abnormalities which appeared in the larval and adult stages of the progeny.

C. H. Richardson

Electrical responses from the lateral-line nerves of fishes. IV. The repetitive discharge. Hudson Hoagland. *J. Gen. Physiol.* 17, 195-209 (1933); cf. C. A. 27, 3755-6. -Largely physiol. The rise and decline of frequency of impulses from the lateral-line nerve could be accounted for if the frequency were proportional to the concn. of an intermediate compd. (B) produced as the result of the consecutive reactions,  $A \rightarrow B \rightarrow C$ . Another possible alternative: The circulation may act to remove substances normally inhibiting a process which tends to produce continuous excitations.

C. H. R.

Carbohydrate metabolism of parasitic protozoans. II. The sugar metabolism of trypanosomes. Th. v. Brand. *Z. Zellforsch. mikroskop. Anat.* 19, 587-614 (1933); cf. C. A. 27, 3989. -*Trypanosoma brucei* is able to secure necessary sugar from such low concentrations as those characteristic of diseased organs. It utilizes glucose, mannose, fructose and galactose in the proportion of 100:86:50:21:9. Arabinose, xylose, lactose and probably sucrose are not utilized by this organism, and proteins only to a negligible amt.

Henry Tauber

The digestion of wood by insect larvae. K. Mansour

and J. J. Mansour. *Proc. Acad. Sci. Amsterdam* 36, 795-9(1933).—The larvae of 2 wood-feeding Coleoptera were free from associated microorganisms, either intracellularly or in the alimentary canal; nevertheless both digest wood rapidly. Larvae of *Macrotoma palmata* yielded a stomach juice rich in cellulose-splitting enzyme; in 48 hrs., at pH 6.3, 0.5 cc. of juice hydrolyzed 28% of the 6 mg. purified filter paper added. The animal lives on the wood of *Morus alba*, which contains less than 0.5% of total sugar and starch; it is, therefore, dependent for nutrition on the hydrolysis of cellulose. Larvae of *Xystrocerus globosa* yielded no cellulose-splitting enzyme, but only an active amylase. Correspondingly it is found only in the sapwood (6.2% sugar and 3.9% starch), and not the heartwood, of its host (*Albizzia lebbek*). The animal, therefore, depends on these constituents of the wood, and correspondingly the amount of its excreta is very large. Wood-feeding insects thus belong to 3 types: those like the 1st above, which contain a cellulase; those like the 2nd, which do not, and are therefore restricted to woods with a high content of starch or sugar; and finally those like termites, which harbor various microorganisms able to digest cellulose. A no. of the species recorded in the literature are assigned to these 3 groups. K. V. T.

The presence of a phenolic substance in spider blood. J. Millot and R. Jonnart. *Compt. rend.* 197, 1002-3 (1933).—The nonfatty granulations found in the blood of araneids (*Bull. biol. France & Belg. Suppl.* 8, 1-240 (1926)) are studied further.  $K_2Cr_2O_7$  turns them brown. The perchlorate  $KIO_4$  and *p*-aminophenol in oxidizing medium gave positive tests for the presence of a phenol,

though of varying intensity with the granules and the cell plasma. In most cases mono- and dihydric phenols occurred simultaneously in different proportions. No difference in species, in nutritional condition, nor in development of genital organs seemed to be correlated with this occurrence. The phenols disappeared at the time the skin was cast but reappeared within the following week. It seems probable that the occurrence of these usually toxic substances may be one of the causes of casting skins among the Arthropods. Anne E. White

Electrokinetic studies on marine eggs. Katsuma Dan. *Am. J. Med. Sci.* 187, 204(1934).—The method consists in measuring the horizontal displacement from the vertical path of fall of eggs. Charges found on eggs of various species under different circumstances follow: (1) *Arbacia punctulata*: eggs with jelly, -34.1 mv.; without jelly, -30.3 mv. When killed by heat, this egg does not change its charge at all, and when it is fertilized, the absolute magnitude of the charge is decreased. (2) *Cumingia tellinoides*: eggs with jelly, -34.1 mv.; without jelly, -28.8 mv. (3) *Asterias forbesii*: with jelly, -18.95 mv.; without jelly, -19.9 mv.; eggs killed by heat, -19 mv. (4) *Echinarrachnius parma*: with jelly, -31.6 mv.; without jelly, -20 mv. approx. (5) *Nereis limbata*: unfertilized eggs, -10 mv., approx. (6) *Cerebratulus lacteus*: chorions contg. eggs move toward the anode. Egg cells move toward the cathode within the chorions. In sea water these eggs show 0 potential. R. C. Willson

Respiration of mosquito larvae and pupae (Kalandadse) 14.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPEL

Chemical constituents of "miso," a Japanese food. III. Free fatty acids and saponin. Yoshito Sakurai. *J. Agr. Chem. Soc. Japan* 9, 1328-30(1933); cf. C. A. 27, 3756. —Oleic, linoleic, linolenic, stearic and palmitic acids were found in a free state in "miso." The existence of arachidic acid was suspected. Four g. of a Ca salt of saponin, m. 264-6°, was isolated from 9 kg. of "miso." Free saponin, m. 232°, was sepd. by  $H_2SO_4$ . It was identified with soy-bean saponin. Y. Kihara

The manufacture of farinaceous products. Stefano Camilla. *Giorn. farm. chim.* 82, 349-60(1933).

Lewis W. Butz

Maturation of grains of wheat; influence of certain physicochemical phenomena. Maurice Piettre. *Compt. rend.* 198, 608-11(1934).—The maturation of green wheat grains stored at -5° to -7° is characterized by a rapid decrease within 4 days of reducing and nonreducing sugars and within 8 days of globulin and albumin, coincident with a rapid decrease of water. P. D. A.

Poisoning of human beings by weeds contained in cereals (bread poisoning). D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 219-66(1933).—Data are given on the toxicities to animals of the seeds of numerous varieties of plants growing on the wheat lands of S. Africa. The seed of *Vicia sativa* L. contained 64.8 mg. HCN per 100 g.; the cyanogenetic glucoside is vicianin. The seed of *Datura stramonium* L. contained 0.49% total alkaloids, chiefly hyoscyamine. Published data on the chemistry of the toxic constituents of the various seeds are reviewed. Seventy-one references. K. D. Jacob

The economic importance of controlled fermentation [in bread making]. F. E. Thomas. *Atti 1° congr. intern. panificazioni Roma* 1932, 488-91(1933).

L. H. Bailey

Some recent discoveries dealing with the nutritive value of milk. L. A. Maynard. *Cornell Veterinarian* 23, 362-7(1933).—A review. K. D. Jacob

Effect of pasteurization on some of the nutritive properties of milk. W. E. Krauss. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect., 26th Ann. Convention, Sept.,*

1933, 3-9. —The only effect of pasteurization on the nutritive value of milk is a partial destruction of vitamin B (B<sub>1</sub>). The partial destruction of vitamin C depends in its degree on the kind of pasteurization. Milk is a rather poor source of both these vitamins, but this deficiency can be met by proper dietary control. The continued use of pasteurized milk offers no serious problem from the food standpoint. J. C. Jurrjens

Effect of metals on the vitamin C content of milk. F. Schlemmer and H. Cahnmann. *Deut. Nahr.-Rundschau* 1932, 182-3. —The vitamin C is destroyed by Cu, and less markedly by Sn; Ni, Cr and Al are least destructive. B. C. A.

Raw versus pasteurized milk. W. L. Burgess, et al. *Scottish J. Agr.* 17, 1 35(1934). —The effects of pasteurization on the compn. and nutritive value of milk are discussed. K. D. Jacob

Physical and chemical effects of homogenization on milk. G. Malcolm Trout. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect., 26th Ann. Convention, Sept., 1933*, 199-220. —Mixed milk was used contg. approx. 3.7-3.8% fat, and was homogenized before and after pasteurization at various temps. and pressures. A pressure of more than 1500 lb. per sq. in. is unnecessary for elimination of the formation of cream layer. Homogenization has practically no effect on the sp. gr. There was an increase in foaming with raw milk and a decrease with pasteurized milk. Milk pasteurized before homogenization was considerably more stable to alc. than after. A decrease in viscosity was observed after homogenizing pasteurized whole milk. When milk was homogenized at pressures not exceeding 1500 lb. per sq. in., the fat loss in the skim milk during centrifugal sepn. should not exceed 30%. The homogenized cream butter showed no inclination toward defects during the working process, but yielded a firm, waxy body, similar to that from unhomogenized cream. J. C. Jurrjens

The relation among sugar, chlorides and serum refraction in milk. Thure Sundberg. *Svensk Kem. Tids.* 45, 253-75(1933). —The subject matter is presented in

extensive tables. Dilm. of milk is detected by distorted relations.

A. R. Rose  
Report of the laboratory methods committee on accuracy of sampling for fat tests at the weigh can. A. J. Powers. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect., 26th Ann. Convention* Sept., 1933, 95-159; cf. C. A. 27, 1412.—Tabulated results of fat tests and their greatest variations in 58 dairies are given. There was a persistent tendency for the non-agitated samples to test higher than the agitated ones.

J. C. Jurrjens  
Weigh-tank test variations. D. H. Bailey, J. W. Mitten, and F. M. Twining. *Proc. Intern. Assoc. Milk Dealers, Lab. Sect., 26th Ann. Convention* Sept., 1933, 81-95.—The importance of proper mixing of the milk in the weigh tanks is pointed out and good results were obtained by using a slow-speed 4-bladed propeller.

J. C. Jurrjens  
Detection of the addition of skim milk to milk chocolate. H. Jesser. *Chem.-Zig.* 58, 148(1934).—A study has been made of milk chocolates of known compn. For the purpose of detg. skim milk in the presence of full milk, it is necessary to det. also the butyric acid no. and the sapon. no. On the basis of these figures it is possible to calc. the amt. of skim milk present. With these methods of investigation, the compn. of milk chocolate can be detd. more rapidly than by the time-consuming method proposed by Härtel (C. A. 21, 285; 27, 5838) for the detn. of sugar, casein and crude fiber, and the results are just as accurate.

F. L. Dunlap  
The acidoproteolytes in gaseous associative fermentation in milk. Constantino Gorini. *J. Bact.* 27, 69-70 (1934).

John T. Myers  
Trembles (or milk sickness). James Pitton Couch. U. S. Dept. Agr., *Circ.* 306, 1-11(1933); cf. C. A. 22, 440; 24, 372 3.—Milk sickness or trembles is a disease that attacks persons and lower animals alike. It is due to a poisonous substance, *tremetol*, present in certain poisonous plants. In the Eastern portion of the U. S. white snakeroot is the plant that carries tremetol. In the Southwest, jimmivweed and a closely related plant, *Aplopappus fruticosus*, furnish the poison. The poison is secreted in the milk of animals that have grazed on these plants and such milk is capable of causing the disease in persons and suckling animals. The disease can be prevented by keeping livestock away from the plants either by fencing off the areas where the plants grow or better by destroying the plants. W. H. Ross

Report of milk-borne epidemic diseases in the United States and Canada (1924-1931 inclusive). S. J. Crumbine. *Proc. 47th Ann. Meeting Conf. State and Provincial Health Authorities* June, 1932, 33-9; U. S. Pub. Health Eng. Abstracts 13, Mi, 11(Aug. 19, 1933). C. R. F.

Manufacture and sale of ice cream in relation to public health. Thomas Benson. *J. Roy. Sanit. Inst.* 53, 452 7(1933); U. S. Pub. Health Eng. Abstracts 13, Mi, 12(Aug. 19, 1933).—Bacteria and chem. standards are suggested as follows: Not more than 100,000 bacteria per cc., and no coliform bacteria in 0.1 cc. All ice cream mixes shall be pasteurized efficiently. Ice cream must contain not less than 8% butter fat and not less than 18% milk solids. Because of the great variability in market samples of British ice cream, standards should be set up.

C. R. Fellers  
Iodine numbers of Norwegian butter. Kr. Støren. *Meldinger Norges Landbruks.* 13, 857-74(1933).—Results are given of detns. of I nos. in 663 different samples of butter from 102 Norwegian dairies collected during the years 1929-32. The av. I no. was 32; the upper and lower limits were 43.9 and 25.1, resp. The variations were closely connected with the seasons; during autumn and winter, I nos. varied from about 28 to 32, increased during spring to 37-40, and stayed there until October. The connection between the I no. and the consistency of the butter is discussed.

H. C. M. Ingeberg  
Antirachitic factor in preserved eggs. E. Lesné and R. Clément. *Compt. rend. soc. biol.* 107, 1533-4(1932).—The vitamin D content of eggs, which is not high, is not appreciably diminished by hard-boiling or by keeping

the eggs for 8 months in Ca(OH)<sub>2</sub> or Na silicate soln.

B. C. A.  
Watery whites of eggs. Report of preliminary investigations. A. S. Canham. *Onderstepoort J. Vet. Sci.* 1, 539-66(1933).—Candling is not an exact method for detg. whether an egg contains a watery white. In candled normal eggs the percentages of thin albumin ranged from 25.4 to 51.8 and of thick albumin from 48.2 to 74.6. In candled watery-white eggs the thin albumin ranged from 18.1 to 93.7% and of thick albumin from 6.3 to 81.9%. Normal eggs kept for varying periods of time became in many cases definite watery-white eggs although this could not be shown by candling. The  $pH$  values of the whites of normal eggs ranged from 6.8 to 8.5, and those of watery-white eggs from 7.2 to 8.0. The causes of watery-white eggs are probably warmth, vibration or movement, storage or age, excessive porosity of the shells in a few cases, and strain in the hens toward the close of a heavy egg-laying period. K. D. Jacob

The A:B (acid:base) coefficient applied to the estimation of the quality of meat. I. A. Smorodintzev. *Bull. soc. chim. biol.* 15, 1256-62(1933); cf. C. A. 27, 4840.—Adjust the  $pH$  of 200 cc. N AcONa to 8.3, add 50 g. of the chopped beef, shake 15 min., filter and titrate an aliquot part with 0.1 N NaOH, using phenolphthalein. The calcd. no. of cc. of N NaOH required for 100 g. beef = A. Shake another 50 g. of the sample with 200 cc. 0.1 N AcOH and titrate an aliquot part of the filtrate with 0.1 N NaOH. The calcd. no. of cc. N acid neutralized by 100 g. beef = B. The ratio A/B ranges from 0.08 for tendons to 4.3 for pure muscle fiber. For inferior cuts A/B averages 0.73 and for choice cuts 3.2.

L. E. Gilson  
Changes in canned meat. I. Changes in muscle protein in canning. Yuzuru Okuda and Kazuo Yamafuji. *J. Agr. Chem. Soc. Japan* 9, 835-44(1933).—Muscle proteins, prepd. from hen, whale and fish, were heated at 140° for 1 hr. in a sealed tube. About 20% of protein N was hydrolyzed. The higher the  $pH$  value, the more NH<sub>3</sub> and H<sub>2</sub>S were produced. The quantities of cystine, arginine, histidine and lysine decreased. The changes of the quantities of tryptophan and tyrosine were very small; no change could be observed in proline content. Protein S changed into H<sub>2</sub>S, sulfide S, sulfate S and sol. org. S, especially when the reaction was alk. Y. K.

The cool storage, handling and ripening of pears. G. B. Tindale and S. A. Trout. *J. Dept. Agr. Victoria* 32, 38-40(1934).—The optimum ripening temp. for Williams pears is 55-65°F. When the fruit is stored at 32°F., core breakdown and scald do not develop till after approx. 20 weeks, but the fruit must be removed at the end of 12 weeks in order for it to ripen properly; the appearance of the 1st sign of yellow color marks the end of the cool storage life of the fruit. As measured by the CO<sub>2</sub> evolution, the daily rate of respiration of pears stored at 32°F. increases to a max. at the green-yellow stage and then rapidly decreases until the fruit ceases to liberate CO<sub>2</sub>. The optimum storage conditions vary somewhat with different varieties of pears.

K. D. Jacob  
Experiments with California dates in storage. Wm. R. Barger. *Rept. 10th Ann. Date Grower's Inst.* 1933, 3-5.—Storage of dates at 0-10°F. reduced chem. and phys. changes in the fruit to a min. and prevented molding and souring during storage, but did not kill the fruit or the contaminating spores; normal life and the causes of molding and souring revived after storage. Lower temps. were required to prevent deterioration in the dark soft invert-sugar types of fruit than in the lighter-colored cane-sugar types. Absorption of moisture during storage hastened the formation of sugar spots on the fruit. The use of moisture-proof containers or wrappers minimized the deterioration due to absorption of moisture during storage and the loss of moisture after storage. K. D. J.

Study of the changes in composition of tomato juice on standing. Charles F. Poe. *Fruit Products J.* 13, 116-17(1933).—"The results of the exptl. data show the necessity for great care being exercised in the canning of tomato juices. As little time as possible should elapse

from the beginning to the completion of the canning process. The increase in the amt. of volatile acid is significant. This increase began immediately and reached values several times the original amt. in 2 hrs. The analysis of the volatile acids may offer an excellent means of detecting decompn. in juices which have fermented during the canning process. It has been found that the av. value for volatile acids is less than 1.0, this value being expressed as the no. of cc. of 0.1 N NaOH required to neutralize the volatile acids from 100 cc. of the sample."

F. L. Dunlap

**Physicochemical analysis and problems of flocculation.**  
I. Flocculation of grape-juice colloids. S. I. Inozemtzev. *J. Gen. Chem.* (U. S. S. R.) 3, 114-20(1933).—The colloid content (I) of grape juice (II) can be roughly deduced from the stability of emulsions formed by shaking II with  $C_6H_6$ , PhMe or  $Et_2O$ , the best results being obtained with  $CaH_2$ . The observations indicated that I varies greatly with different samples of II, as well as for the same sample during maturation. I is greatly diminished by boiling II. The system II- $EtOH$ - $Et_2O$  exhibits every stage from complete clarity to complete flocculation.

B. C. A.

**Pectase.** S. F. Tserevitinov and O. I. Rozanova. *Schriften zentr. biochem. Forschungsinst. Nahr.-Genussmittelind.* 3, 251-68(1933).—The deleterious effects of light and air on pectase are shown by quant. data on the activity of the enzyme. Pectase content has been detd. for various grasses and plants; potato plants and Swedish clover were found richest in pectase. Activity decreases during storage; in 3-5 months lucerne pectase was 2.0 times weaker at 2°, and 5.5 times weaker at room temp. than its initial activity. Com. use of pectase is favorably indicated in those industries needing to remove pectin from fruit juices and like products. **Influence of temperature and  $pH$  on coagulation of fruit pectin by pectase.** *Ibid.* 269-79.—From trials with apples, grapes, currants, gooseberries, raspberries, strawberries and cranberries it was found that the optimum temp. for coagulation of pectin by pectase is 60-65°. Optimum  $pH$  values for coagulation vary considerably, even in juice of the same fruit. A table of natural juice  $pH$  and optimum coagulation  $pH$  values is given, together with tables and curves showing effects of temp., concn., etc. **Action of pectase on fruit-juice pectins.** *Ibid.* 280-90.—Expts. are cited, with tables and curves, to show that pectin can be removed from fruit juices as required, with pectase under conditions adapted to the juice being treated. **Clarification time varied from 8 days (currants) to 50 days (custard apples).** **Removing pectin from cranberry juice.** *Ibid.* 291-8.—Pectase is effective for removing pectin from cranberry pulp or juice on a com. scale.

Julian F. Smith

**The pectin content of some Philippine fruits.** F. T. Adriano, H. L. Ylizarde and E. Villanueva. *Philippine J. Agr.* 3, 273-9(1932).—Of 14 different Philippine fruits analyzed, the rind of Tahiti lime had the highest pectin content (2.63%). Bignay, native orange, duhat, mabolo, naranjita, santol, hevi and guava follow in descending order, and contain sufficient pectin for jelly-making and many important industrial preps. Eleven references.

John O. Hardesty

**Studies on the quick freezing of Philippine fruits and the utilization of the frozen pack products.** F. T. Adriano, A. Valenzuela and L. G. Miranda. *Philippine J. Agr.* 4, 41-72(1933).—Strawberries, mangoes, avocados, lanzones, ates, guavas, young coconuts, pineapples, nangkas, lemasas, chicos and zapotes made frozen products of better flavor, color and texture when frozen at 0°F. and -40° than those frozen at 18°F. Thirty-two references.

John O. Hardesty

**The value of Philippine fruits and vegetables for the preparation of fermented and unfermented pickles.** F. T. Adriano, A. Valenzuela and D. S. Santos. *Philippine J. Agr.* 4, 13-40(1933).—Fermented pickles from fruits and vegetables, namely, ampalaya, radishes, cucumbers, papaya, onions, beans, seguidillas, balimbing, cauliflower, chayote, etc., were better in texture, flavor and keeping

qualities than the unfermented pickles. Below 40° salometer hevi softens in texture and further softening occurs even when the brine concn. is brought back to 40° and above. Toughness of the fermented pickles of eggplants, paayap and papaya is prevented by steaming prior to bottling. The materials and equipment used in the pickling process are described.

John O. Hardesty

**The chemical composition of Philippine mushrooms.** F. T. Adriano and R. A. Cruz. *Philippine J. Agr.* 4, 1-12(1933).—Analyses of 23 Philippine species and 5 species of mushrooms imported from China, Japan and France showed the former to average higher in fat, protein and mineral contents and lower in crude fiber and carbohydrates. *Psaliota campestris*, *Psaliota merrillii* Copel. B., *Hirneola affinis* (white gelatinous), *Auricularia polytricha* (brown top and white bottom), *Collybia albuminosa* (Berk.) Petch, *Lycoperdon lilacinum* Copel. (puffball) and *Volvaria esculenta* Bres. (kabuteng saguing) were higher in food value than any of the others. Canned mushrooms were exceptionally high in Fe, Na and Cl contents. Six references.

John O. Hardesty

**Experiments in storing of cabbage and other vegetables.** Olav Moen. *Meldinger Norges Landbruks.* 13, 767-86(1933).—Treatment with  $Cl_2$ ,  $CH_3O$ ,  $SO_2$ ,  $O_3$ ,  $CaO$ , powder, S and lime-copper sulfate and drying of the air in the storage rooms with  $CaCl_2$  or  $CaO$  did not prove effective. Ordinary storage methods are far from satisfactory.

H. C. M. Ingeberg

**Emulsification by mustard.** John W. Corran. *Spice Mill* 57, 175-7(1934).—Mixts. of lime water and olive oil contg. various quantities of mustard were shaken. For small amts. of mustard the emulsion was of the greasy (water-in-oil) type, but as the mustard content increased the emulsion inverted to the creamy (oil-in-water) type. Fine mustard flour was more effective than coarse. The factors affecting the stability of mayonnaise are discussed and exptl. data are presented showing the stabilizing effect of mustard.

L. W. E.

**Toxic constituents of the so-called bongkreng poisoning in Java.** A. G. van Veen and W. K. Mertens. *Rec. trav. chim.* 53, 257-60(1934).—The investigation was undertaken to ascertain the toxic principles formed in bongkreng and semaji, 2 auxiliary foodstuffs commonly used in middle Java, but not infrequently of high toxicity. The toxic substances, 2 in no., were isolated only after the most tedious and careful procedures, by the repeated use of immiscible solvents  $Et_2O$ ,  $CHCl_3$ , petr. ether and aq. solns. of varying  $pH$  values. The essential facts developed were: The poisonous principles result from the action of certain bacteria (notably "bacterium hongkreng") on domestic by-products of the coconut (press cake). Soy bean and peanut cake treated in a similar manner do not develop these poisons. Cooking or roasting of bongkreng or semaji has little or no effect on their toxicities. Of the 2 poisonous principles one formed yellow flat needles or leaflets (I), m. 171-2°, the other (II) a colorless fatty (thus far non-cryst.) product. I appears to be a high-mol. protein-like substance in loose combination with a lower mol. yellow protein-like substance, disocn. gradually taking place by the action of heat,  $EtOH$ , certain salts, etc., whereby the toxicity becomes markedly less. The development of I and II is invariably shown by the appearance of a yellow color, and may result by bacterial action not only on bongkreng and semaji, but on glycerol, oleic, stearic and palmitic acids, certain hexoses, pentoses and sugar alcs. in suitable nutrient media. I induces narcotic phenomena; II induces tetanic phenomena. II is N-free, has the character of an acid, is easily oxidized and is extremely sensitive to heat.

W. O. E.

**Improvements in the manufacture of dry fodders.** J. Landis, H. Burekhardt and E. Steiner. *Schweiz. landw. Mh.* 10, 282, 293, 314(1932); *Fortschr. Landw.* 8, 280(1933).—As compared with hay cured on the ground, hay cured on scaffolds showed smaller loss and higher digestibility of its nutrient contents, a better flavor and a smaller water content. Curing on scaffolds was particularly advantageous in rainy weather.

K. D. J.

*Lathyrus sativus* L. (chickling vetch; Khesari; Indian

pea) as a stock food. D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 163-71(1933).—The fresh green plants of *L. sativus* cut at the flowering stage contained ash 6.0,  $P_2O_5$  0.51, CaO 1.08, fat 4.47, cellulose 36.6, protein 17.3 and  $H_2O$  74.5%. Hay made from the flowering and seeding plants contained ash 8.0,  $P_2O_5$  0.34, CaO 0.96, fat 2.4, cellulose 27.0, protein 20.9 and  $H_2O$  8.3%. The ripe seed contained ash 2.9,  $P_2O_5$  0.74, CaO 0.24, fat 0.6, protein 28.0 and  $H_2O$  10.0%. When they were fed without any addnl. ration, the fresh plants in the pre-flowering and flowering stages were poisonous to horses. Cattle, sheep and rabbits consumed relatively large amts. of the plant without any ill effects. The active principle of *L. sativus* is not definitely known. K. D. J.

A hexosephosphoric acid obtained from the hydrolysis of flour (Posternak) 6. Detn. of Pb in small quantities in food products (Samuel, Shockley) 7. Rept. of the mycologist for the year 1932 [microorganisms and tea manuf.] (Cadd) 11D. Normal absorption and excretion of Pb [detn. of Pb in food] (Kehoe, et al.) 11A. Lipolytic activities of several bacteria causing bitter cream (McGrath, Anderson) 11C. Digestibility of milk (Mortenson) 11F. Action of lipolytic bacteria on natural fats (Collins) 11C. Destruction of carbohydrates by bacteria (Levine, Watkins) 14. Treatment of sewage from food industries (Bode) 14. Washing fruit for removing spray residues (U. S. pat. 1,945,922) 15. Spray desiccation of juices or sirups (U. S. pat. 1,946,566) 13. Reducing the oil content of soy-bean meal [for use in bread making] (U. S. pat. 1,947,200) 27.

McCance, R. A., and Shipp, H. L.: The Chemistry of Flesh Foods and Their Losses on Cooking. Special Rept. Series No. 187 of the Med. Research Council. London: H. M. Stationery Office. 146 pp. 2s. 6d.

Analisis químico de forrajes mexicanos y su valor alimenticio. Mexico, D. F.: Secretaria de Agricultura y fomento. 19 pp.

Finely subdivided food products. Bernard J. G. Chicago. U. S. 1,947,520, Feb. 20. Preparatory to drying, various products such as cheese, meats, yeast, cereals, fruits or nuts are finely subdivided by the action of a rotating wire brush (various operative details being described).

Vegetable jelly for use as a food. Arthur W. Thomas and Morris Mattikow. U. S. 1,946,649, Feb. 13. Agar agar 1, gum karaya 0.5-1.0 and an acid such as tartaric acid somewhat less than 1 part are used together to form a compn. which can be dissolved in hot water to form a stiff and elastic jelly upon setting at ordinary room temps.

Heat-sealable opaque wrapping paper for foods. Walter W. Herrick (to Riegel Paper Corp.). U. S. 1,946,141, Feb. 6. Paper is coated on one or both sides with wax contg.  $TiO_2$ .

Preserving foods. I. G. Farbenind. A.-G. (Heinrich Kircher, inventor). Ger. 588,467, Nov. 18, 1933 (Cl. 53c. 6.01). Addn. to 554,512. The method of 554,512 for preserving cut flowers by treatment with aq. methyl-cellulose soln. is applied to the conservation of foods, both fruit and flesh.

Protective lacquer for food containers. Alberto Williams (to Swift & Co.). U. S. 1,945,584, Feb. 6. A lacquer is prepd. by dissolving shellac and rosin in alc. by suspending them in the alc. on a porous tray close to the surface of the alc.

Cereal food. Eugene H. McKay (to Kellogg Co.). U. S. 1,946,803, Feb. 13. For prepg. a "ready to eat" food, whole or broken rice kernels are cooked, partially dried, ground into particles about 0.06-0.12 in. in diam., the ground material is formed into a ribbon, the ribbon is dried until hard and brittle, and then is puffed by heating.

"Ready-to-eat" cereal food. Eugene H. McKay (to Kellogg Co.). U. S. 1,945,946, Feb. 6. Various details are given of a process of prepg. a shredded, puffed and

1 toasted food from a cooked mixt. of rice, bran and water U. S. 1,945,947 relates to details of prepg. a crisp porous food from rice.

Bleaching flour. J. R. Short Milling Co. Ger. 591,304, Jan. 18, 1934 (Cl. 53c. 6.02). See Brit. 846,408 (C. A. 26, 587).

Wheat flour, etc. Kenneth P. Wanklyn. Brit. 401,941, Nov. 23, 1933. The fatty acids in wheat germ treated by heating at reduced pressure or in an artificial atm., e. g., N or other inert gas, is neutralized by adding  $NaHCO_3$  before or during the treatment. The treated germ is then mixed with wheat flour, millers' offal or cattle or poultry food. To make a specially white bread or feeding meal, the treated germ is bleached with  $NO$ ,  $Cl$ ,  $NCl_3$ , etc., before admixt.

Dry concentrator suitable for treating flour, gold sands, etc. James F. Gibson. U. S. 1,945,526, Feb. 6. Structural and mech. features.

Baked flour products such as cakes. Albert K. Epstein and Benjamin R. Harris. U. S. 1,945,346, Jan. 30. Small proportions of diketones such as biacetyl and 2,3-pentadione are added to pastry ingredients in order to give a butter-like aroma and flavor.

Flour mixture for making cake dough. Jacob Finkel U. S. 1,944,880, Jan. 30. A dry powder is prepd. by agitating and heating a mass of grain flour under a vacuum for removing moisture from the flour, then adding a shortening and other perishable ingredients to the dried flour and continuing the heating and agitation of the mixt. at a temp. below  $85^\circ$  to drive off substantially all free moisture, and to effect softening of the flour gluten, and further blending of the ingredients. U. S. 1,944,881 relates to a similar process in which "cocoanut oil" and cocoa are added to the flour, etc.

Bread. Etablissements Vitafor. Fr. 757,111, Dec. 20, 1933. Bread is improved by the addn. during manuf. of a stable emulsion of animal and vegetable fats, Vichy salts, an essence and a coned. sugar sirup in water.

Treating surplus bakery bread for use in other foods. Karl P. Keeney and Harold E. Turley. U. S. 1,945,436, Jan. 30. The material is subjected to the action of a digestant such as pepsin or diastatic malt in the presence of acidified water, and is agitated until the non-crust material is broken down and mixed with the water; the crust material is then removed, and remaining material may be further digested. App. is described.

Filter for milk, etc. Alma J. Clare. Brit. 400,833, Nov. 2, 1933.

Butter substitute. Kametarô Kawai. Japan. 100,020, March 9, 1933. A butter substitute is prepd. by mixing margarine or hardened oil with purified wax sepd. from cod-liver oil by cooling below  $0^\circ$ .

Butter substitute. Asahi Seiraku K. K. (Zyûgorô Sugai, inventor). Japan. 100,257, March 25, 1933. To margarine are added a fermentation product of palm oil, milk sugar and lactic acid bacilli and a fermentation product of natural butter and glucose.

Margarine. Bruno Behrend. U. S. 1,944,962, Jan. 30. A fat mixt. is churned with soured skimmed milk in which lecithin and malt ext. are dispersed. Cf. C. A. 28, 1116.

Margarine. Albert K. Epstein and Benjamin R. Harris. U. S. 1,945,347, Jan. 30. A small proportion of a diketone such as diacetyl and 2,3-pentadione is added to oleomargarine, in order to improve its flavor. Cf. C. A. 27, 4600-1.

Cheese. Albert K. Epstein and Benjamin R. Harris. U. S. 1,945,345, Jan. 30. A small proportion of a diketone such as diacetyl or the like is added to cheese such as Cheddar type cheese in order to improve its flavor and keeping properties.

Sterilizing liquid egg material, milk or other foods with chlorine and by use of violet rays. Samuel Tranin and Rudolph M. Snyder (to Samuel Tranin). U. S. 1,945,102, Jan. 30.  $Cl$  gas is introduced into a stream of the material and it is then passed closely adjacent a violet ray lamp incidental heat from which serves to evap. the gas. App. is described.

**Egg filtering apparatus.** Melville J. True (to Armour & Co.). U. S. 1,946,772, Feb. 13.

**Preserving unfermented fruit juices.** Silvere C. Vandecaveye (to State College of Washington). U. S. 1,947,237, Feb. 13. In treating fruit juices by means of generations of yeasts derived from the yeast naturally present in the fruits, the liquid is kept at a temp. favorable for the yeast development which is allowed to proceed until foam bubbles indicate CO<sub>2</sub> production and beginning of EtOH formation; further development of the yeasts is then checked and they are pptd. by heating to above 45° for 30–40 min., followed by cooling to 25° for the purpose of promoting a new generation of yeast by inoculation with fresh juice material; the ppts. formed are allowed to settle and the clear portion of juice is sepd., and the procedure is repeated for removing substantially all N and P.

**Pectin product.** Willard E. Baier and Robert B. Harris (to Calif. Fruit Growers Exchange). U. S. 1,945,963, Feb. 6. About 5–10% of acetonedicarboxylic acid is added in prep. a dry, finely divided pectin product, in order to produce a stable effervescent compn. A buffer salt such as Na citrate also may be added.

**Treatment of insect-infested fruit such as oranges or grapefruit.** Bronson C. Skinner (to Biogdex Co.). U. S. 1,947,115, Feb. 13. The fruit is provided with a thin film-like coating of waxy material such as paraffin to reduce wilt and shrinkage, and is then steamed for 4–6 hrs. at a temp. of about 43–46°.

**Chocolate sirup.** Wallerstein Co. Brit. 401,333, Nov. 6, 1933. See U. S. 1,854,353–5 (C. A. 26, 3310).

**Seasoning material.** K. K. Suzuki Shōten (Fukutaro Tsunoda and Sekizyūō Ōno, inventors). Japan. 99,003, Feb. 17, 1933. Proteins are hydrolyzed with a strong

acid. The product is concd. with HCl and cooled, to give a mixt. of glutamic acid hydrochloride and NH<sub>4</sub>Cl. The mixt. is suspended in H<sub>2</sub>O, NH<sub>3</sub> is introduced and free glutamic acid is crystd. This is purified and converted to the Na salt for use as a seasoning material.

**Seasoning material.** Dai Nippon Jinzōhiyō K. K. (Kōtarō Shimo and Yutaka Tanimura, inventors). Japan. 99,741, Feb. 23, 1933. Animal or vegetable proteins are hydrolyzed with an acid or alkali, the product is neutralized, mixed with carbohydrates and NaCl, and subjected to saccharification.

**Roasting coffee.** Joseph F. Gilbreath. U. S. 1,946,398, Feb. 6. A mixt. of an org. acid and water (suitably a soln. of HOAc or citric acid) is added to freshly roasted coffee before drawing it from the roasting oven and while it is still hot, the proportion of acid added being varied as the percentage of acid naturally present in the coffee, for the purpose of inhibiting staling or rancidity.

**Apparatus for decomposing materials containing proteins.** K. K. Suzuki Shōten (Genpei Shimizu, inventor). Japan. 99,214, Jan. 26, 1933. The app. is designed for decomp. large amts. of material contg. proteins with mineral acids by applying heat, pressure and agitation.

**Stock feed containing molasses and cereal material, etc.** Albert H. Schmidt. U. S. 1,945,918, Feb. 6. Various details of app. and mfg. operations are described.

**Preserving fodder.** Willy Rojahn and Michel Mercurio. Brit. 401,867, Nov. 23, 1933. A layer of absorbent material, e. g., peat dust, chaff, kieselsuhr, slag, ash, cork meal, is provided on the floor space of a store chamber and sprayed with formalin or dil. aq. solns. of formalin compds. that generate bactericidal gases, e. g., formalin H<sub>2</sub>SO<sub>4</sub>, formalin Al sulfite, before the introduction of the fodder.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Progress in the field of recovery of volatile solvents.** L. Piatti. *Kunststoffe* 24, 6–9 (1934).—A patent review.

**Progress Reports—Metallurgical Division.** I. Mineral Physics Studies. Preliminary report on dust settling. R. S. Dean, John Gross and C. E. Wood. Bur. Mines, *Rept. of Investigations* No. 3223, 37 (1934).—A chem. combination in a dust- or fume-laden atm. forms a rapidly settling cloud of rather large particles that collect the dust or fume particles and sweep them out of the atm. The most promising agent investigated is NH<sub>3</sub> and steam. Steam or NH<sub>3</sub> alone improves the settling, but the 2 together are immensely more efficient.

**The control of the condition of the air in cooled spaces.** Kurt Linde. *Beihfte Z. ges. Kälte-Ind.*, Ser. 2, No. 7, 1 47 (1933).

**Heat transfer in air coolers with ribbed tubes.** Theodor E. Schmidt. *Beihfte Z. ges. Kälte-Ind.*, Ser. 2, No. 6, 1 45 (1933).

**The motion of granular or pulverous materials in a horizontal rotating cylinder.** I. Yoshitoshi Oyama. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 12, 953–75 (1933). (*Abstracts* (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) 23, Nos. 468–77).—Granular materials in circular motion with the wall of the cylinder are in an area surrounded by 2 curves crossing at a stationary point. Above the crit. velocity, these 2 curves are expressed by an empirical formula:  $\rho = a e^{b\theta}$ , in which  $\rho$  denotes radius of curvature,  $\theta$  is angular displacement,  $a$  and  $b$  are consts. The area in which granular materials are in contact with the inside wall of the cylinder has a min. value relative to the no. of rotations. The max. in flying quantity is independent of the quantity of the charge and it is found at 78 r. p. m. for 200 mm. of the inner diam. of the revolving cylinder. The rotation of grains 0.08 mm. in diam. is discontinuous. K. Konda

Experimental investigation of the efflux of granular

mass. Kōichirō Takahashi. *Bull. Inst. Phys.-Chem. Research* (Tokyo) 12, 984–93 (1933) (*Abstracts* (in English) published with *Sci. Papers Inst. Phys.-Chem. Research* (Tokyo) 23, Nos. 468–77).—The velocity of grains falling through a round hole at the bottom of a cylindrical vessel does not depend on the height of the grain layer unless the layer is very thin. The falling velocity of grains piled above a certain limit of height is expressed by the following empirical formula:  $v = k \sqrt{gd} / (f\mu + a(\bar{D}/d))$ , where  $v$  denotes the velocity of grain;  $d$ , the diam. of hole;  $\bar{D}$ , the mean diam. of grains;  $g$ , the acceleration of gravity;  $f$ , a function depending on  $\mu$  given by  $\mu = \tan \theta$  ( $\theta$  is an angle subtended by the horizontal plane and generating line of the cone of grain formed by the pile of falling grains),  $k$  and  $a$  being consts. independent of materials. Similarly the pressure acting on the hole is expressed as follows:  $P = c_1 g d^2$ , in which  $P$  is the total pressure;  $\mu$  the apparent sp. gr. of the grain;  $c_1$ , a const. K. Konda

**Steam research program. II. Vapor pressure of water.** Leighton B. Smith, Frederick G. Keyes and Harold T. Gerry. *Proc. Am. Acad. Arts Sci.* 69, 137–88 (1934); cf. C. A. 23, 1450.—Details are given of expts. between 150° and 374°, leading to the following equation:  $\log_{10}(p/p_0) = (x/T) (a + bx + cx^2 + dx^3) / (1 + dx)$  in which  $x = T_0 - T$ ,  $p_0 = 218.167$  atm.,  $T_0 = 647.27^\circ\text{K.}$ ,  $a = 3.3463130$ ,  $b = 4.14113 \times 10^{-2}$ ,  $c = 7.515484 \times 10^{-3}$ ,  $d = 1.3794481 \times 10^{-2}$ ,  $e = 6.56444 \times 10^{-4}$ , which reproduces the data and those of Osborne, *et al.* (C. A. 27, 1792) to within 4 parts per 10,000. Tables of vapor pressure and of  $dp/dt$  are given. H. W.

**Safety precautions in chemical manufacture.** T. J. Dixon. *Chemistry & Industry* 1934, 167–71. E. H. Betz, J. H. Holden and J. O. Handy. *Ind. Eng. Chem.* 25, 774–6 (1933).—Between July 1, 1931, and June 30, 1932, 607 detns. of SO<sub>2</sub> in the air of Pittsburgh were made. The sampling station was 75 ft. above the ground and in a typical location with respect to sources of SO<sub>2</sub>.

The yearly av. was 0.3 p. p. m. with a max. of 2.5 p. p. m. The yearly morning av. was 0.38 p. p. m. and the afternoon av. was 0.19 p. p. m. It is to be noted that the tests were made during a period when industrial activity was considerably below its peak, and on the decline.

G. L. Kelso

**Common misconceptions regarding the possibilities of protection against dichlorodithyl sulfide (mustard gas) and first aid to persons poisoned with this substance.** Muntsch. *Gasschutz u. Luftschutz* 4, 20(1934); cf. C. A. 28, 528<sup>a</sup>, 566<sup>a</sup>.—The possible use of salves as a protective coating is discussed and discarded as ineffective and impracticable. The impregnation of clothing with chloride of lime or other Cl preps. which have the power of destroying dichlorodithyl sulfide is also discarded as presenting tech. difficulties, as well as having probable harmful effects upon the wearer. Contaminated portions of the skin may be freed from this poison by repeated washing with fresh portions of kerosene or other petroleum products provided this treatment is started not more than a half hr. after contamination. Thorough bathing with warm water and soap is also effective if undertaken within a half hr. The earlier these treatments can be given the more is the chance of success. It is entirely useless to undertake treatments to remove the poison after the skin shows signs of redness or swelling. It is known that black skin is much less susceptible to the poison than white skin and M. thinks that this fact offers a promising line of investigation.

A. L. Kibler

**Lead absorption and excretion in relation to the diagnosis of lead poisoning.** Robert A. Kehoe, Frederick Thammann and Jacob Cholak. *J. Ind. Hyg.* 15, 320-40 (1933).—Studies were made of the Pb excretion of subjects for a period of months after the cessation of well-known types of Pb exposure, also single or repeated observations were made on patients with actual or suspected Pb poisoning. In addn., examn. was made of the tissues in fatal cases in which Pb was a suspected factor. It is concluded that persons who have absorbed abnormal amts. of Pb excrete Pb at higher than normal rates after the cessation of Pb exposure. The duration of the period of increased Pb excretion depends upon the extent of Pb absorption. The rate of Pb output diminishes rapidly for a period of several weeks, after which there is a prolonged and gradual diminution in excretory rate until the normal level is reached. The relative intensity of the Pb exposure is indicated by the initial height of the excretory level, by the sharpness of the decline in the excretory rate during the early weeks of freedom from exposure, and by the duration of the period of high excretion. Persons abnormally exposed to Pb show the presence of unusual amts. of Pb in their circulating blood during life and in their tissues at necropsy for variable periods of time after the discontinuance of their exposure. The total amt. of Pb in the body varies with the severity of the Pb exposure and the interval between exposure and death. The detection of an abnormally high rate of Pb excretion or an unusual amt. of Pb in the tissues is useful in estg. the severity of the Pb exposure. It does not constitute proof of the existence of Pb intoxication. The recognition of either of these phenomena is greatly facilitated by the study of excreta or tissues soon after the cessation of exposure. Eleven references. E. G. M.

**Lead absorption and excretion in certain lead trades.** Robert A. Kehoe, Frederick Thammann and Jacob Cholak. *J. Ind. Hyg.* 15, 306-19(1933).—Groups of workmen, representing different degrees of Pb exposure, were studied as to their fecal and urinary Pb excretion. The mean Pb excretion of all types of workmen in a white lead plant was found to be  $3.76 \pm 0.26$  mg. per sample of feces,  $0.57 \pm 0.03$  mg. per g. of ash in the feces, and  $0.24 \pm 0.01$  mg. per l. of urine. The corresponding values for workmen in a plant mfg. storage batteries were, resp.,  $2.53 \pm 0.18$ ,  $0.45 \pm 0.03$  and  $0.18 \pm 0.01$  mg. Workmen exposed only to inorg. Pb dusts in a plant mfg. tetraethyl Pb excreted Pb at mean rates of  $0.56 \pm 0.06$  mg. per fecal sample,  $0.20 \pm 0.02$  mg. per g. of fecal ash, and  $0.14 \pm 0.01$  mg. per l. of urine. Clinical

<sup>1</sup> Pb poisoning had occurred in the first 2 plants. The tetraethyl Pb plant had shown none during the 5 years of observation. Evidence is presented for the belief that Pb exposure is safe if it does not give a mean Pb excretion of more than 0.6 mg. per day in the feces and 0.15 mg. per l. in the urine. Conclusion: The occurrence of Pb poisoning may be expected under conditions in which Pb is excreted at a mean rate above 1.1 mg. per day in the feces, and 0.21 mg. per l. in the urine. Twelve references.

E. G. Meiter

**Aerochemical war gases and protection against them.** Walter Meyer. *Pharm. Ztg.* 78, 1280-2(1933).—The more important war gases are arranged in 4 groups, and their physiol. actions, together with their most effective antidotes, are given.

W. O. E.

**Importance of insulation on furnaces.** B. Thomas. *Heat Treating and Forging* 19, 49-51, 78-9(1933).—The application and cost of insulating industrial furnaces are considered.

**Catalytic reactions.** I. G. Fairbairn, A.-G. (Walter Simon, Paul Jacob and Wilhelm Kunze, inventors) Ger. 589,968, Dec. 21, 1933 (Cl. 12o. 1.05). Catalytic reactions, especially the pressure hydrogenation of carboniferous materials, are carried out with cryst. W compds. as the catalyst. Cf. C. A. 27, 1112.

**Purifying gases.** Ateliers J. Hanrez (Soc. anon) Fr. 756,702, Dec. 14, 1933. Gases or smokes are brought into contact with a liquid capable of retaining impurities contained therein, the liquid being in a vessel containing clays, tubular systems, etc., conducting or not conducting for a part. An elec. current is caused to pass through the system liquid-container. A substance may be incorporated in the liquid to give insol. substances with the impurities.

**Generation of high-pressure gas.** Yūzaburō Murakami and Miyukichi Kobayashi. Japan. 99,867, March 1, 1933. The gas is generated by adding water (200 parts) to a mixt. of solid CO<sub>2</sub> (400) and CaC<sub>2</sub> (400) in a generating chamber.

<sup>9</sup> **Clarifying aqueous liquids.** René A. Henry. Ger. 591,266, Jan. 18, 1934 (Cl. 85c. 1). This corresponds to Brit. 322,798 (C. A. 24, 2815), but gives addl details.

**Concentration of liquids containing volatile matter.** Artur Vadász. Hung. 107,480, Dec. 1, 1933. The liquid is divided into 2 parts. One is heated to remove the volatile constituents and the other is cooled to absorb substances removed from the first. Thus a double concn. is effected. Details of the app. are given.

**Method of discharging solid, liquid or gaseous materials from high-pressure reaction apparatus.** Friedrich Uhde. Brit. 401,429, Nov. 16, 1933.

**Emulsions.** International Bitumen Emulsions Corp. Brit. 401,131, Nov. 9, 1933. Aq. emulsions of asphalt, pitch, tar, resin, wax or mineral or other oils, stabilized with alkali caseinate, are treated with a soln. of acid, e. g.,  $H_3PO_4$ ,  $H_2BO_3$ , to reduce the alky. of the caseinate and prevent its deterioration.

**Vaporizing mercury.** John J. Grebe (to Dow Chemical Co.). U. S. 1,946,851, Feb. 13. For vaporizing Hg, as in power cycles, a current of Hg vapor is caused to travel through a heating zone such as a pipe system in which it is superheated from an external source of heat, and small portions of liquid Hg are simultaneously injected so that the liquid is vaporized by the superheat of the vapor.

**Separating gaseous products from hydrocarbon vapors or the like by a liquefaction and rectification system.** Leon S. Gregory. U. S. 1,946,580, Feb. 13. App. and various details of operation are described.

**Recovery of gases such as sulfur dioxide from dilute mixtures such as smelter gases.** Fredrik W. de Jahn (to Jacob D. Janssen). U. S. 1,946,489, Feb. 13. The desired component such as  $SO_2$  is absorbed from the mixt. in a first solvent such as water and is then removed from this solvent by a second solvent such as  $AmOAc$  immiscible with the first solvent, and is finally expelled from the second solvent.

**Purifying gases such as carbon dioxide.** Sidney T. Adair and Charles F. Cushing (to Chester F. Hockley, as receiver for Silica Gel Corp.). U. S. 1,945,407, Jan. 30. The gas is compressed and liquefied, some of the liquid is expanded, heat from the gas prior to compression is transferred to the expanded liquid to sep. moisture from the gas, the cooled gas is contacted with a dehydrating agent to remove more moisture, the dehydrated gas is passed through solid, porous, adsorbent material such as silica gel to remove odoriferous compds., and the purified gas is supplied for the compression. An arrangement of app. is described.

**Absorption of carbon monoxide or alkadienes from gases or vapors.** N. V. Bataafsche Petroleum Maatschappij. Dutch 31,454, Dec. 15, 1933. CO is absorbed in a neutral cuprous salt soln. in the presence of a reducing agent ( $HONH_2$ ,  $HCl$ , hydroquinone, sulfite,  $SnCl_2$ , etc.). Alkali or alk. earth chlorides dissolved in  $H_2O$  or  $EtOH$  are used as solvent for  $CuCl$ . By heating to  $40-80^\circ$  the soln. is regenerated and the gas recovered.

**Apparatus for forming solid carbon dioxide from the liquefied gas.** Frederic H. Foster and Walter C. Priestley. Brit. 389,475, Mar. 13, 1933.

**Use of liquid "amo" in refrigerating systems.** Gerald C. Connolly and Ernest B. Miller (to Silica Gel Corp.). U. S. 1,947,381, Feb. 13. "Amo" is used with an absorbent comprising a gel such as silica gel impregnated with a substance such as  $CaCl_2$ ,  $SrCl_2$  or  $LiCl$  with which the "amo" forms a compd.

**Spray desiccation of materials such as juices or sirups.** Wm. S. Bowen. U. S. 1,946,566, Feb. 13. Various details of app. and operation are described.

**Drying viscous material.** The War Minister (Shigeo Mukai, inventor). Japan. 99,065, Jan. 16, 1933. Viscous material is agitated in such a way that many small air bubbles are enclosed; then it is evapd. to dryness *in vacuo*.

**Dispersions and dispersing and precipitating agents.** James F. Mosley. Brit. 401,282, Oct. 23, 1933. See *Ir.* 749,446 (C. A. 28, 546<sup>2</sup>).

**Rendering  $\beta,\beta'$ -dichlorodiethyl sulfide innocuous.** Chem. Fab. von Heyden A.-G. (Curt Philipp, inventor). Ger. 590,796, Jan. 9, 1934 (Cl. 78d. 1.02). Addn. to 557,081 (C. A. 27, 355). The dichloroamides used in the method of Ger. 557,081 are mixed with inert solids, such as kieselguhr or talc, to form compns. which can be strewn. Alkali, alk. earth and Mg carbonates or bicarbonates may be included in the compns. Cf. C. A. 28, 1427<sup>1</sup>.

**Electrical apparatus such as transformers.** Charles F. Hill and James T. Goff (to Westinghouse Elec. & Mfg. Co.). U. S. 1,947,085, Feb. 13. Between parts such as those of transformers there is interposed a heat-conducting and -insulating material comprising a mixt. of quartz sand or the like and an impregnating jelled vegetable oil such as jelled China-wood oil.

**Electrical apparatus for testing insulating materials.** Frank C. Doble (to Doble Engineering Co.). U. S. 1,945,263, Jan. 30.

**Thermal insulator for use in cold storage.** Toshio Kuzuyama. Japan. 99,137, Jan. 24, 1933. A mixt. of kieselguhr, sawdust and clay is molded into bricks, heated at  $1000-1100^\circ$ , cooled to  $250-300^\circ$ , immersed in melted asphalt and cooled quickly.

**Heat- and sound-insulating compositions.** Franz Jaray. Austrian 130,008, Dec. 27, 1933 (Cl. 80d). Fibers of cotton, glass wool, rayon, hemp, jute, etc., of at least 25 cm. length are arranged in parallel, impregnated with 10-35% of a binder such as rubber, glue, water-glass or a synthetic resin, and molded under pressure.

**Insulated electrical conductor.** Beauford H. Reeves (to Rockbestos Products Corp.). U. S. 1,946,331, Feb. 6. A stranded conductor or the like is provided with an insulation which does not evolve an inflammable or explosive gas at elevated temps. and which includes non-brittle fibrous material such as asbestos, in an amt. sufficient to retain at least part of the insulation on the conductor, the insulation including materials such as borax and Na silicate which are capable of forming a vitreous-like tube when highly heated.

**Electrical-insulating material suitable for use at high temperatures.** Leon McCulloch (to Westinghouse Elec. & Mfg. Co.). U. S. 1,947,096, Feb. 13. A plurality of layers of asbestos paper, rolled to crush conducting particles, are used, each layer contg. a partially carbonized org. binder such as may include heat derivs. of China-wood oil, etc.

**Electrical insulation on metal sheets.** George C. Kiefer and Charles A. Scharschu (to Allegheny Steel Co.). U. S. 1,946,146, Feb. 6. Metal sheets are passed through a soln. formed of Na silicate, water and chromic acid in specified proportions, passed through rolls to remove excess soln., dried and baked at a temp. high enough to drive off excess water, form a ppt. and bake the latter onto the sheets.

**Vehicle body with heat-insulated compartments suitable for transporting solid carbon dioxide.** Eugene A. Hults (to Mathieson Alkali Works). U. S. 1,945,689, Feb. 6.

**Apparatus for applying insulating coatings to wire and burning off volatile ingredients.** Frank Martindell (to Western Elec. Co.). U. S. 1,947,478, Feb. 20. U. S. 1,947,479 (Frank Martindell and Ansel D. Miller (to Western Elec. Co.)) also relates to app. for the same general purpose.

**Coating surfaces.** Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co.). Brit. 401,500, Nov. 16, 1933. Articles are impregnated or coated for elec. insulation by applying styrene in a pre-polymerized state or as a soln. of polystyrene in monomeric styrene without a volatile solvent and then hardening by heat treatment, e. g., at  $100-180^\circ$ . The treating liquid may contain catalysts, e. g., Bz peroxide, or non-volatile softening agents, e. g., tritolyl phosphate.

**High-tension submarine cable.** Georg Zapf (to Felten & Guillaume Carlswerk A.-G.). U. S. 1,945,704, Feb. 6. A conductor is provided with an oil-impregnated paper insulation, an overlying layer of non-metallic material such as a cellulose ester or ether impermeable to oil and a rubber sheathing, and is treated with paraffin to close its surface pores.

**Insulation on submarine cables, etc.** Willoughby S. Smith, Henry J. Garnett and John N. Dean. U. S. 1,946,337, Feb. 6. A gutta-percha insulation is used conjointly with a material contg. coal tar such as a mixt. of pitch and anthracene oil which may be used as a coating or impregnating material and which is substantially free

from acid and basic components and from readily volatile substances.

**Composition for impregnating cable insulation.** George F. Kennedy (to Hercules Powder Co.). U. S. 1,946,322, Feb. 6. A hydrocarbon oil is used with rosin substantially free from oxidized components in a proportion of about 5-50%.

**Cables.** W. T. Henley's Telegraph Works Co. Ltd. and Percy Dunsheath. Brit. 400,929, Oct. 27, 1933. The insulation in a cable is impregnated with oil, etc., exposed to the pressure of gas enclosed between the insulation and the cable sheath, the gas space being electrically screened and divided longitudinally into a no. of sep. spaces.

**Cables.** N. V. Hollandsche Draaden Kabelfabriek. Brit. 401,001, Nov. 6, 1933. Bodies comprising coherent insulating and conducting portions like those described in Brit. 396,891 (C. A. 28, 842) are made of insulating material which is liquid or plastic originally and afterward sets solid, portions being rendered con-

ducting by mixing powd. graphite or metal therewith. Suitable materials are shellac, cellulose ester lacquer, and artificial resins. Comps. contg. binding agents, e. g., resins, pitch, hydrocarbons, and asphalt, fibrous materials, e. g., asbestos, paper, cellulose and wood meal, and fillers, e. g., powd. quartz, kaolin and fluorspar, may be used, the filler being replaced (partly) by conducting materials. Or paper may be impregnated with artificial resin portions of which contain powd. graphite.

**Cables.** James H. Young and H. H. Robertson Co. Brit. 401,401, Nov. 16, 1933. A cable comprising a conductor and insulation has a flame-proof outer covering of dry chlorinated biphenyl and (or) chlorinated polyphenyl in admixt. with resins, waxes or asphalts.

**Cables.** C. H. F. Müller A.-G. Brit. 401,560, Nov. 16, 1933. An elec. cable consists of a flexible body of insulating material, e. g., rubber, having an internal passage with smooth walls having a firmly adherent layer of conducting material, e. g., "Aquadag," and contg. a flexible conductor.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**The Sanitary Water Board.** W. L. Stevenson. *Year-book Dept. Health Pennsylvania* 1931, 117-26; U. S. *Pub. Health Eng. Abstracts* 13, S, 73 (Dec. 2, 1933).—A progress report of the many activities of the State Water Board. C. R. Fellers

**The Kingsbridge and Salcombe Water Board's works.** J. M. Linton Bogle. *Water and Water Eng.* 35, 109-14 (1933); U. S. *Pub. Health Eng. Abstracts* 13, W, 55 (May 20, 1933).—Water is taken from Bala Brook, a tributary of the Avon River, piped  $1\frac{1}{4}$  mile to the filter house, thence flows  $8\frac{1}{2}$  miles to a 750,000-gal. reservoir. The chemicals used in filtering include alum before filtration, lime after filtration to neutralize acidity, and  $\text{Na}_2\text{Al}_2\text{O}_4$  to be used when the water is discolored. C. R. Fellers

**Municipal water supplies of Virginia.** F. H. Fish. Va. Polytech. Inst., Eng. Extension Div. Series *Bull.* No. 29, 35; U. S. *Pub. Health Eng. Abstracts* 13, W, 72 (July 1, 1933).—Descriptive. Mineral analyses of all water supplies in the state are being compiled. C. R. F.

**Public water supplies in North Dakota.** A. L. Bayone. *Trans. N. Dak. Water & Sewage Works Conf.* (1st, 2nd, 3rd and 4th Ann. Meetings) 154-62; U. S. *Pub. Health Eng. Abstracts* 13, W, 71 (July 1, 1933).—Sources, descriptions and characteristics of N. Dak. water supplies are given. C. R. Fellers

**Water-purification plant at Ottumwa, Iowa.** Horace A. Brown. *J. Am. Water Works Assoc.* 26, No. 2, 260-70 (1934).—Des Moines River furnishes the supply, which fluctuates widely. Lime is used to remove carbonate hardness. From an Aeromix the water passes a flocculator, a baffle system and a clarifier. Soda ash is then added to reduce noncarbonate hardness to 10-15 p. p. m. and  $\text{Al}_2(\text{SO}_4)_3$  to bring the  $\text{pH}$  to 9.8. Another baffle system flocculator and clarifier bring the water to the filter house. Here it is recarbonated. The water gets a final treatment with  $\text{NH}_3$  and  $\text{Cl}$  in the suction line of the service pumps. D. K. French

**Cheltenham water supply and its chlorination.** J. S. Pickering. *Water and Water Eng.* 36, 11-13 (1934).—A description of the present and the proposed plant. Alumina and  $\text{Cl}$  treatment is used. W. A. Moore

**New waterworks of the town of Potsdam, near Eiche, Germany.** O. Sprung. *Gas u. Wasserfach* 74, 1052-9 (1931); U. S. *Pub. Health Eng. Abstracts* 13, W, 54 (May 20, 1933).—Underground water contg. Fe and Mn has a hardness of 215 p. p. m. and a  $\text{pH}$  value of 7.9. Equipment is described. Fe and Mn removal are by aeration followed by double filtration. C. R. Fellers

**Investigation of the central water supply of the city of Vienna.** Viktor Gegenbauer. *Wasser* 7, 50-73 (1933).—The city supply is obtained from springs or wells in the mountains and led by 2 conduits to the city. It is un-

4 treated. Total bacteria count and no. of organisms producing fermentation on samples taken at the lower end of the conduits and at taps in the city indicated that no pollution occurred within the city mains. However, pollution occurred at times of high water, i. e., after the melting of snow or heavy rainfall. This was due to the fact that at such times natural filtration was deficient, the contaminated surface water reaching the wells without being filtered by penetration of the upper strata of soil. High turbidity also occurred at such times, so that by rejecting water from such wells as were turbid pollution could be avoided. An automatically recording turbidimeter, through which the water flows continuously and in which the light from a const. source traverses the column of water and falls on a photoelec. cell, is described. Remedial measures included reforestation of barren areas and protection of the water-shed against pollution by man. Statistical treatment of the data obtained is discussed. M. G. Moore

**Deep-well water supply system for the town of Weston.** A. G. Peirson. *Can. Engr.* 64, No. 17, 13-16 (1933); U. S. *Pub. Health Eng. Abstracts* 13, W, 96 (Oct. 7, 1933). The supply from the Huron had to be abandoned because of diminishing supply and poor quality in favor of deep gravel-walled wells. The first wells sunk yielded water contg. 584-1360 p. p. m.  $\text{NaCl}$  which could not be decreased sufficiently by pumping to become potable. Other satisfactory wells were located. The water requires no chem. or phys. treatment. C. R. Fellers

**Chemical properties of the water of some lakes of the Kurgan forest steppe.** A. V. Golovin. *Trav. inst. recherches biol. Perm.* 4, No. 3-4, 61-75 (in English 70-8) (1932).—Waters of 41 lakes in the Kurgan forest steppe of the Ural province were all alk. and differed little in the amt. of dissolved  $\text{O}$  near the surface and near the bottom of the lakes. The waters are higher in alkali ions than in  $\text{Ca}$  and  $\text{Mg}$ , and  $\text{Mg}$  is higher than  $\text{Ca}$ , the concn. range of  $\text{Cl}$  is wide and many of the lakes are low in sulfate and carbonate. Most of the lakes analyzed fall into groups I and III of Palmer's classification (cf. C. A. 5, 3869), two lakes belonged to group II, and some lakes of group III showed a tendency to approach group IV. As the lake passes from its "youth" to "maturity," which corresponds to groups I and III of Palmer, it shows an increase in dry residue, increase of general concn. and of concn. of alkali ions and chloride ions. There is also a decrease in concn. of  $\text{Ca}$  and  $\text{CO}_3$  ions. Tables giving complete analyses of the lakes are included. Rea Mairiel

**Standards of purity as specified in the tri-state treaty.** Thomas Parran, Jr. *Proc. 47th Ann. Meeting Conf. State and Provincial Health Authorities N. America* 175-80; U. S. *Pub. Health Eng. Abstracts* 13, S, 73 (Dec. 2,

1933).—Tidal waters are divided into 2 classes. Class A waters are used primarily for recreational purposes, shell-fish culture and the development of fish life. Class B waters are not expected to be used primarily for recreational purposes, etc. Chem. and biol. standards for each class are set up and aim properly to safeguard the public from a health and sanitation aspect without actually requiring sewage purification beyond actual needs.

C. R. Fellers

Studies of the effect of a small impounding reservoir on stream purification. G. M. Ridenour. *Sewage Works J.* 5, 319-32(1933).—Seasonal studies are compared to show the effect of a small impounding reservoir on the purification of a comparatively heavily polluted stream. These studies show that the biochem.-O-demand reduction through the reservoir amounted to 86.5% in the summer time as against 52.5% in the winter time. The av. detention periods of the pond during those seasons were 2.8 and 3.0 days, resp. Av. reduction in *es. coli* amounted to 76% in the summer time as against 40% during the winter. Coeffs. for rate of deoxygenation and reoxygenation of the pond with respect to Streeter's formulae for deoxygenation of sewage-polluted water under conditions of reoxygenation are detd. Of 13.5 p.p.m. O consumed through the pond in summer, 10.4 p.p.m. was furnished by atm. absorption and photosynthetic processes. This amounted to 466 lb. per day. During the winter season 9.8 p.p.m. was furnished by the above processes, equiv. to 407 lb. per day or 87% of that provided in summer.

E. Hurwitz

Modern water purification. S. Johnsen. *Tek. Ukeblad* 80, *Sanktaer- og Varmeteknikk* 15-17(1933).—A review describing filtering app. of the closed type.

C. A. Rohak

Micro forces in water as applied to the practice of water purification. Julius Wigger and H. Bach. *Wasser* 7, 22-49(1933); cf. *C. A.* 18, 560.—A theoretical (math.) discussion of surface tension and surface energy, including capillary rise, pressure in drops, development of Poiseuille's equation, mol. arrangement in unimol. films, corrosion at surfaces, etc.

M. G. Moore

Sterilization of drinking water by silver-coated sand. S. V. Moiseev. *J. Am. Water Works Assoc.* 26, 217-38(1934).—By a special method 145 different Ag-coated sands were prepd., and the one possessing the greatest microbicidal power and stability was selected. Two exptl. lab. plants are described. As long as the sand remained clean and unpolluted its sterilizing properties were efficient. Conclusions: The oligodynamic action of Ag is stronger with pathogenic forms. It increases the longer the Ag is in the water. A concn. of 0.3% Ag by wt. appeared best.

D. K. French

Water and the chemist. H. Bach. *Wasser* 7, 11-21(1933).—A general discussion of the uses to which water is put.

M. G. Moore

The effect of the decomposition of natural organic contaminating matter on the properties of surface waters. H. Haupt. *Wasser* 7, 138-52(1933).—Lab. studies on the decompn. of leaves of various trees under water are reported with tabular data giving total solids, permanganate consumption,  $pH$ , content of the extn. liquid in coloring matter and tannin, etc. In the case of oak leaves about 4% of the leaf material goes into soln. in 4 weeks. Much more tannin and coloring matter (humic acids) are produced by oak leaves than by beech. The high tannin content and acid character of the extn. liquid delay the beginning of the normal  $CH_4$  fermentation. Lab. expts. on the removal of color and tannin from such exts. by alum show that the usual treatment is not always successful unless the  $pH$  is reduced. In view of the cost of such treatment H. advises that when possible reservoirs be protected from leaf contamination and vegetation be removed from new basins before they are used. Pines are best for forests about reservoirs, oaks are especially objectionable.

M. G. Moore

Production of "distilled water" by electrodesmosis. H. R. Dietzel. *Pharm. Ztg.* 79, 71-2(1934); cf. *C. A.* 26, 2896.—An illustrated exptl. study giving the values

(tabulated) obtained with 8 samples of  $H_2O$  over periods of 35, 27 and 25 days, resp.

W. O. E.

Tastes and odors in the Delaware River. J. Wendell Burger and Stanley Thomas. *J. Am. Water Works Assoc.* 26, 120-7(1934).—The taste is described as earthy-musty, and is more pronounced than the odor. It is attributed to general org. disintegration and is corrected and overcome by prechlorination.

D. K. French

Elimination of taste in water passing through creosoted wood-stave pipe. J. F. Harkom and C. Greaves. *Eng. J.* 14, 515(1931); *U. S. Pub. Health Eng. Abstracts* 13, W, 55(May 20, 1933).—Creosoted pipes should be flushed for 1-1½ months before use. Chlorination forms phenols and unpleasant tastes in creosoted waters. Waters contg. 3-5 p.p.m. of creosote oil were rendered palatable by superchlorination and subsequent dechlorination by  $SO_2$ . The higher the concn. of Cl used, the shorter was the required contact period for superchlorination. The best contact period was 24 hrs. when 2-3 p.p.m. of Cl was used for water contg. 0.5 p.p.m. creosote. The contact period with  $SO_2$  was unimportant. Filtration of the water through activated C was effective in removing the creosote taste.

C. R. Fellers

Activated-carbon treatment. Frank E. Turner and Carl Haynes. *Rept. 8th Mo. Ann. Water Sewerage Conf.* 1932, 24-5; *U. S. Pub. Health Eng. Abstracts* 13, W, 64(June 17, 1933).— $H_2S$  odor was successfully removed by activated C fed at the rate of 0.1 grain per gal. and costing \$1.57 per million gal. at Cameron, Mo. Phenol tastes were effectively removed from the water supply at Moberly, Mo., by activated C.

C. R. Fellers

Results from a small, inexpensive iron-removal plant. E. S. Flannery. *Rept. 8th Ann. Mo. Water Sewerage Conf.* 1932, 33; *U. S. Pub. Health Eng. Abstracts* 13, W, 64(June 17, 1933).—A small plant costing \$1650 consisting of aerators, a settling basin, and a rapid sand back-washing filter effectively freed a ground-water supply contg. 5 p.p.m. of Fe. The capacity is approx. 75 gal. per min.

C. R. Fellers

Prechlorination. Cleo Brown. *Rept. 8th Ann. Mo. Water Sewerage Conf.* 1932, 26; *U. S. Pub. Health Eng. Abstracts* 13, W, 64(June 17, 1933).—Prechlorination saved 0.3 grain per gal. of alum and paid for itself. It also produced a safer and more palatable water, with less color, and saved wash water.

C. R. Fellers

Reasons for and difficulties encountered in the use of ammonia-chlorine in Richmond. Marsden C. Smith. *Va. Polytech. Inst., Eng. Extension Div. Series, Bull.* No. 29; *U. S. Pub. Health Eng. Abstracts* 13, W, 72(July 1, 1933); cf. *C. A.* 28, 2389.—In first operating the Richmond plant,  $NH_3$  was added to the raw water about 2 min. ahead of the Cl. A residual Cl content was soon present over the settling basins and on top of the filters. It was several hrs. before the Cl appeared in the filter effluent and it was accompanied by disagreeable odors and tastes due to unloading the filters. When the filters were sufficiently cleaned after several hrs., the quality of the water improved. Cl and  $NH_3$  were applied in a 3 to 1 ratio.

C. R. Fellers

The detection of nitrite in water. M. Montalti. *Diagnostica tec. lab. (Napoli) Riv. mensile* 4, 488-92(1933).—The Zlataroff (*C. A.* 17, 2028), Vergnoux (*C. A.* 23, 3037) and Ravenna (*Analisi Chimica, C. A.* 16, 2095) reactions for the detection of nitrite have been compared. The sensitivities found in g. per l. were, resp.:  $5 \times 10^{-6}$ ,  $5 \times 10^{-4}$  and  $5 \times 10^{-7}$ . The last method is therefore to be preferred. The reagent is prepd. by mixing solns. A and B. Addn. of 5 drops of the reagent to 100 cc. of sample gives a rose coloration in dil. and an orange coloration in more concd. ( $5 \times 10^{-3}$  g. per l.) solns. of nitrite. Soln. A = 0.5 g. sulfanilic acid in 150 cc. 10% AcOH. Soln. B 0.2 g.  $\alpha$ -naphthylamine boiled in 150 cc. 10% AcOH followed by the addn. of 20 cc.  $H_2O$ .

L. W. B.

Water softening for municipalities. C. S. Childs. *Trans. N. Dak. Water & Sewerage Works Conf.* (1st, 2nd, 3rd and 4th Ann. Meetings) 148-53; *U. S. Pub. Health Eng. Abstracts* 13, W, 73(July 1, 1933).—Water softening is economically practicable and justifiable in communities

having hard waters. For every 80 p. p. m. of hardness removed, there is an approx. saving of \$5.00 per capita per year, divided equally between the user and the municipality. C. R. Fellers

**Columbus softens her water supply.** L. F. Warrick. *State Board of Health Bull. Wis.* 5, No. 14, 7(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 67(June 24, 1933).—High mineral and Fe content made softening an economical measure. Fe and Mn in water not only discolor the water, but stain clothes and fixtures, and impair water mains. An off-flavor is also imparted to the water. Flocculation of the Fe adds 1 more safeguard to the safety of the supply. C. R. Fellers

**Water softening at Quincy, Illinois.** W. R. Gelston, Jr. *J. Am. Water Works Assoc.* 26, 70-6(1934).—The hardness averages about 150 p. p. m. subject to seasonal variation. Softening aims to reduce this to 70 p. p. m. total hardness, 40 p. p. m. as carbonate and 30 p. p. m. as noncarbonate hardness. Aluminum or iron sulfate is first added, then after a short settling  $\text{CaO}$ , as the water goes to the first paddle mixers, then Na aluminate and returned sludge. A Dorr clarifier removes about 95% of the turbidity. After this the water is recarbonated and finally chlorinated. The cost averages between \$8.00 and \$9.00 per million gallons. D. K. French

**Softening reactions with barium carbonate or hydroxide.** J. Leick. *Wasser* 7, 197-205(1933).—Tables and graphs report data from a no. of expts. on the treatment of both natural and synthetic waters with  $\text{BaCO}_3$  or  $\text{Ba(OH)}_2$ . This method has the advantage of removing sulfate hardness without increasing the salt content of the water, as the sulfate as well as the Ca or Mg is pptd. The reaction is more complete at higher temps. The presence of  $\text{CO}_2$  favors the reaction, probably by the formation of  $\text{Ba(HCO}_3)_2$  which reacts more readily than the normal salt. Treatment with  $\text{BaCO}_3$  may increase the carbonate hardness, as the sulfate is pptd. because of the formation of  $\text{Ca(HCO}_3)_2$ . When used in conjunction with soda-lime or phosphate treatment, the baryta treatment must be first before the  $\text{CO}_2$  is removed. M. G. Moore

**Softening plant reduces soap usage.** E. S. Cary. *Water Works Eng.* 87, 65 6(1934). W. A. Moore

**The manufacture of artificial zeolites. The control of zeolite water softeners.** Paul G. Bird. *Iowa State Coll. J. Sci.* 8, 183-5(1933).—Optimum proportions for the artificial zeolite were  $\text{SiO}_2:\text{Al}_2\text{O}_3:2.2:1$ . The max. capacity was obtained when a gel was made to contain about 1.25 g. mols of  $\text{Al}_2\text{O}_3$  per l. The gel was filter-pressed, frozen at 21°F. for 48 hrs., dried at room temp. and tested for capacity. Freezing increased the capacity, as did the addn. of small amts. of  $\text{Na}_2\text{CO}_3$ , agar, casein or NaOH. Addn. of small amts. of NaCl,  $\text{Na}_3\text{PO}_4$  or  $\text{Na}_2\text{B}_4\text{O}_7$  or of large amts. of gluc, casein or  $\text{Na}_2\text{CO}_3$  cause a decrease in capacity. Automatic control of the regeneration of zeolite softeners could be effected by making use of the greater cond. of the softened water or of a light-sensitive control activated by the lines which appear in hard water but not in softened waters. F. E. B.

**Analytical problems connected with boiler waters.** G. Ammer and H. Schmitz. *Wasser* 7, 185-96(1933).—Volumetric methods for phosphate detn. are reviewed. A no. of attempts to det. phosphate and sulfate in the presence of each other are reported. Pptn. of phosphate with Ag ion, removal of excess Ag with Cl, and subsequent pptn. of sulfate with  $\text{BaCl}_2$  is not satisfactory, because of the marked adsorption of Ba ion by AgCl. Even after filtration, enough AgCl remains in colloidal condition to adsorb an appreciable quantity of Ba and thus introduce a large error in the back titration with K palmitate. Blacher's method for the detn. of sulfate (*C. A.* 3, 2335-6; 4, 2965) can be simplified for field and control work by omitting the heating to drive off  $\text{CO}_2$  and adding 2 cc. 0.1 N HCl and shaking instead. The results check the original method to within 3%. The following method is recommended as sufficiently accurate for boiler-water control for the detn. of phosphate and sulfate in the same sample (all reagents are 0.1 N): After detg. the alky. of the sample against both phenolphthalein and methyl

orange, add 10 cc.  $\text{CaCl}_2$  soln. and 1 cc. excess HCl, and heat the flask or shake until the  $\text{CO}_2$  is expelled. Just neutralize against phenolphthalein with NaOH, heat 2 min. longer to ppt. all the phosphate, cool and add a drop of HCl to neutralize. Titrate with K palmitate to a faint pink. This pts. the excess Ca. Add  $\text{BaCl}_2$  soln until the color disappears, and 2 cc. in excess. Brief heating ppts. the  $\text{BaSO}_4$  quantitatively. Back-titrate the excess Ba with K palmitate, as in the method of Blacher.

Data given indicate that the error in sulfate does not exceed 4%, that in phosphate sometimes reaching 10-15%. A similar method for the detn. of sulfate alone with soap soln. is given, with a correction curve. M. G. Moore

**The historical development of the treatment of boiler feed waters.** A. Splittgerber. *Wasser* 7, 156 74(1933), cf. *C. A.* 27, 3271.—A historical review, with 45 references, including mention of publications of recently organized societies. M. G. Moore

**The solution of silicic acid by water and its removal.** Hans A. Reimers. *Wasser* 7, 175-84(1933).—Equations show the decompn. of adularia ( $\text{KAlSi}_3\text{O}_8$ ) in nature by  $\text{CO}_2$ -contg. water with the ultimate formation of  $\text{Al}_2\text{O}_3$  and other products. The action of alkali carbonates on these intermediate products yields  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$ , which may remain in water as colloids for varying periods. Phosphate treatment does not remove silicates satisfactorily from boiler waters. Water (170 l.) previously softened with lime and contg. 6 mg./l.  $\text{SiO}_2$  was treated with 23.5 cc. of 20%  $\text{ZnSO}_4$  soln. with stirring. The flocc settled faster than an alum flocc, leaving the water clear and free from  $\text{SiO}_2$ . In a soda-lime treatment plant the Zn salt may be added along with these reagents. CaO or other base must be present. M. G. Moore

**Survey of the flora and fauna of the water supplies of the Madras Presidency.** S. A. Rafay. *Indian J. Med Research* 20, 1083-1100(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 104(Dec. 2, 1933).—The water supplies are subject to dense and rapid algal growths. Exptl work showed the amt. of  $\text{CuSO}_4$  required to destroy the several species. By treating one of the principal lakes with 0.3 p. p. m. of  $\text{CuSO}_4$ , the Cl requirement for purification decreased from 2 to 0.6 p. p. m. Extensive data are tabulated. C. R. Fellers

**Algal growths and water supply.** J. W. Husband. *Water and Water Eng.* 35, 765-80(1933).—By treating the water with 2-5 lb. of  $\text{KMnO}_4$  per million gal. growth of algae was prevented. W. A. Moore

**The removal of bacteria from water by the surface action of crystalline metals.** van der Leeden. *Wasser* 7, 90 103(1933).—The views of various authors regarding the mechanism of the oligodynamic action of pptd. Ag are briefly reviewed. Under the same conditions this material is as effective as catadyn Ag for water sterilization. The action of pptd. Cu ("Zement Cu") on water and sewage was investigated. Contact of dairy sewage with 10 g./l of this material reduced the bacterial count from  $15 \times 10^6$  per cc. to  $7 \times 10^4$  in 5 min. and to  $2.4 \times 10^4$  in 1 hr. Contact with 25 g./l. reduced a count of  $13.6 \times 10^6$  to  $2 \times 10^4$  in 30 min. Larger amts. of Cu gave no better results. Expts. with this type of sewage indicated that the use of a filter of pptd. Cu following chlorination still further reduced the bacterial count and reduced the residual Cl to a negligible amt. Filtration of domestic sewage through pptd. Cu alone indicated that the bactericidal action was not reliable but appeared to vary from day to day. Expts. on a com. scale showed that such a filter reduced a residual Cl content of 6-7 p. p. m. in domestic sewage to 1 or less p. p. m. Contrary data are presented from different plants on the use of pptd. Cu to remove slight amts. of residual Cl from drinking waters. M. G. Moore

**Bacterial removal by means of the electrocatadyn process.** G. A. Krause. *Wasser* 7, 74-89(1933).—The advantages of the electrocatadyn process over the static catadyn sand process include: (1) The cost is lower, as the cost of prepg. the Ag-carrying sand or other material is greater than the cost of the Ag used; (2) the electro process can be satisfactorily used with turbid waters; (3) the concn of Ag in the water can be readily controlled; (4) the process

can be practically automatic, requiring a min. of attention; and (5) but little plant space is required. The voltage used must be below the decompn. potential of water, not above 1.6 v. Aside from the size of the plant, current consumption depends on: (1) the elec. cond. of the particular water, and hence the mineral content, (2) the current efficiency for the particular water (about 50% for drinking waters), (3) the  $pH$ , neutral or alk. waters accelerating the sterilizing action, (4) temp., higher temp. being favorable, and (5) the degree of pollution of the water treated, the degree of bactericidal power desired, and the chances of adsorption of Ag by pipes, etc. The process is well adapted to the treatment of small amts. of water. Examples are given of its use in treating drinking water, bath waters (cf. *C. A.* 27, 4009), water for ice manuf., and its use on ships and in breweries. The sensitivity of organisms used in brewing to catadyn water makes it very satisfactory as a wash water in this industry. Five cuts and 36 references.

M. G. Moore  
Destruction of carbohydrates and organic acids by bacteria from a trickling filter. Max Levine and J. H. Watkins. *La. Eng. Expt. Sta., Bull.* No. 110, 54 pp. (1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 39 (June 10, 1933).—The nature and type of bacteria capable of destroying lactic acid are described and discussed. A small building-lath filter, receiving *creamery wastes*, was the source from which 18 species of bacteria, falling into 9 genera, were isolated. Two of the species, *Vibrio carcharias* and *Lactobacillus acidovorans*, are new. Several species were capable of producing org. acids from carbohydrates and oxidizing these acid products. Other species utilized org. acids only without attacking carbohydrates. A reaction of  $pH$  5.0 inhibited the growth of nearly all these organisms. Such inhibiting reactions occur in the upper part of a trickling filter receiving milk wastes contg. 0.5–0.6% lactose. AcOH was readily attacked by 14 species of bacteria, but only 2 attacked chloroacetic acid. Cf. *C. A.* 26, 5482.

C. R. Fellers  
Operation of Brantford filtration plant. F. P. Adams. *Can. Engr.* 64, No. 13, 66–7 (1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 104 (Dec. 2, 1933); cf. *C. A.* 27, 4406.

C. R. Fellers  
A critical survey of the problems of the reconditioning of water mains and its proved economic solution. A. Gossley. *Water and Water Eng.* 36, 24–8 (1934).—The causes of corrosion in water mains and the various methods used in reconditioning them are discussed. The electrodeposition of bitumen from an aq. soln. is recommended. The pure bitumen deposited on the walls of the pipes is tasteless, odorless, and adheres tightly to the pipes. It is not affected by traffic vibrations. The mains can be reconditioned in 6 hrs. by this method. W. A. M.

F. C. Gaiser, *Wasser* 7, 104–16 (1933).—Ten tables present data from a no. of lab. expts. on the changes in concns. of salts,  $CO_2$ , etc., in both standing and circulating water with time, the changes being due to evapn. or contact with Fe, wood, marble, lime, etc. Conc. changes were greater in running water. The original lime content of the natural water rather than the  $CO_2$  content is probably the important factor in salt pptn. and hence the formation of tufas in nature.  $CO_2$  may be removed from many natural waters without the pptn. of lime, while marble sometimes acts as a seeding agent for its pptn.

M. G. Moore  
Economics of corrective treatment for cold-water corrosion—application in public water supplies. Edward S. Hopkins, James W. Armstrong and John R. Baylis. *Ind. Eng. Chem.* 26, 250–4 (1934).—The effects of lime treatment on the cost of steam generation, soap consumption, renewal of pipes, and industrial water softening are discussed. Comparative costs of water softening by means of lime, caustic soda and soda ash are given. W. A. M.

E. A. Anderson, C. E. Reinhard and W. D. Hammel. *J. Am. Water Works Assoc.* 26, 49–60 (1934).—Tests were made with galvanized iron as the source of zinc, in distd. water with and without Cl. The addn. of Cl in amounts up to 5 p. p. m. reduced the rate of corrosion when compared to

that in distd. water. In distd. water in 7 days enough Zn went into soln. to render the water unfit for drinking. The max. safe concn. of Zn in drinking water is 40 mg. per liter. Fifteen references.

Sewage disposal at Johannesburg, S. Africa. E. J. Hamlin and H. Wilson. *Surveyor* 83, 203–4 (1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 27 (Apr. 22, 1933).—The plants and equipment are described.

C. R. Fellers  
Results of investigations in the operation of the municipal sewage-disposal plant of north Nürnberg. Eduard Merkel. *Wasser* 7, 206–32 (1933).—The plant, serving a population of 193,000, consists essentially of 4 settling basins, each of 1000 cu. m. capacity and supplied with 2 conical sludge-collecting pits at the outlet end; 2 groups of 4 sludge-digestion units, each of 750 cu. m. capacity; and sludge-drying beds of 8000 sq. m. area. Structural features and operation are given in detail. The plant handles an av. of 720 l. of sewage per sec., of which about 120 l. is surface water from a small stream. Mech.

clarification of 95% or more is obtained. 200 cu. m./day of fresh sludge is collected. The dried sludge (6% of the wt. of the fresh) contains about 18% sand, 12-5% raw fat and 62% other org. matter. Gas collected from the digestion tanks averages 3210 cu. m. daily with a heat value of 54-5500 cal./cu. m. During the winter the digesting sludge is heated. Tables show the character of entering sewage, effluent and sludge, as well as conditions in the small stream (flow of 8-10 cu. m./sec.) receiving the effluent.

M. G. Moore

Approach to city saved by sewage-works design, construction and operation of Saranac Lake Plant. Henry N. Taylor. *Sewage Works J.* 5, 278-88(1933).—The diversion of raw sewage from the Saranac River to the new Saranac Lake plant removed objectionable and unsightly river water conditions. The plant and operation are described.

One-man sewage-plant operation. Lewis D. Suhr. *Munic. Sanit.* 4, No. 3, 80-3(1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 37 (May 20, 1933).—A flow sheet and routine operation of the Woodstock, Ill., plant is described.

C. R. Fullers

Shallow clarification basins (as separate settling units) for sewage treatment considered from the chemical standpoint. W. Husmann. *Wasser* 7, 233-8(1933).—The relative merits of the Imhoff tank (1) and sep. settling basins and digesting units (2) are discussed from the chem. and hygienic standpoints, without regard to factors of economic and engineering importance. The direct connection between digesting sludge and fresh sewage in (1) permits septic sludge at times to be stirred up and to contaminate the clarified effluent, this sometimes producing an effluent of poorer quality than the influent. The sudden entrance of large amts. of solid matter or of cold water of higher d. may produce these conditions by rapidly sinking to the bottom and thus causing the sludge to rise. The argument that in (2) the sewage being clarified is too long in contact with the settled sludge is not valid in the case of modern basins with continuous mechanical removal of settled sludge. In this type of shallow basin aerobic conditions prevail. However, if sludge removal is not quant., anaerobic conditions may develop in the old sludge and thus produce objectionable conditions in the clarified effluent.

M. G. Moore

Experiences with the treatment of sewage from food industries. G. Bode. *Wasser* 7, 259-71(1933).—Sewage from factories using potatoes in the production of alc., etc., can be treated without difficulty at the city disposal plant. Wastes from factories using the molasses by-product from sugar factories as raw material require special treatment. These liquors are often evapd. at the plant, the residue is burned and the K salts are extd. Two cases are considered where evapn. was not possible. The use of trickling units was not advisable because of the sensitiveness of this process to changes in the concn. of the sewage, the presence of disinfectants from wash waters, etc. In order to prevent the wastes from becoming foul in the stream receiving them care was taken to maintain aerobic conditions. The water leaving the plant at 90° was allowed to fall in fine streams 25 cm. into the 1st of 3 basins, and then was allowed to overflow into the 2nd basin while the temp. dropped to 30°. Tables reporting total solids, N, KMnO<sub>4</sub> consumption, etc., both at the plant and along the small stream receiving the effluent indicate satisfactory operation.

M. G. Moore

The treatment of spent gas liquor in admixture with sewage at the sewage purification works at Cheltenham. 4th Report of the Liquor Effluents Subcommittee. F. R. O'Shaughnessy. *Trans. Inst. Gas Engrs.* 79, 422-30 (1929-30).—See *C. A.* 24, 4108. Alden H. Emery

Soundness tests for sewage filter media. H. G. Payrow. *Civil Eng.* 4, 90-2(1934).—Resistance to the strain caused by recrystn. of Na<sub>2</sub>SO<sub>4</sub> repeatedly taken up by limestones and slags is used as a test of resistance to freezing and thawing.

Ann Nicholson Hird

Explosions in sewers. J. J. Jessup. *Munic. Sanit.* 3, 197(1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 43(June 17, 1933).—Stagnant gases from leaky gas mains and gaso-

line vapors are the most common cause of sewer explosions in Los Angeles. Gasoline should not be disposed of in sewers.

C. R. Fullers

Explosion and health hazards in sewage-works operation. G. W. Jones. *Sewage Works J.* 5, 289-301(1933).—The 2 definite hazards involved in the handling, disposal and utilization of sewage gas are (a) explosion hazard, (b) health hazard due to presence of toxic constituents and low O content of gas.

E. Hurwitz

Copper and biological sewage treatment. F. Sierp and F. Fränsemeier. *Wasser* 7, 239-58(1933).—Lab expts. on domestic sewage are reported. The hydrolytic acidity of Cu salts is neutralized in whole or in part by the carbonates or proteins present in sewage. The Cu is pptd. as sulfide if H<sub>2</sub>S is present. Samples of fresh sludge were treated with varying amts. of CuSO<sub>4</sub> and seeded with old sludge to which no Cu had been added. The effect of the Cu varied with the individual type of sludge, but in general the presence of up to 0.5-1% Cu (on the dry wt. of sludge) produced no noticeable decrease in 8-day or 184-day gas production. Larger amts. of Cu decrease gas production markedly and even cause acid fermentation. In such cases a drop occurs in the 8-day curve at 0.5-1.0%, in the 184-day curve at 1.5% Cu. Curves showing O<sub>2</sub> consumed against time for the digestion of domestic sewage—not sludge—showed that Cu in concns. up to 5 mg./l. decreased the values of O<sub>2</sub> consumed slightly but did not alter the general shape of the curve. Amts. greater than 10 mg./l. did alter the curve, the initial rise occurring about 24 hrs. later. When consumed O<sub>2</sub> is plotted against Cu concn. a sharp break occurs in the curve at about 20 mg./l., the curve being practically horizontal to the axis of Cu concn. beyond this point. A curve of total no. of bacteria against Cu shows a sharp break at the same point, but contrary to expectation, the total no. of bacteria increases with Cu concn., although the no. of *Es. coli* decreases. Increased Cu content delays the time at which nitrification begins. In normal sewage the lower the initial pH, the lower is the 5-day biochem. O demand. The effect is more pronounced when Cu ion (5 mg./l.) is present. Lab. expts. on the activated-sludge process indicated that domestic sewage undergoes normal digestion in the presence of 1 mg./l. of Cu ion. Three mg./l. retarded the process appreciably and 20 mg./l. fed intermittently was distinctly detrimental. Of the Cu added 80% was found in the dried sludge, 20% having gone off in the effluent.

M. G. Moore

Regulations on use of sewage for irrigating crops. Anon. Calif. Dept. Pub. Health, *Special Bull.* No. 59, 3 pp.(May 27, 1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 64(Sept. 30, 1933).—The use of raw untreated sewage for fertilizing or irrigating growing crops is prohibited. Effluents from septic, Imhoff or settling tanks may be used for watering or fertilizing only such crops as nursery stock, cotton, hay, rice, alfalfa and fodder corn. Milk cows will not be pastured on land wet with untreated sewage.

C. R. Fullers

Factors affecting the efficiency of sewage sedimentation. G. J. Schroepfer. *Sewage Works J.* 5, 209-32(1933). Sedimentation of sewage is influenced by 4 factors: (a) characteristics of liquid, (b) characteristics of the solids, (c) phys. characteristics of the design and (d) miscellaneous effects. Under (a) it is shown that viscosity changes in the liquid have a more important effect on the hydraulic values of the particles than do changes in sp. gr. of the water due to temp. variations. Under (b) the characteristics of the solids, their size, sp. gr., concn. and shape, influence sedimentation of sewage somewhat in the order named. Flocculation and coagulation exert variable effects. (c) Various factors affecting sedimentation under characteristics of design might be placed in the following order according to importance: detention period, inlet and outlet effects, depth and ratio of length to depth, velocity of flow, shape of tank and bottom surface area. Mechanism effects exert either a negligible or a variable influence, depending on the design and operation. (d) Miscellaneous features such as currents, eddies and biol. effects exert some influence. The influence of elec. effects

and bottom reaction appears to be negligible in sewage sedimentation.

**Additional comments on Fair and Moore's article on "Heat and energy relations in the digestion of sewage solids."** D. Althausen, C. S. Boruff, A. M. Buswell and G. E. Symons. *Sewage Works J.* 5, 233-5(1933); cf. *C. A.* 27, 2510.—Excessive gas yields per g. of volatile matter digested are probably due to error in detg. the total solids and volatile matter content of the raw and digested sludges rather than in measurements of the gases produced. Evidence is also given that all of the data used in Fair and Moore's math. considerations are based on batch expts. which do not represent the true course of digestion of materials as observed in practice. E. H.

**Mechanism of the activated-sludge process.** C. Lumb. *Surveyor* 83, 229-30(1933); *U. S. Pub. Health Eng. Abstracts* 13, S, 27-8(Apr. 22, 1933).—The removal of colloidal matter from sewage by activated-sludge treatment is discussed. The explanation of the mechanism of the clarification stage of the activated-sludge process involves physicochem., enzymic, biol. and biochem. phenomena.

**Chemical treatment of sludge to facilitate disposal.** Charles C. Agar. *Sewage Works J.* 5, 270-7(1933).—A résumé of satisfactory experiences showing the value of chemicals in making possible economical and convenient methods of conditioning sludge for disposal. Among the chemicals most frequently used are lime, chloride of lime, alum, chlorinated copperas and  $\text{FeCl}_3$ . E. H.

**Prefiltration treatment of sewage sludge.** F. W. Mohlman and G. P. Edwards. *Ind. Eng. Chem.* 26, 226-30(1934).—Numerous filter aids, both chem. and phys., were tested. It was found that digested sludge required more  $\text{FeCl}_3$  than activated.  $\text{Na}_2\text{Cr}_2\text{O}_7$  added up to 1% reduced the amt. of  $\text{FeCl}_3$  required and prevented the loss of ferrous Fe in the filtrate. A smaller amt. of  $\text{FeCl}_3$  is required if lime is added after the  $\text{FeCl}_3$  treatment to raise the  $\text{pH}$  to 9 or higher.  $\text{FeCl}_3$ ,  $\text{NaCl}$  and  $\text{FeSO}_4$  plus lime were found to be of no value. Paper pulp when used in amts. equal to 50% of the wt. of dry sludge aided filtration. Preheating of fresh sludge from 22.2 to 32.2 before  $\text{FeCl}_3$  treatment improved filtration. W. A. Moore

**The disposal of surplus activated sludge.** H. D. Bell. *Munic. Eng. Sanit. Record* 92, 745-7(1933); cf. *C. A.* 27, 2234.—An outline is given of experience with a plant at Barnsley based on the discovery that it is possible to sep. up to 65% of the supernatant liquor from activated sludge by mixing it with an inert material with a rough surfaced contour such as sand. A. W. Furbank

**Laboratory experiments on the thermophilic digestion of sewage sludge.** H. Bach. *Wasser* 7, 289-310(1933).—The work of Rudolfs and Heukelejian (cf. *C. A.* 25, 1928) is briefly reviewed and checked. The "thermophilic" sludge used for seeding was prepd. by incubating fresh domestic sludge in a medium favoring the development of  $\text{CH}_4$ -producing bacteria (5 g.  $\text{Ca}(\text{OAc})_2$ , 0.5 g.  $\text{NH}_4\text{Cl}$ , 0.25 g.  $(\text{NH}_4)_2\text{HPO}_4$  and distd. water to 500 g.) at 48° for 3 weeks. Three flasks, each contg. 500 g. of fresh sludge, were incubated at 50°. A was seeded with 25 cc. of thermophilic sludge, B with 25 cc. of Imhoff tank sludge, and 25 cc. of water was added to C. Gas production in A began immediately and reached 10.8 l. after 30 days. In B gas began to be appreciably evolved after 10 days and reached 8.65 l. after 48 days. Gas production did not begin in C until after it had ceased in A and B (55 days) and reached 35.18 l. after 118 days. From the fact that the wt. of sludge decompd. in C lay between the wts. for A and B, B. concludes that the gas produced in C was largely  $\text{H}_2$ . Three flasks, each contg. 800 g. of equal parts of thermophilic and fresh sludge, were incubated at 50°, 25 g. of fresh sludge being added to each daily. An av. of 21.9 l. of gas was produced in 47 days, 595 cc. per g. of org. matter decompd. or about 100 cc. per g. of added org. matter. A similar expt. on continuous digestion indicated that a vol. of less than 500 cc. of the digesting sludge mixt. was sufficient to decompose 1 g. of org. matter (dry wt.) daily, while with mesophilic digestion 1 l. is required. Advantages of the thermophilic process would be speed of

digestion, large amt. of gas produced, and saving in plant space and hence in construction cost. However, the sludge is more alk. and the odor more objectionable than that of sludge produced at lower temps. It does not drain or filter readily, the org. matter seeming to remain in colloidal condition. No satisfactory method of settling this was found. Three cases of the use of thermophilic digestion in plants are briefly reviewed. M. G. Moore

**Treatment of sewage sludge by bacterial digestion.** Herbert C. Whitehead and Francis R. O'Shaughnessy. *Proc. Inst. Civil Engrs.* (London) 233, 38-135(1931). See *C. A.* 27, 1692. Ann Nicholson Hird

**Water-pollution research.** A. Parker. *Munic. Eng. Sanit. Record* 92, 888-9(1933).—The solvent action of many natural waters on lead service pipes, with resulting contamination, is briefly discussed. A. W. Furbank

**Water from coke-chemical plants.** P. I. Kotliarov. *Coke and Chem.* (U. S. S. R.) 1932, No. 12, 13-21.—Treatment of water discharged from coke and coke by-products plants in the European and U. S. practice is described. James Sorrel

**The effect of precipitants on textile waste liquors.** H. P. Chrisco, A. McLaren White and H. G. Baity. *Sewage Works J.* 5, 674-84(1933).—Chem. treatment of the waste liquors is necessary before discharge into the stream and factors affecting exact treatment are: (1) use of stream, (2) diln. factor afforded, (3) biochem. O demand, (4) acidity or alk., (5) color, (6) odor and (7) suspended solids. Tables and details of exptl. work on 29 different textile wastes are given. For each waste coagulation tests were run with varying amts. of different reagents. The  $\text{pH}$  and the color were measured for each waste before and after treatment. Color detn. was made by comparison with Pt-Co standards. Reagents used in this work were alum, lime, copperas,  $\text{CaCl}_2$ ,  $\text{FeCl}_3$ ,  $\text{H}_2\text{SO}_4$  or mixts. of these. The textile wastes were classified under the following types: (1) indigo wastes, (2) S wastes, (3) processing wastes, (4) miscellaneous dye wastes. In general it seemed that copperas and lime together formed the most satisfactory treating material for color removal. E. H. Hurwitz

**Water-borne typhoid fever in Chamberlain, S. D.** W. W. Towne. *J. Am. Water Works Assoc.* 26, 99-110(1934).—Temporary discontinuance of the sedimentation basin due to freezing is considered as a possible cause of the epidemic, permitting infection of the distribution system. Milk and food supplies were not probable sources. D. K. French

**Twelve months' records of mosquito breeding in Telok Anson with special reference to hydrogen-ion concentration.** A. G. Badenoch. *Malayan Med. J.* 7, No. 3, 82-7, 90(1932); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 10(June 24, 1933).—Colorimetric detn. of natural waters of this region show a  $\text{pH}$  of 4-8.5. Common species of *Anopheles* and *Culex* were found breeding throughout this range. Neutral and slightly alk. waters favored *Anopheles* in preference to acid waters. C. R. F.

**Respiration of mosquito larvae and pupae and the effect upon them of petroleum, shade and dirty water.** L. Kalandadse. *Arch. Schiffs-Tropen-Hyg.* 37, 88-103(1933); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 10(June 24, 1933).—Larvae of *Culex*, *Stegomyia* and *Anopheles* can survive submergence for several hrs., the time of survival of *Stegomyia* being greatest. Petroleum is considered to be a contact poison acting through the tracheae. Horse manure pollution discouraged *Anopheles* breeding. C. R. Fellers

**Presence of *Anopheles* larvae in the salt waters of Tunisia Sahel.** Georges Villain. *Riv. malarial.* 11, 346-52(1932); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 23(Oct. 7, 1933).—Fourth stage *Anopheles* *egyptii* reared in fresh water and transferred to  $\text{NaCl}$  soln. at 24° were unaffected by concns. not exceeding 0.9%. A 1.1% soln. was fatal in 4-7 days. Sea water was less lethal than  $\text{NaCl}$ , 1.5% sea water having the same toxic effect as 1.2%  $\text{NaCl}$  soln. *A. multicolor* was reared in salt water which was 20% higher than sea water in salt concn. C. R. Fellers

**Results of biological and chemical investigations on the effect on fish of waste waters containing potash.** G. Ebeling. *Wasser* 7, 272-88(1933).—About 25 individual lab. expts. are reported on the effect of mill tailings and wash waters from kieserite ( $MgSO_4 \cdot H_2O$ ) on fresh-water fish and lower animals which serve as their food. Similar expts. with K, Mg or Na salts alone showed that the poisoning action of these wastes was due first to the specific action of K ion, second to Mg, and not to osmotic effects. The presence of Ca ion tends to annul the poisoning action of K. A study of both biol. and chem. conditions in a stream receiving such wastes is reported. Bibliography is given. M. G. Moore

**Destruction of a house-infesting tick, *Liponyssus nagoyoi*.** Saburo Mitsuohori. *J. Pub. Health Assoc. Japan* 8, No. 11, 14(1932); *U. S. Pub. Health Eng. Abstracts* 13, P, 3(June 3, 1933).—This small tick bites men and animals and is able to transmit plague. Volatile chemicals, except  $C_{10}H_8$  and camphor, were effective in destroying the ticks. The recommended contact chemicals are  $CCl_4$ ,  $CHCl_3$ ,  $C_6H_6$  and chloropicrin. C. R. Fellers

**Chlorinating an open bathing beach.** Leonard M. Board. *Munic. Sanit.* 3, 194(1932); *U. S. Pub. Health Eng. Abstracts* 13, Sw, 6(June 17, 1933).—*Es. coli* at a fresh water bathing beach was effectively controlled by the application daily of HTH powder (a Cl compd.) to the surface of the water. The residual Cl never exceeded 0.1 p. p. m. All gas-forming bacteria were not destroyed. C. R. Fellers

**New public baths in Copenhagen sports ground.** A. Hüttemeier. *Ingeniøren* 40, 252; *U. S. Pub. Health Eng. Abstracts* 13, Sw, 7(June 24, 1933).—The tank holding 220,000 gal. and maintained at a temp. of 22° is filled from the city water supply, and the water is recirculated every 5½ hrs. It is purified by mech. filtration at the rate of 65 gal. per min. and by chlorination at the rate of 0.2 p. p. m. of liquid Cl. Aeration is by compressed air. Sea salt, 1%, is added. C. R. Fellers

**Taste and odor control with activated carbon.** Henry Wiesner, Jr. Proc. 8th Ann. Conference Water Purification, W. Va. Univ. Tech. Bull. No. 6, 42 3(1933).—Better taste and odor removal was obtained with smaller dosages of activated C by introducing it into the water just before filtration than by adding it with the coagulants. G. L. K.

**Activity of nonpathogenic bacteria utilizing mineral matter in the thermal water of Aix-les-Bains and Aix-Burtscheid (Schloemer) 11C.** App. for removing sludge from tanks used for sewage treatment (U. S. pat. 1,947,429) 1. App. for controlling the admixt. of gases and liquids as in treating water with Cl (U. S. pat. 1,945,757) 1.

**Water Softening and its Control.** London: Imperial Chem. Industries, Ltd. Reviewed in *Water & Water Eng.* 36, 30(1934).

**Water purification.** Ralph A. Stevenson (to Great Western Electro-Chemical Co.). U. S. 1,946,818, Feb. 13. Sludge removed from material such as in water or sewage purification is separately chlorinated and the chlorinated sludge is then used to effect pptn. of undesirable suspended matter.

**Apparatus suitable for filtering water.** Marcel Lamort (to Établissements E. & M. Lamort Fils). U. S. 1,945,491, Jan. 30.

**Apparatus suitable for filtering water, etc.** Edmund von Maltitz. U. S. 1,945,839, Feb. 6. Structural and mech. details.

**Apparatus suitable for filtering cistern water.** Gregory T. Hiatt. U. S. 1,946,163, Feb. 6.

**Regeneration of manganese filters during operation.** Dénes Molnár. Hung. 107,175, Sep. 1, 1933. Mn filters can be regenerated in works where excess Cl is added to the water before the Mn filter and excess Cl is removed by active charcoal or thiosulfate after filtration, by increasing the Cl addn. and making the water slightly alk. The Cl-free water is then aerated to remove its aggressivity.

**Apparatus for introducing a chemical into water in proportion to its flow.** Compagnie pour la fabrication des compteurs et matériel d'usines à gaz. Fr. 756,828, Dec. 15, 1933.

**Proportionate feeding of fluids such as water-treating reagents.** Reginald M. Banks, John H. Banks and William W. Burritt. U. S. 1,946,474, Feb. 13. Various details of app. and operation are described.

**Apparatus for carbonating water.** John R. Manley (to Manley Automatic Co.). U. S. 1,945,489, Jan. 30. Structural features.

**Softening water.** Hall Laboratories Inc. Fr. 756,761, Dec. 15, 1933. Water contg. Ca and Mg compds. is softened by adding thereto an alkali metaphosphate, preferably in amt. of at least 4 gram-mols. of  $NaPO_3$  for 1 gram-mol. of Ca compd. in the water. The  $NaPO_3$  is preferably sold mixed with an alk. reagent.

**Softening and degassing boiler water.** Chemische Fabrik Budenheim A.-G. (Guido Hedrich, inventor). Ger. 589,963, Dec. 19, 1933 (Cl. 85b. 1.01). The water is softened and degassed by adding  $Fe(H_2PO_4)_2$  and alkali or alkali phosphate.

**Base-exchange water-softening apparatus.** The Permutit Co. Brit. 400,762, Nov. 2, 1933.

**Base-exchange water-softening apparatus.** Wm. Bobb & Co., Ltd., and Charles Wm. Gidlow-Jackson. Brit. 401,025, Nov. 9, 1933.

**Base-exchanging substances.** Aktiebolaget Filtrum. Brit. 401,235, Nov. 9, 1933. The process of Brit. 395,185 (C. A. 28, 240) is modified by adding the neutral salt, e. g.,  $CaCl_2$ , in a solid powd. or other finely divided state to the mass of base-exchanging clay.

**Gel production from solid reagents.** Wm. Vaughan (to Permutit Co.). U. S. 1,945,838, Feb. 6. In forming a gel such as a water-softening zeolite gel, reagents such as Na silicate and Na aluminate are mixed in dry powd. form, the dry mixt. is moistened with water, the moist mixt. is allowed to stand and is then dried and washed with water.

**Regenerating water-purifying zeolite beds.** Dana Burks, Jr. (to Board of Trustees, Univ. of Ill.). U. S. 1,947,248, Feb. 13. In a process involving water treatment, a regenerating stage in which brine is passed through the bed, and a washing stage in which water is passed through the bed in the same direction but at a more rapid rate than in the water-purification stage, the regenerating brine comprises approx. the last two-thirds of the effluent of a previous regenerating stage and the first part of the effluent of a previous washing stage, mixed and with addn. of regenerating salt (the shift from the washing stage to a following water-purification stage being effected by reducing the rate of flow of water through the zeolite bed).

**Agent for cleaning boilers.** The Minister of Navy (Toyoshirō Miyoshi, inventor). Japan. 99,816, Feb. 27, 1933. The agent is a mixt. of alkali phosphates, aluminates, nitrites (or sulfites) and caustic alkali (or alkali carbonate).

**Preventing boiler incrustation.** Alfred Pfeiffer. Ger. 590,705, Jan. 8, 1934 (Cl. 85b. 1.36). Addn. to 510,299 (C. A. 25, 1016). An alternative method of arranging the coated fabric, used in the method of Ger. 510,299, is described. As a further alternative, appropriate reagents in powd. form may be wrapped in an uncoated fabric. Cl. C. A. 27, 2236.

**Apparatus for sterilizing water or sewage with chlorine** Gerald D. Peet. Brit. 401,589, Nov. 16, 1933.

**Sewage treatment.** Wm. C. Laughlin (to Filtration Holding Corp.). U. S. 1,945,051, Jan. 30. After screening out coarse particles, sewage is treated with a "collecting agent" comprising a finely divided fibrous material such as waste paper or paper pulp in water suspension, capable of absorbing grease particles and forming a semi-solid mass, the materials are then passed through a clarifier app. for removing a portion of the solid-free liquid, and solids and semi-solids are treated in a second clarifier app. for removal of a further portion of the liquid; the liquid is recirculated into the first clarifying app. for further treatment, and resulting solids and semi-solids are subjected

to further liquid and solid sepn. An app. arrangement is described.

**Sedimentation tanks for treating sewage, etc.** Reginald A. Dibdin. Brit. 401,804, Nov. 16, 1933.

**System for purifying sewage with activated sludge.** Franz Leiner. Ger. 591,260, Jan. 18, 1934 (Cl. 85r. 3.02).

**Controlling the humidity and temperature of the air in buildings.** George H. Fisher (to Minneapolis-Honeywell Regulator Co.). U. S. 1,946,903, Feb. 13, 1933. Various details of app. and operation are described.

**Preparations for purifying air and liberating oxygen.** Ewald Herzog (to Deutsche Gold & Silber Scheideanstalt

vorm. Roessler). U. S. 1,946,460, Feb. 6. An alkali metal peroxide 100 is treated with water 6-9 parts in the form of a spray at a temp. of about 0° and in the presence of a catalyst such as  $MnO_2$  which promotes  $O$  liberation in the presence of  $CO_2$  and water.

**Air-conditioning apparatus (including an ozonizer).** Arthur A. Roesch (to Roesch Enamel Range Co.). U. S. 1,945,379, Jan. 30. Structural features.

**Oligodynamic treatment of liquids.** Oligodyn A.-G. Fr. 756,351, Dec. 8, 1933. The metal having oligodynamic action is brought into action by an elec. current, the electrodes being mounted on a common base in the form of a handle.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**General system of soils.** Eick 'Sigmund. *Math. naturw. Ans. ungar. Akad. Wiss.* 49, 79-101(1932).—See C. A. 27, 1909.

**The dynamic properties of soil.** V. Dynamics of soil on plow moldboard surfaces related to scouring. Ralph D. Doher and M. L. Nichols. *Agr. Eng.* 15, 9 13(1934); cf. C. A. 27, 3277.

**Some properties of the soil solution and the colloids in certain Iowa soils.** Gordon B. Killinger. *Iowa State Coll. J. Sci.* 8, 203-4(1933).—Nine soils from different parts of the state were examd. The difference in colloidal content might be useful in detg. soil types. The org. matter was chiefly colloidal. When N was high, C and P were also high. The water-sol. minerals were not present in soil solns. in the same ratio as in the soils. The equiv. for base exchange was related to the loss on ignition. Colloids from the soils promoted gas production by anaerobic bacteria.

**A review of results of dielectric methods for measuring moisture present in materials.** N. E. Edlefsen. *Agr. Eng.* 14, 243-4(1933).—A given quantity of water when distributed evenly through a soil produces a greater change in the dielec. const. of comparatively dry soil than it does in the same soil when relatively wet; however, the relation is practically linear for percentages of water up to the moisture equiv. of the particular soil under investigation. Eleven references.

**Study of the relation of the organic content of soil to its pH.** J. R. Endsley and W. F. Hall. *J. Tenn. Acad. Sci.* 9, 78-83(1934).—Studies made in western Tenn. showed both soil and subsoil to be acid in correlation with org. matter present and with sandness of soil.

**The nature of the base-exchange material of soils and of the bentonitic clays as revealed by chemical investigations and x-ray analysis.** W. P. Kelley and W. H. Dore. *Trans. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 34-6(1933)(in English); cf. C. A. 25, 1317.—Examn. of soil colloids sepd. by sedimentation and freed from org. matter by  $H_2O_2$  oxidation indicated that replaceable base can often be increased several fold by dry grinding in a ball mill. Similar results were obtained with bentonites. The replaceable element showing the greatest increase is Mg, although with one bentonite and colloids from humid soils, K and H were also increased. Grinding exposes new surfaces with replaceable bases which may differ from those previously at the surface. X-ray diffraction patterns by the powder method of 9 bentonites and 6 soil colloids, examd. in the original state, ground for a long time and also after satn. with various bases, indicated essentially similar cryst. structure with only slight differences attributable to different absorbed bases and impurities. Bentonites showed a simpler structure than soil colloids; there seem to be 5 classes of the former, and lines from the latter sometimes included 2 of these classes. Replaceable bases are indicated to be an integral part of the cryst. structure, not merely adsorbed on surfaces, although in ordinary exchange studies only the latter are replaced. The original base in the bentonites

and California soil colloids was Mg, later more or less replaced by Ca, K, Na, etc. The Cecil colloid is a cryst. acid salt. These inorg. base-exchange materials form a closely related series of secondary products from weathering. The ratio  $SiO_2:Al_2O_3$  varies, without great effect upon crystal structure. The effects of heating as well as these chem. and x-ray studies indicate that the soil colloid is no well-known zeolite, but probably a true clay mineral related to montmorillonite, a Mg aluminosilicate.

**The causes and mechanism of an increased cation exchange in various soils after  $Ca(OH)_2$  treatment.** A. Th. Tyulin and E. M. Bystrova. *Trans. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 85 107(1933)(in English).—A review and extended discussion of lab. expts. with various soils and artificial gels, from which it is concluded that increase in exchange capacity following  $Ca(OH)_2$  treatment is due principally to activation of "coagels" formed by the mutual pptn. of oppositely charged sols, e. g., negatively charged clay and positively charged  $R_2O_3$  aq. This passive gel can again acquire a neg. charge and upon  $Ca(OH)_2$  treatment  $Ca^{++}$  is adsorbed, to be released subsequently by exchange with other cations. Thirty-six references.

**Exchangeable cations of the soil and plant.** K. K. Gedroiz. *Trans. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 71-83(1933)(in German); cf. C. A. 28, 2089.—A general discussion with description of pot expts. in which oats, mustard and buckwheat were grown in heavy chernozem from which all exchangeable bases had been removed and replaced by Ca and K furnished at different rates by complete fertilizer. Yields indicated that the crops secured sufficient K and Mg for max. growth from the soil contg. only exchangeable Ca. In similar expts. with soil satd. with other elements, the crop on the fertilized Ca soil was slightly superior to that on the original soil; that on Sr soil was somewhat inferior, but practically equal when the fertilization was supplemented by  $CaCO_3$ . Small crops were secured from soil satd. with Mg,  $Fe^{++}$ , Al and H. With  $CaCO_3$ , there was a small crop on  $Fe^{++}$  soil, but none on soil satd. with Cd. On H-satd. soil,  $CaSO_4$  was ineffective, indicating the importance of  $CaCO_3$  as a neutralizing agent. It is noted that although soils satd. with Na are unproductive, there is some evidence that Na is important in N nutrition.

**Action of hydrogen peroxide upon the soil.** K. K. Gedroiz. *Trans. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 41-70(1933)(in German); cf. C. A. 26, 2264.—A review and description of exptl. work with chernozem soils. Treatment of 5 g. soil with 60 ml. 30%  $H_2O_2$  without heating changed org. N practically completely to  $NH_3$ ; a trace was oxidized to nitrate. Org. matter was reduced from 9.3 to 1.1% and the reaction made alk., 0.1%  $CO_2$  being found in the residue from the originally  $CaCO_3$ -free soil. Addn. of 1 g.  $CaCO_3$  to the sample prior to treatment hindered the action. Heating the mixt. resulted in considerable loss of N, increased by  $CaCO_3$ . In further expts., 10 g. soil with 25 ml.  $H_2O$  and increments of  $H_2O_2$  added gradually without heating were finally

evapd. to dryness on the water bath. The  $p_H$  value of a sample so treated without  $H_2O_2$  was 6.75; up to 20 ml.  $H_2O_2$  caused a regular decrease in  $p_H$  to 3.75, and up to 100 ml. caused a subsequent rise to 5.92. Water-sol. org. matter, both total and that oxidizable by  $KMnO_4$ , as well as  $CaO$  and  $MgO$  were considerably increased by  $H_2O_2$  treatment. Sol. org. acids were evidently formed. Exchangeable bases in  $H_2O_2$ -treated soil as compared with the original soil were detd. with difficulty; apparently this was due largely to loss of permeability with humus. The efficiency of  $N$  NaCl in exchange was cut in half, of  $N$   $NH_4Cl$  reduced 30%, but that of 0.05  $N$   $HCl$  reduced by only 8%. With 4  $N$   $NH_4Cl$ , but not with 4  $N$  NaCl, the difference almost disappeared. The effect of  $H_2O_2$  upon a no. of soils caused small decreases in exchange capacity, but with a heavy chernozem there was a 50% reduction, an indication of the possible importance of humus in exchange reactions. Similar soils satd. with  $Na$  prior to treatment with  $H_2O_2$ , etc., were more dispersed after the latter treatment, indicating some protective action of humus against alkali damage. The cementing action of humus in the soil is important.

C. J. Schollenberger  
The concentration of carbon dioxide in the soil air under various crops and in fallow soils. F. B. Smith and P. E. Brown. *Iowa State Coll. J. Sci.* 8, 1-16(1933).—The concn. of  $CO_2$  in the soil air in fallow soils and in soils under the crops (corn, alfalfa, red clover, cowpeas, soy beans, oats, wheat and bluegrass) and under various soil treatments was detd. The  $CO_2$  is due to plant growth, microbiological action and decay of org. matter. Rates of diffusion may influence concns. of  $CO_2$ . Bluegrass and corn in early stages of growth depress microbiological action. Legumes seem to stimulate it. Deep-rooted legumes produce more  $CO_2$  than shallow-rooted legumes. Concns. of  $CO_2$  in the soil air as a measure of the rate of  $CO_2$  production in field soils are of limited value. It is not a desirable method for detecting differences due to soil treatment.

F. E. Brown  
Increased yields from the action of small quantities of basic materials on acid soils. H. Kappen. *Deut. landw. Presse* 60, 547(1933).—The exchange acidity of a humus, sandy loam was reduced from 8.4 to 1.4 when 5000 kg. of  $CaCO_3$  per 100 sq. m. of soil was used with an acid fertilizer.  $CaCO_3$  (10,000 kg.) reduced the exchange acidity to 0.4, and the  $p_H$  of the soil was increased from 4.77 to 5.83. A basic fertilizer contg.  $NaNO_3$ , Thomas meal and a potash salt reduced the exchange acidity to 1.8 and increased the  $p_H$  to 5.5. Increased yields corresponded to the reduction in soil acidity.

K. C. H.  
Studies on sugar cane and sugar-cane soils. I. The immediate and residual effects of lime on crop yield. P. E. Turner. *Empire J. Exptl. Agr.* 2, 78-92(1934).—Plant and ratoon canes, grown on unflocculated, acid soils in Trinidad, benefited greatly by liming up to the lime requirement (as detd. by the degree of unsatn. of the soil with exchangeable  $Ca$ ) of the soil. On soils exhausted through continued practice of a type of "shifting" cultivation, the benefit derived from liming was at 1st very small, but it appeared to attain normal proportions in the course of time. In the absence of  $(NH_4)_2SO_4$ , the lime-yield curve followed the law of diminishing returns; in its presence, the curve rose to a max. point which corresponded to an application of lime equal to the calcd. lime requirement. After the max., the curve showed a significant fall which occurred either when an excess of lime was applied in the presence of small applications of  $(NH_4)_2SO_4$  or when an excess of  $(NH_4)_2SO_4$  was applied in the presence of small amts. of lime. Fluctuations in the quality of cane due to liming were unimportant in comparison with the accompanying increment in yield, unless conditions were very unusual.

K. D. Jacob  
Recent developments in the agriculture of sugar cane in Queensland. H. W. Kerr. *Empire J. Exptl. Agr.* 2, 20-8(1934).—In the sugar-cane districts of Queensland, the highly acid alluvial soils of the heavy rainfall areas show marked response to applications of phosphates, but not to potash. The deep, red volcanic loams are con-

spicuously deficient in potash, but phosphates have little effect on cane yields. The red loams vary considerably in their potash and phosphate requirements. Practically all the cane soils are notably deficient in  $N$ .  $KCl$  and  $K_2SO_4$  are of equal value as sources of  $K$  for cane in Queensland. Extn. of the soil phosphates with 0.01  $N$   $H_2SO_4$  (250 parts/part of soil) and of the soil potash with 0.02  $N$   $HCl$  seems to give a good index of the  $P$  and  $K$  requirements of the soils. Soils more acid than  $p_H$  4.3, as detd. in 1.0  $N$   $KCl$  soln., respond to applications of lime, soils less acid than  $p_H$  4.7 seldom show response. Marked increases in cane yields are obtained by the use of molasses as fertilizer. A method for testing the maturity of cane is based on the fact that the expressed juices from 3 equal sections of a mature cane stalk contain approx. the same amts. of reducing sugar; this value tends to a const. min at this period.

K. D. Jacob  
Soil and mineral supplements in the treatment of bush sickness. T. Rigg and H. O. Askew. *Empire J. Exptl. Agr.* 2, 1-8(1934); cf. C. A. 27, 2243.—Sheep depastured on typical bush-sick country at Glenhope, New Zealand, were drenched twice a week with (I) 3-4 g. Onekaka limonite, (II) 7-9 g. of the silt and clay fractions of Nelson soil contg. 0.75-1.0 g.  $Fe_2O_3$  sol. in 0.1  $N$  oxalic acid and (III)  $Fe$   $NH_4$  citrate equiv. to 0.75 g.  $Fe_2O_3$ . Sheep drenched with II gained rapidly and continuously in wt. and remained perfectly free from bush sickness; those receiving I showed no improvement over the controls. In general, sheep receiving III remained free from bush sickness, but did not make as good growth as those receiving II. The failure of I to overcome bush sickness suggests that an adequate supply of  $Fe$  compds. is insufficient in itself to prevent the disease, and that some other factor operates detrimentally to the normal functioning of the animal system.

K. D. Jacob  
Studies on the viability of *Eimeria tenella* in soil. F. D. Patterson. *Cornell Veterinarian* 23, 232-49(1933).—Addn. of 10% of  $CaO$  to soils contaminated with oöcysts of *E. tenella* did not prevent infection of chickens in 12 weeks.

K. D. Jacob  
The fertilizer effect of various mineral phosphates compared with the effect of easily soluble phosphate fertilizers. Paul Solberg. *Meldinger Norges Landbruks* 13, 481-540(1933).—On boggy soil, the effect of mineral phosphates is nearly as great as that of ordinary superphosphate, provided the lime dressing is not too high, and is equal to that of Thomas and Rhenania phosphates, while on mineral soil (morainic) the results are more variable.

H. C. M. Ingeberg  
Statistics of production, consumption, etc., of phosphate rock and superphosphate, 1932. A. N. Gray. *Superphosphate* 7, 1-6, 21-8(1934); cf. C. A. 27, 1430, 1701.—World data are given.

K. D. Jacob  
Fertilizers and the [British] Empire. A. N. Gray. *Empire J. Exptl. Agr.* 2, 65-77(1934).—Detailed data are given on the production, consumption and trade in  $N$ ,  $P$  and  $K$  fertilizers and fertilizer materials in the Brit. Empire.

K. D. Jacob  
Artificial fertilizers registered [in Victoria] for 1934. Analyses and unit values. W. C. Robertson. *J. Dept. Agr. Victoria* 32, 43-52(1934); cf. C. A. 27, 1440.

K. D. Jacob  
Sulfates and chlorides as fertilizers. III. Effects on the viscosity and the surface tension of pastes made from rice starch. Isenosuke Onodera. *J. Agr. Chem. Soc. Japan* 9, 1077-90(1933); *Bull. Agr. Chem. Soc. Japan* 9, 139-40.—Rice paste had a max. viscosity when  $NH_4Cl$ ,  $Na$  phosphate and  $K_2SO_4$  were applied as fertilizers to the rice plant in the pot. The viscosity was generally larger with sulfates than with chlorides. If fertilizers of  $K$  and  $NH_4$  with different anions were used, the viscosity of the rice paste was larger than that with fertilizers having the same anion. The surface tension of the rice paste was greater when the compds. of  $K$  and  $NH_4$  with the same anion were used as fertilizer.

Y. Kihara  
Composts and fertilizers in relation to greenkeeping. II. Nitrogenous fertilizers. T. W. Evans. *J. Board Greenkeeping Research* 3, 34-8(1933); cf. C. A. 25, 5218.—

The use of  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{CaCN}_2$ , and Nitro-chalk on golf greens is discussed. K. D. Jacob

A field method for the determination of the fertilizer requirements of soils. I. M. Robertson and A. B. Stewart. *Scottish J. Agr.* 17, 71-9(1934).—Expts. with the Mitscherlich plot method are described. In general, Scottish soils, with the possible exception of newly broken-up lea, are very deficient in N, and show a marked response to N fertilizers. K. D. Jacob

The effect of fertilizer salts on the soil. O. Diehl. *Ernähr. Pflanze* 30, 41-5, 61-4(1934).—Of 14 different salt solns. used,  $\text{KCl}$ ,  $\text{Ba}(\text{OH})_2$ , and  $\text{Ca}(\text{OH})_2$  produced the greatest increase in the speed of sedimentation in a  $\text{CaO}$ -free suspension of loess loam soil. The values were 15, 20 and 20 mm./min., resp. A 6%  $\text{KCl}$  soln. produces the max. effect for that salt.  $\text{CaO}$  in the original soil suspension reduces the effect of the salt concn. Of the salts of uni-, bi- and trivalent metals, the chlorides produced the greatest acceleration of flocculation. Increasing the diln. of the soil suspension caused a decrease in acceleration with the alkali metals and a less marked decrease with the bi- and trivalent metals ( $\text{Ca}$  and  $\text{Fe}$ ), the values tending to become const. This is expl. proof of the need for  $\text{CaO}$  with heavy applications of K salts. Similar tests with silt soil showed the loosening action of  $\text{CaO}$  on the structure of such soils. John O. Hardesty

The economic importance of effective plant protection by the use of potash fertilizers. H. Eisele. *Ernähr. Pflanze* 30, 66-8(1934).—A general review with 21 references is given. John O. Hardesty

The calcium antagonism in soil and oakwood. Arthur C. Magill. *J. Tenn. Acad. Sci.* 8, 273-321(1933).—An extensive survey over much of Tenn. showed that high soil Ca is assocd. with high Ca in oak in 0.90 correlation, but low-Ca soils (Ca below 0.35%) yield oak high in Fe. A. Lloyd Taylor

Absorption of manganese by wheat seedlings. Jehiel Davidson. *Trans. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 84(1933)(in English).—A résumé of conclusions drawn from soln. culture expts. with  $\text{Mn}_2\text{O}_3$ ,  $\text{MnO}_2$ ,  $\text{MnCl}_2$  and  $\text{MnSO}_4$  as sources of Mn,  $\text{NaNO}_3$ ,  $\text{NH}_4\text{Cl}$  and  $(\text{NH}_4)_2\text{SO}_4$  as sources of N,  $\text{K}_2\text{SO}_4$  and  $\text{KCl}$  and K phosphates and  $\text{CaCO}_3$  to regulate  $pH$ . Physiologically alk.  $\text{NaNO}_3$  but not  $\text{NH}_4$  salts decreased Mn absorption from sources other than  $\text{MnCl}_2$ . Mn absorption was but slightly decreased from  $\text{MnCl}_2$  by  $\text{CaCO}_3$ , but phosphates caused decreases when  $pH$  was const. The results indicate that the availability of Mn to plants is detd. by the combined effect of  $pH$  and anions, and the effect is through the soly. of Mn rather than upon the absorptive power of the plant. The results further show the utility of  $\text{H}_2\text{O}$  cultures in solving practical problems, and indicate the necessity of considering the effect of applied fertilizers and amendments upon the availability of soil constituents. C. J. Schollenberger

The relative palatabilities of seeds mixtures, and a study of the influence of fertilizers on natural hill pastures. W. B. J. Milton. *Empire J. Exptl. Agr.* 2, 51-64(1934).—As shown by the degree to which the plots were grazed by sheep and cattle, the palatability of pasture grasses was increased by the application of either Ca, N, P or K fertilizers; in general, the hardest grazed plots were those that had received all 4 elements, Ca being particularly effective in increasing grass palatability. To a certain extent, the increased palatability of the plots was due to the effect of the fertilizers in promoting the growth of naturally palatable plants, such as *Molinia* and clover. The effect of lime, either alone or in combination with fertilizers, was much more marked than that of superphosphate. Twenty-two references. K. D. Jacob

Investigations in pasture production. VI. Studies of effect of ammonium sulfate and frequency of cutting on production of pasture under system of mowing only. A. W. Hudson. *New Zealand J. Agr.* 48, 17-24(1934); cf. C. A. 28, 555<sup>4</sup>.—In general, applications of  $(\text{NH}_4)_2\text{SO}_4$  increased the growth of grass for periods of from a few weeks to a few months after application, depending on the time and amt. of the application. The period of bene-

ficial effect of each application of  $(\text{NH}_4)_2\text{SO}_4$  was usually followed by a period of slumping in grass production which coincided with a reduction in the amt. of clover growth and the more or less unthrifty appearance of the grass. Ground limestone was somewhat more efficient in preventing increased soil acidity, due to  $(\text{NH}_4)_2\text{SO}_4$ , when it was applied in mixt. with  $(\text{NH}_4)_2\text{SO}_4$  than when it was applied separately once a year. K. D. Jacob

Fertilization of meadows in relation to the new ruling on agricultural fats. L. Schmitt. *Deut. landw. Presse* 60, 473, 484, 496(1933).—Governmental restrictions on fat imports in Germany necessitate an increased production of hay for feed. Use of Thomas meal alone on meadows over a period of 15 years did not increase production. K phosphate alone increased yields about 60% and the yield of N in the hay was increased from 85.8 to 131.4 kg./ha. The application of N fertilizers did not appreciably increase yields. K. C. Beeson

Effects of time of planting and of fertilizer mixtures on the curly-top resistant sugar-beet variety U. S. No. 1 in Idaho. A. W. Skuderna, C. E. Cormany and L. A. Hurst. *U. S. Dept. Agr., Circ.* 273, 1-15(1933).—Fertilizer mixts. contg. high percentages of  $\text{P}_2\text{O}_5$  produced larger yields of beets and greater yields of sugar per acre than mixts. in which N or K predominated. A sharp decrease in stand of beets occurred when the percentage of N in the fertilizer mixt. exceeded 8%. The tests indicate that a fertilizer mixt. in which the percentage of  $\text{P}_2\text{O}_5$  predominates is likely to produce consistently good results with sugar beets, especially under cropping and soil conditions that necessitate the use of com. fertilizers. W. H. Ross

Liming conditions for flax. Johannes Görbing. *Deut. landw. Presse* 60, 475(1933).—Optimum root growths were obtained when burned limestone was added to a soil to increase the  $pH$  from 5.6 to 6.2-6.7. Less satisfactory growths of flax roots were obtained at  $pH$  of 7.4. Electro-metric titration of the soil with lime water is the most satisfactory method of detg. lime requirements. K. C. Beeson

Orchard sprays in New Zealand. VII. Combination sprays. G. H. Cunningham. *New Zealand J. Agr.* 48, 1-12(1934); cf. C. A. 28, 248<sup>9</sup>.—The uses and chemistry of various spray mixts. are discussed. Thirty-one references. K. D. Jacob

The composition, application and general effects of the main orchard sprays at present applied to pome fruits. P. H. Thomas and T. D. Raphael. *Tasmanian J. Agr.* 3, 145-53(1932).—A review. K. D. Jacob

Experiments with dormant sprays for control of leaf and nut case-bearers [on pecans]. Fred. W. Walker. Ga.-Fla. Pecan Growers Assoc., *Proc. 37th Ann. Convention 1933*, 31-5.—Dormant spraying of the trees with a 1:15 soln. of tar or creosote emulsion, just before the opening of the buds, gave practically complete control of case-bearers. Bordeaux and Pb arsenate sprays were ineffective. K. D. Jacob

Effects on apple trees of lime sulfur following Bordeaux mixture. G. H. Cunningham. *New Zealand J. Agr.* 48, 15-17(1934).—The ppts. obtained by adding  $\text{CuSO}_4$  or Bordeaux-mixt. solns. to equiv. amts. of 0.1% lime S soln. were not injurious to the fruit or foliage when they were applied to Delicious, Jonathan, Sturmer and Rome Beauty apple trees in early summer; with smaller amts. of Cu or larger amts. of lime S injury is likely to result, because of the formation of sol. Cu compds. Injury is not likely to follow when apple trees are sprayed with either 5-4-50 or 3-4-50 Bordeaux mixt. at the green-tip stage, and followed at the pink or pre-pink stage with 0.2% lime S. K. D. Jacob

The abrasive effect of lime as used in Bordeaux mixture. E. L. Nixon. *Agr. Eng.* 14, 335-6(1933).—When pulverized pebble lime or hydrated lime was used in a 4-4-50 Bordeaux mixt. the abrasion of the spray-nozzle disks (as indicated by the loss in wt.) was approx. 0.5 times as great as when lump lime was used. K. D. J.

Tar distillate emulsions for the control of the rosy aphid and other fruit insects. F. Z. Hartzell and P. J.

Parrott. N. Y. Agr. Expt. Sta., *Bull.* 636, 29 pp. (1933).—The tar distillate emulsions used as insecticides consist of refined creosote oil (the fraction distg. from 200° up being redistd. to remove the light and heavy ends) prepd. with various emulsifiers. Certain foreign and nearly all domestic com. products contain, in addn., various amts. of petroleum oil. Five-year tests indicate that these emulsions are highly effective against the rosy apple aphid (*Anuraphis roseus*), black cherry aphid (*Myzus cerasi*), and the eye-spotted budmoth (*Spilonota ocellana*). For the above insects, 4 gals., 5 gals. and 7½ gals., resp., of the concd. emulsion are mixed with water to make 100 gals. of spray. The sprays are applied in the early spring when the buds are dormant. The importance of proper timing of sprays is emphasized. Methods and costs of prep. a concd. tar distillate emulsion from tar oil 3.25 gal., petroleum lubricating oil 0.75 gal., sulfonated cod oil 0.4 gal. and NaOH 2.50 lb. are given. Com. products contain about 80% of active ingredients. C. H. R.

Are we developing strains of codling moths resistant to arsenic? Leonard Haseman and R. L. Meffert. Mo. Agr. Expt. Sta., *Bull.* 202, 11 pp. (1933).—When 0.00275 mg. Na arsenite is injected into the body cavity of full-grown larvae of *Carpocapsa pomonella*, 85–80% of them die within 4 hrs. 0.00425 mg. Na arsenite injected by mouth into the digestive tract of the full-grown larvae kills 75–80% in 4 hrs. 0.24 mg. PbHAsO<sub>4</sub> introduced by mouth into the digestive tract kills 26–33% of the larvae in 4 hrs., and 63–73% in 8 hrs. Na arsenite is therefore slightly more than 1/3 as toxic when injected into the body cavity than when introduced into the digestive tract, and is about 113 times as toxic as PbHAsO<sub>4</sub> in the digestive tract of full-grown larvae. In the digestive tract, a sublethal dose of Na arsenite (0.00375 mg.) gave approx. the same percentage mortality of Colorado larvae (purported to be difficult to control with arsenicals) as of Missouri and Virginia larvae. Likewise a sublethal dose of 0.24 mg. PbHAsO<sub>4</sub> in the digestive tract gave about equal mortalities of Colorado, Missouri and Virginia larvae. Therefore, Colorado strains of codling-moth larvae are not more difficult to control with As than are Missouri and Virginia strains. Methods are described. C. H. Richardson

Copper in relation to chlorophyll and hemoglobin formation. O. S. Orth, G. C. Wickwire and W. E. Burge. *Science* 79, 33–4 (1934).—The soil in one portion of a chlorotic orange orchard was treated with CuSO<sub>4</sub>. It cured the "frenching" or chlorotic condition. Leaves from the treated area contained 4.6 times as much chlorophyll as those from the untreated area. No Cu was found in either. Cattle pastured on Cu-poor land developed nutritional anemia. Conclusion: Cu is necessary for the formation of both chlorophyll and hemoglobin. J. J. W.

Greenhouse fumigations with naphthalene solutions. Frank Wilcoxon, Albert Hartzell and W. J. Youden. *Contrib. Boyce Thompson Inst.* 5, 461–9 (1933); cf. C. A. 21, 792; 24, 4350. —A method is described for using a soln. of naphthalene in oil and of naphthalene in S in a fumigation process in which a desired concn. of naphthalene is maintained throughout the fumigation period. Control of red spider mite was obtained by using this fumigation process for 14–16 hrs. Plants usually sensitive to naphthalene fumigation were not injured. N. M. N.

[Report on] agriculture. J. A. Verret and A. J. Mangelsdorf. Hawaiian Sugar Planters' Assoc., *Proc. 52nd Ann. Meeting* 1932, 33 pp. (1933).—Dipping the cut ends of cane seed-pieces in 1% Ceresan soln., immediately after cutting the stalks, reduced the rotting and increased the germination of the cuttings. K. D. J.

The germicidal efficiency of hypochlorite solutions in the presence of chicken manure. Ernest C. McCulloch. *J. Bact.* 27, 37 (1934).—The data indicate that a new compd. probably a chloramine is formed by the action of hypochlorite on NH<sub>3</sub> from the manure. J. T. M.

Hoary cress control. A. Morgan. *J. Dept. Agr. Victoria* 32, 1–6, 40 (1934).—When it was applied under dry-farming conditions to a soil having a relatively impervious clay subsoil, NaCl in concns. lethal to hoary cress (*Lepidium draba* L.) penetrated to a depth of only 8–10

1 in., and little or no control of the weed was obtained. Application of 5 tons of NaCl per acre to a typical black Wimmera soil resulted in lethal concns. at a depth of over 4 ft. and gave a high kill. Application of 600 gal of 12.5% NaClO<sub>2</sub> soln. per acre did not give permanent control of the weed. The best results were obtained by spraying the plants with acid Na arsenite soln. (0.4% As<sub>2</sub>O<sub>3</sub> and approx. 5% H<sub>2</sub>SO<sub>4</sub>). The max. rate of movement of As soln. downward through the tissues of the hoary cress plant was 0.5 in./sec., under field conditions, whereas in the morning glory the max. rate was 2.5 in. sec. K. D. Jacob

Influence of regular dipping on the Merino sheep and its fleece. J. E. Duerden, G. S. Mare and V. Bosman. *Onderstepoort J. Vet. Sci.* 1, 567–80 (1933).—Dipping sheep in Na arsenite soln. (2 lb./100 gal. water) at weekly intervals for 1 yr. had no effect on the body and fleece wts., or the fiber thickness, staple lengths, fiber contours, and S content of the wool. The wools of sheep dipped either in arsenite soln. or in pure water deteriorated somewhat in color, handle and appearance; these effects seemed to be due to the hardness of the water used in prep. the dips. K. D. Jacob

Detn. of Pb in small quantities in spray residues (Samuel, Shockey) 7. Action of dil. HCl on phosphorites (Anosov, Ust-Kachintzev) 18. Nematode disease of potatoes caused by *Heterodera schachtii* (O'Brien, Prentice) 11D. Use of sewage for irrigating crops (Anon.) 14. Baltimore sewage-treatment plant [sludge used as fertilizer] (Finck) 14. Disinfectants [for destruction of parasites] (Fr. pat. 757,040) 17. K Mg sulfate [fertilizer] (Ger. pat. 591,097) 18. Double nitrates [fertilizers] (Ger. pat. 591,458) 18. Treating polyhalite [to produce fertilizers] (U. S. pat. 1,946,068) 18. H<sub>3</sub>PO<sub>4</sub> or Ca superphosphate (Japan. pat. 100,142) 18.

Fertilizer. Beverly Ober and Edward H. Wright (to Oberphos Co.). U. S. 1,947,138, Feb. 13. A phosphate fertilizer in the form of porous discrete nodular encrusted and indurated globoid particles, having a crushing strength several times as great as that of fully cured den superphosphate and contg. K- and N-bearing material, is prepd. by a described autoclaving process.

Fertilizers. Oskar Ried and Karl Ruschertner. Austrian 136,025, Dec. 27, 1933 (Cl. 45g.). The activity of natural or artificial fertilizers is modified by irradiation. Details are given.

Fertilizers. Paul Christian. Fr. 756,777, Dec. 15, 1933. Artificially prepd. substances contg. SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> are used as fertilizers. They may be made by decomposing sol. glass with a sol. Al salt such as Al(NO<sub>3</sub>)<sub>3</sub>, preferably in the presence of peat, lignite or other substance of large surface. Rare earths in amt. in excess of that found in the natural silicates may be added.

Fertilizer. Camille Malignon and Pierre Kachkaroff. Fr. 756,875, Dec. 16, 1933. Org. fertilizer contg. N and a tar composed of N-contg. substances are obtained by distg. vegetable materials such as wood, peat, straw, lignin and certain coals at a temp. up to 400° in an atm. of NH<sub>3</sub>.

Fertilizer of slow action. Mitsui Kōzan K. K. (Shimizu Oda, inventor). Japan. 100,380, Apr. 4, 1933. The fertilizer is prepd. by mixing a mixt. of a fertilizing material of quick action (such as (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, NH<sub>4</sub>NO<sub>3</sub>, etc.) and urea with an aldehyde, especially HCHO.

Carbon fertilizers. I. G. Farbenind. A.-G. Fr. 756,614, Dec. 13, 1933. The unwashed intermediate products obtained during the prepn. of active C and resulting from the treatment of carbonaceous substances by solid or dissolved activating agents are neutralized and used as fertilizers. Thus, peat is treated with H<sub>3</sub>PO<sub>4</sub>, calcined and neutralized with NH<sub>3</sub> or caused to react with P<sub>2</sub>O<sub>5</sub> and ground with CaO.

Fertilizing salts. Hans Grah. Brit. 401,520, Nov. 16, 1933. See Fr. 748,471 (C. A. 27, 5467).

Treatment of tricalcium phosphates for the production of soluble fertilizers. Soc. anon. produits chimiques et

engrais L. Bernard. Belg. 398,256, Sept. 30, 1933. The phosphate is heated at about 1200° with an excess of alkali and SiO<sub>2</sub> such that 1 mol. of alkali oxide combines to form an alkali Ca phosphate and an alkali Ca silicate.

Autoclaves and associated apparatus for producing a fertilizer from nitrogenous material such as feathers, hair, wool or leather by thermal decomposition under pressure. Wm. W. Pagon (to Oberphos Co.). U. S. 1,945,229, Jan. 30. Structural and operative features.

Apparatus and method for drying fish and slaughterhouse refuse. Conrad Schlotterhose and Hermann Brandt (trading as Schlotterhose & Co.). Brit. 365,308, Jan. 21, 1932.

Apparatus for drying fish and slaughterhouse refuse. Conrad Schlotterhose and Hermann Brandt (trading as Schlotterhose & Co.). Brit. 382,085, Oct. 20, 1932. Addn. to 365,308 (preceding abstr.).

Insecticide. Wm. K. Price. U. S. 1,947,169, Feb. 13. A spray suitable for repelling codling moths contains naphthalene together with a less readily vaporizable carrier such as an emulsified oil.

Insecticides. James R. Cattanch. Brit. 401,519, Nov. 16, 1933. An insecticide in jelly form for diln. with H<sub>2</sub>O is prepd. by sapon. a mixt. of a fatty substance, *e. g.*, lard and a vegetable oil, *e. g.*, coconut oil, with alkali, neutralizing the product or rendering slightly acid and then incorporating a mineral oil ext. of pyrethrum. Cf. C. A. 27, 2246.

Insecticides. Imperial Chemical Industries Ltd. and Stephen H. Oakshott. Brit. 401,707, Nov. 20, 1933. Insecticidal compns. are prepd. by incorporating quaternary compds. of nicotine and like bases of tobacco, made by interaction of the base with inorg. acid esters of long-chain aliphatic alcs. contg. more than 6 C atoms, *e. g.*, dodecyl or octadecyl bromide, with a solid liquid diluent, *e. g.*, talc, kieselsguhr, H<sub>2</sub>O, nicotine, solns. of nicotine in oils, tar and petroleum oils.

Insecticides. Ernst B. Nier, Ida E. Adolph, Richard W. Nier, Martha H. Pross and Johannes K. Nier (trading as Hermann Nier). Brit. 401,914, Nov. 23, 1933. A molten mixt. of C<sub>10</sub>H<sub>8</sub> and a small quantity, *e. g.*, 3% of nicotine, is poured into grooves of perches, etc., to destroy parasites on poultry or domestic animals.

Insecticides, etc. Alfred Kirkham and Peter Spence & Sons Ltd. Brit. 401,705, Nov. 16, 1933. See Fr. 754,128 (C. A. 28, 1133').

Insecticides. Anciens établissements Aulagne & Cie. Fr. 757,152, Dec. 21, 1933. Pine oil, turpentine oil, citronella oil, etc., are emulsified in water with sulfonated fatty alcs. or esters, sulforicinate, soaps, for use as insecticides, etc.

Dusting insecticide. Dai Nippon Mokuzai Bôhû K. K. (Kyo Katô, inventor). Japan. 100,320, March 29, 1933. Addn. to 96,607. A fine fibrous substance (such as sawdust) is treated with a mixt. of CCl<sub>4</sub>, HCHO, *o*- or *p*-dichlorobenzene, naphtha and a small amt. of chloropierin.

Colorless household pyrethrum insecticide. Nicholas A. Sankowsky and Dudley H. Grant (to Stanco Inc.). U. S. 1,945,235, Jan. 30. Pyrethrum flowers are extd. with kerosene to obtain a strong kerosene soln. of pyrethrus, the soln. is shaken with anhyd. MeOH to dissolve part of the ext. in the MeOH, the latter is cooled to about 0° and centrifuged to remove impurities, the MeOH is

distd. off *in vacuo* and the remaining purified ext. contg. pyrethrins is dissolved in water-white kerosene.

Preserving the pyrethrum content of chrysanthemum flowers. Wm. A. Hughes (to Harvel Corp.). U. S. 1,945,148, Jan. 30. After picking, the flowers are treated with sufficient kerosene or cymene to protect the pyrethrin from the atm.

Dehydroroteneone. Herbert L. J. Haller and Paul S. Schaffer (to the public for free use). U. S. 1,945,312, Jan. 30. Rotenone is hydrogenated in the presence of a Ni catalyst.

Insecticide and fungicide. Johannes A. L. Bouma. Dutch 30,941, Sept. 15, 1933. An insecticidal or fungicidal plant ext. (*e. g.*, quassia wood, rhatany root, pyrethrum flowers) is added to S-treated fatty or etheral oil (*e. g.*, 6 parts linseed oil plus 1 part S heated to 120°). Gluc, gelatin and similar substances, also powdered materials, talcum powder, may be added to the mixt. Cf. C. A. 27, 2754.

Fungicide and insecticide. Sándor Terényi. Hung. 107,115, Sept. 1, 1933. A compd. of quinquivalent As with a bivalent metal (Ca, Mg, Zn, Cu, etc.) is mixed with a compd. of a trivalent metal (Fe, Al, etc.) with quinquivalent As. *E. g.*, Na<sub>2</sub>AsO<sub>4</sub> soln. is added to a soln. of MgSO<sub>4</sub> and FeCl<sub>3</sub> and the reaction of the soln. is adjusted to very weak acidity.

Fungicides. Lelio Ferri. Brit. 401,603, Nov. 16, 1933. See Fr. 751,277 (C. A. 28, 1134').

Washing fruit such as pears for removing spray residues, etc. Fred Stebler (to Food Machinery Corp.). U. S. 1,945,922, Feb. 6. In washing fruit with a soln. such as HCl for removing Pb arsenate of lower sp. gr. than that of the fruit, the fruit is supported while partially submerged in the soln. and the soln. is sprayed over the fruit. App. is described.

Composition for combating diseases of plants such as those of cryptogamic character. Georges Truffaut and Isaak Pastac (to Soc. anon. établissements et laboratoires Georges Truffaut). U. S. 1,947,320, Feb. 13. A water-sol. org. coloring matter is used with a wetting agent such as a substituted amide of a fatty acid.

Anticryptogamic products. Adolpe Audet. Fr. 756,755, Dec. 15, 1933. A resin dissolved in an emulsifiable heavy oil is added to anticryptogamic solns. to impart wetting and adhering power thereto.

Parasiticide composition. Max L. Tower and Harry W. Dye (to Niagara Sprayer and Chemical Co.). U. S. 1,945,542, Feb. 6. A compn. suitable for use on foliage comprises an insol. powder such as S the particles of which are coated with a substantially insol. colored colloidal substance such as a green-dyed casein and bentonite mixt.

Composition for destroying weeds, etc. Elmer H. Hyde and Floyd D. Hager (to American Tar Products (Co.)). U. S. 1,946,462, Feb. 6. For killing vegetation, a mixt. is used comprising all the distillates of coal tar which are driven off up to a temp. of about 425–540°.

Pest-destroying compositions. Permutit A.-G. Ger. 591,107, Jan. 16, 1934 (Cl. 451. 3.01). Compns. for destroying beet carrion beetles and their larvae comprise an alimentary poison, *e. g.*, Schweinfurt's green, Na<sub>2</sub>SiF<sub>6</sub>, or an arsenate, mixed with fish meal, flesh meal or dried blood, with or without a diluent or nutrient such as bran. The compns. may be made into a paste and then applied by stewing.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

Alcohol fermentation by *Rhizopus*. Fumio Hemmi and Norimasa Tsukitani. *J. Agr. Chem. Soc. Japan* 9, 1371–81 (1933).—*Rhizopus delemar*, *R. tritici*, *R. tonkinensis*, *R. oryzae*, *R. japonicus* and *R. acidus* produce alc. When they are cultivated in koji water, the first 3 varieties produce more alc. The addn. of CaCO<sub>3</sub> to the koji water increases the yield of the mold, but the addn. of K<sub>2</sub>HPO<sub>4</sub> increases the production of alc. When the aq. ext. of the

mold is added to glucose, the action of zymase is too weak to be noticed.

Y. Kihara  
An unknown factor stimulating the formation of butyl alcohol by certain butyric acid bacteria. E. L. Tatum, W. H. Peterson and E. B. Fred. *J. Bact.* 27, 207–17 (1934); cf. C. A. 27, 1906.—An unknown substance which greatly stimulates the fermentation of corn mash by certain butyric acid bacteria was found in potatoes, yams,

oranges, lettuce, cabbage, alfalfa, soy and navy beans, wheat middlings and malt sprouts. It greatly increases the destruction of starch and increases the production of BuOH 10-fold. Yields of acetone and alc. are not affected. The concn. of the substance varies in different plants. Different strains of bacteria differ in their response to it. It can be purified with ammoniacal Pb(OAc)<sub>2</sub>.

John T. Myers

Butanol-acetone fermentation. IV. Minoru Tsuchiya. *J. Agr. Chem. Soc. Japan* 9, 783-97(1933); cf. *C. A.* 27, 5468. —Molasses was fermented by acetone bacteria in mixts. with more than 2 parts of corn. When the molasses was added during the fermentation, 3.6 parts of molasses could be used for 1 part of corn. Molasses treated with charcoal gave a better yield of acetone. The excess of protein in the materials hindered the fermentation. The addn. of CaCO<sub>3</sub> had a bad effect.

Y. Kihara

Amlyo method of fermentation. II. Kunimoto Muta and Shori Tanaka. *J. Agr. Chem. Soc. Japan* 9, 1239-48 (1933); cf. *C. A.* 26, 5167. —Twenty kinds of molds were examd. to det. their saccharifying powers. Y. K.

The fermentation of citron. C. R. Fellers and E. G. Smith. *J. Bact.* 27, 63(1934).

John T. Myers

An extremely economical sugar fermentation. H. J. Conn and Mary A. Darrow. *J. Bact.* 27, 51-2(1934). —*Bacterium globiforme* and some similar organisms ferment glucose with the formation of large proportions of CO<sub>2</sub> and almost no acid.

John T. Myers

Fermentation without yeast cover. H. Niggemeyer. *Wochschr. Brau.* 50, 153-6(1933). —The procedure described by Hallermann (*C. A.* 25, 4656) and Sailer (*C. A.* 25, 4999) was tried extensively by N. Perforated Al trays having slots as advocated by Hallermann were tried on 3 types of beer (export, lager and Pilsen). A very clean yeast crop was obtained; however, the yeast was found to be very weak. It took 11 days to carry out the first fermentation instead of the usual 8 days. It is assumed that the retarding effect is due partly to CO<sub>2</sub> accumulation and partly to elec. currents (Cu attenuators and Al trays). The effect on export and lager beer was a slight improvement in taste—they were milder. The flavor of the Pilsen beer was greatly altered and considerably improved. The removal of krausen in case of strongly hopped beer gives a pleasant, mildly bitter beverage devoid of harsh-bitter taste.

S. Józsa

Constituents of commercial cider and apple product vinegars. S. L. Crawford and J. M. Ward. *Fruit Products J.* 13, 48-51(1933). —A general discussion of the constituents, analytical data and their interpretation. *Ibid.* 83-4. A continuation of the above-mentioned discussion. *Ibid.* 107-8. The max., min. and av. results of analyses are given of 100 pure cider vinegars of known origin, calcd to 4 g. per 100 cc. acidity. These vinegars were produced by various legitimate manufacturers in the ordinary commercial manner during the years 1924 to 1927 in 9 eastern and central states. The analyses are given to show as clearly as possible the extremes to which various constituents sometimes fluctuate as actually encountered in practice. *Ibid.* 169-71, 174, 187(1934). —Analysis is given of vinegar made from second pressing after some fermentation has ensued. In such vinegars, the solids, non-sugar solids and pentosans are abnormally high, and the polarization is right-handed, with no Pb acetate ppt. Where no appreciable fermentation has taken place, vinegar from second pressings is only slightly above the av. in total solids, non-sugar solids and pentosans, the polarization and lead acetate ppt. being normal. Analyses are given of 3 vinegars produced from apple juice which had been preserved with Na benzoate. Such vinegars are abnormally high in total solids and non-sugar solids, and a high percentage of the total solids will be reducing sugars. This type of vinegar may usually be recognized not alone by the high solids and reducing sugars but by the usual high plus polarization, caused by the *d*-rotary sugars, being more difficult of fermentation in the presence of benzoic acid. Max., min. and av. of analyses are given of 25 evapd. apple product vinegars (waste vinegar) and these data discussed.

F. L. Dunlap

Effect of acid spray on germination. Max. Hamburg. *Brau-Malsind.* 33, 75-8, 127-8(1933). —A criticism of Paula's work (*C. A.* 27, 3028). Gottfried Paula. *Brauer-Hopfen-Zig.* "Gambrinus" 60, 154-7(1933). —Addnl. data supplementing previous work (*C. A.* 27, 3028). S. L.

Protein composition of Austrian barleys of the 1933 crop. W. Rokita and H. Löhner. *Brauer-Hopfen-Zig.* "Gambrinus" 60, 170-1(1933); cf. *C. A.* 26, 4907.

Thirteen samples were analyzed. The total protein content, salt-sol. and alc.-sol. protein varied within the following limits, resp.: 9.36-15.20, 2.59-3.75, 3.01-6.90%, in percentage of total protein the salt-sol. part amounted to 23-37%, and the alc.-sol. to 29.8-45.4%. S. L.

Pericarp and testa of barley and wheat. L. Krause. *Wochschr. Brau.* 50, 209-12(1933). —The study of Grun. (*C. A.* 24, 5930) is extended. Microscopic studies of pericarp and testa were made on a 4-rowed barley, huskless barley and wheat. The pericarp showed an outer cork layer which was missing around the embryo on ordinary barley. The cork layer was defective at the upper tip. The lower part of the brown streak along the ventral canal is sepd. from the embryo only by a cellulosic matter which adsorbs water easily. This is the place where water will enter the grain.

S. Józsa

Malts of the 1933-1934 season. S. Pickholz. *Brau-Malsind.* 33, 154-5(1933).

S. Laufer

The balance of protein and extract in some maltings. E. Ehrlich. *Brauer-Hopfen-Zig.* 73, 571-3(1933). —Lab. malting trials were carried out with 20 barleys of various types. The max., min. and av. values were found for yield of malt 94.19, 87.40, 91.47%; losses due to rootlets 5.44, 2.50, 3.93%; losses due to steeping and respiration 8.45, 2.05, 4.60%; distribution of the barley protein in malt 91.67, 83.69, 87.58%, and in rootlets: 13.66, 7.1, 10.87%; increase in ext. from barley to malt 4.71, 2.20, 3.59%; increase in sol. protein from barley to malt 1.91, 1.276, 1.628%, resp.

S. Laufer

New method for estimating the color of malt. H. Krawawnik. *Wochschr. Brau.* 50, 165-6(1933). —Slight variation in color can be detd. by exposing glass-light paper used in photography to a source of light passing through glass capsules contg. the wort. A standard light source and capsules of exact dimensions are essential. A thickness of 5-10 mm. is suggested. The prints are developed and fixed in the usual way. Standards could be prepared by a central brewing institute lab. and a positive glass printed which could be used at the same time when prints are made from samples; this would exclude errors from the light source and developing.

S. Józsa

Organic bases of "dizake," a kind of sake produced in Kagoshima. Kotaro Nishida and Aritomo Yamada. *J. Agr. Chem. Soc. Japan* 9, 830-4(1933). —Agmatine (nitrate) 1.40 g., betaine (hydrochloride) 0.8 g., hypoxanthine (hydrochloride) 0.6 g., choline (hydrochloride) 4.20 g. and NH<sub>3</sub> 4.73 g. were isolated from 20 l. of "dizake." Arginine could not be found.

Y. Kihara

Determination of colloidal form of protein nitrogen in brewery liquids. II. A. Stádník. *Kvas* 1932, No 12 15; *Chem. Obzor* 8, Abstract sect., 162. —By shaking brewery liquids with active C the colloidal part of the protein substances is adsorbed. The pptg. power increases in the series: tannin < phosphotungstic acid < C. Adsorption by C gives colorless filtrates, facilitating the detn. of formal N. The method is described.

J. K

The stirring of mashies. E. Jalowetz and S. Pickholz. *Brau-Malsind.* 33, 88-91, 101-3(1933). —Lab. and brewery mashies were made with continuous and intermittent, fast and slow stirring, to det. the effect which the type of stirring during mashing has on the compn. of worts and of the resulting beers. The analysis revealed a difference in quality and compn., although the values observed in the brewery were not comparable with those obtained in the lab. The authors attribute the differences which are noted between "directly heated beers" and "steam-heated beers" to the variation in stirring of the mash which is brought about by the 2 different methods of heating; the variation in stirring, in turn, is responsible for the large or small differences in temp. between the edge

and middle of the mash, which obviously will have a decided effect on the compn. of the wort and consequently on the quality of the resulting beer. S. Laufer

**Influence of sulfates and chlorides of alkaline earths in the brewing liquor on the composition of wort.** P. Kolbach and G. Haussmann. *Wochschr. Brau.* 50, 201 (1933).—Gypsum in brewing liquor tends to lower the  $p_H$  of the mash. The effect is similar to that obtained by acidification or decarbonation of the mash. Decarbonation, however, increases the phosphate content whereas gypsum lowers the phosphate content considerably by pptn. No salt is introduced by decarbonation in contrast to gypsum treatment. The permissible amt. of gypsum varies in the opinion of authorities from 30 to 175 g. per hl. Various amts. were tried (0, 25, 50, 100 and 200 g. per hl.). Amts. such as might be used in practice showed no effect. The  $p_H$  value was decreased with increasing  $CaSO_4$  dosage, the phosphate content decreased and the non-coagulable N increased. No effect on the color was observed. Other salts as  $CaCl_2$ ,  $MgSO_4$ ,  $MgCl_2$  and  $Ca$  lactate were tried. The effects were similar except that the Mg salts decreased the  $p_H$  value only slightly. S. Józsa

**Sugar estimation in wort and beer by means of Fehling solution.\*** E. Rothenbach. *Wochschr. Brau.* 50, 189-91 (1933).—Incorrect calcn. is responsible for differences in results of detns. at different labs. (cf. Laster, C. A. 27, 4501). Pavlovski's method and calcn. (Die Brautechnischen Untersuchungsmethoden, C. A. 26, 1704) are compared with Laster's (Kjeldahl's). The results are identical. S. Józsa

**Final attenuation determined by composition of wort and not by type of yeast.** G. Isotti. *Wochschr. Brau.* 50, 181-2 (1933).—From various sources 28\* bottom fermentation yeasts, known as high-, medium- and low-attenuating, were tried on 3 worts from 12.6° to 13.1° Balling. The final attenuation (apparent) was practically the same for each sample of yeast. The final attenuation therefore is not detd. by the type of yeast employed but merely by the typical character of the wort. S. J.

**Influence of aluminum on wine.** Josef Schindler. *Vinarski Obsor* 26, 86-8 (1932); *Chem. Obsor* 8, Abstract sect., 166.—Al, especially in combination with other metals, is corroded by contact with alc. beverages; beer and wine cause discoloration of Al and are made turbid by it. Fruit juices contg. more sugar and acids have no effect. J. Kučera

**Removal of beer scale from aluminum, V<sub>2</sub>A steel and other metals.** A. Freymann. *Schweis. Bräu. Rundschau* 44, 13 (1933).—Tests were made with a new prepn. "IST" which is an acid deriv. of  $CaH_2$ , has no  $HNO_3$  and is non-poisonous. This paste yields satisfactory results and eliminates all the difficulties usually encountered with  $HNO_3$ . S. Laufer

**Pitch-coated aluminum chips (for clarification).** Hell. *Wochschr. Brau.* 50, 206-7 (1933).—Eckert's article (C. A. 27, 5886) is criticized on the ground that the comparatively smooth surface of metal foils is likely to be far less effective than wood shavings. The pitch might chafe or splinter from the metal. There are also dangers of infection since the material is not sterile. S. Józsa

**The use of Mammut bio-chips.** W. Rokita. *Brauer-Hopfen-Zig. "Gambrinus"* 60, 124-6 (1933); cf. Fink, C. A. 27, 3773.—Comparative tests with and without bio-chips have demonstrated that the chips, when used in proportion to 10 g. per hl. during primary or secondary fermentation, accelerate fermentation and aging, and generally improve the beer quality. S. Laufer

**Relationship between stability of beer and germ content of the wort; and scheme of systematic sampling of wort for biological investigation.** I. Janensch. *Wochschr. Brau.* 50, 172-5, 177-81 (1933).—The general belief that it is not necessary to have the wort absolutely free from microorganisms when it enters the fermentation vat is criticized. Mere microscopic examn. after fermentation is not sufficient and infection may develop. Sources of infection are described and the most commonly found organisms are listed. J. suggests taking samples at

various parts of the cooler and refrigerator for drop cultures. S. Józsa

**Stabilization of beer and its fermentation.** J. Satava. *Kvas* 1932, No. 28/29; *Chem. Obsor* 8, Abstract sect., 162-3.—Good beers contain less than 1% maltose. J. Kučera

**Determination of oil in compressor air and its influence on head retention (of beer).** H. Siegfried. *Schweis. Bräu. Rundschau* 44, 27-32 (1933).—The air said. with oil is drawn through water from which the oil is extd. with  $Et_2O$  either directly or after coagulation by addn. of Al sulfate. The results obtained by either method differ at the most by 1 mg. per l. from the theoretical value. The main condition for correct detn. lies in obtaining a quant. absorption of the oil from air by water, which is secured by bringing air and water into intimate contact with each other. Compressor, machine and motor oils, and vegetable oils such as olive and peanut oil had practically no effect upon head retention of beer, while animal fats such as butter and lard, and a certain compd. of soap and mineral oil were detrimental to the head of foam. Machine and compressor oils, however, should also be eliminated, since they impart, even when present only in traces, an unpleasant flavor to the beer. S. Laufer

**Growth of yeast and oxygen deficiency.** R. Koch. *Wochschr. Brau.* 50, 169-72 (1933).—According to R. Windisch's investigations the fermentative power of yeast is impaired rather than improved by aeration. The question arises with the introduction of closed wort coolers and closed fermentation vats on the continent. K. finds that moderate aeration at low fermentation temp. is beneficial; however, it becomes injurious when carried to extremes. Aeration is distinctly stimulating at the commencement of fermentation. Yeast was studied in drop cultures in an atm. deprived of  $O_2$ . Reproduction was less than normal for the first 24 hrs. and ceased in 2-3 days. S. Józsa

**Montanin poisoning [in the brewing industry] (Flamm) 11H. Bacterial removal by means of the electrocatadyn process [in the brewing industry] (Krause) 14.**

**Alcohols.** Aktieselskabet Dansk Gaerings-Industri. *Brit.* 401,495, Nov. 16, 1933. See Fr. 745,860 (C. A. 27, 4342).

**Apparatus for obtaining anhydrous alcohol continuously from mashes, worts, spent sulfite liquors, etc., by distillation followed by dehydration.** Adolf Gorhan (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,946,020, Feb. 6. Various details of app. and operation are described.

**Propionic acid fermentation.** Hugh R. Stiles. U. S. 1,948,447, Feb. 6. A fermentable mash contg. sol. carbohydrate material of at least 25% fructose equiv. is subjected to the combined action of mannitol-forming bacteria and propionic acid bacteria, in order to obtain a high proportion of propionic acid. Cf. C. A. 28, 565<sup>5</sup>.

**Butanol-acetone fermentation of carbohydrates.** Miklós Moskovits and Krausz-Moskovits Egyesült Ipartelepék R. T. Hung. 106,787, Aug. 1, 1933. A mash contg. about 7% carbohydrates is fermented; then a mash of twice this concn. ( $1/4$  to  $1/10$  of the vol. of the original mash) is added. Afterward  $1/2$  to  $1/4$  by vol. is added at intervals of 3-6 hrs. until twice the original vol. is reached and this is fermented to a carbohydrate content of about 0.6-1.0%.

**Apparatus for regulating the temperature of fermenting liquids.** Rudolf Horsch. Ger. 589,944, Dec. 18, 1933 (Cl. 6b. 18). Addn. to 540,057 (C. A. 26, 1706).

**Apparatus for utilizing the gases from fermenting liquors.** Ernst Ludwig and Wilhelm Brill. Ger. 589,886, Dec. 12, 1933 (Cl. 6a. 22).

**Fermentation processes.** I. G. Parbenind. A.-G. Brit. 401,284, Nov. 1, 1933. See Fr. 743,530 (C. A. 27, 3775).

**Fermenting distillery mufts.** Gaston Denys. Brit. 401,138, Nov. 9, 1933. Cf. Fr. 730,666 (C. A. 27, 370)

and abstract from *Bull. assoc. chim. suc. dist. (C. A.)* 27, 3773). Derivs. of salicylic acid such as Na,  $\beta$ -naphthol or PhOH salicylates may be used.

Apparatus for cooling and carbonating beer, etc. Fred A. Block. U. S. 1,946,962, Feb. 13. Structural features.

Yeast fermentations. Johannes van Loon. Ger. 581,761, Dec. 13, 1933 (Cl. 65. 16.01). Yeast fermentations are improved by the presence of a small amt. of aromatic acyl peroxide such as benzoyl, toluyl or naphthyl peroxides.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Identification of organic compounds. XIII. L. Rosenthaler. *Pharm. Ztg.* 78, 699-700 (1933); cf. C. A. 27, 5030, 5479.—The properties and reactions of aetbrine (a dialkylaminoacridine), plasmochin (an 8-amino-6-methoxydiethylaminoisoamylquinoline), amatin [1,3,4-C<sub>6</sub>H<sub>3</sub>Me(OAc)CO<sub>2</sub>H], butolan (PhCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OOCNH<sub>2</sub>), and perabrodil (diethanolamine 3,5-diiodo-4-pyridone-1-acetate) are described. B. C. A.

The alkaloids of white hellebore. I. Isolation of constituent alkaloids. Kojiro Saito, Harusada Suginome and Michio Takaoka. *Bull. Chem. Soc. Japan* 9, 15-23 (1934).—The only cryst. alkaloid obtained from *Veratrum grandiflorum* Loes. fil. is jervine, colorless needles contg. 2 mols. H<sub>2</sub>O from dil. alc., m. 240-1°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> -177.5° (abs. alc.); hydrochloride, crystals from dil. alc. contg. varying amts. of alc. and H<sub>2</sub>O all m. about 308°; unstable acetate, m. 234-8°, [ $\alpha$ ]<sub>D</sub><sup>25</sup> -126.8° (abs. alc.). H. A. Beatty

Sage oils. Victor G. Fourman. *Drug and Cosmetic Ind.* 34, 121, 152 (1934).—A discussion. H. M. B.

Volatile plant constituents. I. Atlanton, the aromatic principle of true cedar-wood oil. Alexander St. Pfau and Pl. Plattner. *Helv. Chim. Acta* 17, 129-57 (1934).—*Atlas cedar oil* with the consts.: d<sub>4</sub> 0.9485, n<sub>D</sub><sup>20</sup> 1.5162, [ $\alpha$ ]<sub>D</sub><sup>20</sup> +51° 04', sol. in 7 vol. 90% EtOH, distd. at ordinary pressure yielded some (Me)<sub>2</sub>CO; 1 kg. fractionated (10 mm.) yielded the fractions: (A) 80-122°, (B) a sesquiterpene fraction, 124-32°, (C) 139-56°, and (D) sesquiterpene alcs. and ketones, 157-9°. (A) after repeated distn. (10 mm.) yielded a ketone (1%) C<sub>15</sub>H<sub>14</sub>O, b. 82-4°, d<sub>20</sub> 0.9495, n<sub>D</sub><sup>20</sup> 1.4831, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -0° 14' (semicarbazone, m. 163°); (B), equal about 50% of the original oil, distd. over Na yielded cadinene (dihydrochloride, m. 116-7°), (C) upon further distn. yielded sesquiterpenes; (D) (30% of the oil) fractionally distd. in an atm. of N yielded middle fractions, b. (1 mm.) 120-1°, d<sub>20</sub> 0.9803, n<sub>D</sub><sup>20</sup> 1.513-23, [ $\alpha$ ]<sub>D</sub><sup>20</sup> +4° to 8°; upon exposure to the air the d. and  $\alpha$  rose rapidly. Analysis: C= 81.02-81.67, H= 10.11-10.81; formylation showed an alc. content of 12.8% (calcd. as C<sub>15</sub>H<sub>22</sub>O); titration with hydroxylamine, a ketone content of 27% (calcd. as C<sub>15</sub>H<sub>22</sub>O). Further examn. showed the alcs. to be a mixt. of bi- and tricyclic sesquiterpene alcs. Ketones sepd. by semicarbazide yielded atlanton (E), C<sub>15</sub>H<sub>22</sub>O, mixed with a ketone, C<sub>15</sub>H<sub>22</sub>O<sub>2</sub>. (E) when subjected to a series of reactions was shown to be a mixt. of 2 ketones which were designated

as  $\alpha$ -atlanton, CH<sub>3</sub>.CH:CMc.CH<sub>2</sub>.CH<sub>2</sub>.CHCMc:CHCO-

CH:CMc<sub>2</sub>, and  $\gamma$ -atlanton, CH<sub>3</sub>.CH:CMc.CH<sub>2</sub>.CH<sub>2</sub>.C:CMcCH<sub>2</sub>COCH:CMc<sub>2</sub>, which is converted upon sapon. with splitting off of 1 mol. Me<sub>2</sub>CO into 9-acetyldipentene and 9-acetylterpinolene which upon further sapon. produces 1-methyl-4-acetylcyclohexene (F) with a loss of 1 mol. Me<sub>2</sub>CO. The latter reaction tends to prove that (F) does not occur as such in plants but is formed by steam distn. of the oil from plant material. Studies on the oils obtained from the wood of Himalaya and Lebanon cedars substantiates the above conclusion that (E) is the aromatic principle in these oils. H. M. B.

The green color of olive oil. L. Nobile. *Boll. chim. farm.* 72, 649-50 (1933).—Decided green color in olive oil is usually due to fermentative processes producing rancidity; adulteration with refined S oils, or to traces of Cu. The Cu is frequently present as stearate.

Lewis W. Butz

The green coloration assumed by camphorated olive oil.

Dino Pontc. *Boll. chim. farm.* 72, 953-5 (1933) Camphorated olive oil made with synthetic camphor becomes green after a time, especially after sterilization. The same product made from natural camphor does not. The green color is due to Cu. Lewis W. Butz

Guaiacol cinnamate. A. Angeletti and U. Gallo. *Giorn. farm. chim.* 82, 361-4 (1933).—Guaiacol cinnamate m. 142°. Guaiacol and cinnamic acid did not form addn. compds. eutectic was observed at 25° corresponding to 94.5% guaiacol. Lewis W. Butz

The detection and determination of guaiacol in the presence of eucalyptole. Dino Pontc. *Giorn. farm. chim.* 82, 365-9 (1933).—In olive oil soln.: Steam-distill a mixt. consisting of 5 cc. of the oil soln., 25 cc. H<sub>2</sub>O and 3-4 drops concd. H<sub>2</sub>SO<sub>4</sub>, collect 250 cc. of distillate, acidify with 2-3 drops concd. H<sub>2</sub>SO<sub>4</sub>, and ext. repeatedly with Et<sub>2</sub>O. Evap. the Et<sub>2</sub>O on a water bath and make alk. with 10% NaOH when the guaiacol dissolves, leaving the eucalyptole. The guaiacol is then isolated by acidification followed by extn. with Et<sub>2</sub>O. In sirups: The sample (15-20 g.) is heated on a water bath to remove EtOH. The remainder of the procedure is as described above. Lewis W. Butz

Carrel-Dakin solution. The solution of sodium hypochlorite—formulas for correction of tables. Carlo Stelfeld. *Tribuna farm.* 2, 59-60 (1934); cf. C. A. 21, 431; 26, 542.—In the prepn. of Dakin's soln. 25% of "available" Cl<sub>2</sub> in the CaOCl<sub>2</sub> has long been regarded as standard. Recent advances have greatly increased this percentage. Instead of using a table to obtain the amt. of the ingredients when the CaOCl<sub>2</sub> varies the following formula is given: (25)(184)/N = X, where N is the actual percentage of "free" Cl<sub>2</sub> and X is the required wt. of CaOCl<sub>2</sub> to prep. a standard soln. From X the relative quantities of NaHCO<sub>3</sub> and Na<sub>2</sub>CO<sub>3</sub> may be easily calcd. Because the French trade calcs. available Cl<sub>2</sub> in 1 pr 1000 g. CaOCl<sub>2</sub>, each 1. a "degree," appropriate conversion formulas are also given. G. H. Conant

The discoloration of a solution of sodium salicylate and sodium bicarbonate in water. M. Beukema-Goudsmut. *Pharm. Weekblad* 71, 196-201 (1934).—The development of color in a soln. contg. Na salicylate + NaHCO<sub>3</sub> occurs only in the presence of free O<sub>2</sub>, and is independent of the pH value. The HCO<sub>3</sub><sup>-</sup> ion is an important factor in the reaction. Very small quantities of Cu can completely suppress the color formation. A. W. Dow

The keeping of and keeping properties of citrus oils. Polaks Fruital Works. *Spice Mill* 57, 169-9 (1934) The effects of light, temp., moisture, and contact with air and metals are briefly reviewed. Sn and Al are not harmful, but the latter is corroded by citrus oils. The common antioxidants are ineffective. Removal of turpenes and diln. with 5 to 10% EtOH are the most effective means of preservation. L. W. Elder

Science and practice in the druggist's shop. H. Wajahn. *Apoth. Ztg.* 49, 181-3 (1934).—An address. W. O. E.

Preparation of a rectal suppository containing digitalis extract. H. Eschenbrenner. *Apoth. Ztg.* 49, 189-92 (1934).—A suitable suppository contg. the active ingredients of digitalis is fully discussed, and a procedure for its prepn. suggested. W. O. E.

Importance of the biological evaluation of drugs. K. W. Merz. *Apoth. Ztg.* 49, 206-10 (1934).—An address. W. O. E.

Propane as fuel in drug laboratories. Walter Meyer. *Apoth. Ztg.* 49, 223 (1934). W. O. E.

**New constants for drugs and galenicals. II. Copper values of drugs in the Supplement to the D. A.-B. V. 1930.** Jul. Aug. Müller. *Pharm. Zentralhalle* 75, 81-6(1934); cf. C. A. 26, 5173.—The Cu values of some 150 drugs and galenicals have been detd. and tabulated.

W. O. E.

**Estimation of animal lipoids and their constituents.** Herbert Patzsch. *Pharm. Zentralhalle* 75, 98 102, 116-20 (1934).—The methods are especially suited to the needs and facilities of the pharmaceutical lab., and based on Abelin's work, *Z. anal. Chem.* 94, 439-64(1933). Twenty-four references.

W. O. E.

**Diacylation of cinchona tincture and extract.** H. Breddin. *Pharm. Ztg.* 79, 148-9(1934).—An illustrated article showing the app. for diacylating the 2 preps. in connection with a pertinent commentary.

W. O. E.

**Diacylation of cinchona fluidextract.** H. Breddin. *Pharm. Ztg.* 79, 163-5(1934).—The previous work (preceding abstr.) is discussed and data are presented on the diacylation of this fluidext.

W. O. E.

**New drugs and pharmaceutical specialties in the 4th quarter of 1933.** F. Zernik. *Süddout. Apoth.-Ztg.* 74, 97-9(1934); cf. C. A. 28, 567<sup>a</sup>.

W. O. E.

**Photochemistry of cod-liver oil.** J. Howard Graham. *Am. J. Pharm.* 106, 44-56(1934).—From the tabulated results there appears to be no conclusive evidence of consistent correlation among the sapon., I, and free acid values. Variations of air, moisture, light and temp. conditions seem to preclude any possibility of close correlation. A realization of the complexity of the chem. nature of cod-liver oil is further emphasized. On considering the 2 generally used tests for rancidity, the Hager-Salkowski would seem to be more preferable to the Kreis in detg. the relative freshness of an ordinarily handled cod-liver oil. Even with the first-mentioned test, the purplish blue obtained with the specimens of fresh oil will continue to appear, for periods up to 35 days, but whereas the color lasts at first for approx. a second, the purple color becomes ever more evanescent as the days increase. A bibliography is appended.

W. G. Gacssler

**Notes on the assay of strychnine alkaloid in strychnine sulfate tablets.** Florin J. Amrhein. *Am. J. Pharm.* 106, 57 8(1934).—By altering the official method, to remove all of the mineral oil, better results were obtained by the following modified method: Weigh 25-100 tablets and transfer directly to a separatory funnel. Add 20 cc. of water to disintegrate the tablets followed by 1-2 cc. of 10%  $H_2SO_4$ . After complete disintegration has been effected ext. twice with two 25-cc. portions of  $CHCl_3$  to remove the fat. Then make alk. with dil.  $NH_4OH$  (1 + 2). Ext. 5 times with  $CHCl_3$ , using 25-, 20-, 15-, 10- and 5-cc. portions, resp., or until the alkaloid is completely removed. Combine the first 2 extns. in a second separatory funnel into the stem of which has been inserted a pledget of absorbent cotton wet with  $CHCl_3$ . Wash with 5 cc. of water contg. a drop of dil.  $NH_4OH$  (1 + 2). When clear, filter the  $CHCl_3$  portion into a small beaker. Wash each successive  $CHCl_3$  ext. with the same wash water and filter in a similar manner into the main portion, finally washing the outer surface of the stem of the separatory funnel with a few cc. of  $CHCl_3$  and adding this also to the main portion. Evap. on a steam bath, removing the beaker from the bath at 3-5 cc. and allow final evapn. to take place in a current of air to prevent decrepitation as the last portions evap. from the beaker. Add 2-3 cc. of neutral alc., cover beaker, and warm on a steam bath to dissolve the residue. Add a few drops of methyl red indicator and titrate with 0.02 N acid to a faint pink color. Add 50 cc. of recently boiled water and continue the titration with 0.02 N acid to a faint red color. (One cc. 0.02 N acid is equiv. to 6.684 mg. of strychnine  $(C_{21}H_{27}O_2N_2)$ , or 8.565 mg. of strychnine sulfate  $(C_{21}H_{27}O_2N_2)_2 \cdot H_2SO_4 \cdot 5H_2O$ , or 7.944 mg. of strychnine nitrate  $(C_{21}H_{27}O_2N_2) \cdot HNO_3$ ). Control analyses were run by means of the regular A. O. A. C. method and it was found that the results obtained varied from  $1/100$  to  $1/10$  of a grain for

the  $1/100$  grain tablet and for the  $1/10$  grain tablet the assay would indicate that it was a  $1/100$  grain tablet.

W. G. G  
**Digitalis purpurea and D. lanata.** A. Pfister. *Anales quim. farm. (Chile)* 3, 1-7(1934).—The chemistry of the active principles is briefly reviewed.

L. E. Gilson  
**International standard for the estrogenic hormone.**

C. Lormand. *Bull. soc. chim. biol.* 15, 1566-8(1933).—The international comm. adopted the hydroxyketone form of the estrogenic hormone from gravid urine as the international standard. The international unit is 0.1  $\gamma$  (approx.  $1/2$  rat unit).

L. E. Gilson  
**Formula and preparation of sirup of terpinol hydrate.** J. R. Machado and J. Sonol. *Rev. facultad cienc. quim. (Univ. La Plata)* 8, Pt. 2, 7-14(1933).—A stable prepn. which does not ppt. when diluted consists of terpinol hydrate 1, EtOH 20, glycerol 20 and simple sirup 60 parts. Other formulas collected from various sources are discussed.

L. E. Gilson  
**The chemical composition of cigarettes and cigaret tobacco leaves of the aromatic and nonaromatic types.** F. T. Adriano, C. G. Ramos and R. A. Isidro. *Philippine J. Agr.* 4, 87-97(1933).—Comparative analyses for moisture, ash, sand, N, nicotine, starch and  $H_2O$ -sol. sugars are given on 5 brands of cigarettes which are imported to the Philippines, 8 Philippine-made aromatic brands, 18 typical brands and 18 varieties of cigaret tobacco leaves.

John O. Hardesty  
**The analysis of aromatic tincture of iron with arsenic.** Miloš Melichar. *Časopis Českoslov. Lékařnictva* 13, 321 7(1933).—To det. EtOH, sucrose, As and Fe on one sample, the EtOH is removed by distn.,  $Fe(OH)_3$  and  $NH_4MgAsO_4 \cdot 6H_2O$  are pptd. together, the mixt. is filtered and sucrose detd. polarimetrically in the filtrate. To the ppt. HCl is added, As is distd. off as  $AsCl_3$  and detd. by titration with  $KBrO_3$ , while Fe remains and is detd. iodometrically.

William J. Husa  
**The testing of sirup of raspberry.** J. Šterba-Böhm. *Časopis Českoslov. Lékařnictva* 14, 14(1934).—To 5 g. of sirup is added about 5 g. of satd. soln. of  $K(SbO) \cdot C_2H_4O_4$ . A strip of filter paper is partially immersed in the liquid for 1-3 hrs., then carefully washed and dried at room temp. With an authentic sirup the paper is colored grayish, sometimes having a barely perceptible pink tinge; a reddish color shows adulteration with other fruits or dyes.

William J. Husa  
**Fowler's solution. I. Chemical composition.** Axel Jernstad & Ottar Østby. *Norg. Apotekerforen. Tids.* 41, 187 90(1933). See C. A. 28, 258<sup>a</sup>.

H. C. M. I.  
**Misbranded livestock and poultry remedies.** H. E. Moskey. *Cornell Veterinarian* 23, 98-109(1933).—An address relating to the work of the U. S. Food and Drug Administration.

K. D. Jacob  
**Body weight and dosage in the assay of digitalis with frogs.** Behrend Behrens and Ernst Reichelt. *Z. ges. expl. Med.* 91, 417 23(1933).—The same dose of strophanthin per g. of body wt. produced wide variations of the mortality rate between different wt. classes of frogs. It is recommended that the same dose be given to all frogs regardless of wt. and that the permissible wt. limits be narrowed for the assay of digitalis.

Milton Levy  
**Practical tests of Dakin solution.** Dulcideo T. de Lacerda. *Tribuna Farm. (Brazil)* 2, 39-40(1933).—In prepg. Dakin soln. it is important that the  $CaCl_2$ , from which the  $NaOCl$  is eventually prepared, have an active Cl content of not less than 20%. A titration method is described for detg. the Cl content of the  $CaCl_2$  and of the prepd. Dakin soln.

M. McMahon  
**Sodium cacodylate. Criticism of some reactions contained in the French Pharmacopea 1908.** François Martin. *Bull. sci. pharmacol.* 41, 21-8(1934).—The reaction of a soln. of  $Me_3AsO_3Na$  against phenolphthalein depends on the concn. of the salt as well as of the indicator. A soln. of the pure salt is alk. Only preps. contg. free acid meet the requirements of the pharmacopea. The test for monomethylarsinate with  $HgCl_2$  is pos. in the neutral salt even in the absence of any impurity, a ppt. of  $Hg_2OCl_2$  being formed. The test with  $AgNO_3$  is

unreliable also, as it reacts with unimportant impurities and also with the absolutely pure salt itself. These tests should be substituted by the detn. of the monomethylarsinate with HI.

A. E. Meyer  
Azochloramide, a new selective chlorine compound. Frans C. Schmelkes, Henry C. Marks, Isabelle B. Romans, Elizabeth S. Horning and Albert F. Guiteras. *J. Bact.* 27, 26-7 (1934).—There was no reaction between azochloramide (*N,N*-dichloroazodicarbonamidine) and a series of amino acids and little with cystine, which is in striking contrast to hypochlorite solns. It is highly bactericidal and highly stable in body fluids. J. T. M.

The pneumococcal powers of sodium oleate and sodium ricinoleate. L. A. Barnes and Charlotte M. Clarke. *J. Bact.* 27, 107-8 (1934).—Na ricinoleate, 0.004% and Na oleate, 0.0004% are approx. the minimal pneumococcal concns. of these soaps. John T. Myers

Ultra-violet absorption and Lovibond unit of vitamin A-containing oils and fats. B. Josephy. *Acta Brevia Neerland. Physiol., Pharmacol., Microbiol.* 3, 133-5 (1933).—The Lovibond values of cod-liver oil, halibut-liver oil, sheep-liver oil and certain other oils and fats contg. vitamin A agree with the ultra-violet absorption at 3280 Å. after sapon., with a mean error less than 5%. Cholesterol must be removed from the unsaponifiable fraction before measuring absorption. J. C. M.

The detection of petroleum in ethereal oils. J. Zimmermann. *Chem. Weekblad* 31, 132-3 (1934).—The oil is distd. *in vacuo* (24-28 mm.) with the Widmer app. (cf. C. A. 18, 1009). The first fraction, b. 10-15°, is treated with concd. H<sub>2</sub>SO<sub>4</sub>. When petroleum is present a clear layer is obtained with  $n_D^{20}$  1.42-1.45, whereas other products from the action of H<sub>2</sub>SO<sub>4</sub> on ethereal oils have a  $n_D$  of at least 1.48. With oils, e. g., turpentine, with fractions distg. below the above temp. the distn. is first carried to 20° and the fraction following this to the end of the distn. is used for the treatment. E. Schotte

The early history of digitalis. A. John Schwarz. *J. Tenn. Acad. Sci.* 8, 358-61 (1933).

A. L. Taylor  
Preparation, toxicity and absorption of bismuth compounds. V. Bismuth compounds of catechol, pyrogallol and gallic acid. W. M. Lauter, A. E. Jurist and W. G. Christiansen. *J. Am. Pharm. Assoc.* 22, 531 4 (1933); cf. C. A. 27, 4026.—Na Bi gallate is a yellow powder; it contains 51.52% Bi and some Na Bi digallate; Na Bi digallate is a yellow powder, has 59.7% Bi and some Na Bi gallate; Na Bi Me gallate is a yellow powder and has Bi 49.56%. Bi pyrogallate is a yellow solid; it has Bi 59.24% (theory 59.7%). Bi catecholate is a yellow powder, insol. in NaOH soln. but sol. in HCl. The compds. in aq. or oil suspension were injected intramuscularly into albino rats. The absorption was detd. by estn. of the unabsorbed Bi remaining at the site of injection. The toxicity was estd. from growth curves. Na Bi digallate is much less toxic than Na Bi gallate. The absorption is not satisfactory as compared with the tartrates and mucates. The absorption and toxicity of Na Bi digallate and Na Bi Me gallate are about the same. The H<sub>2</sub>O solns. are unstable. Although the toxicity of these compounds is low, their slow and incomplete absorption renders them of doubtful utility in therapy. L. E. W.

A new field of investigation in pharmacognosy: the microscopy of glandular products. Heber W. Youngken and Allan W. Reed. *J. Am. Pharm. Assoc.* 22, 1215-18 (1933).—The products studied were fresh and preserved pituitary whole gland and anterior and posterior lobes, whole ovary, corpus luteum, desiccated strips of these and powd., desiccated products specially prepd. from the mentioned materials. Cattle and hogs yielded the products. The descriptions of the reagents and technic as well as the microscopic characteristics of the several products are given. L. E. Warren

Biochemistry and the manufacture of fine chemicals. F. H. Carr. *Chemistry and Industry* 1934, 113-28.—A discussion of the manuf. and applications of some biochem. substances for medical use, including hormones, vitamins, insulin, thyroglobulin, adrenaline, glutathione and sterols. Julius White

1 Test for penetration of petrolatum (Anon.) 22. Cleansing compn. for use as a shampoo (U. S. pat. 1,946,372) 18. Cyclic cyano ketimides and ketones [products as intermediates for perfumes] (Ger. pat. 591,260) 10 Alkylolamine deriva. of aliphatic acids [antiseptics] (U. S. pat. 1,946,079) 10.

Kroeber, Ludwig: Das neuzeitliche Kräuterbuch. Die Arzneipflanzen Deutschlands in alter und neuer Betrachtung. Stuttgart: Hippokrates-Verlag. 448 pp. M. 15.

Jahresbericht der Pharmazie. Jg. 67, 1932. Issued by "Standesgemeinschaft Deutscher Apotheker vorm. Deutscher Apotheker-Verein." Edited by Carl A. Rojahn and S. M. v. Bruchhausen. Göttingen: Vandenhoeck & Ruprecht. 431 pp. M. 24; cloth, M. 26.50.

3 Medical compositions comprising oil and an acidic organo-mercuri compound. Edgar B. Carter and Edmond E. Moore (to Abbott Laboratories). U. S. 1,947,519, Feb. 20. See Brit. 393,102 (C. A. 27, 5895).

Stable injection solutions. Chemisch-Pharmazeutische A.-G. Bad Homburg. Ger. 589,730, Dec. 14, 1933 (Cl. 30k. 2). Addn. to 564,992 (C. A. 27, 1092). The method of 564,992 for producing stable oily solns. of alkaloid salts for injection purposes is modified by using alcs. contg. at least 6 C atoms in the mol., such as octyl, decyl, benzyl alc., etc., to dissolve the salts before adding them to the oil. Thus, quinone-HCl is dissolved in octyl alc. and the soln. then added to olive oil.

Material for lowering blood pressure. Sankyô K. K. (Masao Doki, Tôkichi Miyoshi and Kôkichi Kaluta, inventors). Japan. 99,519, Feb. 14, 1933. Dried and fat-free yeast is decompd. with H<sub>2</sub>SO<sub>4</sub> or HCl under pressure. The product is neutralized with Ba(OH)<sub>2</sub> or lime and impurities are pptd. with AgNO<sub>3</sub> and Pb acetate. The soln. is neutralized with NH<sub>4</sub>OH. The ppt. is dissolved in warm water, treated with H<sub>2</sub>S and the filtrate is concd. to give a material that lowers blood pressure.

Iodine preparations. John C. Harry. Fr. 756,634, Dec. 13, 1933. See U. S. 1,896,171 (C. A. 27, 2533)

Alkaloids. Franz Köck and Franz Messner. Austrian 136,144, Jan. 10, 1934 (Cl. 30f.). Vegetable material contg. alkaloids are fermented, after addn. of sugar or other fermentable substance if necessary. The liquid fermentation products are sepd. and distd., and the alkaloids then recovered from the distn. residue. An example is given in which coffee beans are boiled with dil. HCl and the mixt. is neutralized, treated with sugar, and fermented with yeast under weakly alk. conditions to yield an alk. soln. contg. caffeine.

7 Lobelia alkaloids. Heinrich Wieland (to C. H. Boehringer Sohn). U. S. 1,946,345, Feb. 6. The inactive or but slightly active lobelanidine, which is present in lobeline mother liquors, may be converted into lobeline and lobelanine by oxidation (suitably by use of a permanganate or MnO<sub>2</sub> with dil. H<sub>2</sub>SO<sub>4</sub> soln., by chromic acid in HOAc soln. or by electrolysis). Various examples with details of procedure for the prepn. of the hydrochloride of norlobelidine, etc., are given.

8 Alkaloidal preparations of opium. Paul Casparis and Kurt Siegfried. U. S. 1,947,330, Feb. 13. For producing a prepn. of opium which is almost entirely free from ballast matter and contains a quantity of each of the alkaloids of opium, morphine and narcotine are first sepd. from an opium soln. by use of NH<sub>3</sub> and the other alkaloids are extd. from the mother liquor by use of CHCl<sub>3</sub>.

9 Theobromine and theophylline derivatives. Franz Wratschko. Austrian 135,890, Dec. 11, 1933 (Cl. 12a.). Equimol. amts. of salicylic acid, theobromine or theophylline, and Ca(OH)<sub>2</sub> or Sr(OH)<sub>2</sub> are brought together in water or an org. solvent. Mol. compds. of therapeutic value are obtained. Examples are given.

Berberine salt. Shigeru Mizuno and Kuni'ichi Yoshida. Japan. 99,230, Jan. 23, 1933. Vegetable material contg. berberine extd. with hot furfurole. The

ext., after distn. of the solvent, is mixed with hot water and treated with ether. Berberine-HCl is obtained from the aq. layer.

**Compounds, of aspidinofilicine.** C. F. Boehringer & Soehne G. m. b. H. (Fritz Johannessohn and Hans Hatzig, inventors). Ger. 589,780, Dec. 15, 1933 (Cl. 12p. 12). Aspidinofilicine is treated with cinchonidine or other quinine bases. The products have pharmaceutical uses.

**7-Iodo-8-hydroxy-5-quinolinesulfonates of benzylisoquinoline derivatives.** Chinoin Gyóg- és Vegyszeti Termékek Gyára R. T. Hung. 106,906, Aug. 1, 1933. These salts, obtained directly by action of the acid on derivs. of benzylisoquinoline, have high therapeutic value.

**Isacen.** Sankyó K. K. (Ryûji Takamoto, inventor). Japan. 99,024, Jan. 13, 1933. Isacen, m. 244°, is prepd. by agitating a mixt. of 3,3-bis(*p*-hydroxyphenyl)oxindole and  $\text{Ac}_2\text{O}$  in a current of HCl gas without heating.

**Isacen.** Sankyó K. K. (Ryûji Takamoto, inventor). Japan. 99,025, Jan. 13, 1933. Isacen is prepd. by acetylating 3,3-bis(*p*-hydroxyphenyl)oxindole with  $\text{Ac}_2\text{O}$  or  $\text{AcCl}$  in presence of an unstable metallic chloride which evolves HCl on contact with  $\text{H}_2\text{O}$ .

**Isacen.** Dai Nippon Seiyaku K. K. (Shigenobu Inagaki, inventor). Japan. 100,349, March 30, 1933. By heating 3,3-dichlorooxindole and phenyl acetate at 80–95° for 19 hrs. without catalyst, isacen, m. 242°, is prepd. It is recrystd. from phenyl acetate.

**Styptic.** Meigyô Saitô. Japan. 99,442, Feb. 8, 1933. The fresh marrow and bone tissue of birds and mammals are crushed and treated with org. solvents. The residue is extd. with pure water at 60°. Proteins are pptd. with sulfosalicylic acid, the soln. is neutralized with  $\text{CaCO}_3$  and a styptic is obtained from the filtrate.

**Solid material containing vitamins A and D.** Isamu Hayashi. Japan. 99,171, Jan. 25, 1933. Fish oil (especially cod-liver oil) is decompd. with lipase, and  $\text{CO}_2$  is introduced under pressure; by this means fatty acid contg. vitamins A and D is sepd. The product is neutralized with  $\text{Ca}(\text{OH})_2$  or  $\text{Mg}(\text{OH})_2$  and is dried at a low temp. and a low pressure.

**Vitamin-enriched oil.** The Head of the Tokyo Kôgyô Shikunjo (Yasuyuki Toyama, Tomotarô Tsuchiya and Tokuzô Ishikawa, inventors). Japan. 100,471, Apr. 7, 1933. By heating a mixt. of sliced fish liver and an oil (such as olive oil, colza oil) at below 100°, an oil rich in vitamin A is obtained.

**Vitamins from saponifiable oils.** Walter O. Snelling. U. S. 1,947,315, Feb. 13. A mixt. of an oil such as a fish-liver oil and pentane or the like is heated with an aq. non-alc. soln. of a caustic alkali and the resulting product further treated for vitamin concentrate recovery.

**Preserving vitamin-containing fish-liver oils.** \*Ralph C. Huston and Howard D. Lightbody (to State Board of Agriculture of Mich.). U. S. 1,947,432, Feb. 13. A small proportion of hydroquinone is added as a stabilizing agent. Pyrocatechol, resorcinol, pyrogallol or phloroglucinol also may be used.

**Hormones.** Schering-Kahlbaum A.-G. Brit. 401,205, Nov. 9, 1933. See Ger. 584,143 (C. A. 28, 262°).

**Hormones.** Soc. pour l'ind. chim. à Bâle. Brit. 401,574, Nov. 16, 1933. The hormone of the corpus luteum is concd. by treating a soln. thereof in a solvent

1 immiscible with  $\text{H}_2\text{O}$ , e. g.,  $\text{CS}_2$ , petroleum ether,  $\text{C}_6\text{H}_6$ , PhMe,  $\text{AcOEt}$ , with 1 or more adsorbing agents, e. g., fuller's earth, alumina, kieselsuhr, silica gel,  $\text{CaCO}_3$ , C, kaolin, and extg. the hormone from the adsorbent with an org. solvent, e. g.,  $\text{Et}_2\text{O}$ , MeOH, EtOH,  $\text{Me}_2\text{CO}$ ,  $\text{CHCl}_3$  or a mixt., e. g., of MeOH and petroleum ether, at raised temp. Evapn. of the solvent leaves the product in solid form or as a liquid which solidifies on standing.

2 **Pancreas preparation containing agents which neutralize the toxic influence of the substances of the thyroid gland.** József Baló and Albert Szent-Györgyi. Hung. 107,882, Jan. 2, 1934. Acid or alk. hydrolysis is applied during the process.

**Antiseptics.** Cherg. pharm. Fab. Hubold & Bartsch. Ger. 580,972, Dec. 22, 1933 (Cl. 12q. 12). Addn. to 502,392 (C. A. 27, 4350). The process of Ger. 502,392 is modified by using 2,4-diaminoazobenzene instead of its mono-HCl salt.

3 **Surgical sutures.** Paul Bost. Brit. 401,449, Nov. 16, 1933. Addn. to 274,493 (C. A. 22, 2244). Threads for surgical sutures or fabrics are prepd. from muscle fibers as in 274,493 except that no special precautions as to sterility are observed and the step of tanning in formalin is omitted. The threads so formed are sterilized by boiling in an alc. soln. of  $\text{HgCl}_2$  or by steeping in an aq.  $\text{HgCl}_2$  soln.

4 **Vulnary plasters.** Eugen Sander. Fr. 756,918, Dec. 18, 1933. A polymerizate of an unsatd. org. compd., preferably polyacrylic acid which is transparent, is used for making plasters.

**Medicinal baths.** Prosper Joseph Auguste Georges Demarty. Ger. 591,173, Jan. 17, 1934 (Cl. 30k. 11). Compos. to be immersed in bath water are prepd. by molding a mixt. of Portland cement, powd. Al, and a sludge of radioactive minerals into hollow porous briquets, the hollows of which are then filled with a salt mixt. which evolves  $\text{CO}_2$  when treated with water.

5 **Toilet powder.** Yushichi Nishizawa. Japan. 100,525, Apr. 11, 1933. A toilet powder consists of  $\text{ZnS}$  contg. some  $\text{Mg}(\text{NO}_3)_2$ ,  $\text{KNO}_3$ ,  $\text{NH}_4\text{NO}_3$ , perborates, persulfates and peroxides of Ca or Mg, nitric esters and perboric esters.

**Generating heat for permanent hair waving.** Ralph L. Evans. Brit. 400,943, Oct. 30, 1933. See U. S. 1,894,032 (C. A. 27, 2263) and U. S. 1,919,090 (C. A. 27, 4882).

**Pomades.** Gerhard Kohn. Fr. 757,146, Dec. 20, 1933. Finely divided medicaments which are insol. or nearly insol. in water are incorporated in pomades by dissolving them 1st in org. solvents insol. in water and then emulsifying the solns. in water, using resins as emulsifying agents.

7 **Disinfectants.** Edouard O. Ornfeldt. Fr. 757,040, Dec. 19, 1933. Mineral oils are made semi-solid by treatment with soap powder and a mixt. of beeswax and paraffin, and then mixed with thickeners, such as starch and talc. The products are used for disinfecting and for the destruction of parasites.

**Treating tobacco to prevent irritant action in smoking.** Werner Pettersson. Ger. 509,244, Jan. 27, 1934 (Cl. 79c. 1). In addn. to the substance specified in C. A. 28, 1474, tobacco may be treated with an ethoxydiaminoacridinium chloride, or the K salt of the sulfuric ester of 2-hydroxyquinoline.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

The action of dilute hydrochloric acid on phosphorites. V. Ya. Anosov and V. F. Ust-Kachintzev. *J. Applied Chem.* (U. S. S. R.) 6, 228–38 (in German 238–9) (1933).—The action of dil. HCl on apatite from Khibinsk and on phosphorites from Vyatka, Saratov, Ural, Morocco and Aktyubinsk was studied. The degree of decompn. varies with the origin of the phosphorites. It amounts to 92.23–80.1% for a 5% HCl and 89.96–70.3% for 1% HCl.

An increase of the temp. from 18° to 100° raises the soly. by 1.6 to 22.9%. It is recommended to use an amount of HCl that would convert the total Ca present in the phosphorite into  $\text{CaCl}_2$ . The concn. of the  $\text{P}_2\text{O}_5$  in the ext. increases in proportion to the concn. of the applied acid. When HCl of a concn. up to 2–3% is used it can be partially replaced by  $\text{H}_2\text{SO}_4$ . With 50%  $\text{H}_2\text{SO}_4$  replacement of HCl the degree of decompn. is raised. A. A. B.

**Sulfuric acid production by the lead chamber method.** Pietro Guzzeschi. *Industria chimica* 8, 1884-94(1933); cf. C. A. 28, 859.—The math. analysis of the intensive method of prepg. lead chamber acid is completed.

A. W. C.

The salt cake process for the extraction of copper during the roasting of cupripyrates for the manufacture of sulfuric acid. Yagoro Kato and Takeshi Takei. *J. Electrochem. Assoc. (Japan)* 2, 61-4(1934).—When the salt cake in an optimal amt., 1 mol.  $\text{Na}_2\text{SO}_4$  per mol.  $\text{CuO}$ , is added to  $\text{Cu}$  pyrites during roasting to obtain  $\text{SO}_2$  for  $\text{H}_2\text{SO}_4$  manuf.,  $\text{Cu}$  remains mostly in the sol. state, even at the usual max. roasting temp. of  $850^\circ$ . Salt cake accelerates formation of  $\text{CuSO}_4$ ; also it fuses easily with  $\text{CuSO}_4$ , and prevents decompn. of  $\text{CuSO}_4$ , hindering the formation of  $\text{CuO}$  and  $\text{CuO}\cdot\text{Fe}_2\text{O}_3$ . As the natural sequence of this procedure, gases generated during the roasting do not contain any matter harmful to the lead chamber.

K. Konda

**Good and poor catalysts in the preparation of sulfuric acid.** I. E. Adadurov. *J. Applied Chem. (U. S. S. R.)* 6, 193-204(in German 204-5)(1933).—A review and discussion of the literature.

A. A. Bochtlingk

**Purification of the hydrogen used in the synthesis of ammonia by removing hydrogen sulfide with activated carbon.** V. F. Postnikov and I. P. Kirillov. *J. Applied Chem. (U. S. S. R.)* 6, 240-4(1933).—The capacity of the charcoal depends upon the concn. and is expressed by  $K = 5.88 C_0^{0.33}$ , where the coeffs. 5.88 and 0.367 were detd. graphically from the equation  $\log K = \log a + b \log C_0$  in the coordinate system  $\log K = \text{ordinate}$  and  $\log C_0 = \text{abscissa}$ . An increase in the grain of the charcoal lowers its capacity. Expts. carried out on desorption of  $\text{H}_2\text{S}$  by blowing the charcoal with  $\text{H}_2$  and air at  $100^\circ$  and with the use of vacuum restored the activity to 55-65%.

A. A. Bochtlingk

**The volatilization of ammonium bicarbonate.** I. S. Telemov, G. N. Gorshtein and Z. P. Tkachenko. *J. Chem. Ind. (Moscow)* 1933, No. 10, 53-5.—Higher temp. and smaller crystal size increase the volatility of  $\text{NH}_4\text{HCO}_3$ . Mixing it with other solids does not decrease its volatility, but covering the salt with a film of high-boiling liquid does.

H. M. Leicester

**The simultaneous production of calcium carbide and phosphorus.** A. S. Mikulin'ski. *J. Chem. Ind. (Moscow)* 1933, No. 10, 32-7.— $\text{CaC}_2$  prepd. from phosphorite and C usually contains some P. When this  $\text{CaC}_2$  is heated at  $900^\circ$  in  $\text{N}_2$ ,  $\text{CaCN}_2$  free from P is obtained.

H. M. L.

**Potash.** Bertrand L. Johnson. *Bur. Mines Econ. Paper* No. 16, 78 pp.(1933).—Com. statistics are given, followed by a bibliography.

E. J. C.

**Potash and alumina from Georgia shale.** S. L. Madorsky. *Ind. Eng. Chem.* 26, 256-9(1934).—A practically complete sepn. of  $\text{FeCl}_3$  from  $\text{AlCl}_3$  or the chlorides obtained in the  $\text{HCl}$  extn. of Georgia shale can be obtained by heating the mixt. to about  $600^\circ$  in an atm. of  $\text{HCl}$  gas. The  $\text{Al}_2\text{O}_3$  can then be made essentially Fe free by washing with a dil.  $\text{HCl}$  soln. By this method an Fe-free  $\text{Al}_2\text{O}_3$  can be obtained from Georgia shale as well as  $\text{KCl}$  free from Fe and Al.

J. R. Adams

**Artificial dehydration of hydrated salts by means of solar energy.** A. V. Nikolaev, V. M. Vdovenko and P. F. Pokhil. *Compt. rend. acad. sci., U. R. S. S. [N. S.]*, 1, 25-6(in English 26-7)(1934).—Films of kerosene, etc., on water exposed to sunlight cause a decrease in evapn. and a rise in temp. Said. solns. of  $\text{Na}_2\text{SO}_4\cdot 10\text{H}_2\text{O}$ , exposed to summer sunlight at Kulunda, Western Siberia, showed differences of  $10-16^\circ$ . When the  $32.4^\circ$  point was reached conversion of mirabilite to thenardite set in. The method may have com. applications in Kara Buzaz and the Crimea.

F. H. Rathmann

**New sources and methods for producing boron compounds.** S. I. Volkovich. *J. Chem. Ind. (Moscow)* 1933, No. 10, 56-7.—Datolite is ignited at  $800-50^\circ$ , then mixed with  $\text{H}_2\text{SO}_4$  for 30 min. at  $80^\circ$ . The concd. ext., filtered from  $\text{CaSO}_4$ , is boiled with  $\text{CaCO}_3$  to remove heavy metals, and further concd. to yield  $\text{H}_2\text{BO}_3$ .

H. M. Leicester

**Magnetite and hydromagnetite in British Columbia.** A. M. Richmond. *Brit. Columbia Dept. of Mines Non-Metallic Mineral Investigations Rept. No. 3*, 21 pp(1933).

Alden H. Emery

**Floating molybdenite in Morocco.** Anon. *En. Mining J.* 135, 58(1934).—In Morocco, in the district of Azegour, South Marrakesch, 25 tons per month of M. concentrate are produced, contg. 85%  $\text{MoS}_2$ . Flotation is selective, because of the chalcopyrite present. A flow sheet, operating results and power requirements tabulated.

W. H. Boynton

**Special adaptations of mechanical ovens of type G for burning different kinds of pyrites.** N. L. Arkin. *J. Chem. Ind. (Moscow)* 1933, No. 9, 59-60.

H. M. L.

**Platinum catalyst deposited on silica gel.** M. (1) Kharmandar'yan and G. D. Dakhnyuk. *Ukrain. Khim. Zhur.* 8, Wiss. Teil 36-43(1933); cf. Thompson, C. A. 25, 1069.—Efficient catalysts for  $\text{SO}_2$  manufacture can be prepd. with smaller Pt content but the same activity as the catalysts now in use. Simultaneous pptn. of Pt and  $\text{SiO}_2$  gel yields less effective catalysts than deposition of colloidal Pt on the gel. Colloidal Pt solns. were prepd. by reducing  $\text{H}_2\text{PtCl}_6$  with  $\text{HCHO}$ , pyrocatechol or hydrazine hydrate in presence of Na protalbuminate (cf. C. Paal and C. Amberger, *Ber.* 37, 124-39(1904) and H. Henrich, *Ber.* 36, 609-16(1903); for prepg. Na protalbuminate cf. C. Paal, *Ber.* 35, 2195-206(1902)). The best catalysts that were obtained with hydrazine hydrate, showed only a slight loss in activity after 48 hrs. testing and were almost completely regenerated by air blowing.

V. A. Kalichevsky

**A new negative mass for making accurate plastic reproductions.** P. G. Ross. *Arch. Path.* 16, 869-72(1933).—A method of making accurate plastic reproductions is described in which the neg. material is cheap and easily prepd., and consists of agar 100, oil soap 100,  $\text{MgSO}_4$  40, absorbent cellulose 12 and  $\text{H}_2\text{O}$  700-800 parts by wt. The pos. can be cast in plaster of Paris or paraffin, or made of resinous compds. such as sealing wax. The neg. material can be used repeatedly. The salient feature of the method lies in the resiliency of the agar neg. mass.

Harriet F. Holmes

**Parts for (electrical) installations from phenoplastics.** K. Brandenburger. *Kunststoffe* 24, 25-7(1934).—A discussion.

J. W. Perry

(A comparison of) the general, mechanical and electrical properties of artificial masses made by die-casting and pressing. Th. Ruemele. *Kunststoffe* 23, 201-3(1933).—A discussion.

J. W. Perry

**Supplement to a table of trade marks, factory brands, trade designations, etc., of plastic masses and products therefrom.** Kausch. *Kunststoffe* 24, 28-30(1934). Cf. C. A. 27, 2536, 3783.

J. W. Perry

**The technical utilization of blood.** Walter Obst. *Kunststoffe* 23, 278-9(1933).—Suggestions are given for the profitable com. use of blood albumin produced in Germany.

J. W. Perry

**Press mixtures of type I.** Kurt Brandenburger. *Kunststoffe* 24, 2-3(1934).—A new plastic having a high wetting and binding power for mineral fillers can be used to manuf. products which, even after superficial charring, remain excellent high-tension elec. insulators.

J. W. Perry

**Hand fire extinguishers.** Roy Williamson. *Munich Eng. Samt. Record* 92, 760-7(1933).—The 6 varieties, soda-acid, foam,  $\text{CCl}_4$ ,  $\text{MeBr}$ ,  $\text{CO}_2$ , and dry powder are discussed briefly.

A. W. Furbank

**Production, consumption, etc., of phosphate rock and superphosphate (Gray) 15.** App. for producing  $\text{CaH}_2$  and substantially dry  $\text{Ca}(\text{OH})_2$  from  $\text{CaC}_2$  and  $\text{H}_2\text{O}$  (U. S. pat. 1,947,120) 10. Furnace for oxidizing Pb to  $\text{PbO}_2$  (Russ. pat. 1685) 1. Elec. removal of As from  $\text{H}_2\text{SO}_4$ . (Russ. pat. 1514) 4.

**Gaadinger, C. B.: Pyrethrum Flowers.** Minneapolis. McGill Lithograph Co. 269 pp. \$3.50. Reviewed in *Ind. Eng. Chem., News Ed.* 12, 33(1934).

**Sommerfeld, Arthur:** *Plastische Massen. Herstellung, Verarbeitung und Prüfung nicht metallische Werkstoffe für spanlose Formgebung.* Berlin: J. Springer. 346 pp. M. 28.

**Hydrochloric acid, sodium hydroxide and alumina.** Sydchi Matsumoto. Japan. 99,753, Feb. 23, 1933. A mixt. of clay and NaCl is treated with HF.

**Hydrocyanic acid.** The Roessler & Hasslacher Chemical Co. Brit. 401,351, Nov. 13, 1933. In the manuf. of HCN, *e. g.*, by the dehydration of formamide or the decompn. of NaCN by  $\text{H}_2\text{SO}_4$ , stabilizing concns. of  $\text{SO}_2$  are maintained in the reacting system and retained in the HCN formed.

**Hydrocyanic acid.** Alice F. Walker, executrix for Mark Walker, deceased, and Cornelius J. Marvin (to The Canadian Industries Ltd.). Can. 339,124, Jan. 30, 1934. A mixt. of NaCN and a metal sulfite is made to react with acid so that there is 0.05–0.5% by wt. of  $\text{SO}_2$  in the HCN collected therefrom. A stable, water-white HCN is obtained.

**Absorption of hydrocyanic acid.** Ernő Brummer and István Csordás. Hung. 107,582, Dec. 1, 1933. An aq. or alk. soln. is sprayed into the space contg. gaseous HCN. The soln. may contain a substance that binds HCN to form a solid compd. The liquid is collected and the solid compd. contg. the HCN is filtered off.

**Absorption and recovery of hydrocyanic acid.** Béla Bobest. Hung. 107,883, Jan. 2, 1934. HCN is absorbed by a mixt. or suspension of alkali and alkali earth, or heavy metals. The cyanides formed are leached out with water and HCN is regenerated.

**Nitric acid.** Harry Pauling. Fr. 756,821, Dec. 8, 1933. In concg.  $\text{HNO}_3$ , obtained by aq. absorption of nitrous gases, by subsequent absorption of the residual gases in  $\text{H}_2\text{SO}_4$ , the nitrous gases obtained by denitration of the  $\text{H}_2\text{SO}_4$  are led with the necessary addn. of O, without mixt. with the principal gas current, to act in a particular absorption step on the  $\text{HNO}_3$  obtained in the aq. absorption.

**Nitric acid.** Lonza Elektrizitätswerke und chemische Fabriken A.-G. Fr. 756,593, Dec. 12, 1933. Conc'd.  $\text{HNO}_3$  is made in a continuous manner from water or dil.  $\text{HNO}_3$ , oxides of N and O, under pressure and at more or less high temp., in app. in the form of a column, which is traversed in countercurrent by the liquid components of the reaction and by vapors and gases which rise, these being finely distributed. The temp. in the upper and lower part of the column is regulated to provoke a strong fractionated distn. of the down-flowing acid, the result being obtained, *e. g.*, by introducing heat at the lower part of the column and condensing the vapors at the upper part. The distn. and temp. are regulated by heat-exchange means, *e. g.*, by heating the O by the evacuated acid. An app. is described.

**Concentration of phosphoric acid and a mixture of phosphoric and sulfuric acids.** Dai Nippon Jinzôhiryô K. K. (Tazô Shinya and Hatsutarô Yuma, inventors). Japan. 99,453, Feb. 8, 1933.  $\text{H}_3\text{PO}_4$  or a mixt. of  $\text{H}_3\text{PO}_4$  and  $\text{H}_2\text{SO}_4$  is introduced into a rotating furnace (lined with acid-proof material) from one side, while a heated gas is introduced from the other side, by which the acid is conc'd. Diagrams of the app. are shown.

**Phosphoric acid or calcium superphosphate.** Mitui Kôzan K. K. (Kôzô Ikawa, inventor). Japan. 100,142, March 17, 1933.  $\text{H}_3\text{PO}_4$  or Ca superphosphate is made by heating P ore or other materials contg.  $\text{Ca}_3(\text{PO}_4)_2$  with  $\text{SO}_2$ ,  $\text{H}_2\text{O}$  and  $\text{O}_2$  (or air) below  $100^\circ$ , in the presence of catalysts (such as N oxide or sulfate of Fe, Ni, Co, Mn, Cr, Mo, W, Sn or Cu).

**Refining sulfuric acid.** Paul Weinstock. Ger. 591,056, Jan. 16, 1934 (Cl. 12: 25). Addn. to 578,034 (C. A. 27, 4353). The process of Ger. 578,034 is applied to  $\text{H}_2\text{SO}_4$  contg. coloring impurities. Details are given.

**Contact sulfuric acid process.** Franz P. Fiedler and Alphons O. Jaeger (to Selden Co.). U. S. 1,945,267, Jan. 30. A catalyst is used contg. Ti oxide and V in

chem. combination, such as combined oxides of Ti, V and Ag on diatomite brick fragments.

**Oxidation of ammonia.** The Head of the Tokyo Kôgyô Shikensho (Kasuo Sasaki, inventor). Japan. 99,289, Feb. 1, 1933. N oxides are formed by oxidation of  $\text{NH}_3$  in the presence of Co or its oxide, which may contain 0.001–0.3 part of Ta, Si, Sr, Th, Pd, Ni, Rh, Na, K or their oxides.

**Obtaining alkalies from silicates.** Félix Jourdan. Brit. 401,567, Nov. 16, 1933. In the treatment of silicates, *e. g.*, leucite, with wet steam at high temp. to obtain alkali hydroxides, the silicate, which may be mixed with substances facilitating the reaction, *e. g.*,  $\text{Ca}(\text{OH})_2$ , is charged into the upper portion of an autoclave, the lower portion of which contains  $\text{H}_2\text{O}$ , the steam produced being condensed after attacking the silicate and the  $\text{H}_2\text{O}$  then evap'd. and used again, the cycle being repeated until all the alkali has been ex'd. or the condensed liquid sat'd.

**Alkali chlorides.** R. Englert & F. Becker, Chemische Fabrik, Prag-VII and Kurt Seidl. Fr. 756,413, Dec. 9, 1933. Alkali chlorides suitable for electrolysis are prep'd. by fusing the impure chlorides, freed from sol. sulfates, and sepg. the slags formed which contain the impurities. The formation of the slags may be facilitated by the addn. of  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$  or bauxite or by the introduction of air. The process may be applied to alkali chlorides contg. sol. sulfates by adding to the molten mass an amt. of a carbonate or oxide of Ba or Sr equiv. to the sulfates.

**Alkali chromate.** Toragorô Tanabashi. Japan. 99,438, Feb. 8, 1933. Alkali chromate is formed by roasting a mixt. of Cr ore, alkali carbonate and a small amt. of lime. Extn. with water leaves a residue that contains about 10% of Cr. This is mixed with fresh Cr ore for the next batch.

**Alkali cyanide.** Ryûzaburô Hara. Japan. 100,143, March 17, 1933. Alkali cyanamide is prep'd. by heating alkali cyanide and alkali metal in an atm. of  $\text{N}_2$  at  $400\text{--}650^\circ$  with a catalyst (such as powd. Fe). The product is converted to alkali cyanide by heating at  $650\text{--}850^\circ$  with C.

**Alkali sulfates and phosphates.** Metallges. A.-G. (Conway Freiherr von Girsowald and Erich Stahl, inventors). Ger. 580,125, Jan. 16, 1934 (Cl. 12: 5). Addn. to 571,494 (C. A. 27, 3041). Sec U. S. 1,918,355 (C. A. 27, 4885).

**Removing metal carbides from soot.** Gerhard Kröner and Paul Diltthey (to I. G. Farbenind. A.-G.). U. S. 1,945,907, Feb. 6. For removing metal carbides from soot such as that contg. Ni carbide, the soot is heated in an atm. free from CO to a temp. of about  $150\text{--}600^\circ$  and then is heated in a current of gas contg. CO at about  $50\text{--}210^\circ$  until metallic constituents are removed.

**Double nitrates.** I. G. Farbenind. A.-G. (Günther Hamprecht, inventor). Ger. 591,458, Jan. 22, 1934 (Cl. 16: 6). Double salts useful as fertilizers are prep'd. by combining a nitrate of a univalent metal or radical with a basic nitrate of a bivalent metal or with the normal nitrate and the oxide or hydroxide of a bivalent metal. The reaction may be effected by fusing or sintering a mixt. of the components. Examples are given of the prep'n. of  $\text{Ca}(\text{OH})\text{NO}_3\cdot\text{KNO}_3$ ,  $\text{Ca}(\text{OH})\text{NO}_3\cdot\text{NH}_4\text{NO}_3$ ,  $\text{Ca}(\text{OH})\text{NO}_3\cdot\text{CO}(\text{NH}_2)_2\cdot\text{HNO}_3$ ,  $\text{Mg}(\text{OH})\text{NO}_3\cdot\text{KNO}_3$ ,  $\text{Sr}(\text{OH})\text{NO}_3\cdot\text{KNO}_3$ ,  $\text{Ba}(\text{OH})\text{NO}_3\cdot\text{KNO}_3$  and  $\text{Zn}(\text{OH})\text{NO}_3\cdot\text{KNO}_3$ .

**Water-soluble phosphate compounds.** Emil Reubke (to I. G. Farbenind. A.-G.). U. S. 1,945,914, Feb. 6. A water-insol. Ca phosphate material such as natural tri-Ca phosphate is treated, in the absence of free acids, with an aq. soln. of neutral  $\text{NH}_4$  sulfate at temps. of about  $200\text{--}300^\circ$ , the soln. formed is sepd. from residual  $\text{CaSO}_4$ , the latter is converted into  $\text{NH}_4$  sulfate by use of  $\text{NH}_3$  and  $\text{CO}_2$ , and the  $\text{NH}_4$  soln. thus formed is used for continuing the process.

**Metal phosphates.** Chemische Werke vorm. H. & E. Albert. Ger. 589,913, Dec. 20, 1933 (Cl. 12: 31). The above, with the exception of alkali or alk. earth phosphates, are prep'd. by the double decompn. of Ca phosphates and metal salts in the presence of  $\text{SO}_2$ . Thus, Morocco phosphate is treated with a reaction mixt. of

bauxite and  $\text{H}_2\text{SO}_4$ .  $\text{SO}_2$  is led into the suspension. The  $\text{CaSO}_4$  and  $\text{SiO}_2$  residue is filtered off leaving a  $\text{SO}_2$  soln. of Fe and Al phosphate, these being pptd. by removal of the  $\text{SO}_2$ . Other examples are given.

**Thiocyanogen compounds.** Emil Hene. Ger. 589,967, Dec. 28, 1933 (Cl. 12k. 11). Addn. to 588,944 (C. A. 28, 2133<sup>9</sup>). The method of 588,944 for producing the above compds. is modified by heating  $\text{CaCN}_2$  with  $\text{Ca}(\text{SH})_2$  and alkali hydrosulfides or sulfates, the  $\text{Ca}(\text{SH})_2$  being produced by heating  $\text{Ca}(\text{OH})_2$  with S. Examples are given.

**Titanates.** Hisao Yamamoto. Japan. 99,016, Jan. 13, 1933. A mixt. of ores contg. Ti, an acid sulfate and Cl is fused and the product is extd. with water. By treating the soln. with  $\text{SO}_2$  or dil. mineral acid, titanate is obtained.

**Alumina from clay or kaolin.** Hikoichi Takubo. Japan. 100,117, March 15, 1933.  $\text{Al}_2\text{O}_3$  is prepd. by passing F, produced by heating a mixt. of fluorspar and  $\text{MnO}_2$  (or  $\text{CrO}_3$ ) at 1800-2000° over clay or kaolin. Si and other impurities in the material are vaporized after combining with F.

**Aluminum sulfate.** Wm. S. Wilson (to Merrimac Chemical Co.). U. S. 1,945,171, Jan. 30. Reaction is effected between bauxite and sludge acid from petroleum refining. Sufficient water is evapd. to form a solid product at ordinary temps. contg. less than 17.3%  $\text{Al}_2\text{O}_3$ , the evapd. product is flaked and then dehydrated and roasted in a rotary kiln.

**Aluminum-silicon sulfide.** Metallgesellschaft A.-G. Ger. 552,918, Nov. 6, 1933 (Cl. 12m. 7). The above sulfide, suitable for use as a *vulcanization agent*, is prepd. by heating a mixt. or alloy of Al and Si with S, preferably in powd. form.

**Aluminum-silicon sulfide.** Metallgesellschaft A.-G. Ger. 583,322, Nov. 6, 1933 (Cl. 12m. 6). Addn. to 552,918 (preceding abstr.). The method of 552,918, for producing the above sulfide by treating an Al and Si mixt. or alloy with S is modified by carrying out the reaction with the substances in the fused condition.

**Separation of ammonium chloride from potassium or sodium sulfate.** Teru Nakagawa. Japan. 99,553, Feb. 16, 1933. Since  $\text{Na}_2\text{SO}_4$  and  $\text{K}_2\text{SO}_4$  are more sol. in HCl than in water,  $\text{NH}_4\text{Cl}$  is sepd. from a mixt. with  $\text{Na}_2\text{SO}_4$  (or  $\text{K}_2\text{SO}_4$ ) by adding HCl and concg.

**Ammonium chloride; sodium carbamate.** Robert B. MacMullin (to The Mathieson Alkali Works). Brit. 401,554, Nov. 16, 1933. See Fr. 751,700 (C. A. 28, 863<sup>9</sup>).

**Ammonium phosphates.** I. G. Farbenind. A.-G. (Emil Reubke, inventor). Ger. 591,457, Jan. 22, 1934 (Cl. 16.4). Crude  $\text{Ca}_3(\text{PO}_4)_2$  is treated under pressure with a soln. of a hydrolyzable  $\text{NH}_4$  salt at a temp. above the normal b. p. of the soln. and under such conditions that  $\text{NH}_3$  formed by the hydrolysis is removed. A soln. of  $(\text{NH}_4)_2\text{SO}_4$  and  $\text{NH}_4\text{H}_2\text{PO}_4$  is suitable, and yields  $\text{CaSO}_4$  and  $\text{NH}_4\text{H}_2\text{PO}_4$ . The latter may be treated with the  $\text{NH}_3$  formed by the hydrolysis. Details are given.

**Ammonium sulfate.** Mitsui Kōzan K. K. (Shinsyō Oda and Toyoji Sugimoto, inventors). Japan. 100,381, Apr. 4, 1933.  $(\text{NH}_4)_2\text{SO}_4$  is manufd. by treating crystd.  $(\text{NH}_4)_2\text{SO}_4$  with a gas contg.  $\text{SO}_2$  alone or together with  $\text{O}_2$  at about 100°.

**Evaporating and crystallizing apparatus for recovery of ammonium sulfate, etc., from solutions.** Heinz Leithäuser (to Koppers Co. of Del.). U. S. 1,945,281, Jan. 30. Various structural and operative details are described.

**Calcium chloride.** Kyūzaburō Tomita. Japan. 100,011, March 9, 1933. In mfg.  $\text{CaCl}_2$  from brine (or  $\text{MgCl}_2$ ) and lime, basic Mg chloride is produced. This basic chloride is decompd. with  $\text{CO}_2$ , pptg.  $\text{MgCO}_3$ . From the filtrate  $\text{CaCl}_2$  is obtained by adding lime.

**Porous and anhydrous calcium chloride.** Gi Ideta. Japan. 100,482, Apr. 10, 1933. Ordinary  $\text{CaCl}_2$  is melted at 180-200°, a small amt. of cane sugar or the like is added and the heating is continued.

**Stable bleaching powder.** Adolf Remele (to I. G. Farbenind. A.-G.). U. S. 1,945,918, Feb. 6. For con-

verting undried bleaching powder into a condition in which it is stable during storage, the undried material, contg. at least about 36% available Cl, is treated with an amt. of unslaked lime which is at least sufficient to combine with the "free" water content of the bleaching powder, the mixt. is exposed to temp. conditions leading to the slaking of the added unslaked lime, and the product is finally dried.

**Calcium cyanamide.** Nikodem Caro and Albert R. Frank (H. Heinrich Franck, inventor). Ger. 591,039, Jan. 16, 1934 (Cl. 12k. 9).  $(\text{NH}_4\text{COO})_2\text{Ca}$  is heated to 600-800° in a stream of  $\text{NH}_3$ , which may contain  $\text{CO}$  or  $\text{CO}_2$ . The used gases, contg.  $\text{NH}_3$  and  $\text{CO}_2$ , are cooled to form  $\text{NH}_4\text{COONH}_2$ , from which fresh  $(\text{NH}_4\text{COO})_2\text{Ca}$  for use as starting material is produced.

**Furnace for nitriding carbide to form calcium cyanamide.** Bayerische Stickstoffwerke A.-G. Ger. 588,409, Nov. 17, 1933 (Cl. 12k. 9). Addn. to 565,784 (C. A. 27, 2389<sup>9</sup>).

**Chromic anhydride.** Toragorō Tanabashi. Japan. 99,439, Feb. 8, 1933.  $\text{CrO}_3$  is manufd. from  $\text{Na}_2\text{Cr}_2\text{O}_7$  and 4-5 times of the equivalent amt. of  $\text{H}_2\text{SO}_4$  of Be 55-58°.  $\text{NaHSO}_4$  goes into soln., while  $\text{CrO}_3$  is pptd. as fine crystals. It can be obtained in large crystals by recrystn. from dil.  $\text{H}_2\text{SO}_4$ . The crystals are purified by washing with a satd. soln. of  $\text{CrO}_3$ .

**Chromic oxide.** Toragorō Tanabashi. Japan. 99,440, Feb. 8, 1933.  $\text{CrO}_3$  is reduced by heating at 300-400° with molasses. Black  $\text{Cr}_2\text{O}_3$  is produced, which on heating at 1000-1100° for about 3 hrs. becomes green.

**Cuprous chloride.** Toshio Watanabe (Saburo Awazu, Shizuo Kojima and Toshio Watanabe, inventors). Japan. 99,952, March 6, 1933. A mixt. of  $\text{Cu}_2\text{Cl}_2$  and powd. Cu is mixed with  $\text{CuCl}_2$  soln. or  $\text{FeCl}_3$  soln. and concd. After filtration the soln. is quickly cooled and  $\text{Cu}_2\text{Cl}_2$  pptd.

**Copper sulfate.** Henri Wismer. Fr. 756,364, Dec. 8, 1933. Pure or impure Cu or Cu ores are transformed to  $\text{CuSO}_4$  by heating with  $\text{H}_2\text{SO}_4$ , water and O, under pressure or not.

**Copper sulfate.** Affinerie française. Fr. 756,376, Dec. 8, 1933.  $\text{CuSO}_4$  is made from waste Cu or Cu ores, by oxidation in very weak  $\text{H}_2\text{SO}_4$ , using  $\text{CuCl}_2$  as catalyst. An app. is described.

**Cupric sulfide.** P. R. Mallory & Co. Inc. Ger. 591,168, Jan. 17, 1934 (Cl. 21g. 11.02). Addn. to 590,285.  $\text{CuS}$  in a hard and dense form is prepd. by heating Cu plates of about 5 mm. thickness to between 150° and 500° in a closed vessel filled with S vapor. The product is suitable for use as neg. electrode in the dry rectifier cell described in Ger. 590,285.

**Lead carbonate.** Melville F. Perkins (to American Smelting & Refining Co.). U. S. 1,946,709, Feb. 13. A suspension of a Cl compd. of Pb such as the hydroxy-chloride is treated with  $\text{Ca}(\text{OH})_2$  in such a quantity that the Ca is slightly less than the theoretical equiv. of the Cl to be removed, and the mixt. is carbonated in the presence of a suitable oxidizing agent such as  $\text{Pb}_2\text{O}_4$  to form Pb carbonate and the product is treated with a small amount of an alkali metal compd. such as the hydroxide or carbonate capable of reacting with the remainder of the Cl to produce a water-sol. chloride.

**Magnesium ammonium phosphate.** Constantiu d'Asceev. Brit. 401,407, Nov. 16, 1933. See Fr. 738,847 (C. A. 27, 1997<sup>9</sup>).

**Anhydrous magnesium chloride.** Seisyo Horio (Masao Kajiwara, inventor). Japan. 100,174, March 20, 1933. Hydrous  $\text{MgCl}_2$  is heated by a flame produced by burning  $\text{H}_2$  and  $\text{Cl}_2$  in equimol. proportions.

**Nickel carbonyl.** I. G. Farbenind. A.-G. Brit. 401,438, Nov. 16, 1933. This corresponds to Fr. 740,406 (C. A. 27, 2257<sup>9</sup>), pressures of 2-1000 atm. and temps. of 100-350° being referred to.

**Potassium magnesium sulfate.** Hubert Kappen. Ger. 591,097, Jan. 16, 1934 (Cl. 12f. 5). Carnallite is treated with superheated steam, and the resulting mixt. of KCl and MgO is treated with an aq. soln. of  $\text{MgSO}_4$ . A basic K-Mg sulfate, useful as a *fertilizer*, is obtained.

**Apparatus for collecting selenium dioxide.** Nippon Kôgyô K. K. (Toyo Terasaki, inventor). Japan. 100,187, March 20, 1933. Diagrammatical.

**Silica.** Silica, Verein chem. Fab. (Georg Alaschewski and Paul Roters, inventors). Ger. 591,477, Jan. 22, 1934 (Cl. 12: 38.03). Hydrated  $\text{SiO}_2$ , obtained in known manner from  $\text{SiF}_4$  evolved in the manuf. of superphosphate, is purified in the usual way, and the sludge obtained after the final washing is treated with a small proportion of a polyhydric alc., e. g., glycerol. The dry product obtained from the sludge is easily wetted by aq. liquids, in contrast to the dry product obtained without addn. of an alc.

**Sodium, potassium and calcium nitrates.** Atmospheric Nitrogen Corp. Brit. 401,121, Nov. 3, 1933. See Fr. 747,384 (C. A. 27, 4880).

**Sodium aluminate.** Harold W. Heiser (to Aluminum Ltd.). Can. 339,193, Feb. 6, 1934. Purified  $\text{Al}(\text{OH})_3$  10 and c. p. soda ash 8 parts are finely ground and intimately mixed; solid Na aluminate is added as a binder, the mixt. is moistened with about 10–15% water and formed into briquets, which are heated to 900–1100°. Solid Na aluminate of high purity and substantially free from insol. material is produced.

**Sodium chloride.** Ryo Saburo Hara. Brit. 401,612, Nov. 10, 1933.  $\text{NaCl}$  is recovered from substances contg. it, e. g., rock or sea salt, by extg. with liquid  $\text{NH}_3$ , sep. insol. substances and evapg. the soln. Extn. is preferably at 0° to –10°, a less sol. compd.,  $\text{NaCl} \cdot x\text{NH}_3$ , being formed below –10°.

**Sodium chloride.** Asahi Garasu K. K. Fr. 757,080, Dec. 20, 1933. Crude  $\text{NaCl}$  is purified by dissolving it under pressure in liquid  $\text{NH}_3$ , preferably at below 0°, removing the insol. impurities by filtration, evapg. the clear soln. to sep. pure  $\text{NaCl}$  and filtering again.

**Sodium ferrocyanide.** The Head of the Tokyo Kôgyô Shikenjo (Heima Shinozaki, inventor). Japan. 99,402, Feb. 6, 1933.  $\text{Na}_2\text{SO}_4$  is converted to  $\text{NaCN}$  by heating with C,  $\text{CaCO}_3$  and  $\text{Fe}_2\text{O}_3$  in  $\text{N}_2$  under pressure. The cyanide is mixed with water (more than the amt. sufficient for making satd. soln. of  $\text{NaCN}$ ) and a sol. ferrous salt and warmed, producing  $\text{Na}_2\text{Fe}(\text{CN})_6$ . By introducing  $\text{CO}$  into the soln., the sulfide is converted to carbonate with liberation of  $\text{H}_2\text{S}$ . On evapn. of the soln. the ferrocyanide is obtained, free from sulfide and chloride.

**Friable caustic soda.** John W. Koenders (to Dow Chemical Co.). U. S. 1,946,863, Feb. 13. Solid  $\text{NaOH}$  having a fibrous cryst. structure, the crystals of which exhibit a preferred orientation and possess a definite fiber axis as shown by an x-ray diffraction pattern, and which is softer and more easily crushed than the ordinary product, is prepd. by filling molten  $\text{NaOH}$  into a container such as a sheet iron drum to which a small amt. of an oil such as paraffin oil or a heavy motor oil is added prior to introducing the molten  $\text{NaOH}$ .

**Purifying waste caustic soda liquors.** Erik L. Rinman. Brit. 393,962, June 12, 1933. Addn. to 381,697 (incorrectly given as 361,697 in C. A. 27, 4081). In obtaining waste liquors free from  $\text{SiO}_2$  as described in 381,697, the hydroxides or oxides of Ca and (or) Mg, with if desired  $\text{Al}(\text{OH})_3$ , are used as precipitants, while the alk. of the digester liquor is reduced by an amt. approx. corresponding to the added Ca and Mg oxide and hydroxide. The process may be used when the  $\text{NaOH}$  lye contains  $\text{Na}_2\text{S}$ ,  $\text{Na}_2\text{SO}_3$ ,  $\text{Na}_2\text{SO}_4$ , contact substances, phenols, org. oxy acids or the like.

**Sodium phosphate.** Hiroshi Tanaka. Japan. 99,830, Feb. 28, 1933. When  $\text{AlPO}_4$  is heated with  $\text{SiO}_2$  and  $\text{Na}_2\text{CO}_3$  (or  $\text{NaOH}$ ),  $\text{Na}_3\text{PO}_4$ ,  $\text{CO}_2$  and  $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$  are produced. Thus  $\text{Na}_3\text{PO}_4$  is easily sep'd. from alumina; this is the principle adopted in the process.

**Anhydrous sodium sulfide.** Henry H. Mayers (to Rohm & Haas Co.). U. S. 1,946,089, Feb. 6. A granular product contg. over 85%  $\text{Na}_2\text{S}$  is prepd. by heating hydrous  $\text{Na}_2\text{S}$  under reduced pressure and simultaneously stirring the mass by plowing and turning it over.

**Oxides of titanium.** Intermetal Corp. Fr. 756,605, Dec. 13, 1933.  $\text{TiO}_2$  having particles of the order of 0.2–

0.4  $\mu$  is obtained by causing a soln. of  $\text{HCl}$  to react with an amt. of  $\text{TiCl}_4$  in excess of that which normally is sol. in the said soln. The product of the reaction is heated, the size of particle being controlled by the degree of heating.

**Titanium oxide.** I. G. Farbenind. A.-G. (Paul Weise and Friedrich Raspe, inventors). Ger. 591,007, Jan. 15, 1934 (Cl. 22f. 7). See Fr. 738,620 (C. A. 27, 2050).

**Removing iron from chromium salt solutions.** J. R. Geigy A.-G. Ger. 591,098, Jan. 16, 1934 (Cl. 12m. 8). See U. S. 1,909,865 (C. A. 27, 4036).

**Effecting reactions such as those between silica and magnesium carbonate for producing a hydrous silicate.** Ernest W. Rembert (to Johns-Manville Corp.). U. S. 1,945,534, Feb. 6. For promoting reactions between solid finely divided silicious materials and sparingly sol. reactive compds. such as  $\text{MgCO}_3$  in the presence of water, an alkali such as  $\text{Na}_2\text{CO}_3$  is added, the mixt. is heated and the alk. soln. is sep'd. from the silicate product. An arrangement of app. is described.

**Carbon dioxide from gases such as furnace or kiln gases.** Mark Shoeld (to Koppers Co. of Del.). U. S. 1,945,002, Jan. 30. See Can. 337,153 (C. A. 28, 1821<sup>9</sup>).

**Recovery of carbon dioxide from mixtures with other gases.** Rikwagaku Kenkyûjo (Bennosuke Kubota and Kashiwa Akashi, inventors). Japan. 99,767, Feb. 24, 1933. Org. amines dissolved in org. solvents are brought into contact with gases contg.  $\text{CO}_2$ . From the solid condensation products formed  $\text{CO}_2$  is regenerated by heating, with or without the solvent.

**Nitrous oxide.** Leo Schlecht and Alfred von Nagel (to Winthrop Chemical Co.). U. S. 1,946,114, Feb. 6.  $\text{NH}_3$  and O are passed over a catalyst such as Fe oxide and Bi oxide which promotes  $\text{NH}_3$  oxidation, at 200–550°, and at so slow a speed that the formation of NO is substantially suppressed, but sufficiently rapid to prevent the  $\text{NH}_3$  from being substantially converted into N, and the NO and higher oxides of N are removed from the resulting gas.

**Hydrogen sulfide from gases.** Ludwig Rosenstein and Gustav A. Kramer (to Shell Development Co.). U. S. 1,945,163, Jan. 30. See Can. 335,454 (C. A. 27, 5492).

**Drying gases containing sulfur dioxide.** Erzröst-G. m. b. H. Wilhelm Lindheimer and Josef Walmrath. Ger. 589,966, Dec. 19, 1933 (Cl. 12: 24). Wet  $\text{SO}_2$  gases for contact  $\text{H}_2\text{SO}_4$  plant are dried by passage through one or more  $\text{SiO}_2$  gel filters before introduction into the contact chamber.

**Material for producing sulfur dioxide.** Aladár Vajdaffy. Hung. 107,239, Sep. 1, 1933. Powd. S or flowers of S are mixed with inorg. substances that do not give any noxious combustion products at the ignition temp. of the S. Waterglass or a solvent for S is used as binding material.

**Catalytic oxidation of sulfur dioxide to trioxide.** Alphons O. Jaeger (to Selden Co.). U. S. 1,945,811, Feb. 6. A gaseous mixt. contg.  $\text{SO}_2$  and O is passed over successive layers of a V-contg. catalyst having an overload capacity in excess of that of Pt contact masses; the gases are cooled between successive layers, and at least the first layer is of such thickness that the effective contact time of the gases passing through it is not sufficiently in excess of that required for the normal percentage conversion at normal operation to permit excessive heat evolution under overload; the subsequent layers are of sufficient thickness to permit commercially economical outputs per vol. of catalyst. App. is described. Cf. C. A. 27, 3043.

**Krypton and xenon from air.** Wolcott Dennis (to Air Reduction Co.). U. S. 1,945,365, Jan. 30. Various details (app. and operation) of a liquefaction and rectification system are described. U. S. 1,945,366 relates to app. for the same purpose.

**Sulfur recovery from sulfides, etc.** Louis F. W. Leese. U. S. 1,947,529, Feb. 20. See Fr. 746,675 (C. A. 27, 4637).

**Sulfur from iron sulfide ores.** Raymond G. Brown (to Sulphide Corp.). U. S. 1,946,349, Feb. 6. Ore contg. Fe sulfide and other metal values is reduced to a

fineness of less than 60 mesh, the Fe present is chlorinated to  $\text{FeCl}_3$  with dil. chlorinating gases, liberated S is removed as a vapor substantially free from heavy metal chlorides; the  $\text{FeCl}_3$  is then oxidized by a preheated oxidizing gas such as air, the preheat of which supplies such a quantity of heat that the oxidation is effected without permitting fusion of the  $\text{FeCl}_3$  or other heavy metal chlorides present; chlorinating gases formed in the oxidizing reaction are passed to the chlorinating zone to chlorinate addnl. Fe sulfide contg. material. App. is described. Cf. C. A. 28, 2609.

**Recovery of sulfur.** Raymond F. Bacon and Wilber Judson (to Raymond F. Bacon). Can. 339,298, Feb. 6, 1934. Elementary S is recovered from iron pyrites by suspending a finely divided mixt. of pyrites and carbonaceous matter in a stream of hot gas contg.  $\text{SO}_2$ . The labile S is distd. off from the pyrites,  $\text{FeS}$  is formed, and the  $\text{SO}_2$  reduced to elementary S. The  $\text{FeS}$  is passed into a countercurrent stream of oxidizing gas to produce  $\text{SO}_2$ .

**Smelting sulfide ore.** Raymond F. Bacon. U. S. 1,944,873, Jan. 30. A mixt. of ore such as a pyrites-chalcopyrites charge, carbonaceous reducing agent such as coke in amt. sufficient to reduce a substantial part of the  $\text{SO}_2$  formed to elemental S, and slagging materials such as silica and Ca sulfite is smelted and the smelter gases contg. elemental S may be passed in contact with a catalyst such as porous alumina or hauxite capable of accelerating further reduction of the  $\text{SO}_2$  in the gases to produce elemental S; the S is sep'd. from accompanying gases, and the gases are contacted with lime to form Ca sulfite and the latter is returned to the smelting operation as a source of slagging material.

**Treating iron pyrites.** Stanley I. Levy (to Sulphide Corp.). U. S. 1,948,325, Feb. 6. The material is treated with  $\text{FeCl}_3$  vapors in an amt. just sufficient to convert the Fe to  $\text{FeCl}_2$ , while maintaining a temp. (suitably about 800–1000°) sufficient to cause the  $\text{FeCl}_2$  to react, liberating elemental S in vapor form. An arrangement of app. is described.

**Sulfur from gas filters.** Gewerkschaft Mathias Stinnes. Ger. 548,408, Nov. 17, 1933 (Cl. 12a. 17). Addn. to 573,868 (C. A. 27, 4301). In extg. S from gas filters by extn. with  $\text{C}_2\text{H}_6$  by the method of 573,868, the process is accelerated by giving the filter mass a 15% addn. of water.

**Sulfur and metal chlorides.** Stanley I. Levy. Ger. 585,506, Oct. 5, 1933 (Cl. 40a. 2.60). See Brit. 359,568 (C. A. 26, 4922).

**Carbon black.** Jesse A. Guyer (to Phillips Petroleum Co.). U. S. 1,946,739, Feb. 13. Gases (such as those from natural gas or from oil cracking) contg.  $\text{C}_2\text{H}_4$ ,  $\text{H}_2$ , etc., are subjected to a controlled partial cracking in a temp. range of about 675–950° and at about atm. pressure in a time period of about 0.002–0.02 min., by which about 35–50% of olefins are produced, and the resulting gaseous mixt. is subjected to a partial combustion to produce carbon black. An arrangement of app. is described.

**Active carbon.** Carbo-Norit-Union Verwaltungs-Ges. m. b. H. Ger. 591,090, Jan. 16, 1934 (Cl. 12a. 33). The reactivation of used pulverulent active C is effected by briquetting the C, with or without the aid of a binder, and treating the briquets with a mixt. of steam and an oxidizing gas contg. less than 15% by vol. of O, e. g., a mixt. of steam and air contg. 2% of O. The air-steam mixt. is preheated to 80–250°. The briquets may also be preheated with superheated steam. They crumble during the reactivation process.

**Regenerating active carbon.** The Gas Light and Coke Co. Ger. 587,600, Nov. 6, 1933 (Cl. 26d. 13.01). See Brit. 374,597 (C. A. 27, 4041).

**Retort and associated apparatus for revivifying spent activated carbon by air treatment and heating.** Raymond G. Davis (to Darco Corp.). U. S. 1,945,479, Jan. 30. Structural and operative details.

**Adsorbent charcoal.** Louis Friderich. Fr. 757,172, Dec. 21, 1933. An adsorbent charcoal for sterilization and adsorption, is prep'd. by agglomerating active charcoal

in impalpable powder by means of a dil. soln. of nitro-cellulose or salts of cellulose, putting the paste in a thin layer and removing the solvent by known means. For sterilization, the charcoal may be mordanted with salts of Ag.

**Absorbent felt.** Joseph E. Plumstead (to Jessup & Moore Paper Co.). U. S. 1,947,103, Feb. 13. For producing an absorbent felted product suitable for use with waterproofing agents, a finished or prep'd. cellulosic fibrous pulp is employed which has been previously cleaned by neutralizing and dissolving the cementing intercellular substances, and the pulp is treated with a fiber curling or kinking agent such as NaOH and an auxiliary agent such as Na sulfide or a Cu or Zn comp'd. which improves the activity of the curling or kinking agent. U. S. 1,937,104 relates to a process in which artificially curled or kinked fibrous material impregnated with a Cu comp'd. is further treated with an  $\text{NH}_3$  comp'd. to form a mucilaginous coating on the fibers simultaneously with the production of the felted sheet, to obtain a finished product of increased strength. U. S. 1,947,105 relates to a process in which finished or prep'd. cellulosic fibrous pulp is treated with Na sulfide soln., producing kinking, curling or crimping of the pulp fibers (previously cleaned of cementitious intercellular substances). U. S. 1,947,106 relates to a process in which fibrous cellulosic pulp is showered with a treating soln. and shredded and defelted in the presence of the soln., screened to sep. excess soln. and passed between presser rolls for further removal of soln. App. is described. U. S. 1,947,107 relates to a process of accelerating the kinking, curling and crimping of prep'd. cellulosic fibers by bruising the fibers (suitably by the action of a ball mill) at one or more points of their length, and treating the fibers with a soln. such as soap, NaOH,  $\text{Na}_2\text{S}$ ,  $\text{ZnCl}_2$ , etc., to effect selective or pronounced reactivity at the bruised points and consequent accelerated curling of the fibers. U. S. 1,947,108 relates to a process of curling fibers for making absorbing paper by building up a layer of the fiber pulp on the wall of a centrifuge and flushing NaOH soln. of non-mercerizing strength through the fibers. App. is described.

**Catalyst.** The Head of the Tokyo Kōgyō Shikenjo (Gorō Shima, Ichitarō Kitawaki and Tyōkan Matsuda, inventors). Japan. 100,509, Apr. 13, 1933; cf. Japan 94,998 (C. A. 27, 2771). A catalyst is prep'd. by treating Fe, its alloys or iron oxides in the form of scales or fine granules with HCl,  $\text{HNO}_3$ , their salts or mixt. of these reagents.

**Condensation products.** I. G. Farbenind. A.-G. Brit. 401,237, Nov. 9, 1933. Phenols, or derivs. thereof are caused to react with unsatd. aliphatic acids, or derivs. thereof, in the presence of  $\text{BF}_3$ , if desired in the presence of a solvent which does not react under the prevailing conditions, e. g., benzene,  $\text{C}_6\text{H}_6$ , PhMe, xylene,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ . The products are obtained as a viscous liquid or pronouncedly adhesive mass which can be drawn into threads or as a rubber-like mass. Among examples (1)  $\text{BF}_3$  is introduced by a current of N into a mixt. of olive oil and cresol mixt. at room temp., the temp. rising to 45°; after standing overnight the mixt. is dild with  $\text{C}_6\text{H}_6$ , the  $\text{BF}_3$  decompd. with  $\text{Na}_2\text{CO}_3$ , the product filtered and the  $\text{C}_6\text{H}_6$  and undecompd. cresol distd. off, (2) linseed oil for lacquer is similarly condensed with cresol mixt. or anisole; and (3) com. linseed oil acids and cresol are similarly condensed.

**Condensation products.** Wilhelm Kraus. Ger. 589,989, Dec. 21, 1933 (Cl. 12a. 17.05). Products capable of being hardened are obtained by condensing urethan and urea with aq.  $\text{CH}_3\text{O}$  in the presence of an acid contact agent at high temps. Thiourea may also be present.

**Condensation product of formaldehyde and ammonium thiocyanate.** Ralph A. Jacobson (to E. I. du Pont de Nemours & Co.). U. S. 1,945,315, Jan. 30. A product sol. in acetone and which is compatible with nitrocellulose, etc., is obtained from  $\text{NH}_4\text{CNS}$  and formaldehyde by heating.

**Press-mixtures of urea-formaldehyde condensation products.** The British Cyanides Co., Ltd. Ger. 586,543,

Oct. 23, 1933 (Cl. 396. 22). See Brit. 350,498 (C. A. 27, 381).

**Oil-soluble condensation product.** Tadae Syōno. Japan. 99,551, Feb. 16, 1933. PhOH is condensed with HCHO in the presence of hydroxides, carbonates or bicarbonates of K, Na, NH<sub>4</sub> or Ca(OH)<sub>2</sub> as a catalyst, in the amt. of about 1% of PhOH used. After the condensation is completed, the product is heated with pine resin to give an oil-sol. product.

**Surface treatment of Bakelite articles.** A. Stevens and V. Widdowson. Belg. 398,169, Sept. 30, 1933. Greasy or oily substances which appear on the surface of Bakelite articles on molding, are removed by means of a solvent that can penetrate to a certain depth, in order to permit labels, etc., to adhere to the surface. \*

**Artificial masses.** I. G. Farbenind. A.-G. Brit. 401,200, Nov. 9, 1933. The masses are made by the action of Cl on polyvinyl chloride in soln. or suspension in a suitable solvent or swelling agent, e. g., CCl<sub>4</sub>, C<sub>2</sub>H<sub>5</sub>Cl, (I). Highly polymerized products may be chlorinated and simultaneously or subsequently depolymerized by a suitable rise in temp. The products may be used for the *manuf. of films, lacquers, impregnating agents, molded or sprayed masses or wrapping sheets*. Softening agents, e. g., a H<sub>3</sub>PO<sub>4</sub> ester, a phthalic acid ester, castor or linseed oil, coloring agents and filling agents may be added. In examples (1) polyvinyl chloride of low polymerization is suspended in CCl<sub>4</sub> and treated with Cl at (60-70)°, the product being pptd. with MeOH and (2) highly polymerized polyvinyl chloride is dissolved in I at 70-80° and treated with Cl at 100°; the product is sepd. by steam distn. of the solvent.

**Artificial masses.** László Bolgár. Hung. 107,782, Dec. 15, 1933. Tar residues or asphalts are mixed with acids or acid salts contg. fillers (sand, rock powder, clay, sawdust, cork, fibers, graphite, etc.) up to a content of 90%, and the mixt. is pressed into shape. Cf. C. A. 27. 2001.

**Artificial material.** Aladár Vajdaff. Hung. 107,439, Dec. 1, 1933. The cellulose content of plant fibers is nyltrated and the moisture content is maintained above 24%. Disintegrated portions of plants, resins, fatty acids or their salts, latex, pitch, paraffin or cements are added, and the mixt. is pressed into shape.

**Compound sheet material.** Arthur S. Lewenstein. Brit. 401,391, Nov. 16, 1933. Plywood is surfaced with synthetic resin by applying to 1 or both surfaces (fabric and paper) treated with the resin, which may be partially cured, and completing the cure by subjecting the assembly to 75-500 lb. per sq. in. Fabric, if used, is placed between the plywood and paper.

**Adhesive.** Sadakichi Satō. Japan. 99,757, Feb. 24, 1933. A waterproof adhesive is prepd. by treating cellulose materials (especially hemicellulose) and proteins of soy bean in the colloidal state with ZnCl<sub>2</sub> and NaOH, etc.

**Adhesive for wood.** Hōnen Seiyu K. K. (Eijirō Ichikawa, inventor). Japan. 99,595, Feb. 16, 1933. A mixt. of powd. soy bean (100 parts), slaked lime (5), soda ash (5), anhyd. Na silicate (20), water (240-270) and Canada balsam (40) in CS<sub>2</sub> (60) is specified.

**Adhesive suitable for use on glass, metals, wood, etc.** Myron E. Delaney (to Halowax Corp.). U. S. 1,945,803, Feb. 6. About equal parts of a normally solid chlorinated naphthalene and ester gum are used together with about 5% of rubber latex.

**Cement composition suitable for adhering to smooth surfaces such as glass.** Loven Lasher. U. S. 1,945,149, Jan. 30. Na silicate, rosin, gum arabic, PbO, glycerol and water are used in prep. a cement.

**Protein solutions such as those of casein.** Charles Graenacher (to Soc. pour l'ind. chim. à Bâle). U. S. 1,946,159, Feb. 6. See Fr. 730,216 (C. A. 27, 383).

**Hardened or condensed products of sericin.** Kyōsuke Nishizawa and Takashi Kirigakubo. Japan. 100,256, March 25, 1933. Sericin is treated with acids, NH<sub>3</sub>, caustic alkali, salts, phenols, naphthols or methylenic compds. as gelatinization reagents and HClO or compds. liberating HCHO as condensation reagents.

**Composition for phonograph records.** James E. Syn-

onds (to United Research Corp.). U. S. 1,946,597, Feb. 13. Polymerized vinyl acetate 77, amorphous silica 20, dibutyl phthalate 0.25 and coloring matter such as carbon black about 2.75% are used together.

**Diaphragms suitable for use in "loud-speaking" apparatus.** Constantin Chlowsky and Paul Breton. U. S. 1,945,933, Feb. 6. In the manuf. of diaphragms having a backing of material such as silk muslin permeable to fluids, the backing is stretched and placed above a liquid such as Hg at a distance from the surface of the liquid which is less than the desired thickness of the diaphragm, and there is poured upon the backing material, in the form of a fluid adapted to coagulate, the substance (such as a cellulose-acetate varnish) which is to constitute the diaphragm material and coagulation of the material is permitted.

**Clay compositions.** George H. Hadfield and Sand & Shingle Ltd. Brit. 401,304, Nov. 2, 1933. A compn. for surfacing artificial cricket pitches, etc., consists of fibrous material, plastic material of the nature of clay and very finely divided non-plastic, preferably siliceous, material. A typical compn. contains asbestos 16-44, sawdust 0-24, clay 6-12%, with SiO<sub>2</sub> and fine sand as remainder.

**Acid treatment of Japanese acid clay.** Nippon Sekiyū K. K. (Masakichi Mizuta and Teiji Yoshimura, inventors). Japan. 100,247, March 24, 1933. Acid clay is treated with concd. H<sub>2</sub>SO<sub>4</sub> *in vacuo*, by which the utilization of the acid is improved.

**Flotation of alunite.** Tomekichi Ishikawa. Japan. 100,390, Apr. 4, 1933. By mixing finely crushed ore contg. alunite (dia. less than 0.3 mm.) with 5 times its wt. of water, 0.1-0.2% AcOH or acetate and 0.1% palm oil, a mixt. of the oil and alunite is floated on the surface and sepd. from the other rocks.

**Treating polyhalite.** Hans Friedrich. U. S. 1,946,068, Feb. 6. The mineral is heated with water in the presence of an acid N-O compd. such as HNO<sub>3</sub> or nitrous gases and the resulting soln. is sepd. from insol. residue and may be crystd. to produce a fertilizer which may be treated with NH<sub>3</sub>.

**Plant for recovering asbestos from minerals.** Michail P. Brodsky. Ger. 591,402, Jan. 20, 1934 (Cl. 1a. 32).

**Powdered agar-agar.** Dai Nippon Seiyaku K. K. (Suekichi Oki and Kyō Imo'o, inventors). Japan. 99,061, Jan. 16, 1933. Seaweed is extd. with hot water. Agar-agar is sepd. from the concd. ext. by adding Na<sub>2</sub>SO<sub>4</sub>, washed with H<sub>2</sub>O and dried at low temp.

**Powdered agar-agar.** Kwan Kimura and Sakae Nagai. Japan. 99,998, March 9, 1933. Liquid agar-agar and air under pressure and below 0°, are separately introduced into a chamber; moisture in the frozen particles is removed by means of warm air.

**Artificial pumice.** Soc. anon. des hauts-fourneaux et mines de Halanzy and Soc. des hauts-fourneaux de Saulnes Jean Raty & Cie. Fr. 756,445, Dec. 9, 1933. Artificial pumice is made by blowing slag from blast or metallurgical furnaces on to a previously wetted surface where it swells and is cooled. The product is broken up to the desired size.

**Apparatus for making artificial pumice from blast-furnace slag.** Bruck, Kretschel & Co. Ger. 591,153, Jan. 17, 1934 (Cl. 80b. 5.06).

**Apparatus for manufacturing table salt.** Masao Fujiwara and Nagayasu Bandō. Japan. 99,247, Jan. 30, 1933. Diagrammatical.

**Plaster for casts.** Wilhelm Utermann. Ger. 589,961, Dec. 19, 1933 (Cl. 80b. 25.08). A bituminous plaster for making casts is made by dissolving rubber waste in asphalt, mineral oil bitumen, etc., at 200-250° and adding ground chalk, shale, limestone or asbestos, so that the final product contains 5-25% rubber waste and 25-60% chalk, etc.

**Compositions for making dental plates.** Deutsche Celluloid-Fabrik. Ger. 591,282, Jan. 19, 1934 (Cl. 30b. 12.01). Use is made of compns. comprising a water-insol. cellulose ether and a non-saponifiable plasticizer, e. g., PhC<sub>2</sub>H<sub>4</sub>OH, limonene or *p*-cymene.

**Lining for apparatus for oxidizing ammonia.** Dai Nippon Jinzōhiryō K. K. (Takejiro Takahashi, inventor).

Japan. 100,038, March 9, 1933. The lining material is a mixt. of  $\text{BaSO}_4$  (e. g., 50 parts),  $\text{BaO}$  (80), powd. asbestos (10) and Na silicate (50) and water. Cf. C. A. 27, 1457.

**Magnetic core material.** Howard L. Cobb (to Research Corp.). U. S. 1,946,964, Feb. 13. A sintered mixt. is used comprising  $\text{Fe}_2\text{O}_3$  and a monoxide of another metal such as that of Cu, Ni, Pb, Cd, Zn or Ca capable of chemically combining with the  $\text{Fe}_2\text{O}_3$ .

**Clutch and gear materials.** Theodor Sachs. Brit. 400,172, Oct. 11, 1933. Bearings, gears, etc., are made from woven fabrics, paper, etc., embedded in a synthetic resin,  $\text{CH}_2\text{O}$  condensation product or the like, the fabric, etc., being impregnated with a non-drying oil prior to insertion in the binding material. Part of the fabric material may be impregnated with graphite by the wet method instead of with oil. Steaming may precede the impregnation with oil.

**Flexible packing for rods and shafts.** Fletcher H. Field (to Rhodes Metallic Packing Co.). U. S. 1,946,527, Feb. 13. A tubular braided core which may be formed of wire or metal ribbon such as Mg or a Cu-Pb alloy extends through a body of packing and constitutes a lubricant reservoir. U. S. 1,946,528 relates to a packing comprising a core such as may be formed of wire contg. Mg, a surrounding layer of a nonabrasive metal alloy having heat-resisting properties, such as a Mg alloy and a protecting cover of braided Mg alloy wire.

**Fluid suitable for use in pressure apparatus such as hydraulic brake systems or the like.** Arthur G. Weber and Richard B. Schneider (to E. I. du Pont de Nemours & Co.). U. S. 1,945,543, Feb. 6. Castor oil, rape-seed oil or liquid petrolatum is used with a mixt. of higher-boiling oxygenated org. liquid products obtainable as a by-product in the catalytic hydrogenation of oxides of carbon to MeOH, which serves to give a desirable viscosity over a wide temp. range.

**Mixture of colloidal metal and fat.** Shinkichi Horiha, Mizuho Otagiri and Tatu Kiyota. Japan. 100,366, Apr. 1, 1933. A metal oxide in a mixt. of fats (or oils) and fatty acids is reduced with an agent such as hydroquinone or  $\beta$ -phenylenediamine. The products of oxidation of the reducing reagent and free fatty acids are sepd. by the difference of the soly. in a solvent such as MeOH.

**Coating for wood or cardboard articles.** László Dér. Hung. 107,622, Dec. 15, 1933. A mixt. of gypsum 4 parts by wt., flour, wood flour or sawdust 1 part and varnish 1 part is stirred with water to form a pulp. The pulp is spread on the articles to be coated and when dry forms a hard glossy surface.

**Treated paper or the like for preventing tarnishing of silverware.** Arthur E. Thurber and Raymond H. Sholtz (to Oneida Community, Ltd.). U. S. 1,946,508, Feb. 13. See Can. 333,430 (C. A. 27, 4675).

**Heating by chemical action.** Daniel Mangrané. Fr. 756,836, Dec. 15, 1933. In obtaining heat by exothermic reactions based on the substitution of one metal by another in a salt, the reaction is made slower by the production of secondary reactions which are themselves exothermic. Thus, the secondary reactions are produced by introducing a salt of a metal which has several valencies and an oxidizing agent. Thus, if the primary reaction is the conversion of Fe to  $\text{FeCl}_2$  and  $\text{CuCl}_2$  to Cu,  $\text{SnCl}_4$  is introduced and is converted 1st to  $\text{SnCl}_2$  and then reduced to Sn.

**Protecting printed documents, etc.** Joseph Broadman. U. S. 1,947,516, Feb. 20. An addnl. flexible sheet of light-permeable material such as transparent paper is connected to each side of a sheet of printed paper or the like by an intermediate layer of adhesive such as a cold-water wheat-flour paste which is caused to enter and penetrate only the inner part of the addnl. sheet material; the exterior surface of the addnl. sheets is then coated with a layer of light-permeable protective material such as Manila gum varnish which penetrates only the outer portion of the sheet and is of flexible and non-peeling resinous character.

**Films, plates, etc.** I. G. Farberind. A.-G. Fr. 756,422, Dec. 9, 1933. Films, layers, fibers plates and other

plastic substances are made from solns. of colloidal salts obtained by causing polymeric polycarboxylic acids, rich in COOH groups, or their alkali salts to react with salts of elements capable of forming cations (metals) with the exception of alkali metal salts. Alkali salts of polyacrylic acid are particularly suitable. As metal salts, products contg. Ag, Pb or Ur may be used in photography, those contg. Pb or Th may be used for radiographic work and products contg. Fe may be used in electrotechnics.

**Detergents.** Robert H. Marriott. Brit. 401,413, Nov. 16, 1933. Washing-compns. consist of a sulfonated alc. or an alkali salt thereof, and bentonite, "willkinit" or equiv. clay. An alk. substance, e. g., borax,  $\text{Na}_2\text{HPO}_4$ , a medicament, e. g., menthol,  $\text{H}_2\text{O}$ , glycerol, an emollient and coloring substances may be added. Examples include a shampoo prepd. by mixing bentonite 3, Na salt of sulfonated lauryl alc. 1, and  $\text{NaHCO}_3$  1 lb. and dissolving 0.5 oz. of the mixt. in 10 oz.  $\text{H}_2\text{O}$ .

**Cleansing agent.** Wilhelm Lohmann. Ger. 588,205, Nov. 14, 1933 (Cl. 22g. 14). Addn. to 502,816 (C. A. 24, 5446). The method of 502,816 for producing cleansing blocks from factice, sand and substances yielding  $\text{NH}_3$  is modified by replacing the latter by acid salts such as  $\text{KHSO}_4$ .

**Cleansing composition suitable for use as a shampoo or on fine fabrics.** Roy H. Brownlee. U. S. 1,946,272, Feb. 6. A non-alk. cleansing compn. contains a phosphate such as primary Na phosphate or di-Na phosphate and a water-sol. non-drying oil such as sulfonated coconut or castor oil in a quantity not materially greater than is sufficient to neutralize the relatively slight alkalinity of the salt in aq. soln.

**Wetting and other agents.** Henkel & Cie. G. m. b. H. Brit. 401,116, Nov. 9, 1933. This corresponds to Fr. 746,435 (C. A. 27, 4539) but the esters or thio esters of Brit. 401,117 and 401,120 (C. A. 28, 2364\*) are sulfonated.

**Wetting and emulsifying agents.** British Dyestuffs Corp. Ltd. Ger. 588,690, Nov. 23, 1933 (Cl. 12o. 23.01) See Brit. 274,611 (C. A. 22, 2268).

**Waterproofing material.** Rikwagaku Kenkyūjo (To-kishige Kusama and Tatuichi Yokoyama, inventors) Japan. 99,764, Feb. 24, 1933. Powd. rubber is heated with tetralin at  $130-180^\circ$  for 2-6 hrs. and then the solvent is expelled. A mixt. of the product with an org. solvent is used for waterproofing paper, cloth, etc.

**Moisture-proofing compositions.** Fred K. Shankweiler (to Hercules Powder Co.). Brit. 401,534, Nov. 16, 1933. See Fr. 740,013 (C. A. 28, 5639).

**Agent to prevent clouding of spectacles.** The War Minister (Shintarō Kunisawa and Hidejirō Kōda, inventors). Japan. 99,290, Feb. 1, 1933. The agent is a mixt. of polyhydric alcs. (such as ethylene glycol or glycerol), water, resin soap and saponin (or a sulfonate of a hydrogenated ring compd. contg. an alkyl group).

**Stirrer for muffle or flame furnaces for making sodium sulfate.** Alphonse Zieren. Ger. 591,268, Jan. 18, 1934 (Cl. 12f. 5).

**Forming centers of golf balls or the like, which are liquid at normal temperatures.** Douglas F. Twiss and Albert E. T. Neale (to Dunlop Rubber Co., Ltd.) U. S. 1,947,539, Feb. 20. Liquefying centers are formed of parts of different materials such as gelatin gel and  $\text{NH}_4\text{NO}_3$  which are of solid character but when assembled and in contact with each other form a liquid product.

**Wood polishes.** Albert van Rōyen. Fr. 756,536, Dec. 11, 1933. Polishes are colored the same color as the wood to be polished and contain insecticides such as corrosive sublimate or pyrethrum oil.

**Glass polisher.** Tomio Satō. Japan. 100,342, March 29, 1933. The polisher is prepd. by steaming a molded mixt. of powd. silica, Al silicate, acid clay, chalk, flour, K soap and gelatin soln.

**Shoe polish.** Sándor Szalay. Hung. 107,877, Jan. 2, 1934. To a mixt. of carnauba wax 16-18, montan wax 12-14 and ceresin 8 10% is added a turpentine soln. of 4 5% aniline dye.

**Shoe-stiffening material.** David B. Macdonald (to United Shoe Machinery Corp.). U. S. 1,945,850, Feb. 6. The marginal portions only of a blank of porous absorbent material such as a thin fabric are charged with a non-stiffening substance such as rubber or farina gelled in water to reduce the absorptivity of that portion preparatory to treating the blank with a stiffening substance such as celluloid.

**Cleaning tobacco pipes, etc.** Boris Hellmann. Brit. 401,436, Nov. 16, 1933. Pipes, cigar holders, etc., are cleaned and disinfected by filling with a solvent consisting of a mixt. of  $\text{Me}_2\text{CO}$  or the like, a nitrated hydrocarbon, e. g.,  $\text{PhNO}_2$ , and a dil. mineral acid, e. g.,  $\text{HCl}$ , which may be replaced by  $\text{Ac}_2\text{O}$  where the solvent comes into contact with metal.

**Reagent for preventing molding.** Goichi Hirata. Japan. 100,141, March 17, 1933. The reagent is prep'd. by

1 introducing  $\text{Cl}_2$  into an aq. or alc. soln. of urea and then mixing with mustard oil.

**Insecticide for white ants.** Tosane Matsudaira. Japan. 99,524, Feb. 14, 1933. A mixt. of  $\text{As}_2\text{O}_3$ , saccharin, starch, Pb arsenate, gum arabic and powd. rice is specified.

**Deodorizing insecticide.** Kazuhiko Koyama. Japan. 100,477, Apr. 10, 1933. The insecticide is a mixt. of camphor, chloronaphthalene (or *p*-dichlorobenzene) and some essential oils (such as the Japanese pepper oil, 2 cinnamon oil, camphor oil).

**Fireproof antiseptic.** Tatsusaburō Saitō. Japan. 99,918, March 2, 1933. The antiseptic is a mixed soln. of  $\text{Mg}(\text{NH}_4)_2(\text{SO}_4)_2$ ,  $\text{Mg}(\text{NH}_4)_2\text{Cl}_2$  and ethyl oxalate.

**Fluid-pressure-controlled alarm device suitable for use with fire extinguishing systems.** Arthur C. Rowley (to Globe Automatic Sprinkler Co.). U. S. 1,946,412, Feb. 6. Structural and mech. features.

## 19- GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Study of the technic of stained glass of the Middle Ages.** G. Chesneau. *Bull. soc. encour. ind. natl.* 132, (109-25(1933)).—Stained glasses of the 12th and 13th century cathedrals were exam'd. The raw materials used for the fundamental white glass were sand, plant ashes to furnish K, common salt and a little  $\text{MnO}$  to neutralize the coloration due to Fe oxides. The glass was worked on a table and varied in thickness. Some glass was blown in cylinders and had uniform thickness. Glass was colored by the addn. of metallic oxides.  $\text{Cu}_2\text{O}$  gave red glass;  $\text{CoO}$  with traces of  $\text{CuO}$  gave blue glass; the blue was often modified by the presence of  $\text{NiO}$  or  $\text{MnO}$ ; yellow was produced by the oxysulfide of Sb with some  $\text{Fe}_2\text{O}_3$ ; violet was produced from pyrolusite which contained some Fe;  $\text{CuO}$  was added to give green. All of these metallic oxides with the exception of Co were found in France. The Pb used to secure the glass in the windows contained some Sb, making it slightly harder.

C. B. Jeuni

**Effect of composition of glass and temperature and strength of alkali solutions on bottle scratching, together with discussion of methods proposed to measure scratchability.** H. A. Trebler and J. H. Shrader. *Proc. Intern. Assoc. Milk Dealers, Plant Sect., 26th Ann. Convention* Sept., 1933, 60 8.—There is no evidence that the cleaning soln. now used in bottle washers (0.3 3% alk. for 8 16 min. at 140 160° F.) materially contributes to a softening of the glass surface, making it more susceptible to scratching. At present no practical lab. test for resistance to scratching is known. Bottles should be bought on the basis of service test both for breakage and scratching.

J. C. Jurgens

**Recent developments in design and operation of industrial furnaces.** G. A. Merkt. *Iron Steel Eng.* 11, 76-84 (1934).—Recirculation of approx. 30% of the waste gases in a glass-melting furnace, fired with natural gas, has given highly satisfactory results. In the cited case the waste gas was returned to the pot without regeneration by tapping the flue to the stack.

W. H. Hoynton

**Flameless furnaces and their use in glass melting.** N. P. Krasnikov. *Keram. i Steklo* 9, No. 10, 11-15 (1933).—The principles of flameless firing, different types of burners, and advantages in applying flameless firing to the Fourcault channel and annealing furnaces are described.

M. V. Kondoidy

**Manufacturing glass for electric bulbs in tank furnaces.** B. V. Khovanskii, A. I. Morozov and A. N. Nagornuil. *Keram. i Steklo* 9, No. 10, 8-11 (1933).—Conditions required for the production of glass for elec. bulbs in a tank furnace of the Simplex type are discussed.

M. V. K.

**The physical processes occurring in the melting and cooling of glass.** J. T. Littleton. *J. Am. Ceram. Soc.* 17, 43-9 (1934).—Fusion of the batch is soon completed; most of the time is used in freeing the glass from gas bubbles and in improving homogeneity. Melting may be

similar to a diffusion process, aided by convection currents. Only elec. cond. data indicate the existence of silicate compds. Dissolved gases probably assist fining by diffusing into the bubbles and increasing their size. Devitrification is avoided by knowing the devitrification temp., staying above that temp. during melting and fining, and cooling rapidly through that zone. Data show that viscosity changes with time, and when instantaneous values of viscosity are used, the rate of release of stress during annealing is proportional to the stress divided by the viscosity. The const. of proportionality has the dimension of the shear modulus of glass and is equal to  $1/4$  the value of the shear modulus in glass at room temp.

C. H. Kerr

**Comparison tests with alumina and feldspar as alumina-containing materials in glass.** Fr. Stang. *Glashutte* 63, 615-16 (1933).— $\text{Al}(\text{OH})_3$  is equal to or superior to feldspar in fusibility in the presence of Na carbonate. Feldspar is superior to  $\text{Al}(\text{OH})_3$  in fusibility in the presence of Na sulfate. In the presence of both Na carbonate and Na sulfate the relative fusibilities depend on the proportion of the mixt.  $\text{Al}(\text{OH})_3$  and feldspar are more fusible than  $\text{Al}_2\text{O}_3$ ;  $\text{Al}(\text{OH})_3$  is better because of a more uniform compn., and it produces a finer tinge in the finished glass.

M. V. Kondoidy

**Light permeability and color tone of building and illuminating glass.** H. Craemer. *Glashutte* 63, 616-17 (1933).—The reason for the greenish coloring of glass employed for illuminating and building purposes is the presence of metallic oxides, especially of  $\text{Fe}_2\text{O}_3$  and  $\text{FeO}$ , in the glass melt. The green coloring means a loss of light, because only the green colors pass through the glass unweakened, while all the other colors of the spectrum are partly absorbed and destroyed. The phys. decolorization of glass, or an addn. of complementary pigments, lowers the total permeability of the glass. The green tinge is removed only by means of chem. decolorization of the glass. Tests showed that Ce and Mn are especially interesting as decolorizers.

M. V. K.

**A study of some frit compositions.** C. W. Parmelee and K. C. Lyon. *J. Am. Ceram. Soc.* 17, 60-6 (1934).—Frits contg.  $\text{Na}_2\text{O}$ ,  $\text{CaO}$ ,  $\text{B}_2\text{O}_3$ ,  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  were studied. For proper fusibility and fluidity some  $\text{B}_2\text{O}_3$  is necessary.  $\text{SiO}_2$  should not exceed 8.0 equiv.  $\text{Na}_2\text{O}$  and  $\text{CaO}$  may vary from 0.3 to 0.7 equiv.  $\text{Al}_2\text{O}_3$  may be used up to 0.1 equiv. at least.  $\text{B}_2\text{O}_3$  need not exceed 0.5 equiv. To prevent excessive corrosion of the smelter lining, the  $\text{SiO}_2$  content should not exceed 1.0 equiv. The soly. of the frit glass in  $\text{H}_2\text{O}$  is roughly proportional to the mol. ratio  $(\text{Na}_2\text{O} + \text{B}_2\text{O}_3)/(\text{CaO} + \text{SiO}_2)$ . Small addns. of  $\text{Al}_2\text{O}_3$  (about 0.1 equiv.) will reduce the soly. about one-half. A frit of low soly. can be made without using  $\text{Al}_2\text{O}_3$ .

C. H. Kerr

**Artificial resins, etc., as the intermediate layer in safety glass.** A. Bresser. *Kunststoffe* 24, 30-2 (1934).—The

use of various synthetic, artificial plastics in the manu- of  
shatter-proof glass is discussed.

J. W. Perry  
Determination of the cristobalite content of silica bricks.  
J. M. G. Hemmar and J. G. de Voogd. *Hot Gas* 53, 492-6  
(1933).—The detn. of cristobalite in burnt silica brick is of  
some importance, because of the relatively large vol. in-  
crease in the rapid  $\alpha$ - $\beta$  transition at 230° and its relation  
to spalling. The Nieuwenburg dilatometer app. (C. A.  
22, 1265, 2863) for cristobalite detn. based on the expan-  
sion of a small test cylinder is described. The test body of  
90% powd. brick (DIN sieve no. 60) + 10% fat clay,  
kneaded with H<sub>2</sub>O and pressed through a 7-mm. glass  
cylinder, is cut off to 30 mm., dried for 1 hr. in *vacuo* at 50-  
60°, then ground to 30 mm. It is heated in the center of  
an elec. furnace; its expansion is transmitted to a little  
mirror, 0.01 mm. expansion giving 9 mm. displacement of  
a light beam on the scale. Several curves of expansion vs.  
temp. rise are given; from these the cristobalite content is  
derived. The results are reproducible in 1% from tests by  
3 independent labs. The test cylinders are used only once.  
Results so far obtained do not point to high cristobalite  
content as a cause of spalling.

B. J. C. v. d. H.  
Some effects of temperature on commercial heat-  
insulating bricks. A. J. Dale and F. Wheeler. *Trans.*  
*Inst. Gas Engrs.* 79, 224-8, 245-53 (1929-30). A. H. E.  
Use of galena, natural lead sulfide, in ceramic industry.  
Marc Larcheveque. *Céramique* 36, 221-4 (1933).

Effect of fineness of flint on vitrification of a ceramic  
body. C. W. Parmelee and W. R. Morgan. *Ceram.*  
*Ind.* 22, 146-52 (1934). Herbert S. Willson

Technical study and practice of the mixing and prepara-  
tion of ceramic stoneware slips. Felix Chalmel. *Cé-*  
*ramique* 36, 235-46 (1933). M. H. Berns

Report on burned clay. Henri Gilardoni. *Céramique*  
36, 185-91 (1933). M. H. Berns

Some experiments on frothed clays. S. R. Hind.  
*Trans. Inst. Gas Engrs.* 79, 228 (1929-30).—China clay  
and ball clay slips were treated to give a froth (method  
not given), the froth was dried, fired to 1250°, ground for  
grog, bonded with 15% ball clay and refired to 1200°.  
The thermal cond. at 267-500° was 0.00050, at 415-800°,  
0.00064 and at 640-1100°, 0.00077. Alden H. Emery

Thermal insulation of crowns of glass furnaces as a  
means of saving fuel and Dinas bricks. N. P. Krasnikov.  
*Keram. i Steklo* 9, No. 9, 20-1 (1933).—Thermal insulation  
of crowns of glass furnaces permits reduction of gas con-  
sumptions by 10% and decreases the total quantity of  
Dinas bricks by half, because they last twice as long.  
Changes appearing in Dinas brick (connected with the  
formation of tridymite) occur irregularly, and the brick  
becomes inhomogeneous when the crown is not insulated,  
while with thermal insulation the production of tridymite  
proceeds uniformly and the brick becomes much more  
stable and durable.

M. V. Kondoidy  
Kieselguhr and insulation in the ceramic industry.  
Lucien Augé. *Céramique* 36, 217-20 (1933). M. H. B.

Measuring the thermal conductivity of refractory  
materials and insulators. L. Longchambon. *Céramique*  
36, 215-17 (1933).—Isothermal surfaces are detd., and the  
quantity of heat which traverses these surfaces is measured.

M. H. Berns  
Refractory brick for Cowper apparatus (blast-furnace  
stoves). R. Leduc. *Céramique* 36, 260-7 (1933).

M. H. Berns  
The measurement of reaction rates [in refractories] at  
high temperatures. J. H. Chesters and C. W. Parmelee.  
*J. Am. Ceram. Soc.* 17, 50-9 (1934).—Cylindrical test  
pieces, formed under 10,000 lb./sq. in. pressure, were  
heated to 1300-1500°. The rate of inversion of quartz to  
cristobalite and the rate of spinel formation in mixts. of  
electrically fused MgO and Al<sub>2</sub>O<sub>3</sub> were detd. from the slope  
of the expansion curve at const. temp. The amt. of  
cristobalite or spinel formed was calcd. from d. detns.  
before and after firing. The products were identified by  
x-ray and microscopic examn. Unfired SiO<sub>2</sub> brick showed  
almost complete inversion to cristobalite in 2 hrs. at

1300°, the corresponding vertical expansion being about  
6%. Adding 2% CaO to unfired quartzite increased the  
rate of inversion quite appreciably. A further addn. of  
1.5% Na<sub>2</sub>O and 1.5% Fe<sub>2</sub>O<sub>3</sub> so increased the rate of in-  
version at 1400° that after 2 hrs. only cristobalite was  
found. A mixt. of electrically fused MgO (0.15-0.06  
mm. grain size) and Al<sub>2</sub>O<sub>3</sub> (3.59-0.15 mm. grain size)  
contained about 25% spinel after 2 hrs. at 1500°. Adding  
2% B<sub>2</sub>O<sub>3</sub> increased the spinel to 75% under the same  
conditions. Test pieces made from MgO and Al<sub>2</sub>O<sub>3</sub> of one  
grain size only (0.06 mm.) showed complete conversion to  
spinel after only 10 min. at 1450°.

C. H. Kerr  
The influence of oxidizing and reducing atmospheres on  
refractory materials. H. T. S. Swallow. *Trans. Inst.*  
*Gas Engrs.* 79, 238-40 (1929-30).—The influence of atm  
on the ordinary refractory test is negligible for firebricks  
contg. normally low amts. of Fe. Heating for a long  
period under reducing conditions lowered the refractorness  
of a brick contg. about 5% Fe<sub>2</sub>O<sub>3</sub> by about 20°. The  
load-bearing capacity of firebricks is lowered by a change  
from oxidizing to reducing conditions.

A. H. Emery  
The after-expansion and true specific gravity of silica  
refractories for carbonizing plant. A. J. Dale, H. T. S.  
Swallow and F. Wheeler. *Trans. Inst. Gas Engrs.* 79,  
229-37, 245-53 (1929-30); cf. C. A. 24, 2565.

Alden H. Emery  
Glazes without lead for terra cotta. V. M. Barshtak  
*Keram. i Steklo* 9, No. 7, 26-7 (1933).—See C. A. 28, 871<sup>9</sup>,  
where the author's name was incorrectly given C. C. Ber-  
man.

E. J. C  
The microstructure of some raw lead mat glazes  
C. W. Parmelee and Wm. Horak. *J. Am. Ceram. Soc.*  
17, 67-72 (1934).—Glazes of the following ranges of  
compd. were fired at cones 03, 2, 4 and 6: 0.4-0.6 PbO,  
0.2-0.3 CaO, 0.0-0.3 BaO, 0.0-0.3 ZnO, 0.1-0.35 Al<sub>2</sub>O<sub>3</sub>,  
0.7-1.8 equiv. SiO<sub>2</sub>. The compds. recognized as crystals  
were anorthite, celsian (probably), tridymite and wol-  
lastonite. Willemite was not observed. The good mats  
were due to crystal sepn. A high Al<sub>2</sub>O<sub>3</sub> content was not  
essential. Anorthite was the principal cryst. form  
present in mat glazes contg. CaO. When ZnO is under  
0.3 equiv. no Zn silicate crystallizes out, but the ZnO  
combines with the other constituents to form a more fluid  
glass. BaO tends to form mats by crytg. out as a mineral  
believed to be Ba feldspar.

C. H. Kerr  
Determination of the effect of direct gas firing on  
porcelain glazes. Arthur P. Watts. *Am. Gas Assoc.*  
*Monthly* 16, No. 1, 8-10; *Ceram. Age* 23, 37-8 (1934).  
Tests on a series of elec. and sanitary porcelain glazes,  
both white and colored, indicated that they can be directly  
fired without damage to body or glaze if flashing and direct  
impingement of the flame is prevented. A material  
reduction in firing time was also obtained. Results of the  
tests on 58 glazes are given.

32 pp. Tl. 2. Textband. 388 pp. Berlin: Chem.  
Lab. für Tonindustrie. M. 3.30.

**Refining glass.** Corning Glass Works. Fr. 756,495, Dec. 11, 1933. Masses of molten glass are refined by adding to the charge to be melted a small amt. of material contg. Br or I, e. g., I, iodates, iodides, iodoform, bromides and bromates.

**Feeding mold charges of molten glass.** Samuel G. Stuckey (to Obeas-Nester Glass Co.). U. S. 1,945,871, Feb. 6. Various details of app. and operation are described. Cf. C. A. 27, 4646.

**Glass tank furnace and associated apparatus.** John L. Drake (to Libbey-Owens-Ford Glass Co.). U. S. 1,945,801, Feb. 6. A displacement plunger is provided to assist in maintaining a desired level of molten glass in the furnace. Various structural and mech. details are described.

**Electric furnace for melting glass.** \*Patent-Treuhand-Ges. für elektrische Glühlampen m. b. H. Fr. 756,498, Dec. 11, 1933.

**Cooling furnace for glass sheets.** Adolf Schild. Ger. 589,678, Dec. 12, 1933 (Cl. 32a. 29).

**Apparatus for drawing sheets of glass.** N. V. Hollandsche Maatschappij Voor de Vervaardiging van Glas. Fr. 756,685, Dec. 13, 1933.

**Apparatus for making glass sheets by vertical drawing.** N. V. Hollandsche Maatschappij Voor de Vervaardiging van Glas. Fr. 756,720, Dec. 14, 1933.

**Sheet wire glass.** Charles B. Kingsley (to Mississippi Glass Co.). U. S. 1,945,995, Feb. 6. Various details of app. and operation are described.

**Sponge-like glass.** Bernard Long (to Soc. anon. des manufactures des glaces & produits chimiques de Saint-Gobain, Chauny & Cirey). U. S. 1,945,052, Jan. 30. Gas-evolving substances such as  $\text{Na}_2\text{CO}_3$ ,  $\text{H}_2\text{BO}_3$ ,  $\text{Al}(\text{OH})_3$ ,  $\text{TiO}_2$ ,  $\text{NH}_4\text{Cl}$  and carbon are incorporated in a glass batch, and the glass material is subsequently maintained close to its softening temp. and sufficiently below the fusion temp. to cause evolution of gas and form a sponge-like product which is suitable for heat and sound insulation.

**Apparatus for manufacture of hollow glass articles such as bottles.** Emile Roirant (to Soc. anon. d'études et de constructions d'appareils mécaniques pour la verrerie). U. S. 1,946,411, Feb. 6. Mech. features.

**Manufacture of hollow glassware such as bottles.** George E. Rowe (to Hartford-Empire Co.). U. S. 1,945,982-3, Feb. 6. Various details of app. and operation are described. U. S. 1,945,985 (Arthur E. Smith, to Hartford-Empire Co.) also relates to the manuf. of bottles, etc.

**Annealing glassware.** Harold L. Eastman (to Hartford-Empire Co.). U. S. 1,947,408, Feb. 13. Various details of app. and operation are described suitable for annealing glassware in an elongated tunnel.

**Apparatus for manufacturing glass cylinders.** Yuzuru Iwasaki. Japan 94,910, March 2, 1933. Diagrammatical.

**Composite vitreous articles.** Società anon. vetreria italiana balzaretto modigliani. Fr. 756,657, Dec. 13, 1933. Glass threads are mounted between sheets of glass to give optical, decorative, thermal or acoustic effects.

**Agatized bodies such as marbles.** Sellers H. Peltier. U. S. 1,946,879, Feb. 13. A pool of molten vitreous material is formed over an orifice (in a described app.), and a stream from the pool is flowed through the orifice, a coloring substance being supplied to the border of the pool to form colored portions in the surface of the stream.

**Compound glass.** British Celanese Ltd. and Wm. H. Moss. Brit. 401,299, Nov. 1, 1933. Laminated glass is made by uniting sheets of glass and a sheet or sheets of a cellulose deriv. by thin films of cellulose derivs., low pressures, e. g., 50 lb. per sq. in. or less, being applied, e. g., in a press or by passing between rubber-faced rollers, while the films are in a softened condition due to the presence of a solvent or swelling agent. Atm. or higher temp., e. g., up to 100°, may be used. The same cellulose deriv. may be used in the films and reinforcing sheets.

**Laminated glass.** Wm. H. Moss (to Celanese Corp. of

America). U. S. 1,947,486, Feb. 20. Glass sheets are pressed together with an intervening layer of a cellulose deriv. compn. such as one contg. cellulose acetate, etc., together with water 1-5% which serves to improve the plasticity of the compn.

**Clay product suitable for light bricks, etc.** Herman Reiser. U. S. 1,945,232, Jan. 30. The residuum obtained by burning rice hulls (suitably in a proportion of about 20-80%) is mixed with brick or potters clay

**Silica-lime brick.** Julius Schöffler (to Koppers Co. of Del.). U. S. 1,945,286, Jan. 30. In prepg. a molding mass for the manuf. of silica brick to be burned, from finely ground silica and lime, only a part of the total content of finely ground silica of the ultimate bricks is mixed with unslaked lime, and the lime in the mixt. is slaked, the product being then mixed with the remaining portion of the silica. App. is described.

**Kiln for making bricks and ceramic articles.** Ferdinand Panta. Ger. 591,086, Jan. 16, 1934 (Cl. 80c. 5). This corresponds to Brit. 346,699 (C. A. 27, 1128).

**Kiln suitable for burning brick or other ceramic products.** John J. Schmidt (to Frederick Iron & Steel Co.). U. S. 1,947,496, Feb. 20.

**Ceramic articles that can be fired at low temperature.** Géza Becker. Hung. 107,181, Sept. 1, 1933. Steatite is added to the raw material in quantities from 20 to 90%. Articles thus obtained can be fired at low temp. and are resistant to rapid variations of temp.

**Ceramic products.** Porzellanfabrik Kahla (Werner Rath, inventor). Ger. 591,090, Jan. 16, 1934 (Cl. 80b. 8.01). Brucite or nemalite is used in the manuf. of ceramic products of high  $\text{MgO}$  content. The powd. mineral alone may be molded and fired, or products of a spinel character may be prepd. from a mixt. of the mineral and  $\text{Al}_2\text{O}_3$ , or a eutectic mixture of the mineral and  $\text{Al}_2\text{O}_3$  may be used as a binder for other refractory materials. Known compns. contg. steatite may be modified by using brucite or nemalite in place of a part of the steatite.

**Oils for ceramic presses, etc.** Karl Jungmann and "Bituma" Bergbau- und chem. Ind. A.-G. Ger. 591,339, Jan. 20, 1934 (Cl. 80b. 24.05). Use is made of mixts. of hydrocarbon oils with (1) liquid resin obtained as a by-product in the cellulose industry, or (2) conversion products of the liquid resin, e. g., tall oil, or (3) a sulfonated fat, fatty oil or fatty acid.

**Foundry and glass-making crucibles.** Edmond Frayssé and Tran van Loi. Fr. 757,216, Dec. 22, 1933. Siliceous sandstone and quartzite are used for making the crucibles which are cut directly from the natural rock.

**Mullite.** Deutsche Ton- & Steinzeug-Werke A.-G. Ger. 589,556, Dec. 9, 1933 (Cl. 80b. 8.07). Ceramic material rich in mullite is prepd. by burning a mixt. of silicates of the sillimanite group and aq. solns. of Al salts, preferably those contg.  $\text{SO}_4$  and Cl ions.

**Apparatus (with a vibrating mold) for making ceramic articles such as refractories.** Elisabeth Lux (to Koppers Co. of Del.). U. S. 1,944,989, Jan. 30. Structural and mech. features.

**Refractory materials.** Jenny Pohl née Hohl. Ger. 591,154, Jan. 17, 1934 (Cl. 80b. 8.16). Refractory substances such as clay, magnesite, dolomite, and  $\text{Al}_2\text{O}_3$  are heated to softening temp. and then passed directly to a system of pressure rolls. The rolled products may be reheated to softening temp. if desired. Dense products suitable for making refractory articles are obtained.

**Abrasive sheets.** Minnesota Mining & Manufacturing Co. Fr. 756,564, Dec. 12, 1933. Polymerization or condensation products of an aldehyde and an amide or imide are used as bonding agent for abrasives on paper, etc.

**Abrasive sheets.** Minnesota Mining & Manufacturing Co. Fr. 756,907, Dec. 18, 1933. Polymerization or condensation products of polyhydric alcs. with polybasic acids or phenols are used as bonding agents for abrasives on paper, etc.

**Abrasive articles such as sheets or disks.** Joseph McKee (to Union Sandpaper Co.). U. S. 1,944,898, Jan. 30. After the article is formed and the adhesive used in its

manuf. has set, particles of material projecting beyond the general level of the majority of particles are broken off, as by the action of rolls.

**Composition for enameling or glazing metals.** Charles J. Kinzie (to Titanium Alloy Mfg. Co.). U. S. 1,944,938, Jan. 30. A coating suitable for use on sheet iron and steel is formed from a batch comprising Na Zr silicate 10-43,  $\text{Al}(\text{OH})_3$  0-3, K feldspar 0-48, quartz 0-24,  $\text{Na}_2\text{CO}_3$  0-11,  $\text{NaNO}_3$  3-5,  $\text{CaCO}_3$  0-8, cryolite 0-7, ZnO 4-14, fluorspar 0-11 and borax 23-47 parts.

**Enameling iron.** Ignaz Kreidl. Austrian 136,003, Dec. 27, 1933 (Cl. 48c). The adhesion of the enamel is

promoted by alloying the Fe with a small proportion of a suitable metal, particularly Ni or Co.

**Enameled gold-alloy or platinum tooth crowns.** Rezső Hejemann. Hung. 106,893, Aug. 1, 1933. A mixt. of  $\text{SiO}_2$  6.5, borax 2.0, cryst. soda 1.65,  $\text{NaNO}_3$  0.30, cryolite 1.20 and SnO 0.50% is heated for 2 hrs. to  $1000^\circ$ , powder and 10 parts of the powder mixed with 0.5 part white clay and an opacifier, the mixt. colored with the usual metal oxides and after addn. of about 0.75 l. water per kg ground in a mill for 24 hrs. An aq. or turpentine pulp, made from the dust is applied to the metal crowns and fired.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

**Calcium aluminates and their significance in cement.** Gunnar Assarsson. *Zement* 23, 1-3, 15-20(1934).—A comprehensive study is made of the phase relations in the system  $\text{CaO}-\text{Al}_2\text{O}_3-\text{H}_2\text{O}$ , with the results shown graphically. The chief cryst. products formed are  $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 10.5\text{H}_2\text{O}$ ,  $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 12\text{H}_2\text{O}$ ,  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 9\text{H}_2\text{O}$ ,  $\text{Al}_2\text{O}_3 \cdot 4\text{H}_2\text{O}$  and  $\text{Ca}(\text{OH})_2$ . The crystn. processes are aided by increase in temp. and retarded by decrease in the amt. of mixing water. The main product of the hydration of  $\text{CaO} \cdot \text{Al}_2\text{O}_3$  is a gel of index 1.53 accompanied by crystals of  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 9\text{H}_2\text{O}$ . The hydration products of  $3\text{CaO} \cdot 5\text{Al}_2\text{O}_3$  are similar. Aluminous cements when shaken with 0.4 to 20 parts of water show soln. only for about an hr., with pptn. occurring rapidly after the second hr. The ratio of CaO to  $\text{Al}_2\text{O}_3$  is highest in the more dil. solns.

H. F. Kriege

**Hydration of the lime silicates in portland cement.** K. Koyanagi. *Zement* 22, 705-8(1933).—Coarse cement particles, freed from adhering dust by 24-hr. shaking with abs. alc. and drying, were shaken for 50 days with 20 times their wt. of distd. water or lime water at  $20^\circ$ . The hydration process after a few hrs. resulted in the sepn. of a finely divided amorphous material having approx. the compn. of plumbierite ( $\text{CaO} \cdot \text{SiO}_2 \cdot 2\text{H}_2\text{O}$ ). In addn.  $\text{Ca}(\text{OH})_2$  in hexagonal crystals larger than the original cement grains developed to the extent of 3, 6.75 and 40.6% after shaking for 1, 2 and 4 weeks, resp. The hydration products of  $3\text{CaO} \cdot \text{SiO}_2$  and  $2\text{CaO} \cdot \text{SiO}_2$  are therefore  $\text{CaO} \cdot \text{SiO}_2 \cdot 2\text{H}_2\text{O}$  and  $\text{Ca}(\text{OH})_2$ . H. F. Kriege

**Investigation of the setting properties of mixtures of anhydrite cement and clay.** A. V. Filosofov. *J. Applied Chem.* (U. S. S. R.) 6, 245-7(1933).—According to expts. which are described in detail, anhydrite cement and clay have a mutually detrimental effect on the setting properties and therefore they should not be used together.

A. A. Bochtlingk

**Examination of cement and mortars.** H. Brückner. *Z. anal. Chem.* 96, 151-60(1934).—A review. W. T. H.

**Concrete strength in the light of new physical research.** Adalbert Pogány. *Zement* 23, 48-50, 63-5(1934).—Microscopic examn. showed that to obtain higher ultimate strengths in concrete, it is necessary to control the hardening processes so as to avoid the formation of minute cracks in the mass. H. F. Kriege

**Protective coatings for concrete and their resistant properties against the action of corrosive liquids.** C. R. Platzmann. *Asphalt Teer Strassenbautech.* 33, 943-4(1933); cf. C. A. 28, 1834'.—Discussion. F. W. J.

**Important advances in road building by the use of new types of asphalt emulsions.** A. Caroselli. *Teer u. Bitumen* 31, 398-400(1933).—A brief description and classification of emulsions. F. W. Jung

**The preparation of a new road binder.** C. F. Broadhead. *Trans. Inst. Gas Engrs.* 79, 531-73(1929-30).—See C. A. 24, 4372, 4912; 25, 1054, 1966. A. H. E.

**The preservation of the technically important properties of tar as the binding element in road surfacing.** Hermann Ehligts and Ewald Flister. *Teer u. Bitumen* 31, 405-9, 417-23, 429-32(1933).—App. for detn. of adhesiveness

and strength are described. The effect of time upon adhesiveness and dropping point is shown graphically and in microscopic structure for various tar mixts.

F. W. Jung

**The present state of road-tar testing.** Georges Batta. *Ind. chim. belge* [2], 5, 47-62(1934).—A discussion of the Belgian specifications.

A. L. Henne

**The adhesion of bituminous binders to stone.** Walter Riedel and Hans Weber. *Asphalt Teer Strassenbautech.* 33, 677-80, 693-5, 713-18, 720-32, 749-51, 793-8, 800-12(1933); cf. C. A. 26, 2568'.—A method for detg. adhesiveness based upon the proportionality between adhesion and effect of electrolytes and soaps upon the covering properties of bituminous materials has been developed and is demonstrated in a large no. of applications. Hygroscopic and other properties of the stone used in road construction appear of greater effect than those of the binder. Adhesiveness of hot bitumen varies less than that of emulsions because of effects of emulsifying and stabilizing agents. That of tar mixts. exceeds that of bitumen mixts. after aging, although less when fresh. F. W. Jung

**The "breaking" of bituminous road-building emulsions through the action of stone.** Hans Weber. *Teer u. Bitumen* 31, 333-6, 349-51(1933); cf. C. A. 27, 4649, 4899. F. W. Jung

**The "breaking" of bituminous emulsions upon stone.** G. H. Klinkmann. *Asphalt Teer Strassenbautech.* 33, 842-4, 873-6, 893-6(1933); Weber and Bechler, cf. C. A. 26, 2568'.—In a method employing mech. agitation of sized stone with the emulsion, the "breaking value" is detd. as the percentage of available bitumen deposited upon the stone surfaces. A no. of Italian stones have been studied with emulsions of various stabilities. Other methods are discussed briefly. Breaking and breaking value are considered from practical and theoretical stand points. F. W. Jung

**Colored bitumen fabrications.** C. R. Platzmann. *Teer u. Bitumen* 31, 369-71(1933).—The use of natural asphalts, e. g., gilsonite, asphaltite or Utah asphalt, in combination with stearin pitch and lanolin or lanolif pitch for the impregnation or coating of roofing paper is described. F. W. Jung

**Slags: their uses in road making.** Bernard H. Knight. *Munic. Eng. Sanit. Record* 92, 704 7(1933). The chemistry of blast-furnace slags as produced in Great Britain today is outlined. Conclusions: The presence of Ca orthosilicate or CaS is liable to produce disintegration. A tendency in this direction is governed by 3 factors: (a) the  $\text{CaO}/\text{SiO}_2$  ratio, (b) the MgO content and (c) the S content. A suggested draft of the Brit. Standard Specification for slag to be used as an aggregate in road surfacing is given; the specification used in Austria is discussed. A. W. Fürbank

**Rammed earth for farm building walls.** Ralph L. Patty. *Aggr. Eng.* 15, 14-15, 17(1934).—The optimum moisture content for rammed-earth walls ranged from 7% for soil contg. 70-80% of total sand to 16% for soil contg. 5-10% sand. Addn. of hydrated lime to the soil reduced the strength of the blocks in compression and also reduced the resistance to weathering. The strength of the

blocks was increased 20-25% by admixing the soil with fibrous materials such as grass sod and flax and oat straw. Plaster bonded to the walls satisfactorily without the use of a base. Linseed-oil paints seemed to adhere to rammed-earth walls better than to wood.

K. D. Jacob. The artificial materials "Steinholtz" and "Dermas." E. Belani. *Kunststoffe* 23, 255-8 (1933).—Various formulas used in making these products (artificial sheet rock) are explained and illustrated by means of examples and the advantages of including micro-asbestos as a filler component emphasized.

J. W. Perry. Roofing paper and zinc sheeting. H. Mallison. *Teer u. Bitumen* 31, 345-8 (1933).—Weathering action on Zn surfaces protected by asphalt and tar papers has been studied. Corrosion is caused by the action of condensed moisture and occurs with both types of paper. Provision for evapn. of condensed water prevents corrosion.

F. W. Jung. Aluminized roofing paper. E. Tauber. *Teer u. Bitumen* 31, 387 (1933).

F. W. Jung. New methods and preparations for preserving wood. Heinrich Wiesenthal. *Kunststoffe* 23, 258-9 (1933).—A discussion with formulas.

J. W. Perry. Preservative treatment of post woods. Deane G. Carter. *Agr. Eng.* 14, 252-3 (1933).—See C. A. 28, 603<sup>9</sup>.

K. D. Jacob. Movement of the pit membrane in coniferous woods, with special reference to preservative treatment. E. W. J. Phillips. *Forestry* 7, 104-20 (1933).—Some aspirated pits occur in green conifer wood contg. much free water; the no. slowly increases as the moisture content falls until the fiber-satn. point is approached, when a rapid increase occurs. The results are considered in relation to the penetration of liquids and the difficulties encountered in treating coniferous timber with preservatives.

K. D. J. Studies in the decomposition of timber under industrial conditions. IV. Extensive wet rot. Ernest A. Rudge. *J. Soc. Chem. Ind.* 53, 37-8T (1934); cf. C. A. 28, 2151<sup>8</sup>.—Samples of oak, elm, chestnut and birch in an advanced state of decay due to "wet rot" were analyzed as in previous studies. All specimens were from timbers that had been in contact with soil. V. Dry rot. *Ibid.* 38-40T. —Two samples of interior building timbers, one from wainscot base in contact with lime plaster and the other from floor-joint imbedded in concrete, were analyzed as before. The results from IV and V confirm R.'s previous conclusion that decay of wood is connected with the close assocn. of Ca with cellulose or its degradation products.

Alfred L. Kammerer

Rept. of the mycologist for the year 1932 [wood rot] (Gadd) 11D. Optical properties of Ca aluminates and ferrites (Akiyama, Sawayama) 2. App. for pre-treating crude cement with waste gases from rotating furnaces (Ger. pat. 589,715) 9.

Cement. Carbo-Lime & Cement Co., Ltd. Fr. 756,953, Dec. 18, 1933. A hydraulic cement is made by grinding limestone or other commercial CaCO<sub>3</sub> till it passes a screen of 10 meshes per sq. cm., heating till it contains not more than 0.5% moisture, grinding again and mixing with a more finely ground clinker contg. tri-Ca silicate. The proportion of CaCO<sub>3</sub> to free oxide in the clinker is 8:1.

Cement. Mikael Vogel-Jorgensen. Fr. 757,107, Dec. 20, 1933. Crude material for cement is wetted with a controlled amt. of water and beaten up in an intense fashion until it has become homogeneous and has acquired the consistency of moist earth. A layer permeable to gas can then be formed without further treatment, such as transformation to nodules or briquets.

Cement. Iwaki Cement K. K. (Mangorô Komuro, inventor). Japan. 99,308, Feb. 2, 1933. Clay is primarily heated at a high temp. (500-800° or 900°) to cause decompn. to Al<sub>2</sub>O<sub>3</sub> and SiO<sub>2</sub>; these are then mixed with other materials for cement manuf. Cf. C. A. 27, 3312.

Magnesia cement. Ryosaku Matsuura (to Minami

1 Manshu Tetsudo K. K.). U. S. 1,946,327, Feb. 6. A cement is prepd. consisting of light burned magnesite contg. 85% MgO and "almost insol." Mg sulfite. Powd. silica, coloring matter, etc., also may be added.

Portland cement composition. Howard R. Starke (to Riverside Cement Co.). U. S. 1,947,504, Feb. 20. A finely ground portland cement is prepd. of which less than 1% comprises particles exceeding 50 microns in diam., interground with about 0.05-1.0% of oleaginous material such as oleic acid which serves to facilitate desired fine grinding.

Acidproof cement. I. G. Farbenind. A.-G. (Karl Frank and Karl Dietz, inventors). Ger. 589,594, Dec. 11, 1933 (Cl. 22i. 1). Addn. to 460,125. An acidproof plastic cement or luting for containers consists of water glass, quartz meal and salts of the type X<sub>2</sub>ZrF<sub>6</sub>, X<sub>2</sub>GeF<sub>6</sub>, X<sub>2</sub>TaF<sub>7</sub> and X<sub>2</sub>SnF<sub>6</sub>, X representing an alkali metal. Cf. C. A. 27, 576.

Basic dolomite clinker. Seisyo Horio (Masaji Kadiwara, inventor). Japan. 99,399, Feb. 6, 1933. A moist mixt. of powd. dolomite, fluor spar and Fe is heated to clinker, which is immersed in a 10% Mg(HCO<sub>3</sub>)<sub>2</sub> soln. and then kept in an atm. of CO<sub>2</sub> and H<sub>2</sub>O at 200°. Cf. C. A. 27, 3797.

Rotary cement kilns. Harry S. Lee. Brit. 401,392, Nov. 16, 1933.

Rotary cement and other kilns. Niels S. Borch. Brit. 401,726, Nov. 20, 1933.

Combined shaft furnace and rotary kiln for cement manufacture. Arno Andreas. Ger. 591,049, Jan. 16, 1934 (Cl. 80c. 14.10).

Concretes. Riverside Cement Co. Brit. 399,101, Sept. 28, 1933. Massive cementitious bodies, e. g., concrete dams, are made from a cement mix or concrete contg. a portland cement of low heat of hardening described in Brit. 400,813 (C. A. 28, 2153<sup>1</sup>).

Concrete bodies. Richard Gruu. Ger. 589,514, Dec. 3, 1933 (Cl. 80b. 21.03). Hard concrete bodies are made by using broken cement clinker or similar clinker as flux.

Glazing concrete objects. Carl Menz and Gustav Boecker. Ger. 589,940, Dec. 18, 1933 (Cl. 80b. 23.04). Concrete objects are glazed by coating them with an Al<sub>2</sub>O<sub>3</sub> cement m. below 1500° and fusing this by a fine pointed flame. Cf. C. A. 28, 2154<sup>2</sup>.

Concrete preparation for building construction. Wm. W. Lillard. U. S. 1,947,345, Feb. 13. Dry cement and dry aggregate are mixed in a central mixing plant distant from the point of use, the mixt. is stored in a dry bin and heat is used to maintain it dry; the mixt. is transported in a dry container to a point near the place of use and is sprinkled with water while agitated and moved into place. App. is described.

Laying concrete roadways. Graham M. Gordon (to Viber Co.). U. S. 1,945,145, Jan. 30. Various details of app. and operation are described for pouring, vibration, air exhaustion and water removal.

Apparatus for lining or coating pipes with fused metals or bituminous compositions. Josef Zavadil. Austrian 135,889, Dec. 11, 1933 (Cl. 48b).

Bituminous compositions for lining pipes. Vereinigte Stahlwerke A.-G. Ger. 591,044, Jan. 16, 1934 (Cl. 22g. 7.02). In coating the inner surfaces of pipes with bituminous compns. applied in the fused state by a centrifugal process, the viscosity of the fused compns. is reduced by adding 1-3% of a drying oil.

Bituminous emulsions for making roads. Ges. fur Teerverwertung m. b. H. (Fritz Kraft, inventor). Ger. 591,340, Jan. 20, 1934 (Cl. 80b. 25.06). As emulsifying agents, use is made of the crude products obtained by heating humous substances, e. g., brown coal or peat, with aq. alkali. Resins, fats or oils, or acids or alcs. obtained therefrom, or naphthenic acids, may be added to the emulsions during or after their prepn. The emulsions may be stabilized by adding to all or a part of the water used a substance capable of swelling, e. g., starch. Cf. C. A. 27, 410.

Sand rock asphalt pavement. Glenn H. Alvey (to Uvalde Rock Asphalt Co.). U. S. 1,946,517, Feb. 13. Limestone rock asphalt is pulverized so that 75% will

pass a 10-mesh screen, sand is added which is poorly graded so as to produce "a max." of voids, the ingredients are mixed and heated to about 150° and an asphaltic flux is added sufficient to coat the sand particles and soften the native bitumen in the rock asphalt. Cf. C. A. 27, 3580.

**Artificial marble.** Kálmán Neuhauser. Hung. 107,705, Dec. 15, 1933. To a pulp of white cement and water coloring material is added, or several pulps of different colors are mixed in such a way as to imitate the layers of natural marbles, and the mixt. is pressed to the desired shape. After setting, the articles are treated with a mixt. of flowers of S, tin ash and oxalic acid, polished and then treated with wax dissolved in turpentine.

**Building material.** I. G. Farbenind. A.-G. (Hans Welsch and Hans Wolf, inventors). Ger. 588,196, Nov. 14, 1933 (Cl. 80b. 1.09). Addn. to 574,793 (C. A. 27, 4650). The method of 574,793 for producing porous building material by treating a hydraulic binding agent with slag and sulfonic acids or sulfonates is modified by adding alkali silicates. Thus, sand, portland cement, Na isopropylsulfonate and water are mixed and water glass added.

**Building material.** Heinrich Peikert. Ger. 589,804, Dec. 14, 1933 (Cl. 80b. 21.04). Material for making light building or insulating masses is formed by treating old paper with soda or lime and water to form a lumpy mass. This is then granulated.

**Cellular building material, etc., from gypsum plaster.** Hans O. Kauffmann (to Buffalo Electro-Chemical Co.). U. S. 1,946,077, Feb. 6. A cementitious material such as  $\text{CaSO}_4 \cdot \frac{1}{2} \text{H}_2\text{O}$  is mixed with a peroxide such as  $\text{H}_2\text{O}_2$  and with water; a potentially active catalytic peroxide-decomp. agent such as  $\text{CoCl}_2$  is added to the mixt. and this catalytic agent is subsequently rendered active (as by adding  $\text{NaOH}$ ) to decompose the peroxide and liberate O in the mixt.

**Cellular product.** George D. King (to The Canadian Gypsum Co., Ltd.). Can. 339,030, Jan. 30, 1934. A dry mix comprises powd. calcined gypsum, finely powd.  $\text{CaCO}_3$ , ground  $\text{Al}_2(\text{SO}_4)_3$  and powd. benzoic acid. When water is added to the mix an improved plastic and cohesive mixt. is obtained which sets and hardens rapidly, forming a composite cellular structure.

**Light stone, etc.** Bruno Neuhoef. Fr. 756,966, Dec. 18, 1933. See Ger. 586,795 (C. A. 28, 1500<sup>9</sup>).

**Forming structural slabs, blocks, aggregate or the like from molten slag and ground limestone or magnesite.** Ray C. Newhouse. U. S. 1,947,488, Feb. 20. A construction material contg. gas pockets is formed by mixing a molten slag with a finely divided carbonate such as  $\text{CaCO}_3$  or  $\text{MgCO}_3$  and allowing the mixt. to cool. App. is described.

**Apparatus for mixing materials such as molten slag with pulverized limestone or gypsum.** Ray C. Newhouse. U. S. 1,947,487, Feb. 20. Structural and mech. features.

**Forming corrugated asbestos cement sheathing.** John W. Ledebor (to Ambler Asbestos Shingle & Sheathing Co.). U. S. 1,944,895, Jan. 30. Various operative details of manuf. are described.

**Mortar.** Chem. Fab. Grunau Landshoff & Meyer A.-G. Ger. 591,469, Jan. 22, 1934 (Cl. 80b. 1.15). Waterproof mortar is obtained by using an aq. soln. of a hydrated alkali aluminate in making the mortar.

**Fireproof stone.** C. Otto & Co. G. m. b. H. Ger. 589,959, Dec. 22, 1933 (Cl. 80b. 8.03). Highly fireproof

stone is made by mixing corundum dust with 10-30% of substances consisting mainly of  $\text{SiO}_2$ , such as quartzite or silver sand.

**Floor covering.** Hermann Baum. Ger. 591,409, Jan. 20, 1934 (Cl. 8b. 4). See Brit. 390,412 (C. A. 27, 5995).

**Floor- and wall-covering material.** Fritz Ebener. Ger. 591,338, Jan. 19, 1934 (Cl. 80b. 21.06). Powd. Fe contg. up to 20% of Si and small proportions of Al and Ti is mixed with concrete.

**Sound-absorbing wall.** Gustave A. New (to National Gypsum Co.). U. S. 1,946,914, Feb. 13. A wall is formed with a layer of cementitious material such as gypsum stucco together with asbestos and mineral wool, and a second layer including portland cement, mineral fiber and Al stearate.

**Ornamenting the surface of building slabs formed of plaster board, asbestos board or the like.** Lloyd V. Casto (to Oxford Varnish Corp.). U. S. 1,947,450, Feb. 20. Before the material has hardened it is subjected to pressure against a surface bearing an ornamental design which will form in the surface of the material interstices of desired contour and depth, and these are filled with different material (such as may simulate wood graining) of contrasting character to produce a uniformly flat surface. App. is described.

**Impregnating fiber board with materials such as fireproofing salts.** Alexander Winogradow. U. S. 1,945,714, Feb. 6. The board is impregnated with a soln. of a salt such as  $\text{NH}_4\text{H}_2\text{PO}_4$  and a portion of the soln. is then removed from the board, throughout its thickness, by squeezing it up to substantially its elastic limit; the board is then dried. Cf. C. A. 27, 5979.

**Wall papers from peeled wood veneers.** Heinrich A. Hellmers. U. S. 1,945,686, Feb. 6. See Brit. 388,544 (C. A. 27, 5931).

**Laminated material suitable for radio panels, furniture, etc.** Robert P. Courtney (to Bakelite Corp.). U. S. 1,946,932, Feb. 13. A cement obtained in the treatment of rubber with  $\text{H}_2\text{SO}_4$  is applied to a base material such as metal or wood and over this is superimposed a compn. contg. a reactive resinoid which is then set and bonded to the base material by heat and pressure.

**"Synthetic insulating lumber."** Orland R. Sweeney (to Iowa State College of Agriculture and Mechanic Arts). U. S. 1,946,952, Feb. 13. Corn stalks are broken up into comparatively small pieces which are commingled with water and the resulting mass is treated with  $\text{CuSO}_4$  soln., pressed and dried. U. S. 1,948,953 relates to a similar process in which, however, the  $\text{CuSO}_4$  soln. is applied to the material while still warm after pressing and drying by heat. Cf. C. A. 28, 1166<sup>8</sup>.

**Treating wood, etc.** I. G. Farbenind. A.-G. Ger. 589,649, Dec. 13, 1933 (Cl. 38b. 2.02). Addn. to 532,578 (C. A. 26, 569). The method of 532,578 for treating combustible material with solns. or suspensions of fireproofing salts in urea- $\text{CH}_2\text{O}$  condensation products, is modified by adding pigments to the soln. or suspension to produce a decorative effect.

**Impregnating wood.** Alfred Nowak. Austrian 135,829, Dec. 11, 1933 (Cl. 38d). Wood is impregnated in a known manner with a soln. of any of the usual preservatives in a volatile solvent, and the excess soln. is run off. The air in the impregnating vessel is then displaced by admitting vapor of the solvent, which may be superheated, and the vessel is then connected to a suction device, whereby the admitted vapor and residual solvent in the wood are removed together. Cf. C. A. 27, 1134.

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

**Performance tests of alcohol-gasoline fuel blends.** R. B. Gray. *Ag. Eng.* 14, 185 (1933).—Octane ratings on 3 gasolines alone averaged 66.6 as compared with 74.0, 79.6 and 84.6 on blends contg. 10, 20 and 30% alc., resp. With light unloaded trucks slightly higher mileages

were obtained from straight gasoline than from the 20% blend, but the reverse was true with very heavily loaded trucks; C accumulation in the cylinder heads was greater with straight gasoline than with the alc. blends. In belt tests on a 4-cylinder tractor fitted with high-altitude

pistons, the max. horsepower increased from 80 with straight gasoline to 44.4 with a 30% alc. blend; with a 20% blend the fuel economy was better than with straight gasoline. A 2-cylinder horizontal tractor engine developed a max. horsepower of 31.7 on straight gasoline and 32.2 with a 10% blend. K. D. Jacob

Annual review of fuel technology in Japan. Fuel Soc. Japan. *J. Fuel Soc. Japan* 13, 4-36(1934)(in English 1-4).—The review includes: the coal-mining industry, the coal-cleaning industry, the coke industry and research, briquets for industrial use, synthetic gasoline, and city gas and the gasification industry. F. I. N.

The physicochemical properties of alcohol-gasoline blends. II. The influence of anhydrous ethyl alcohol concentration upon water absorption. Leo M. Christensen, R. M. Hixon and Ellis I. Fulmer. *Iowa State Coll. J. Sci.* 8, 175-9(1933); cf. *C. A.* 27, 4901.—In series I and II the EtOH content was varied from 0 to 100%. In I, atms. were kept at a relative humidity of either 50 or 100%. The temp. was kept at 0° for 12 hrs. and then at 38° for 12 hrs. Fifty cc. of each blend was put into a 100-cc. Erlenmeyer flask which was fitted with a 2-mm. tube for a vent. In II, 500 cc. of blend in a 1000-cc. Erlenmeyer flask, vented by a 2-mm. tube, was placed outdoors but protected from rainfall. In series III, tests were made on com. storage of 84,000 gal. and of 5500 gal. of 10% EtOH blend. In I, the max. absorption of water for 50% humidity was at 15% EtOH, and for 100% humidity at 8% EtOH. In II, the max. absorption was at 2% EtOH. No measurable absorption occurred within 30 days in any blend above 8% in EtOH. In III, no measurable absorption of water occurred within the time of the expts. (66 days and 13 days). III. The A. S. T. M. distillation curves and Reid vapor pressure. *Ibid.* 237-44(1934).—The data from A. S. T. M. distns. are reported in tables and graphs. The percentages of alc. by vol. are: 0, 0.5, 1.0, 2.0, 4.0, 6.0, 8.0, 10, 15, 20.0, 30.0, 40.0, 50.0, 60.0; 70.0, 80.0, 90.0 and 100. The initial temp. of distn. and the temp. for the first 10% distg. indicate that the easier starting qualities of blends are not due to higher volatility but to the fact that alc.-air mixts. are explosive over a wider range than gasoline-air mixts., and that there would be no greater loss on storage from blends than from gasoline. The lower temp. of volatilization of the first 30% explains the better acceleration, especially in cold weather. The temp. of volatilization of 60% and the last 10% do not indicate that 10% alc. should have much effect on power output of a hot motor or diln. of oil. Vapor lock is not affected by adding alc. IV. Influence of alcohol concentration upon specific volume, fluidity, air to fuel ratio, calorific value, latent heat and fall in temperature on evaporation. *Ibid.* 245-50.—When alc. and gasoline are mixed: there is a slight lowering of temp. with a max. of 2.5° at 10% alc.; the vol. increases a max. of 0.27 cc. per 100 cc. at 10% alc.; and the fluidity decreases 3.5% and the viscosity increases 2% when the mixt. contains 10% alc. The air to fuel ratio for a 10% alc. blend is 4% less than for the original gasoline and the calorific value is 3% less. Evapn. of 10% alc. blends lowers the temp. of the intake manifold approx. 33% more than gasoline. Shop and road tests show that carburetor settings should be the same for straight gasoline and 10% alc. blends. F. E. Brown

Carbonization. IV. Influence of various factors on ignition temperature, reactivities and structure of coke. 22nd Report of the Joint Research Committee of the Institution of Gas Engineers and Leeds University. A. Parker, H. Kerr and C. B. Marson. *Trans. Inst. Gas Engrs.* 78, 240-8(1928-29); 79, 50-103, 143-55 (1929-30); cf. *C. A.* 21, 3121; 23, 2015.—Size of coal carbonized had no effect on the ignition temp. of the coke. Ignition temp. decreased as the temp. of carbonization was lowered or as the volatile matter in the coke increased. Addn. of coke breeze to the coal before carbonization had no effect on the ignition temps. of the resulting cokes.  $\text{Na}_2\text{CO}_3$  lowered the ignition temps. of cokes prepd. above 800°; below 800° there was no effect.

Reactivities of cokes were not greatly influenced by size of coal particles carbonized. Cokes produced at 915° were more reactive than those made at 980°; those made at lower temps. did not exhibit any definite relationship. Addn. of coke breeze to coal before carbonization had no marked effect.  $\text{Na}_2\text{CO}_3$ ,  $\text{CaCO}_3$ , or Fe oxide increased reactivities. There seems to be no correlation of the above with coke structure. V. Temperature, size of coal, blending with inorganic compounds. 23rd Report of the Joint Research Committee of the Institution of Gas Engineers and Leeds University. H. Kerr and C. B. Marson. *Ibid.* 78, 249-51(1928-29); 79, 104-19, 143-55 (1929-30).—A highly coking Durham gas coal, graded into 3 sizes ( $1\frac{1}{4}$  in.,  $\frac{1}{2}$  in. and 8-30 mesh), was carbonized at 920° and 815°. The size of the coal had no effect on the ultimate yields of gas, coke and therns. At 920° the greatest tar yield was obtained with the largest size. The size of coal when carbonized at 920° affects the rate of gas evolution. At 920°, 8-30-mesh coal gave 12,007 cu. ft. of 597 B. t. u. gas; at 815°, 9959 cu. ft. of 649 B. t. u. gas. Final thermal yields were 71.7 and 64.6 therns at 920° and 815°, resp. The compn. of the gas and its rate of evolution were influenced greatly by the temp. of carbonization. The yields of tar, ammoniacal liquor and coke increased as the carbonization temp. was lowered. Increasing addn. of coke breeze had no marked effect on yields of gaseous therns and  $\text{NH}_3$  per ton of coal, but addn. of 30% of breeze lessened tar production, and increased rate of gas production. Effects of adding 2% of  $\text{CaCO}_3$ , Fe oxide and  $\text{Na}_2\text{CO}_3$  were studied. Only  $\text{Na}_2\text{CO}_3$  increased the amt. of gas made. Fe oxide increased tar yield.  $\text{H}_2\text{S}$  was reduced by inorg. compds.; Fe oxide was the most effective. All 3 inorg. addns. increased  $\text{NH}_3$  yield at 920° but (except  $\text{CaO}$ ) decreased it at 815°. V (continued). Supplement to the 23rd Report of the Joint Research Committee of the Institution of Gas Engineers and Leeds University. F. J. Dent, W. H. Blackburn and A. H. Kelly. *Ibid.* 79, 120-55(1929-30).—Variation in the size of Durham coal and addn. of coke breeze to the coal had no influence on the ignition temp. of the coke made therefrom. Cokes prepd. at 815° were ignited more readily (30° lower) than cokes prepd. at 920°. Addn. of 3.3%  $\text{Na}_2\text{CO}_3$  to the coal caused a pronounced lowering of the ignition temp. of the coke prepd. at both temps. Addn. of 2.2% Fe oxide or 3.4%  $\text{CaCO}_3$  lowered the ignition temp. of coal prepd. at 920° but had no influence on the 815° coke. These results are similar to those previously reached for Nottinghamshire coal. Variation in size of coal had no influence on the reactivity of coke toward  $\text{CO}_2$ . Differences between cokes prepd. at 815° and 920° and effect of addn. of coke breeze to the coal were small. Addn. of 3.3%  $\text{Na}_2\text{CO}_3$ , 2.2% Fe oxide or 3.4%  $\text{CaCO}_3$  to the coal before carbonization increased reactivity at both temps. of carbonization. Coke produced from Nottinghamshire coal is much more reactive than coke produced from Durham coal, far more than the differences produced by size of coal, temp. of carbonization or blending. The rate of carbonization of the 2 coals is very different, Nottinghamshire having 15% greater throughput than Durham coal. A. H. E.

Carbonization in semi-intermittent vertical retorts. E. L. Wallis. *Gas J.* 205, 493-6(1934).—See *C. A.* 28, 2157.

Calorific values for calculation. F. J. Matthews. *Steam Engr.* 2, 431-2(1933).—M. discusses various corrections that are applied to heating values. A. H. E.

Thermal treatment of gaseous hydrocarbons. I. Laboratory-scale operation. A. E. Dunstan, E. N. Hague and R. V. Wheeler. *Ind. Eng. Chem.* 26, 307-14 (1934).—A review of lab.-scale work on the pyrolysis and polymerization of gaseous hydrocarbons. By atm. pressure treatment at 700-900° 17-35% of the paraffins ( $\text{CH}_4$  excepted) were converted into liquids, and 30-40% of the olefins. The fraction b. below 200° contains up to 75%  $\text{C}_2\text{H}_4$ , and also PhMe, styrene, xylenes and indene. In the portion b. above 200°  $\text{C}_{10}\text{H}_8$ , anthracene and phen-

anthrene were identified. By the mild pyrolysis of propane and butane it is possible to obtain 90-100% conversion by vol. into gaseous olefins. By the polymerization of olefins at pressures between 200 and 2000 lb. and temps. from 300° to 550° up to 92% conversion to liquids has been attained. From 80 to 86% of the liquids distilled below 200°. They contain olefins and paraffins with 3-8 C atoms per mol. The presence of naphthenes is indicated. In a 30% gasoline blend this fraction was 4%, as good in antiknock value as  $C_6H_6$  on a vol. basis.

II. Semi-industrial production of aromatic hydrocarbons from natural gas in Peralta. W. H. Cadman. *Ibid.* 315-20. —The yields of  $C_6H_6$  obtained by the pyrolysis of the natural gases has been detd. under varying temps. and pressures up to 30 lb. on a semi-com. scale.  $H_2S$  was removed first from the gas by a modified Chance-Claus process. Various furnaces and retort materials, including fireclay, were tested; but certain special steels alone proved satisfactory. A degree of turbulence in the gas flow in the tubes is important. The optimum conversions of several gases to crude  $C_6H_6$  varied from 1.14 to 2.6 gal. per 1000 cu. ft. Surface combustion and submerged flame heating of the gases to be pyrolyzed have proved considerably inferior to metal tube heaters from the standpoint of both  $C_6H_6$  yield and quality. In the reaction products have been identified  $C_6H_6$ , cyclohexene, PhMe, xylenes, styrene, indene,  $C_{10}H_8$ , anthracene, phenanthrene, chrysene, butadiene and isoprene. The vol. of exit gas from the pyrolysis is normally over twice the vol. of inlet gas, and contains 20% olefins, essentially  $C_3H_6$ .

P. I. Wilson, Jr.

The recovery of hydrogen from gaseous hydrocarbons with brown-coal cokes as catalyst. R. Schmidt. *Braunkohle* 32, 889-94 (1933).—Sufficient H can be obtained from the mixt. of  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$ ,  $\text{C}_3\text{H}_8$  and  $\text{C}_4\text{H}_{10}$  formed in the hydrogenation of brown-coal tar to supply the needs of the original hydrogenation. CO formed with H in the first conversion at  $1000^\circ$  with steam can be treated at  $500^\circ$  in a 2nd stage to form  $\text{CO}_2$  and more H. Coke from brown coal gives a 90% and 70% conversion for the 1st and 2nd stages, resp., at commercially satisfactory reaction rates. F. W. Jung

**Thermal decomposition of the "coal hydrocarbon."**  
H. H. Lowry. *Ind. Eng. Chem.* 26, 320-4 (1934). - Coal is not a hydrocarbon, but does contain as an essential part of the structure the 6-C ring of the aromatic hydrocarbons. This nuclear structure becomes more and more condensed through the various ranks from peat to anthracite. Condensation of the aromatic nuclei appears to be the main reaction in the solid residue during pyrolysis, and does not end until graphite is formed. The chemical nature of the condensed products depends on the severity of the thermal treatment. It is suggested that solvent extn. is the mildest type of thermal treatment, and the similarity in compn. of a  $C_{12}H_8$  ext. and a vacuum tar is pointed out (cf. *C. A.* 11, 247, 2956; 17, 3019). The simple aromatic compds. appear in low-temp. tar (cf. *C. A.* 26, 3380), and it is suggested that they are first formed between 450° and 800° by the dehydrogenation of the satd. and unsatd. hydrocarbons having the 6-C ring structure, such as were isolated from the  $C_{12}H_8$  ext. and the vacuum tar. P. J. Wilson, Jr.

**The combustion of carbon.** Martin A. Mayers. *Chem. Rev.* 14, 31-53 (1934).—A review of various exptl. letins. of the mechanism and rate of combustion of solid C by gaseous O, a discussion of previous math. analyses of the process, and a description of some exptl. measurements at low pressures. M. concludes that no complete formulation of the rates or mechanism of the combustion of C is yet possible; much more exptl. work is needed. References to the literature are given. Louise Kelley

Some results of the Fuel Research Coal Survey. F. S. Innatt. *Gas World* 100, No. 2587, Coking Sect., 27-30 (1934).—The extent of the survey of the seams of Great Britain, sampling and analytical methods, and the significance of the results are discussed, including volatile matter, carbonates and Cl in the coal, fusion temps. and mpn. of ash, and swelling properties of the coals. High-

1 and low-temp. coking tests are also summarised

**P. J. Wilson, Jr.**

$\mu$ -Coal. IV. Alterations of the carbonizing characteristics of bituminous coals. Kurt Peters and Werner Cramer. *Brennstoff-Chem.* 14, 445-50(1933); cf. C. A. 27, 3799.—Reproducible values for degree of swelling by the method of Lambris (cf. C. A. 25, 4105) were obtained only with  $\mu$ -size coal. With vitrain, greater swelling was obtained generally with  $\mu$ -coal than with larger sizes. The addn. of  $\mu$ -size durain to a high-volatile la. coal decreased the swelling more than did addn. of larger coal, indicating the use of  $\mu$ -grinding for reduction of sizes, not in banded coals. The swelling of mixts. of swelling la. durain was always less than that calcd. for vitrain alone. Similar results were obtained with mixts. of the mixts.; and 10% and non-oxidized coals. Decrease in oxidized (at 1, increasing oxidation is shown graphically. swelling with 10% could not be restored to oxidized. Swelling and cat. thresholds extd. bitumens. Bitumen and coals by adding it a sextns. with  $C_6H_6$  both at 80° and residual coal from the bed identically in carbonization under pressure behaved identically the hydrogenation of a low-Pseudobitumen, prep'd. extd. coal, conferred carbonizing volatile coal, added to it was given by addn. of normal properties identical to the also, hydrogenated, acquired bitumen. New views in coal chemistry. IV. In the softening and H. Koopmans. *Het Gas* 53, 538 (1933).—A study was made of the process of coal by means of a novel apparatus, measuring the resistance offered by the coal to the horizontal movement of a vertical needle. Ten g. of coal pulverized to 0.1 mm. is pressed (2500 kg. per sq. cm.) in a cylindrical Fe crucible and heated in a stream of CO. The crucible is rotated at 3° per min., the temp. being measured by a thermocouple. A needle attached to a drum, concentric with the crucible and provided with a spiral spring, is inserted into the mass in an opening provided for it near the top of the crucible. The resistance to movement of the needle is plotted; the coal is read from the angle of revolution of the drum required to overcome this resistance; the temp. is read against temp. Softening and solidification are determined as well as softness of the plastic mass is found from the curves. Good coking coals have a long range, softening at low fluidity; increased coalification shortens the range. More rapid heating (from 1° to 3° per min. or more) widens the range. Oxidized coal has a short range. The range of softening mixts. lies between those of the compal softening. The presence of structural plant residues in the coal lowers the fluidity; the range remains the same. The pressure of the coal shifts the curves to the left and decreases the swelling. Furthermore the rate of coal of various volatile contents was determined (under sand) of coal pieces at a heating rate of 1 min. up to 860°; 6 types of coal were studied. High gas content gave strongly porous cokes; low gas content gave less porous cokes; coal gas of low gas content gave dense cokes; the content of volatile matter in the coke was insignificant (from 9.5 to 17.5%). The influence of structural matter on the swelling of the vitrinite was studied during softening. The softening of coal was studied during softening. The softening of coal was studied during softening.

unless this matter exceeds 38% in which case the swelling is decreased; the effect on the coke strength is probably more noticeable. As compared with the important effect of the degree of coalification on the coke quality the difference in coke from "dull" and "bright" coals is inconsiderable. The latter difference does, however, appear in rapid heating tests, e. g., in the volatile-matter detn. dull coal will give a little sintered cake, bright coal a swollen coke button. B. J. C. van der Hoeven

**Classification of coals of the United States according to fixed carbon and B. t. u.** W. A. Selvig, W. H. Ode and A. C. Fieldner. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 527*, 11 pp. (1934).—The following classification is proposed: I anthracite—metaanthracite, 98% or more dry fixed carbon (F. C.); normal anthracite, dry F. C. 92-98%; semianthracite, dry F. C. 86-92%; II bituminous—low volatile, dry F. C. 77-86%; medium volatile 69-77% dry F. C.; high volatile A, dry F. C. <69% and moist B. t. u. 14,000 or more; high volatile B, moist B. t. u. 13,000-14,000; high volatile C, 11,000-13,000 moist B. t. u., either agglutinating or nonweathering; III sub-bituminous—sub-bituminous A, moist B. t. u. 11,000-13,000, weathering and nonagglutinating; sub-bituminous B, moist B. t. u. 9500-11,000; sub-bituminous C, moist B. t. u. 8300-9500; IV lignitic—lignite, moist B. t. u. <8300, consolidated; brown coal, moist B. t. u. <8300, unconsolidated. Supporting data for division points are given. Alden H. Emery

**Anthracite and coke-analysis survey conducted at the Fuel Research Laboratories.** B. F. Haanel and R. E. Gilmore. *Can. Dept. Mines, Mines Branch, Rept. 737-5*, 13 pp. (1933).—Analyses are given of 64 anthracites (Pa., Welsh, Scotch and Westphalian) and 22 cokes. Alden H. Emery

**Effect of oven humidity on accelerated weathering tests of coal.** E. Stansfield and K. C. Gilbert. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 543*, 8 pp. (1934).—An oven for drying coal at controlled humidity (salt solns.) is described. At 30°, K acetate gave 20% humidity, MgCl<sub>2</sub> 32%, Ca(NO<sub>3</sub>)<sub>2</sub> 45%, NH<sub>4</sub>NO<sub>3</sub> 60% and NaCl 75%. Slacking indexes of 7 coals were detd. at these humidities. Humidity control is not essential for high-rank, coking, bituminous coals. For lower-rank slacking coals, reduction of humidity from 40 to 20% on the av. doubles the slacking index, indicating the necessity for humidity control in the detn. of this index. Alden H. Emery

**Gas-value number of coal and gas yield in gas-works practice.** Wilhelm Filtz. *Brennstoff-Chem.* 14, 461-3 (1933).—Use of the formula of Steding (*C. A.* 27, 2016) is demonstrated. Calcd. mixed gas (distn. gas + water gas) yields and total heat values, from coal carbonized and then treated with steam, both plotted against max. heating values of distn. gas for dry coals of different gas values, show increased total heating value of mixed gas so obtained. Necessary admixt. of waste gas or air to obtain gas of desired heating value from a coal of abnormal gas value can also be calcd. F. W. Jung

**The coal-cleaning plant at Michel, B. C.** Paul P. Grundy. *Trans. Can. Inst. Mining Met.* 1934 (in *Can. Mining Met. Bull.* No. 262) 58-77.—G. describes the coal-cleaning plant at Michel, B. C., and gives analyses and float and sink data on coal of various sizes. Alden H. Emery

**Pulverized coal and colloidal fuel.** H. D. Tollemache. *Proc. S. Wales Inst. Engrs.* 49, 345-6, 359-66 (1933); cf. *C. A.* 27, 5171.—Discussion. Alden H. Emery

**Coal hydrogenation.** Calvert C. Wright. *Mineral Industries, Penna. State Coll.* 3, No. 5, 1-2 (1934).—A review. Alden H. Emery

**High-temperature carbonizing properties of coal.** A. C. Fieldner, J. D. Davis, D. A. Reynolds and C. R. Holmes. *Ind. Eng. Chem.* 26, 300-3 (1934).—Representative samples of bright and splint coal and a sample contg. 40% splint and 60% bright coal from the Elkhorn bed were carbonized at 900° in the Bur. of Mines carbonizing app. The yield of coke from the splint coal is slightly higher than from the bright. The former is

more resistant in the shatter and tumbler tests, and the softening temp. of the ash is 450° higher. The yield and quality of the gas from the 2 coals are nearly the same. The bright coal yielded more tar than the splint coal, and it was more phenolic and less benzenoid in character. P. J. Wilson, Jr.

**Oxygen absorption and aging of coals at ordinary temperatures and the chemistry of the sorption of oxygen.** Karl Bunte and Horst Brückner. *Angew. Chem.* 47, 84-6 (1934).—A simple method is presented for detg. the relative O<sub>2</sub>-absorption capacity of coals at ordinary temps. It is based upon measuring the progressive decrease of air pressure in a closed system and the analysis of the remaining gas. In a period of 24 hrs. it was observed that 20 g. of various coals (4900-mesh sieve) absorbed 0.5-21 cc. of O<sub>2</sub>, and in 2 months 17-112 cc. O<sub>2</sub>. The influence of aging of these coals upon softening point, caking index and gas evolution was detd. It was found that the gas yield decreased as the O<sub>2</sub> absorption increased. The O<sub>2</sub> absorption is at least partially a chemisorption, where a C peroxide is formed which, in presence of H<sub>2</sub>O, is split off as oxalic acid. Sixteen references. Karl Kammermeyer

**Rapid method for the determination of the hygroscopic point and the hygroscopic properties of brown coal.** Helmut Krainer. *Braunkohle* 32, 937-41 (1933).—Two graphical methods of detg. the hygroscopic point  $\phi$  from the loss or gain in moisture of a series of coals of different moisture contents placed in a satd. atm. at const. temp. are given with examples. F. W. Jung

**Carbureting test in a retort generator of the Yokohama type.** R. Kada and K. Takahisa. *J. Fuel Soc. Japan* 13, 36-52 (1934) (in English 5-7).—Two tests were carried out: lab. and the full scale with the following conclusions: The gas can be fully carbureted by atomizing oil directly at the gasification zone. It is not necessary to instal a costly carburetor. About 30 l. of heavy oil was supplied per hr. and about 60% of the total heat of oil was gasified; gas increased its calorific value by about 200 cal. per cu. m. Light oil has an advantage as a carbureting oil, but heavy oil may be used since it is far lower in price. F. I. Nakamura

**Heat transmission, with particular reference to modern methods of expressing convection data.** Margaret Fishenden. *Trans. Inst. Gas Engrs.* 79, 578-609 (1929-30).—See *C. A.* 25, 1909. Alden H. Emery

**The determination of volatile sulfur in flue dust.** F. Roll. *Brennstoff-Chem.* 14, 468 (1933).—Ashing should be carried out under conditions similar to actual combustion, i. e., in air and at 950°. Results by a no. of different standard methods are compared. F. W. J.

**Natural gas in Australia and New Guinea.** W. G. Woolnough. *Bull. Am. Assoc. Petroleum Geol.* 18, 226-42 (1934).—About 40 analyses of natural gases in Australia and New Guinea are given. In the Great Artesian basin are 2 types of gas: (1) inflammable hydrocarbon and (2) noninflammable N<sub>2</sub>. CO<sub>2</sub> gases are found in New South Wales and Victoria. Alden H. Emery

**Construction of complete new gas works at Oxford, with costs and working results over eighteen months.** W. Eames Caton. *Trans. Inst. Gas Engrs.* 78, 88-127 (1928-29).—The Oxford gas works are described. The av. coal carbonized per setting per day is 12,056 tons, av. calorific value of gas 485 B. t. u., coke and breeze per ton of coal carbonized 14.00 cwt., tar per ton of coal 11.3 gal., gas per ton of coal 15,396 cu. ft. or 74.66 therms. Costs for different steps are given. Alden H. Emery

**Advances in the technology of natural and refinery gases.** Geo. A. Burrell and Nelson C. Turner. *Penna. State Coll., Min. Ind. Expt. Sta., Bull.* 12, 29-56 (1933).—B. and T. discuss compn. of natural gas, removal of H<sub>2</sub>S (Fe<sub>2</sub>O<sub>3</sub>, lime, Girdler, Seaboard and Koppers hot activation processes), gas transmission, removal of H<sub>2</sub>O, satn. of gas, natural gasoline plants, liquefied gas, efficiency in usc, C black and gas cracking. A. H. E.

**A new recording gas calorimeter.** W. Masterton. *Gas World* 100, 194-6 (1934).—A description of the

Masterton calorimeter, designed on the principles formulated by Boys (C. A. 16, 2772). Also in *Gas J.* 205, 626-8(1934).

Gas dehydration. E. W. Smith. *Trans. Inst. Gas Engrs.* 79, 610-58(1929-30).—See C. A. 24, 4376, 4917; 25, 1970.

Pyrolysis of gas. N. A. Butkov and E. I. Rabinovich. *Nefyanos Khosyaisivo* 25, 88-92(1933).—Gases obtained on vapor-phase cracking of petroleum have the following compn.: butylenes 4.0, propylenes 12.0, ethylene 16,  $H_2$  14, methane and ethane 50%. The calorific values of these gases amount to 11,000-11,500 cal. and since they are high in heavier unsatd. compds. they are unsuitable for city gas because of the formation of condensation products. This gas was re-cracked in a special lab. app. (described in the original paper) consisting of a retort charged with refractory fillers heated to 800-900°, the pressure being maintained at 3-40 mm. Hg. The cracked product was passed through a hydraulic seal charged with white oil, an air and water cooler, 2 wash bottles charged with oil and 2 charcoal adsorbers. The gas obtained had a sp. gr. of 0.367-0.379, calorific value of 5306-5412 cal.; it contained higher olefins 0.0-0.7, ethylene 0.1-0.4,  $CO_2$  0.0-0.2,  $O_2$  0.0-0.2, CO 1.3-1.7,  $H_2$  48.2-62.3 and  $C_2H_{2n+2} + N_2$  36.1-48.8%. The tar obtained as a result of pyrolysis had a sp. gr. of 1.024. In expts. carried out in porcelain tubes of various diams. a gas of 9464-9926 cal. was obtained. A prolonged exposure to high temps. caused a polymerizing effect, while a short exposure produced a lowering of unsatd. compds. such as amylenes, butylenes and propylene and a slight increase in ethylene. The condensate contained up to 8% of crude  $C_6H_6$  and 1%  $C_6H_5CH_3$  in addn. to a light oil with a final b. p. of 175°.

A. A. Bochtlingk

Progress summary on production of substitute gas. Geo. Wehrle, A. C. Rathkey and Alfred Johnson, et al. *Western Gas* 9, No. 12, 14-15, 34(1933).—The conversion of water-gas sets into those for mfg. substitute gas of high calorific value is discussed. Fundamentally the process is similar to carbureted water-gas operation with the coke or coal fuel bed replaced by a refractory screen; oil is sprayed into the top of the generator and is cracked on the latter, where C is deposited as lamp black. Steam is admitted to form blue gas. This and the oil gas together have a calorific power of about 500 B. t. u., and enrichment is carried out to 1000 B. t. u. or more. From 3 to 4 hrs. are required to heat the set to proper operating temps. of 870-980° in the generator and 760-820° in the carburetor and superheater. Practice at Denver, Mason City (Iowa), Chicago, Los Angeles and San Diego is outlined. Conclusions: The problem of making substitute gas has a wide selection of processes available, but the information regarding them is very limited.

A. W. Furbank

Analysis of coke-oven gas. P. K. Sakmin. *Z. anal. Chem.* 96, 104-8(1934); cf. C. A. 28, 809°.—The results of considerable experience are given with respect to suitable app., suitable reagents and manipulation for detg.  $CO_2$ , olefins,  $O_2$ , CO,  $H_2S$ , H,  $CH_4$ ,  $C_2H_6$  and  $N_2$ .

Examination of products of combustion from typical gas appliances. IV. 21st Report of the Joint Research Committee of the Institution of Gas Engineers and Leeds University. J. James W. Wood and Gilbert H. Howarth. *Trans. Inst. Gas Engrs.* 78, 230 9(1928-29); 79, 7 49(1929-30); cf. C. A. 26, 3901. —C() production from

No. 1 geyser burners at several gas rates and variable flame lengths was 417 to <1 part per 10,000 of gas burned. CO can be kept low by restricting gas rate, but for a given CO production, the permissible gas rate increases with the length of flue pipe. No. 2 burners gave greatly improved results. Similar data are given for a surface combustion griller, a domestic griller and a boiling burner.

Alden H. Emery

Investigations on a gas producer [equipped] with a steam jacket. Wilhelm Horak. *Z. österr. Ver. Gas-Wasserfack* 73, 170-81, 194-203(1933).—The extent of chem. reaction and the temp. distribution in successive zones above the slag layer in the coke charge of a gas producer were investigated. The temp. reaches its max. in the zone immediately above the slag layer. In this zone the exothermic reactions (reactions of  $O_2$  with C) take place most extensively. In succeeding zones endothermic reactions (water-gas reaction, and reactions of  $H_2O$  with C) become more prominent and the temp. decreases. Chem. equil. (water-gas and  $CO-CO_2$ ) is reached only near the top of the charge (about 80 cm. above the slag layer). The slag layer is effective in pre-heating the blast gas and in distributing it uniformly over the generator area. The heat taken from the generator by the steam jacket is so small that it does not influence the gas making. Its effect is further minimized by the good distribution of blast through the generator.

Benzene recovery, with particular reference to gas-works practice. W. H. Hoffert and G. Claxton. *Trans. Inst. Gas Engrs.* 79, 726-5b(1929-30).—See C. A. 24, 4375, 4918.

Alden H. Emery

The recovery of benzene by active carbon. H. Hollings and S. Hay. *Gas World* 100, 189-93(1934); *Chemistry and Industry* 1934, 143-55.—A description of the cyclic process developed at Beckton. The  $C_6H_6$  is first adsorbed from the gas by the active C in an adsorber, from which the heat of adsorption is removed by  $H_2O$  in coils. When observation of a flat flame burner shows that  $C_6H_6$  is not all adsorbed, the adsorber is replaced with a freshly steamed one. The spent adsorber is regenerated with both direct and indirect steam for 30-40 min. The regenerated C at 120° is now cooled rapidly by turning fresh gas through. The temp. of the adsorber should be maintained as low as possible, but not below the gas temp. in order to prevent condensation. The  $H_2O$  in the C at the end of the steaming period should be between 15 and 20% in order to ext. sufficient heat to prevent gum formation, the cause of deterioration of the C. Present annual production is 3,000,000 gal. of  $C_6H_6$ , corresponding to 3.1 gal. per ton of coal coked in horizontal retorts and coke ovens. The extn. efficiency is usually over 92%. The av. overall steam consumption has been 36.6 lb. per gal. and the av. rate of C replacement 7.1 lb. per 1000 lb. of  $C_6H_6$ . Practically all the thiophene and  $CS_2$  are removed from the gas, and for a 6 months' period the S in the gas through the plant was reduced from 30.5 to 6.1 g. Only gas free from  $H_2S$  and  $C_2H_2$  and associated unsatd. hydrocarbons is treated. P. J. Wilson, Jr.

The recovery of ammonia in gas manufacture. Indirect, direct and semi-direct processes. 2nd Report of the Ammonia Subcommittee. A. Parker. *Trans. Inst. Gas Engrs.* 79, 260-83, 305-34(1929-30).—See C. A. 24, 2371, 3629.

Economies in the recovery of ammonia by the indirect process. 1st Report of the Ammonia Subcommittee. H. Hollings and S. Pexton. *Trans. Inst. Gas Engrs.* 78, 266-8(1928-29); 79, 254-67, 305-34(1929-30).—See C. A. 24, 1958.

The zinc process for the extraction of ammonia and hydrogen sulfide from gas. 2nd Report of the Ammonia Subcommittee. J. W. Cobb. *Trans. Inst. Gas Engrs.* 79, 291-3, 305-34(1929-30).—See C. A. 24, 3883.

Report on a visit to Germany to inspect the methods adopted for the recovery of phenols from ammonia liquors and kindred subjects. Allan C. Monkhouse. *Trans. Inst. Gas Engrs.* 79, 409-21(1929-30).—Four German plants recovering phenol from  $\text{NH}_3$  liquors by solvents are described. Advantages of the benzene and of the soda method are given. Remarks are made on bacterial purification, recovery of benzene from dephenolated liquor, and electrostatic tar pptn.

Memorandum on processes for the removal of phenol from ammoniacal liquor and effluent spent liquors. A. Parker. *Trans. Inst. Gas Engrs.* 79, 375-408(1929-30).—Phenol recovery is by 4 types of processes: (1) by solvents such as benzene, trichloroethylene, etc., (2) by solid absorbents, e.g., activated C, (3) by volatilization, and (4) extn. from crude coal gas at temps. above the dew point of the gas before liquor condenses. Plants of type (1) in America and Germany are described with operating data and costs, and published data on (2), (3) and (4) are summarized.

The disposal of liquor effluents from gas works. 3rd Report of the Liquor Effluents Subcommittee. A. C. Monkhouse and W. Etheridge. *Trans. Inst. Gas Engrs.* 78, 250-65(1928-29); 79, 335-73, 428-36(1929-30); cf. C. A. 23, 2018; 25, 2547, 4384.—The vol. of tar deposited in the retort house is increased and the higher tar acids in the liquor are decreased by using a restricted gas main in which a finely divided spray of liquor under pressure impinges on the gas stream. Condensation of liquor with the tar was minimized (and hence soln. of higher tar acids from the tar by the liquor) by lagging the extractor and heating the circulating liquor with a closed steam coil. Electrostatic pptn. was highly efficient as a tar extractor, reducing the higher tar acids in the liquor to a comparatively small amt., but total  $\text{O}_2$  absorption and content of monohydric phenol were increased. The precipitators recovered 91.5% of the total tar condensed up to the exhaust (16.1 gal. per ton of coal) and contg. only 14% of liquor.  $\text{C}_6\text{H}_5\text{OH}$  in the liquor increased from 0.403 to 0.721 g. per 100 cc. because of tar previously acting as a partial solvent of the phenol when condensed with the liquor; shaking the liquor with retort house tar reduced  $\text{C}_6\text{H}_5\text{OH}$  to 0.378 g. per 100 cc., while higher tar acids increased from 20 to 137 g. of  $\text{O}_2$  absorbed per 100,000 cc. Cost of electrostatic pptn. was 0.15 d. per 1000 cu. ft. of gas. The lower  $\text{O}_2$  content of the crude gas caused a diminution in the quantities of thiosulfate and thiocyanate in the condensed liquors.

Composition of high-temperature coal tar. V. S. Vasserman. *Coke and Chem.* (U. S. S. R.) 1932, No. 10, 55-8.—Coal tar was analyzed to det. the constituents as present in the original form. To accomplish this no distn. was made as this results in decompn. of the original substances. The coal sample was dissolved in benzene, phenols and acids were sep'd. from the benzene soln. by treatment with 4 N NaOH soln. and the bases by 2 N  $\text{H}_2\text{SO}_4$  soln. Ketones and aldehydes were sep'd. with  $\text{H}_2\text{K}_2(\text{CN})_2$ . The results of the analysis obtained are: (in percentage compn.) insol. sediment 12.1, phenols and acids 0.41; bases sol. in  $\text{HCl}$  3.1; amphoteric bases 0.29; ppt. formed by  $\text{H}_2\text{SO}_4$  treatment (probably insol. salts of bases) 13.3; aldehydes and ketones 5.28; neutral compd.

(hydrocarbons) 65.69. The nature of insol. sediment and that of the ppt. were not definitely det'd. James Sorrel

The heavy fractions of "Donbas" coal tar and study of their purification. N. Narushkin and V. Patz. *Coke and Chem.* (U. S. S. R.) 1932, No. 9, 40-62. J. S.

The analysis of mixtures of bituminous coal tar and asphalt bitumen. H. Mallison. *Asphalt Teer Strassenbautech.* 33, 845(1933).

The law of temperature dependence with tars. W. Eymann. *Asphalt Teer Strassenbautech.* 33, 751-4(1933); cf. C. A. 27, 5926, 5939 and *Verkehrstechnik* No. 16(1932). Time-temp. relationships of the viscosities of tars and fractions are discussed from a theoretical standpoint.

The hydrogenation of brown coal tar by the Klever process (formerly D. R. P. 301,773, 1923). Seidenschneur. *Braunkohle* 32, 853-6, 872-8(1933).—The use of a Mo catalyst yields 70% S-free benzene in the reaction products, without pitch or fuel-oil formation. Pure, hard paraffin may be recovered from the cleared tar. The filtrate, after removal of the soft paraffin, has lubrication value. Practical details are given.

Practical experiences with the micron determination in tars according to the experiments of Nellensteyn. J. Oberbach. *Asphalt Teer Strassenbautech.* 33, 814-16(1933); cf. *Ibid.* 31, 957(1931); C. A. 27, 5939.—A tar is entirely suited for road-building purposes even though contg. <14 million microns per cu. mm. but it must meet the other usual specifications.

Two interesting coke-oven tars of the Urals and Siberia. Karl Frey. *Asphalt Teer Strassenbautech.* 33, 839-41(1933).—Complete analytical data are given for 2 oppositely different tars from similar ovens. Various fractions, particularly the wash oil, are exam'd. as to compn.

The functions of coke ovens. Edward G. Stewart. *Trans. Inst. Gas Engrs.* 79, 660-705(1929-30).—See C. A. 25, 1972.

Factors influencing the reactivity of coke. Gas Research Fellowship Report 1929. F. J. Dent and J. W. Cobb. *Trans. Inst. Gas Engrs.* 78, 252-5(1928-29); 79, 156-96(1929-30).—See C. A. 23, 4048. A. H. E.

Dependence of the properties of coke upon the conditions of preparation. IV. W. J. Müller and E. Jandl. *Brennstoff-Chem.* 14, 441-4(1933); cf. C. A. 28, 881'.—New app. for detg. the "combustibility" (reactivity) of coke by the interferometer measurement of  $\text{CO}_2$  has been developed from older methods. The  $\text{CO}_2$  content of the exhaust air, det'd. at  $\frac{1}{2}$ -min. intervals, is plotted against time; the max. content of  $\text{CO}_2$  is used as an index. An air-passage rate of 20 l./hr., 0.5 cc. finely pulverized coke and a test temp. of 550° showed the greatest differences between the cokes and charcoals tested. With this method, 2 series of cokes, carbonized slowly and rapidly, at temps. of 700-1300°, and degasified for 1-16 hrs., are compared graphically as previously described. The differences caused by slow and rapid heating are small but vary with carbonizing temp.

Filters suitable for the treatment of liquid fuel for internal-combustion engines. Robert Bosch A.-G. Brit. 400,080, Oct. 19, 1933.

Filter used in a liquid-pumping system, e. g., in an internal-combustion engine. Robert Bosch A.-G. Brit. 401,211, Nov. 9, 1933.

Steam superheaters. Percy St. G. Kirke. Brit. 400,252, Oct. 23, 1933.

Steam superheaters. The Superheater Co. Ltd. and Charles Adamson. Brit. 400,703, Nov. 2, 1933.

Fuel briquets. Dezső Fekete. Hung. 106,725, Aug. 1, 1933. Briquets made as usual are treated with sulfite cellulose lye and dried at 250-350° or sprayed with 15% water glass. Solidity increases, and the briquets do not crumble.

Fuel briquets. Ottó Fehér. Hung. 107,171, Sept. 1, 1933. Coke or semicoke powder is mixed with binding material and black or brown coal of grain sizes smaller than 0.5-0.8 mm. but larger than colloidal size. The mixt. is pressed cold or warm.

Coke briquets. János Széki. Hung. 106,935, Aug. 1, 1933. Disintegrated or powd. coke is mixed with tar (ignited or slaked lime also may be added), pressed to briquets and distd. at not over 800° in a current of a washing and hydrogenating gas contg. CO with a partial pressure lower than 1 atm. and steam.

Lignite-coke briquets. Reinhold Ahrendt and Martha Gassel née Wienrich. Ger. 589,896, Dec. 19, 1933 (Cl. 10b. 1).

Coke briquets from brown coal. Konrad Nowak. Ger. 589,895, Dec. 18, 1933 (Cl. 10a. 36.02). Addn. to 488,500 (C. A. 24, 2586). Brown coal contg. less than 8% of water and of a granule size not exceeding 2 mm. is briquetted and coked.

Briquetting brown coal. Fritz Seidenvenhnr and Hermann Pape. Ger. 591,205, Jan. 18, 1934 (Cl. 80a.

25.05). In making egg briquets from moist brown coal, the briquetting molds are coated with powd. clay, chalk or like material.

Briquetting wood charcoal. Clementine Polich. Austrian 135,877, Dec. 11, 1933 (Cl. 10c). Comminuted wood charcoal is mixed with an easily resinifiable tar oil or tar, and the mixt. is briquetted without compression. The briquets are then hardened by heating to 70-200° in a current of air, and may be finally heated to 500-1000° in an inert atm. and cooled in a gas contg. hydrocarbons.

Distillation of lumpy fuels with preservation of their original form. János Széki. Hung. 107,073, Aug. 15, 1933. Mech. details are given.

Retort for distilling bituminous and other fuels. I. G. Farbenind. A.-G. (Ferdinand Lampe, inventor). Ger. 589,818, Dec. 14, 1933 (Cl. 10a. 26.01).

Drying fuels prior to carbonization. Metallges. A.-G. (Otto Hubmann, inventor). Ger. 590,709, Jan. 9, 1934 (Cl. 10a. 36.02). Addn. to 544,192 (C. A. 26, 2579). The fuel is dried until it contains 30-40% of water, and is then briquetted and dried still further. The coarser granules may be sepd. after the first drying step and briquetted separately.

Low-temperature carbonizing plant for solid fuel. British Carbonised Fuels Ltd. and Harold Pearson Hud Fr. 756,961, Dec. 18, 1933.

Catalysts suitable for use in destructive hydrogenation of carbonaceous materials. Mathias Pier and Karl Winkler (to Standard-I. G. Co.). U. S. 1,946,108, Feb. 6. For the production of a catalyst of high mech. stability, a small amt. of Al powder is incorporated with an aq. paste of molybdic acid and ZnO, the mixt. is kneaded (without permitting the temp. to rise above about 50°) and the mixt. is gradually dried. U. S. 1,946,109 relates to the production of S-immune catalysts by mixing Fe, Ni or Co or their alloys or carbides with a paste such as may be formed of molybdic acid, ZnO and MgO and gradually drying the resulting mixt. Cf. C. A. 28, 611<sup>a</sup>.

Destructive hydrogenation of coal, tars, mineral oils, etc. N. V. de Bataafsche Petroleum Maatschappij. Ger. 591,099, Jan. 16, 1934 (Cl. 12a. 1.05). The process is effected in 2 or more stages with the use of Mo or a Mo compd. as the catalyst in the 1st stage, and I or a compd. of I as the catalyst in the 2nd or subsequent stages. Volatile products are sepd. after each stage. Cf. C. A. 28, 292<sup>a</sup>.

Hydrogenation of coal, etc. Mitsui Kōzan K. K. (Kōzō Ikawa and Sōji Kōno, inventors). Japan. 100,484, Apr. 10, 1933. In hydrogenation of coal or the like under high pressure, P compds. or compounds which liberate P compds. not contg. elements of the O and S groups are used as catalysts. Inorg. or org. phosphines or phosphonium compds. are especially recommended. By the use of these compds., the decompn. temp. is lowered. The formation of CH<sub>4</sub> and free C is decreased. The product is rich in the gasoline fraction. The amt. of the catalyst is about 1% of the coal used.

Hydrocarbons from coal. Kyūhei Kobayashi. Japan 99,665, Feb. 21, 1933. A mixt. of coal (fine granules), Japanese acid clay (ordinary or activated) and iron scraps is subjected to dry distn. at below 550°. The amt. of the oil produced from 1 ton of coal is about 20-35 gallons and about 65% of the oil b. 200°. As by-products coke and absorbent clay are obtained.

Hydrocarbons from coal or other carbon compounds. The Head of the Tokyo Kōgyō Sūikenjō (Ichitarō Kitawaki and Tamekichi Suzuki, inventors). Japan. 99,732, Feb. 23, 1933. Before hydrogenation, the carbonaceous material is treated with Cl or Br to decrease the S and ash contents and increase the reactivity toward H.

Apparatus for taking samples of material such as coal or stone from conveyors or the like. Jesse D. Bradford and Wm. S. McAleer (to Koppers Co. of Del.). U. S. 1,944,963, Jan. 30. A system is described for electromagnetic operation of a sampling gate at timed intervals.

Restoring the natural appearance of discolored coal. Nathaniel R. Landon and Ernest V. Collins, Jr. (to D.

L. & W. Coal Co.). U. S. 1,945,371, Jan. 30. Coal discolored by oxidized Fe compds. is treated with a soln. contg. tannin or gallic or pyrogalllic acids and is then exposed to the atm. so that the Fe compds. are converted into other compds. and the natural appearance of the coal is restored.

**Light oils from coal distillation.** Carl Still. U. S. 1,946,721, Feb. 13. Ducts are formed in the interior of a coal charge through which distn. products are withdrawn by suction; light oils are sep'd. from other distn. products, and the sep'd. light oils are stabilized with a polymerizing agent of moderate activity (such as 90% strength  $H_2SO_4$  at ordinary temp.) followed by treatment with a polymerizing agent of greater activity (such as 90% strength  $H_2SO_4$  at 30–35°). An arrangement of app. is described.

**Briquetting coal.** Béla Móry. Hung. 107,977, Jan. 2, 1934. See *Brit.* 372,283 (C. A. 27, 2561).

**Coke briquets.** János Széki. Hung. 108,018, Jan. 2, 1934. A mixt. of distd. powd. fuels (semi-coke) and raw coal with bituminous binder is coked. The gases formed are hydrogenated by means of a current of CO and steam.

**Coking coal.** Gustav Komarek (to Berwind Fuel Co.). U. S. 1,946,628, Feb. 13. For producing dense lumps of coke, coal is continuously fed into a heated rotary retort chamber maintained about half filled with coal and coke, and the retort is rotated at a speed to produce tumbling of the contents and shifting of the mass while at uniform coking temp. App. is described.

**Peat.** Rönstén Chemische G. m. b. H. Brit. 101,227, Nov. 9, 1933. Fr. 756,799, Dec. 15, 1933. Peat is enriched in  $H_2O$ -sol. humins by mixing with substances evolving  $NH_3$ , moistening and storing in a silo. In an example air-dried peat 70,  $(NH_4)_2SO_4$  25 and powd. CaO 5 kg. are moistened with 20 l.  $H_2O$  and stored 6–8 weeks.  $CaCN_2$ , urea,  $(NH_4)_2CO_3$ , etc., may replace the CaO and  $(NH_4)_2SO_4$ .

**Gasification of brown coal.** Gábor Szigeth. Hung. 107,340, Dec. 1, 1933. The gases formed are drawn off from the hottest part of the charge, at about the middle of a gasifying chamber. Thus the steam and  $CO_2$  developing in the first period of heating filter through the ignited charge (at 850–900°) and are transformed partly or totally to permanent gases, the hydrocarbons are partly decomposed and the  $H_2$  formation can well be increased. Steam and  $O_2$  are led into the furnace in sep. pipes. Cf. C. A. 27, 5174.

**Gas.** I. G. Farbenind. A.-G. Fr. 756,778, Dec. 15, 1933. Moist finely granular fuel is introduced into the upper part of a gas generator and caused to pass continually down an inclined plane while being treated by the hot gasifying agents. An app. is described.

**Fuel gases.** Gemeinde Wien-Stadt. Gaswerke (Alfons Klemenc and Johann Rupp, inventors). Austria 136,199, Jan. 10, 1934 (Cl. 23a). Fuel gases contg. CO and  $H_2$  are led at 300–550° over a catalyst such as activated Fe or  $Fe_2O_3$ ; whereby CO is converted into  $CO_2$  and  $CH_4$ .

**Oil gas.** Charles A. Rosier. U. S. 1,945,790, Feb. 6. See Fr. 744,910 (C. A. 27, 4380).

**Gas purification.** Christian J. Hansen (to Koppers Co. of Del.). U. S. 1,944,978, Jan. 30. A soln. of  $NH_4$  thiosulfate is treated with  $H_3PO_4$  to form  $NH_4$  phosphate and  $NH_4$  thionate, and gas such as that from coal distn. is washed with the resulting liquid to remove  $H_2S$  from the gas. App. is described.

**Purifier for generator gas.** Humboldt-Deutzmotoren A.-G. Fr. 757,117, Dec. 20, 1933.

**Regenerating gas-cleaning masses.** Hoersch-Köln Neuenven A.-G. für Berghau und Hüttenbetrieb. Ger. 589,713, Dec. 13, 1933 (Cl. 26d. 8.30). The masses are freed from  $H_2S$  by adding air or  $O$  to gases being cleaned.

**Baffle apparatus for separating dust from fuel gases.** Wilhelm Voigt. Ger. 585,192, Jan. 27, 1934 (Cl. 26d. 1.20).

**Apparatus for determining the amount of "corrected gas" in a stream of raw gas such as producer or water**

**gas.** Maurice B. Zoll (to Western Gas Construction Co.). U. S. 1,947,370, Feb. 13. Various details of an orifice meter system for continuous operation are described.

**Generating combustible gas from air and gasoline, alcohol, pentane, etc.** Walter H. Hermsdorf (to S. H. G. Inc.). U. S. 1,945,550, Feb. 6. Various details of app. and operation are described. Cf. C. A. 28, 884<sup>a</sup>.

**Gas generator.** Elemér Bánki. Hung. 106,762, Aug. 1, 1933. To save costs of compression the pressure formed by the gas development is used for transporting, purification and final compression of gases. Structural details are given.

**Apparatus for producing gas by carbureting air with liquid fuels.** Jesse D. Thomas. U. S. 1,945,464, Jan. 30. Numerous structural and operative details are described.

**Gas producer.** Albert L. Galusha. U. S. 1,947,330, Feb. 13.

**Gas producers.** I. G. Farbenind. A.-G. Brit. 401,463, Nov. 16, 1933.

**Gas producer with a cooling jacket.** Heinrich Koppers A.-G. Ger. 589,785, Dec. 29, 1933 (Cl. 24e. 10.03).

**Coal-gas producer.** Dingler'sche Maschinenfabrik A.-G. Ger. 589,784, Dec. 15, 1933 (Cl. 24e. 9).

**Water-gas producer operated by anthracite waste.** Industries of America, Inc. Ger. 589,728, Dec. 13, 1933 (Cl. 24e. 1.01).

**Low-temperature hydrocarbon gas producer.** Christian Bolz. Ger. 589,766, Dec. 21, 1933 (Cl. 24e. 2.01).

**Ash-discharge device for gas producer.** Metallges. A.-G. (Otto Hubmann, inventor). Ger. 591,008, Jan. 16, 1934 (Cl. 24e. 11.03).

**Device for removing soot, etc., from gas mains of generating plants.** Nikolai I. Ivanovskii. Ger. 591,126, Jan. 17, 1934 (Cl. 24e. 13.01).

**Gas holder of the disk type.** Georg von Hanffstengel. U. S. 1,946,512, Feb. 13.

**Transporting artificial gas containing gum-forming substances through mains.** Walter L. Shively (to Koppers Co. of Del.). U. S. 1,945,001, Jan. 30. In a system in which gas such as coke-oven gas contg. gum-forming constituents is transported through a main at pressures materially higher than the pressure at which the gas is subsequently distributed, and in which gummy substances are deposited in the relatively low-pressure system, the gas is treated, to repress gum formation, by introducing water or steam in the high-pressure line at intervals to maintain a sufficiently high humidity above 80% in the gas in the main, which inhibits gum formation.

**Removing naphthalene and gum-forming constituents from gas.** Alfred R. Powell (to Koppers Co. of Del.). U. S. 1,944,903, Jan. 30. See Brit. 374,975 (C. A. 27, 2565).

**Sulfur recovery in gas purification.** Wilhelm Fitz. U. S. 1,947,467, Feb. 20. Sulfur foam resulting from the removal of  $H_2S$  from gases by wet purification is treated with an oxidizing agent such as  $KNO_3$  soln. in the absence of free inorg. acids at temps. above the m. p. of S and S is recovered as a regulus.

**Removal of organic sulfur compounds from hydrocarbon mixtures.** Deutsches Patent. Hung. 107,609, Dec. 15, 1933. The mixts. are treated at temps. over 300° with nascent H under at least 10 atm. pressure until the av. b. p. decreases less than 50°. E. g., a coal-tar benzene of d. 0.780, av. b. p. 130°, contg. 3.5% org. S was treated in the presence of  $FeS_2$  as a catalyst with H produced from copperized iron and concd.  $FeCl_3$  soln. at 360–410° and 50 atm. until the av. b. p. decreased to 110°. The product contained less than 0.1% S.

**Phenols from tar oils.** John G. Peake (to Timbrol Ltd.). U. S. 1,945,376, Jan. 30. In the recovery of phenols from tar oils by extn. with a soln. of an alkali metal hydroxide, neutral oils and other alkali-insol. compds. are removed from the soln. by distg. under sub-atm. pressure.

**Apparatus for removing tar and water from gas.** Humphreys & Glasgow Ltd. Fr. 756,794, Dec. 15, 1933.

**Purification of primary tars and shale oils.** F. de Ragenrioux, M. De Visscher and E. Van Cuyck. Belg. 395,574, May 31, 1933. The tar or oil is emulsified or mixed with water contg. in soln. or in suspension reagents which make the substances to be eliminated pass into soln. or into suspension; the liquid is decanted and centrifuged.

**Working up tar products and production of phenol derivatives.** Béla Markó. Hung. 107,093, Sept. 1, 1933. Water is distd. from tar products treated with 10-40% NaOH or KOH. There are obtained 2 separable phases, one consisting of alkali phenolates and cresolates and the other of oils free from phenols. The alkalies can be regenerated from the cresolates by electrolysis.

**Tar and other emulsions.** Gustave Labourse. Fr. 756,535, Dec. 11, 1933. Hydrated lime (slaked lime or milk of lime) is used as the emulsifying agent.

**Tar distillation.** Stuart P. Miller, (to Barrett Co.). U. S. 1,947,485, Feb. 20. Tar is sprayed into hot coal-distn. gases and then further distd. and the tar-distn. residue decomposed by direct contact with hot coal-distn. gases, thus producing coke; and the gases and vapors from the distn. are cooled to recover distillates. App. is described.

**Improving tarry acidic substances.** Nenryô Kenkyôjû

Tyô (Yoshikiyo Ôshima and Shingo Aoto, inventors). Japan. 99,830, Feb. 28, 1933. Tarry acidic substances are hydrogenated with or without a catalyst such as  $\text{Fe}_2\text{O}_3$ ,  $\text{FeCl}_3$ , or  $\text{ZnO}$ .

**Liquefaction and rectification system suitable for separation of constituents of coke-oven gas.** Maurice Gobert (to l'Air Liquide (Soc. anon. pour l'étude & l'exploitation des procédés Georges Claude)). U. S. 1,945,367, Jan. 30. Various details of app. and operation are described.

**Coking coal.** Gustav Hilger. Ger. 591,416, Jan. 20, 1934 (Cl. 10a. 22.01). Coal contg. 2-3% of water is packed in a coke-oven chamber with interspersed layers of coke, and then heated first to 300-500° and afterward to a higher temp.

**Coke ovens.** Gustav Hilger. Ger. 589,894, Dec. 15, 1933 (Cl. 10a. 18.02). Coke ovens are charged with a mixt. of good coal and poor-distg. bituminous coal.

**Regenerative coke ovens.** Evence Coppée & Co. Fr. 756,798, Dec. 15, 1933.

**Vertical coking oven.** Didier-Werke A.-G. Ger. 589,509, Dec. 8, 1933 (Cl. 10a. 13).

**Coke-oven battery.** Lloyd F. Schrader and Frederick P. Hart (to Somet-Solvay Engineering Corp.). U. S. 1,947,499-500, Feb. 20.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

**Research developments in the refining of Pennsylvania petroleum.** M. R. Penske. *Penna. State Coll., Min. Ind. Expt. Sta., Bull.* 12, 9-16(1933).—F. discusses the viscosity index, gravity index, b.-p. index, optical index and solvent extn. Alden H. Emery

**Edleannu refining process may be applied to treat practically all petroleum fractions.** O. P. Cottrell. *Oil and Gas J.* 32, No. 28, 64(1933). J. R. Strong

**The Foster-Wheeler tube still in Grozny.** V. G. Nikolaeva. *Nefyanoe Khozaystvo* 25, No. 9, 31-4 (1933).—A Foster-Wheeler atm. tube still with a daily capacity of 2000 tons was built in Grozny in 1930. Steam superheated in a coil in the furnace is admitted into the bubble tower. The furnace has an efficiency factor of 0.75. The superheated steam (400°) consumes about 6.1% of the fuel, the total consumption of which is 2% when producing 65-70% of distillates. A. A. B.

**Diagrams used to show what goes on in a tower during fractionation of complex oil mixtures.** B. P. Voinov. *Oil and Gas J.* 32, No. 35, 14(1934). J. R. Strong

**Some economic aspects of the bituminous sands of Northern Alberta.** S. C. Ellis. *Can. Dept. Mines, Mines Branch, Rept.* 735, 10-29(1934); cf. *C. A.* 27, 3593.—Cost of producing petroleum products from bituminous sands is estd. Yields of various products are tabulated. Alden H. Emery

**Physical tests and properties of oil and gas sands.** George H. Fancher, James A. Lewis and Kenneth B. Barnes. World Petroleum Congress, Preprint No. 8, 14 pp.(1933); *Penna. State Coll., Mineral Ind. Expt. Sta., Tech. Paper No.* 4(1933).—Petrographic examn., screen analysis, porosity and permeability tests are discussed in the light of recent developments. Four methods for the measurement of porosity are compared. A procedure in testing and an app. which yields accurate and reproducible results in the measurement of permeability are described. The permeabilities of 127 samples of various geol. formations are tabulated. A. H. E.

**Some physical characteristics of oil sands.** G. H. Fancher, J. A. Lewis and K. B. Barnes. *Penna. State Coll., Mineral Ind. Expt. Sta., Bull.* 12, 65-171(1933).—Reliable methods for detn. of porosity are discussed. An app. for measuring permeability of consolidated sands is described. Accurate data on permeability and porosity are given for 130 sands. Various methods for computing permeability are compared and conversion factors calcd.

No consistent relationship is found between porosity, permeability and screen analysis. Alden H. Emery

**Russian crude oils as a raw material for the preparation of aviation oils.** A. S. Velkovskii and B. G. Semendov. *Nefyanoe Khozaystvo* 25, No. 10, 49-53(1933).—The Soviet standards for aviation oils differ from the American by a higher flash point (250°), lower pour point (—10°), higher acidity (0.05%) and higher ash content (0.05%). Attempts to select stocks which would make aviation oils that conform to the American standard failed because of the low viscosity at elevated temps., except with Sags oil. The high pour points of the Soviet oils were improved by adding paraffin. The importance of using distillates instead of bottom oils is emphasized. A. A. B.

**Combating paraffin in the production of crude oil.** I. I. Korganov. *Nefyanoe Khozaystvo* 25, No. 10, 27-35 (1933).—The following methods are discussed: (1) blasting, by lowering the charge to the bottom of the hole; (2) expansion of the hole; (3) use of solvents such as gasoline,  $\text{C}_6\text{H}_6$ , kerosene and crude oil; (4) heating with superheated steam; (5) heating by circulating hot crude oil or by lowering chemicals producing heat on being dissolved, such as Ca carbide or NaOH; (6) burning of a combustible mixt. (Garner-Leyden process). A. A. B.

**The oxidation of paraffin and ceresin by air at higher temperatures.** Typko. *Erdol u. Teer* 9, 451(1933), cf. *C. A.* 27, 5954. F. W. Jung

**The effect of Paraffin on wax crystallization and the pour point of lubricating oils.** J. C. Zimmer, G. H. B. Davis and P. K. Frolich. *Penna. State Coll., Min. Ind. Expt. Sta., Bull.* 12, 57-63(1933).—Small amts. of wax in lubricating oils cause them to congeal at relatively high temps. Interlocking wax crystals prevent the free flow of oil at low temps., and retention or adsorption of oil by the wax causes the mixt. to set to a gel. Paraffin is preferentially adsorbed by the wax, reducing the size of the crystals and preventing the adsorption of large quantities of oil by the wax. This allows the oil to flow freely at low temps. even though solid wax particles are suspended in the oil. Alden H. Emery

**Advances in production, recovery and purification of benzene during the year 1932.** Fritz Rosendahl. *Teer u. Bitumen* 31, 393-6(1933).—Brief bibliographical and patent description. F. W. Jung

**Diethyl peroxide as a proknoek.** A. Egerton and A. R. Ubbelohde. *Nature* 133, 179(1934).— $\text{Et}_2\text{O}_2$  is a violent proknoek, slightly more potent than  $\text{C}_2\text{H}_5\text{NO}_2$  at the same

concn. Its knocking action is inhibited by  $PbEt_4$ .  $BiH_3O_2$  is likewise definitely a proknock. In spite of the ease of thermal decompn.,  $H_2O_2$  has a definite but slight proknock tendency. W. J. Peterson

**Drilling mud.** Percy Meyer. *J. Inst. Petroleum Tech.* 20, No. 123, 10-33(1934).—Drilling mud is a "semi-solid" colloidal suspension and both shear force, or yield point, and viscosity govern its flow. The two properties can be measured at once by detg. the rate of flow through a capillary at various heads. Shear force alone can be measured by a "shearometer." Next to density, shear force is probably the most important quality of a mud. To utilize the Schlumberger elec. coring app. in deep tests, the mud must be of high density but thin enough to allow the plummet to reach the bottom of the hole. The barytes combined with the clay to form the mud must be easily wettable. The mud should not settle out on standing; to prevent settling, a min. of 68-70 lb. of clay per cu. ft. is necessary. *Aqualog* or *bentonite* may be added to the clay to supply the needed colloidal quality. Barytes reduces greatly the penetration of the mud into the formation. Na silicate, phosphate, carbonate and hydroxide are used for thinning mud but the silicate, especially, is incalculable in its effect. Emma R. Crandal

**Mud solution, its preparation and distribution among the large oil fields.** P. I. Rozhen. *Neftyanoe Khosyaistvo* 25, 141-6(1933).—Various methods used in mining and sepg. clay (from mech. admixts.) are discussed. A. A. B.

**The synthesis of lubricating oils from Kogasin.** Preliminary communication. Franz Fischer and Herbert Koch. *Brennstoff-Chem.* 14, 403-8(1933); cf. *C. A.* 24, 4919.—A series of chlorination products has been prep'd. from the olefin-contg. gas-oil fraction, Kogasin II, obtained in the benzene synthesis from CO and H. They were condensed with a no. of aromatic hydrocarbons by using  $AlCl_3$ . Best yields were obtained with the tri- and tetrachloro compds. and xylene. The oils resembled naphthene-base oils in properties. Catalytic hydrogenation gives a water-white oil of low sp. gr., high stability against oxidation, small carbon residue, which retains its lubricating value at low temp. Comparative phys. data are given for the various oils prepared. Bibliography. F. W. Jung

**Friction tests on lubricating oils.** J. W. Donaldson and D. R. Hutchinson. *J. Soc. Chem. Ind.* 52, 424-9T (1933). The app. consists of a pendulum carrying adjustable wts. and supported at the fulcrum by means of a single sphere that rests in a seat or by a single small sphere that rests on four larger moving spheres. The whole app. is provided with a heating device. The time of swing of the pendulum is detd. by numerous tests over long and short periods, and by dividing the time of damping by the time of one complete swing, the no. of swings can be detd. from the no. of swings made, the decay of oscillation per swing is calcd. and whiz this value is used in the Hardy formula a simple expression for coeff. of friction,  $\mu$ , is derived for each type of app. Mineral, fixed and comp'd. oils ranging in sp. gr. at 60°F. from 0.880 to 0.964, in viscosity at 100°F. from 75 sec. to 1490 sec., total acidity from a trace to 7.0% and sapon. no. from 0 to 18.0 were tested on both types of app. Based upon the formula  $\mu = 9.39/T$ , where  $T$  is the damping time, coeffs. of friction of mineral oils were found to increase as the viscosity decreases on heating, which is attributed to increased no. of asperities in the bearing being brought into contact. A decrease in coeff. of friction at high temp. of the fixed oils suggests chem. changes. J. L. Essex

**Artificial aging of lubricating oils.** S. Fachini and F. Sporer. *Giorn. chim. ind. applicata* 15, 553-6(1933).—An artificial aging test for lubricating oils consists in heating for specified times in air. The temp. is fixed at 150°, and the times used are 15, 50, 75, 100 and 150 hrs. Heating was carried out in a porcelain crucible of the Rosenthal type, which is absolutely neutral and unattacked. The oils are classified into 4 groups. I shows the presence of an insol. residue (in ordinary gasoline) after heating 15 hrs.; II and III withstand 75 and 100 hrs. of

heating; while IV give no residue even after 150 hrs. of heating. A. W. Contieri

**Flash-point testing of lubricating oils.** D. Holde. *Erdöl u. Teer* 9, 485-7, 497-8, 506-11, 523(1933).—The various methods, definitions and literature of flash point are discussed. References. F. W. Jung

**Influence of roughness of surface and variation of speed on boundary lubrication.** P. S. Caldwell and A. S. T. Thomson. *J. Roy. Tech. Coll. (Glasgow)* 3, 106-15 (1933); cf. *C. A.* 25, 2842.—Scraping, burnishing and running-in of the surfaces result in a considerable reduction in the value of the coeff. of static friction, by 45% with white metal on Ni-Cr steel, by 25% with P-bronze on Ni-Cr steel, and by 8% with cast Fe on Ni-Cr steel. A further reduction is produced by grinding or lapping the surfaces; of the above combinations the last-named gives the lowest coeff. of static friction (0.130). With increase in rubbing speed under relatively low loads, decreases to a min., then rises; the speed at which this min. occurs varies directly with load and static friction and inversely with the viscosity of the lubricating oil. Friction-rubbing speed curves are given for 6 oils under boundary, film and greasy conditions of lubrication. B. C. A.

**Railroad-car journal oils tested under severe conditions of temperature change and load.** C. M. Larson. *Oil and Gas J.* 32, No. 30, 15-16, 18(1933).—The torque is measured in ft. lb. caused by the resistance of a satd. waste pack against the journal surface. A low rate of change in viscosity with temp. is needed as well as a low rate of change in adhesion with temp. J. R. Strong

**Low-viscosity oils as substitutes for high-viscosity lubricants.** D. S. Velikovskii and P. P. Khrshanovskii. *Neftyanoe Khosyaistvo* 25, 113-15(1933).—The authors tested in the Olsen machine various mixts. of kerosene with (1) cylinder-oil distillate and (2) sulfurized and chlorinated cylinder-oil distillate. They found that (2) has a higher breakdown point than (1). A sulfurized oil of 1.2  $E_{50}$  viscosity is equal to a fuel oil of 4.2  $E_{50}$  viscosity. The theory of lubrication is discussed in detail. A. A. B.

**Comparison of Soviet and foreign greases.** D. S. Velikovskii, L. G. Yartzeva-Pod'yapolskaya and L. S. Shekhoyan. *Neftyanoe Khosyaistvo* 25, No. 6, 55-9; No. 8, 176-9; No. 10, 53-6(1933).—A number of Russian and foreign greases were analyzed and various tests were made with automobile and ball-bearing greases. It is concluded that the Russian greases are inferior to the foreign products and various recommendations for the improvement of the former are made. A. A. B.

**Tentative method of test for penetration of greases and petrolatum.** Am. Soc. Testing Materials A. S. T. M. Designation: D217-33T; Am. Standards Assoc. A. S. A. No.: Z11.3-1933, 6 pp.(1933). Alden H. Emery

**Simple, compact and unusually flexible vacuum asphalt unit completed at Sunray refinery.** W. T. Ziegenhain. *Oil and Gas J.* 32, No. 29, 10(1933). J. R. Strong

**Plasticity of bitumens.** R. N. J. Sual and G. Koens. *Bitumen* 4, 16-19(1934); cf. *C. A.* 27, 2795.—Concentric and high-pressure capillary viscometers are used for measuring the viscosity of bitumens. Both types of app. give reliable data. Bitumens of different penetration and viscosity values fall on a straight line when log viscosity is plotted vs. log penetration. From data on numerous bitumens it is concluded that there is a close relationship between plasticity and ductility. If a bitumen cannot be found with the desired properties for a given use, a mixt. of several bitumens often yields a product with the desired plasticity. Howard A. Smith

**Analysis of mixts. of bituminous coal tar and asphalt bitumen (Mallison) 21.** Hydrogenation of brown coal tar [lubrication value of by-product paraffin] (Seldenschnur) 21. Pyrolysis of gas [from cracking of petroleum] (Butkov, Rabinovich) 21. Thermal treatment of gaseous hydrocarbons (Dunstan, et al.) 21. Genesis of Central-Asiatic petroleum deposits (Porfir'ev, Vasil'ev) 8. Oil-bearing deposits in Sakhalin (Gedroits) 8. Direct oxidation of satd. hydrocarbons at high pressures (Wiezevich, Frolich) 2. Gravitation measurements carried out in the Emba dist.

[crude-oil deposits] (Skvortzov) 8. Source of various salts recovered in the Texas Company's refinery (Duce) 8. Phase equil. in hydrocarbon systems (Sage, *et al.*) 2. Light oils from coal distn. (U. S. pat. 1,946,721) 21. Removal of org. S compds. from hydrocarbon mixts (Hung. pat. 107,609) 21. Destructive hydrogenation of mineral oils (Ger. pat. 591,099) 21. Purification of shale oils (Belg. pat. 395,574) 21. Preventing oxidation of petroleum hydrocarbons (Japan. pat. 99,257) 27. Elec. furnace for dry distn. of hydrocarbons (Japan. pat. 99,987) 4.

Echantillonnage et analyse des huiles de graissage et des graisses lubrifiantes. Brussels: Association belge de standardisation. 75 pp.

**Refining petroleum oils.** Walter L. Savell (to Mathieson Alkali Works). U. S. 1,945,121, Jan. 30. Oil such as a gasoline, naphtha or kerosene is subjected to the action of a substantially dry Ca hypochlorite contg. over 50% available Cl at a sub-cracking temp.

**Dewaxing petroleum oils.** Ernest W. Reid (to Carbide and Carbon Chemicals Corp.). U. S. 1,947,359, Feb. 13. The oil is dissolved in a mixt. of isopropyl ether 60 and acetone 40% and the soln. is cooled to sep. the wax by pptn.

**Apparatus for filtering petroleum vapors through solid adsorptive material.** Malcolm P. Youker (to Grey Process Corp.). U. S. 1,945,249, Jan. 30. Various structural and operative details are described.

**Contact tower with superposed perforated shower and collecting plates suitable for fractionating petroleum vapors.** George B. Coubrough (to Lummus Co.). U. S. 1,945,600, Feb. 6. Structural features of an app. arranged for passing vapors transversely through showers of liquid.

**Coking heavy petroleum residues, etc.** Charles W. Andrews and Reginald D. Rogers (to C. P. T. Development Corp.). U. S. 1,944,872, Jan. 30. The material, in liquid form, together with an O-contg. gas is sprayed into a closed chamber at approx. atm. pressure and at such a temp. as to cause partial combustion of the liquid, thus raising its temp. to such a point as to drive off volatile portions of the liquid and progressively deposit a solid carbonaceous residue upon the floor of the chamber in the form of coke. The floor of the chamber is externally heated to approx. a coking temp., and periodically the introduction of material is interrupted and the layer of coke formed is withdrawn. App. is described.

**Hydrogenating carbonaceous materials such as a petroleum residue or tar oil, etc.** Lajos von Szeszich (to Deutsche Gold- & Silber-Schneideanstalt vorm. Roessler). U. S. 1,946,341, Feb. 6. A carbonaceous material contg. S is mixed with other material which is poorer in S and the mixt. is treated with H<sub>2</sub> at 350-600° under pressures above 100 atm. in a reaction vessel contg. a catalyst comprising Fe, Ni or Co, there being present throughout the entire reaction a quantity of H<sub>2</sub>S such that the activity of the catalyst is increased over the action of the catalyst including the metallic sulfides when employed in the absence of the H<sub>2</sub>S.

**Cracking petroleum oils.** Albert G. Davis (to Gasoline Products Co.). U. S. 1,947,001, Feb. 13. Oil is heated (suitably in a pipe coil) to a cracking temp. under pressure and then passed to a reaction chamber where it is digested under pressure and at a cracking temp.; cracked products are passed to a zone of reduced pressure in which lighter fractions are distd. off, and a hydrocarbon material such as liquid bottoms, substantially none of which will volatilize in the zone of reduced pressure, is also introduced into the latter. App. is described. Cf. C. A. 28, 1850<sup>2</sup>.

**Cracking hydrocarbons.** Henry Dreyfus. Brit. 401,286, Oct. 30, 1933. Gaseous or vaporized hydrocarbons boiling below 150° are converted into hydrocarbons of lower H content, which may be olefinic or acetylenic, by contact at a raised temp. with a liquid or semiliquid compn. contg. free C., *e. g.*, a cracking residue of high b. p., tar or pitch from the destructive distn. of oil, coal

or lignite, a natural tarry product, a suspension of graphite in a heavy oil. In an example a mixt. of C<sub>2</sub>H<sub>4</sub> and C<sub>2</sub>H<sub>6</sub> is passed at 450° and 5 atm. through a cracking residue and olefins are removed from the reaction products by H<sub>2</sub>SO<sub>4</sub>.

**Cracking hydrocarbons.** Deutsche Erdöl A.-G. Brit. 756,922, Dec. 18, 1933. Residues from coking of coals are freed from ash, *e. g.*, by treatment with acid, activated by treatment with steam at 350° and used as catalysts for cracking hydrocarbons.

**Cracking hydrocarbon oils.** Edward W. Isom (to Sinclair Refining Co.). U. S. 1,945,275, Jan. 30. A gas oil is forced successively through primary and secondary stages in a heating zone under superatm. pressure and thence into an expansion chamber. In the primary stage the oil is heated to a high-cracking temp. and as it is discharged from this stage a relatively cool crude oil at a temp. below about 175° is added in such proportion as to reduce the temp. below the point at which substantial cracking occurs. In the secondary stage the oil is heated to a cracking temp. lower than the temp. of the oil discharged from the primary stage, the pressure on the oil passing from the secondary stage to the expansion chamber is reduced, vapors of gasoline character are taken off from the expansion chamber and residue is discharged from it. App. is described.

**Cracking hydrocarbon oils.** Donald F. Gerstenberger (to Universal Oil Products Co.). U. S. 1,945,604, Feb. 6. Various details are described of app. and operation of a cracking system comprising a pressure heating coil and enlarged reaction chambers.

**Hydrocarbon oil cracking.** Lyman C. Huff (to Universal Oil Products Co.). U. S. 1,946,938, Feb. 13. Oil is heated to a cracking temp. under pressure while flowing through a pipe coil and is discharged into the upper portion of an enlarged reaction chamber maintained under cracking conditions of temp. and pressure; vapors and unvaporized oil are both passed downwardly through the reaction chamber for conversion of the vapors and the vapors and unvaporized oil are withdrawn from the lower portion of the reaction chamber. A sep. washing oil such as raw oil alone or mixed with reflux condensate is passed downwardly over the inner surfaces of the reaction chamber at an elevated temp. such as to prevent substantial cooling of the vapors so that conversion of the vapors is not interfered with but the temp. is not sufficiently high to cause substantial coking of the washing oil in the reaction chamber. App. is described.

**Cracking hydrocarbon oils.** Alphonse W. Jurrison, Albert B. Cox and Andrew M. Wood (to Universal Oil Products Co.). U. S. 1,946,939, Feb. 13. Various details of app. and operation are described, involving use of an oil-heating coil and an enlarged chamber.

**Cracking hydrocarbon oils.** Ross C. Powell (to Texas Co.). U. S. 1,947,110, Feb. 13. An app. of the "coil and drum" type comprises a heating coil, a cracking vessel fed from the coil and provided with a pump for independently circulating oil from the vessel through another heating coil and back to the cracking vessel, a second cracking vessel fed by overflow from the first vessel and various other auxiliary app.

**Cracking mineral oils.** Arthur E. Pew, Jr. (to Sun Oil Co.). U. S. 1,946,329, Feb. 6. Oil such as gas oil is vaporized, entrained liquid particles are removed from the vapors and the oil vapors are then dried (in another part of the app.) by mixing with them a relatively small proportion of a dry hydrocarbon gas and, in still another part of the app., the mixt. formed is heated to a cracking temp., followed by cooling and fractionation. An arrangement of app. is described.

**Cracking oils.** Carl Still (trading as Firm Carl Still). Brit. 401,508, Nov. 16, 1933. Oils are fractionated in a distn. column into a benzene distillate, middle oils and pitch, the middle oils being circulated through a cracking coil and the products returned to the distn. column where they are expanded in contact with the pitch and part of the crude oils. App. is described.

**Refining overhead products from oil cracking.** Jacques C. Morrell and Gustav Eglyoff (to Universal Oil Products

(n.). U. S. 1,946,094, Feb. 6. Heated vaporous products are treated with  $\text{SO}_2$  and steam in the presence of a non-metallic solid contact material such as fuller's earth (the quantity of  $\text{SO}_2$  being not substantially in excess of that necessary to remove S and gum-forming substances from the distillate). U. S. 1,946,095 relates to the similar use of an acid of P such as  $\text{H}_3\text{PO}_4$  with a free O-contg. gas and a non-metallic solid contact material such as fuller's earth. U. S. 1,946,096 relates to treatment of the vapors with an aq. soln. of a water-sol. borate such as borax and with steam.

**Hydrocarbon oil conversion.** Carbon P. Dubbs (to Universal Oil Products Co.). U. S. 1,946,463, Feb. 6. Oil is subjected to an initial conversion by passing it through a heating coil, vaporizer and dephlegmator maintained under superatm. pressure; highly heated unvaporized oils from the vaporizer are passed through succeeding app. units in which the pressure is successively reduced, to vaporize substantial portions of the oil, and the vapors are dephlegmated, condensed and collected, distillate being redphlegmated, and reflux condensate being returned to the initial heating coil for retreatment. Various features of app. are described.

**Refining hydrocarbon oils.** Homer T. Darlington (to Oil Corp. of America). U. S. 1,944,877, Jan. 30. Oil such as crude petroleum is heated and vaporized under pressure, the pressure is released to facilitate vaporization, and the vapors are passed through a series of successively cooler bodies of condensate and oil alternately, the bodies of oil contg. a solid treating agent such as fuller's earth or bog iron ore in colloidal dispersion. App. is described.

**Refining hydrocarbon oils.** Johannes A. Buchel and Roytus N. J. Saal (to Shell Development Co.). U. S. 1,945,516, Feb. 6. In the manuf. of refined transformer, spindle and lubricating oils from a mixt. of heavy hydrocarbons contg. aromatic hydrocarbons, by use of liquid  $\text{SO}_2$ , there is added to the liquid  $\text{SO}_2$  a fluid aromatic hydrocarbon such as  $\text{C}_6\text{H}_6$  or the like to increase the content of components sol. in liquid  $\text{SO}_2$ , by means of which the ratio of high-boiling aromatic content in the ext. layer to high-boiling aromatic content in the raffinate layer is increased.

**Distilling hydrocarbon oils.** Ernest W. Thiele (to Standard Oil Co. of Ind.). U. S. 1,947,319, Feb. 13. A stream of heated oil undergoing distn. is passed into an enlarged chamber in which vapors are evolved; vapors from this chamber are passed into a fractionating tower and a portion of the vapors is diverted to a second enlarged chamber for preheating it and the heated oil is then passed into the second chamber. Various features of app. are described.

**Light hydrocarbon oils by distillation of solid materials such as coal.** Lewis C. Karriek. U. S. 1,945,530, Feb. 6. In a continuous process for producing hydrocarbon oil lighter than water from solid carbonizable material such as coal, a mixt. of such material and a highly adsorptive material such as coke contg. adsorbed Cu, Co or Cr is passed under pressure through a cylindrical retort or the like and heated to increasing temps. in progressive stages to effect controlled pyrolysis; vaporized distn. products are withdrawn in a direction counter to the general movement of the mixed material through zones of successively decreasing temps., and incompletely decompd. liquid distn. products are returned to the heating zone with addnl. carbonizable material for further conversion. App. is described.

**Dewaxing of hydrocarbon oil.** Frederick W. Sullivan, Jr. (to The Standard Oil Co.). Can. 339,270, Feb. 6, 1934. Hydrocarbon oil is dewaxed by dilg. with 1 to 4 times its vol. of a mixt. contg. about equal quantities of AcOME and  $\text{C}_6\text{H}_6$ , and cooling the soln. to  $-50^\circ$  to  $-15^\circ\text{F}$ . to ppt. hydrocarbon wax. The wax is sepd. and the diluent is removed from the hydrocarbon oil. Cf. C. A. 27, 4664.

**Filtering out finely divided impurities from liquid hydrocarbon products such as oils, tars, etc.** Rudolf Wietzel and Bruno Engel (to I. G. Farbenind. A.-G.). U. S. 1,945,583, Feb. 6. The liquids are filtered through finely divided semi-solid carbonaceous residues obtained in the

destructive hydrogenation of carbonaceous materials such as coal, tar or oil.

**Furnace setting and tube banks for oil heating and steam generation.** John S. Wallis (to Foster Wheeler Corp.). U. S. 1,945,581, Feb. 6. Numerous structural details are described of an app. suitable for use in oil-fractionating systems.

**Heated tank for separating oil and water from oil-field emulsions.** Wm. G. McMurray (to M. & V. Tank Co.). U. S. 1,946,220, Feb. 6.

**Oils.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 756,640, Dec. 13, 1933. The pour point of oils, particularly crude mineral, lubricating, combustible, tar and schist oils, is lowered by adding to the oils a small amt. of an org. compd. having 5 or (and) 6 atom rings and lateral chain contg. 10 or more C atoms, such that in a mononuclear system there are more than one of these chains and in a polynuclear system there is at least one of these chains. N or O or both may be present in the rings and (or) side chains. Examples of substances are tristearate of pyrogallol, phloroglucinol and trihydroxytriphenylmethane, distearate of 1,5-dihydroxynaphthalene and resorcinol, hexastearate of rufigallic acid and distearylalizarin.

**Mineral oils.** N. V. de Bataafsche Petroleum Maatschappij. Fr. 756,343, Dec. 8, 1933. Oils are refined by treatment with a mineral acid, neutralization with an alkali and then treatment with an aq. soln. of a mineral salt such as NaCl or  $\text{CaCl}_2$ .

**High-pressure hydrogenation of mineral oils.** Minami Maushū Tetsudō K. K. (Yūdō Tanaka, Sei Mizoshita, Nen Maeda and Masaharu Ueno, inventors). Japan. 100,179, March 20, 1933. Mineral oils are hydrogenated under high pressure with Japanese acid clay contg. reduced Ni as a catalyst. The catalyst is prepd. by reducing the acid clay mixed with ammonia soln. of  $\text{Ni}(\text{OH})_2$  or NiO.

**Utilizing sludge acid from oil refining.** Wm. S. Wilson (to Merrimac Chemical Co.). U. S. 1,945,172, Jan. 30. Sludge acid is dild. with water to ppt. a fraction of the dissolved org. matter constituting a fuel oil, and the residual dild. liquor is allowed to act upon calcined clay to form an alum liquor and to cause the residual clay to collect org. matter from the liquor. An arrangement of app. is described.

**Apparatus for purifying waste oils.** Syōjirō Watanabe. Japan. 99,938, March 4, 1933. Diagrammatical.

**Device for supplying fire-extinguishing foam to oil tanks.** Benjamin A. Moeller. Brit. 401,005, Nov. 9, 1933.

**Oil and wax compositions.** I. G. Farbenind. A.-G. Brit. 399,527, Oct. 1, 1933. Liquid or solid hydrocarbons, e. g., benzene, gasoline, kerosene, gas oil, lubricating oil or grease, paraffin wax, are mixed with a high-mol. polymerization product of an iso-olefin such as those described in Brit. 401,297 (C. A. 28, 2367\*). Among examples (1) a lubricating grease is made by mixing lubricating oil with highly polymerized isobutylene, together with oleic acid glyceride,  $\text{Ca}(\text{OH})_2$  and NaOH soln., and (2) a paraffin wax compn. for the manuf. of candles is made by incorporating a small amt. of polymerized isobutylene in the wax. The lubricating oil compns. may be used as insulating oils in elec. transformers or switches.

**Fuel.** Erwin F. Spellmeyer (to The Art Metal Works, Inc.). Can. 339,200, Feb. 6, 1934. A fuel consisting of a mixt. of 20% of a petroleum distillate having a boiling range of  $194-262^\circ\text{F}$ . and 80% of a petroleum distillate having a boiling range of  $288-352^\circ\text{F}$ . has a flash point of about  $55^\circ\text{F}$ ., ignites quickly, evaps. slowly, is substantially nonexplosive, and is ignitable by pyrophoric spark.

**Benzene storage.** Paul Vondiziano and Naim Majdalany. Fr. 756,367, Dec. 8, 1933. The vapors collecting at the top of storage tanks for benzene are liquefied by passage through a series of small tanks partly filled with water and fitted in the upper part of the storage tank.

**Cracked gasoline with good anti-detonating properties.** John C. Black. U. S. 1,945,508, Feb. 6. A petroleum oil is cracked under pressure at temps. of about  $425-480^\circ$  and the hot cracked oil products are passed into a zone of lower pressure and there is vaporized, sepd., condensed and collected only a lower-boiling portion of the gasoline

stock; hot residual cracked oil products from the primary zone of lower pressure are passed into a secondary zone of still lower pressure and the remaining higher-boiling portion of the gasoline stock is vaporized and sepd. and this sepd. portion only is passed through a heated zone at about 480–660° and cool hydrocarbon oil is injected, as the cracked product leaves the heated zone, in quantities sufficient to lower the temp. of the vaporized cracked products below an active cracking temp.; reformed gasoline stock is sepd. contg. a high percentage of hydrocarbons of the carbocyclic series possessing anti-detonating characteristics. An arrangement of app. is described.

**Treating cracked gasoline.** Paul I. Murrill (to R. T. Vanderbilt Co.). U. S. 1,947,219, Feb. 13. Gum formation is inhibited by the addn. of a diaryl aryene diamine suitably about 0.002–0.01 g. per 100 cc. of diphenyl-*p*-phenylenediamine).

**Stabilizing cracked gasoline.** Ralph C. Cook (to Universal Oil Products Co.). U. S. 1,945,599, Feb. 6. Vaporous gasoline-like products of hydrocarbon oil cracking are subjected to condensing in a condensing zone, a portion of the vaporous products is withdrawn from this zone; the distillate obtained is moderately heated by heat exchange with the withdrawn vapor, so as to remove from the distillate gases and vapors lighter than gasoline, the vaporous products are returned to the condensing zone, and the unvaporized stabilized distillate is independently collected. App. is described.

**Treating dephlegmated vapors of gasoline from cracking processes.** Richard F. Davis (to Universal Oil Products Co.). U. S. 1,946,131, Feb. 6. Dephlegmated cracked gasoline vapors are contacted with dry SO<sub>2</sub> and the heavy reaction products thus formed are sepd. App. is described.

**Cracked "hydrocarbon spirits" motor fuel.** Frederick B. Downing and Herbert W. Walker (to E. I. du Pont de Nemours & Co.). U. S. 1,945,521, Feb. 6. Formation of gummy substances is retarded by the addn. of about 0.03% of xylenols such as 4-hydroxy-1,3-dimethylbenzene or an alkyl substitution product. Numerous examples are given.

**Refining gasoline vapors.** Arthur Lachman (to Vapor Treating Processes Inc.). U. S. 1,945,114, Jan. 30. In treating gasoline vapors at elevated temps. with metallic salt solns. such as those of ZnCl<sub>2</sub> of optimum concn., heat economy is effected by utilizing a temp.-reducing soln. of metallic salt initially to treat the gasoline vapors and then treating the vapors with the soln. obtained by the first step. App. is described.

**Addition agent for motor gasoline.** Gyula Lakner. Hung. 107,493, Dec. 1, 1933. To 100 l. gasoline is added 34 g. of an agent consisting of 2.7% naphthol, 8.1% phenol, 8.1% *p*-dichlorobenzene, 27.0% naphthalene and 54.1% stearoptene. The agent prevents deposition of C in the valves.

**Revivifying spent filter clay used for treating oils.** Norman E. Lemmon and Arthur B. Brown (to Standard Oil Co. of Ind.). U. S. 1,946,748, Feb. 13. The clay is washed with an org. solvent such as naphtha to remove adhering oil, residual solvent is swept out of the material with an inert water-free gas such as refinery "high line" gas to leave the clay in a dry water-free condition, and org. matter present in the clay is destroyed by ignition.

**Revivification of spent clays used for decolorizing and clarifying lubricating oils.** Albert E. Buell (to Phillips Petroleum Co.). U. S. 1,945,215, Jan. 30. The clay is agitated with an oil solvent such as naphtha and the oil-free clay is then agitated with a mixt. of naphtha and an alc. soln. of NaOH.

**Lubricating oil.** Bert H. Lincoln and Alfred Henriksen (to Continental Oil Co.). U. S. 1,944,941, Jan. 30. A hydrocarbon lubricating oil is given a lower coeff. of friction by the addn. of a small proportion (suitably about 0.5%) of a halogenated ester of an org. acid with a monohydric alc. or with a dihydric alc., such as chlorinated ethyl oleate or chlorinated methyl stearate, or of ethyl oleate or stearate, butyl oleate, phenyl stearate or the like.

**Lubricating oil.** Bert H. Lincoln (to Continental Oil

Co.). U. S. 1,945,614, Feb. 6. A deflocculating agent (suitably 35–100 g. per gal. of oil) consisting of an oxidation product obtained by oxidizing a stereometrical isomeride of oleic acid with KMnO<sub>4</sub> is used with a lubricant contg. a hydrocarbon oil existing as an iso-colloidal system having an external and an internal phase, to increase the dispersion of the internal phase. The oleic acid isomeride is obtained by treating oleic acid with HN(O).

**Lubricating oil.** Bert H. Lincoln and Alfred Henriksen (to Continental Oil Co.). U. S. 1,945,615, Feb. 6. The film strength of a lubricating oil is improved by adding a small proportion (suitably about 1%) of a condensation product obtained by condensing with an alk. condensing agent such as Na ethoxide a halogenated wax such as a chlorinated wax with itself or a similar compd. so that the condensation product contains a small amt. of halogen in org. combination.

**Lubricating oils.** Garland H. B. Davis (to Standard Oil Development Co.). Brit. 401,841, Nov. 7, 1933. The viscosity index of hydrocarbon lubricating oils is raised with reduction, or without undesirable rise, in the pour point by adding waxy hydrocarbons and up to 10% of a substance depressing the pour point. Compounding materials, *e. g.*, rosin, Pb or Al oleate, may be added. Specified depressants are natural resinous materials, *e. g.*, wax tailings, gums occurring in gasoline, *p*-coumarone resins, gum damar and copals, the partial oxidation products of paraffin wax or waxy hydrocarbons and the acids derived therefrom or the Zn or Mg salts thereof, synthetic oils obtained by condensing waxy hydrocarbons with aromatic compds., *e. g.*, C<sub>6</sub>H<sub>6</sub>, PhMe, C<sub>10</sub>H<sub>8</sub>, anthracene, naphthols, anthrasols, substituted phenols and aromatic gas oils. Cf. C. A. 27, 4665.

**Lubricating oil.** Nippon Sekiyū K. K. (Dokichi Nakamori, inventor). Japan. 99,215, Jan. 26, 1933. Fish oil or another animal or vegetable oil is hydrogenated until its I value becomes 120–150, and is then polymerized by heating in the presence of a catalyst (such as Japanese acid clay, silica gel, active C). The polymerization product is mixed with mineral oil to form a lubricating oil.

**Dewaxing mineral lubricating oils.** Francis X. Govers (to Indian Refining Co.). U. S. 1,945,350, Jan. 30. A wax-bearing mineral oil is mixed with acetone and C<sub>6</sub>H<sub>6</sub> in such proportions that the acetone and C<sub>6</sub>H<sub>6</sub> together, at a temp. of about 38°, have complete solvent action on the wax-bearing oil, and, at temps. of about –20° and below, have substantially complete solvent action on the liquid hydrocarbons present but substantially no solvent action on the solid hydrocarbons present, so that by use of the solvent and by a cooling and filtering system (various details of which are described) a "low cold test" oil can be obtained.

**Refining high-viscosity petroleum lubricating oil stocks with liquid sulfur dioxide.** Wolfgang Grote and Paul Oberfell (to Edelcanu G. m. b. H.). U. S. 1,945,500, Jan. 30. The uncooled unextd. stock is dild. with SO<sub>2</sub> in amt. substantially miscible with the stock at the extrn. mixing temp. and sufficient to cause a decrease in viscosity to permit of efficiency and satisfactory cooling and single zone counter-current extrn.; the dild. stock is cooled to the desired extrn. mixing temp., and extd. in a single counter-current zone with liquid SO<sub>2</sub>. An arrangement of app. is described. Cf. C. A. 28, 1524<sup>a</sup>.

**Heat-exchange device suitable for cooling oils as in lubricating systems.** Leo M. Monroe. U. S. 1,945,287, Jan. 30. Structural details.

**Apparatus for filtering waste lubricating oils.** K. K. Hansin Tekkōzyo. Japan. 100,003, March 9, 1933. Diagrammatical.

**Die lubricant.** Robert T. Wood (to Magnesium Development Corp.). U. S. 1,946,121, Feb. 6. A die lubricant for Mg base alloys comprises a suspension of comminuted graphite in CCl<sub>4</sub>.

**Lubricating with greases.** Frank J. Hall. U. S. 1,947,470, Feb. 20. In lubricating bearings such as those of automobiles, an artificially colored grease is used and after a period of use is displaced by a grease of different color

(the different color facilitating observance of the replacement of the old grease by the new).

**Lubricating greases.** I. G. Farbenind. A.-G. Brit. 401,295, Nov. 6, 1933. See Ger. 574,753 (C. A. 27, 4666).

**Apparatus for melting asphalt, etc.** Eugen May. Ger. 588,526, Nov. 23, 1933 (Cl. 22k. 7) and Ger. 589,567, Dec. 11, 1933, addn. to 588,526.

**Asphalt-like material from hydrocarbon oil residues.** Clifton J. Pratt (to Universal Oil Products Co.). U. S. 1,946,947, Feb. 13. Pressure-cracking residue, while at a temp. above 230°, is passed into the vapor space of a chamber contg. water maintained under substantially atm. pressure; constituents volatilized from the residue are removed in vapor form, unvaporized material accumulates in the chamber contg. water and the residue solidifies to an asphalt-like material which is sep'd. and recovered. App. is described.

**Bitumen jelly.** "Rinulgia" Vertriebsgesellschaft für Asphalt-, Teer- und Strassenbauprodukte Clause & Co.

Komm.-Ges. Ger. 589,960, Dec. 19, 1933 (Cl. 80b. 25.06). An asphalt-tar mixt. contg. 7.5-25% tar is heated to 140° and a quantity of boiling alk. water equal to the wt. of the asphalt-tar mixt. is added; 1.5% of an emulsifying agent is also added.

**Separating borneol from pine oil.** Irvin W. Humphrey (to Hercules Power Co.). U. S. 1,945,501, Jan. 30. Pine oil is subjected to the action of H<sub>2</sub>O and the treated oil is fractionated. Cf. C. A. 28, 634<sup>2</sup>.

**Oleoresinous pine-tree product suitable for use in resin soap manufacture, etc.** McGarvey Cline. U. S. 1,945,421, Jan. 30. A natural oleoresin as obtained from living trees is subjected to a heat treatment at a temp. sufficiently high to distill off the water and water-sol. acid constituents but not substantially higher, and leave a substantially transparent, viscous liquid stable over long periods of time.

**Shaft furnace for continuous carbonization of wood, etc.** Adolf Fehmel. Austrian 135,883, Dec. 11, 1933 (Cl. 10c.).

## 23—CELLULOSE AND PAPER

CARLETON F. CURRAN

**The constitution of cellulose.** II. Staudinger. *Chem.-Ztg.* 58, 145-8(1934).—A review. E. H.

**Critical study of some factors influencing the determination of  $\alpha$ -cellulose.** Harry F. Lewis and B. L. Browning. *Paper Trade J.* 97, No. 24, 39-44(1933).—From a crit. comparison of the methods of the U. S. Forest Products Lab. method, the Tech. Assoc. of the Pulp & Paper Ind. standard (which is essentially the same as the Am. Chem. Soc. method) and the U. S. Bur. of Standards, and an expl't. study of the effects of the chief factors influencing the results, a modification of the Tech. Assoc. of the Pulp & Paper Ind. method is presented and will be used as a basis for future investigations. The modifications in technic comprise: (1) control of temp. (maintained at 20°) of all liquids added throughout the operation at least through the acid wash; (2) allowing the alk. suspension to stand after diln. and prior to filtration in order to furnish the dild. alk. soln. its max. peptizing action; (3) washing with 100 cc. of 7.3% NaOH sol. to water wash to remove a considerable amt. of alkali-sol. org. matter.

**The preparation of cellulose from peat disintegrated while in a frozen condition.** E. Pallas. *Kunststoffe* 24, 5-6(1934).—By grinding or otherwise disintegrating frozen peat, recovery of its cellulose in useful form can be greatly facilitated. Use of chemicals can be either avoided entirely or the amts. required greatly decreased.

**The kinetics of cellulose reactions.** Ichiro Sakurada. *Cellulosechem.* 15, 3-8, 17-20(1934).—See C. A. 26, 3662, 6122; 27, 3814, 4667.

**Process for the preparation and aging of alkali cellulose.** F. Steimmig. *Russa* 8, 829, 831(1933).—Pulp in the form of a thin continuous web is passed through a mercerizing bath, supported on 1 or between 2 conveyors; on leaving the bath it is pressed, transferred to another conveyor and passed through an aging chamber in which aging can be carried out at a higher temp. (and consequently in a shorter time) than usual because the condition of the material permits of rapidly cooling it as soon as the required degree of aging has been reached. A. P.-C.

**Impregnating cellulose with cuprammonium.** G. Durst. *Kunststoffe* 24, 27-8(1934).—A patent review.

**Acetylation of cellulose.** D. Krüger and W. Roman. *Angew. Chem.* 47, 58-61(1934).—A discussion of the catalytic action of acids in the acetylation of cellulose in mixts. of glacial AcOH and Ac<sub>2</sub>O, based upon literature data and addnl. expl't. work. The new results with HI, HCl, HClO<sub>4</sub>, H<sub>3</sub>PO<sub>4</sub>, and especially with H<sub>3</sub>PO<sub>4</sub> + NaClO<sub>4</sub>, make it probable that the acetylation of cellulose takes place through a salt-like "critical complex," which is

formed by the basic constituents of the cellulose mols. with the catalyst acid. It is likewise probable that undissoc. acid mols. are actively engaged in the catalytic effect. Expl't. data are reported. Fifty-five references.

**Fractionation of commercial acetylcellulose and ethylcellulose.** L. Ubbelohde. *Cellulosechem.* 14, 169(1934).—The viscosity measurements of Herzog and Deripasko (C. A. 26, 2313) and of Okamura (C. A. 28, 1525<sup>9</sup>) are criticized.

**Cellulose esters and their relation to the structure of cellulose.** Malowan. *Nitrocellulose* 5, 26-8(1934).—A review. E. M. Symmes

**Ethyl-, benzyl- and acetylcelluloses, and their dielectric properties.** Max Speter. *Nitrocellulose* 5, 28-9(1934); cf. C. A. 26, 5426.—Films of ethyl-, benzyl- or acetylcellulose assume pos. or neg. charges, depending upon the conditions during rubbing.

**Spontaneous orientation of the micelle in unstretched acetyl- and nitro-cellulose films.** Ichiro Sakurada and Keiraku Futino. *J. Soc. Chem. Ind., Japan* 36, Suppl. binding 659-61(1933).—X-ray examn. of unstretched films showed orientation, asserted by S. and F. to be due to the anisodiametric properties of the cellulose fibers and also to the influence of surface tension.

**Cellulose, lignin and paper-making studies.** Louis E. Wise. *Paper Ind.* 15, 509-11, 568-71(1933-34); cf. C. A. 27, 4923.—A review with 90 references.

**The preparation of lignin, its nitration and the properties of the products obtained.** W. M. Nyhof. *Chem. Weekblad* 31, 90-6(1934).—The elementary analyses of lignins prepd. according to various methods are compared. The agreement between the results would probably have been greater if the various authors had applied a uniform method of drying. The crystals of nitrolignin obtained by Kürschner (C. A. 26, 3103) could not be duplicated and are probably cryst. impurities. The elementary analyses of various nitration products from different authors compare favorably notwithstanding the variation in the materials and the methods.

**The manufacture of a polychromatic viscose foil.** G. S. Ranshaw. *Kunststoffe* 23, 279-80(1933).—Two or more viscose solns. each contg. a different dyestuff are compounded in such a way as to avoid a homogeneously mixed, uniformly colored soln. before pouring the film.

**New methods for investigating rayon.** R. Flint. *Kunststoffe* 24, 32-4(1934).—A general discussion.

**Chemical researches on the woods of Karafuto.** II. Masuzo Shikata and Shokoku Ba. *Cellulose Ind. (Tokyo)*

9, 305 9; *Abstracts* (in English) 37-9(1933); cf. C. A. 26, 5204.---The air-dried pulp (10 g.) from coarse bark (I) and smooth bark (II) of "Eso" spruces, digested with  $(\text{NH}_4)_2\text{SO}_4$ , and contg. 0.33 and 0.30% ash and 86.73 and 86.72%  $\alpha$ -cellulose and the same kinds of barks (III), (IV), digested with  $\text{Mg}(\text{HSO}_4)_2$ , and contg. 0.47 and 0.40% ash and 86.83 and 83.20%  $\alpha$ -cellulose, were mercerized with 90 g. of 18% NaOH soln. at about 18° for 1 hr., pressed to 28  $\pm$  1 g., and treated with 5.5 g.  $\text{CS}_2$ ; the xanthate thus obtained was dissolved in a dil. NaOH soln. so as to contain 7% cellulose and 6% NaOH, ripened at 23° for 6 or 7 days and spun at a velocity of 28.61 m./min. Strengths/denier (g.) of threads were, resp., 0.86 (I), 0.81 (II), 0.62 (III) and 0.63 (IV) (Kipawa 0.91). The  $\alpha$ -cellulose contents of "Eso" spruces are larger than that of Kipawa spruce in general; the viscose threads from these pulps are inferior to that of the latter. However, it is believed that a good viscose pulp will eventually be made from the Japanese spruce. III. *Ibid.* 309-11.---The results of analysis on "Doroyanagi" (*Populus suaveolens* Fish.) "Onohyanagi" (*Salix Opaca* Anders.) and "Bak-hoyanagi" (*Salix Caprea* L.) are (each in %) ash 0.98, 0.42, 0.57; alc.- $\text{C}_2\text{H}_5$  ext. 2.34, 2.39, 4.03; cold-water-sol. matter 1.23, 0.41, 2.07; hot-water-sol. matter 2.86, 2.58, 4.77; 1%-NaOH-sol. matter 24.56, 22.91, 21.25; mannan —, 1.42, 2.37; galactan 1.07, 0.61, 0.58; pentosan 17.41, 19.91, 14.03; hemicellulose 18.48, 20.52, 14.61; N 0.06, 0.06, 0.07; crude protein 0.37, 0.39, 0.43; lignin 22.47, 19.19, 21.22; total cellulose 56.86, 55.71, 54.96;  $\alpha$ -cellulose 33.82, 35.71, 37.27;  $\beta$ - $\gamma$ -cellulose 22.04, 20.34, 17.68;  $\alpha$ -cellulose in total cellulose 59.48, 64.00, 67.83;  $\beta$ - $\gamma$ -cellulose in total cellulose 40.52, 36.00, 32.17; methoxyl 5.41, 5.57, 5.96; [(methoxyl/lignin)  $\times$  100] 24.11, 29.02, 28.08. These *Salicaceae*, especially *Salix Caprea* L. are almost equal in the content of total cellulose and  $\alpha$ -cellulose to *Todomatsu Abies* Juss and inferior to Karafuto spruce described in Part II but may be used as pulpwood. K. Konda

The value of lauan as pulp material. Nobuhiko Migita. *Cellulose Ind.* (Tokyo) 9, 338-42; *Abstracts* (in English) 41-4(1933).---The chemical compn. of white lauan and its pulping by the soda process are described and chem. compn., bleachableness and phys. properties of lauan pulp are given. Lauan wood is not considered to be suitable for paper, since its fibers are unsuitable and the pulp prepd. from them has many defects. On account of its high price, it is hopeless to use lauan pulp for the loading material for softwood pulp. K. Konda

Physicochemical studies of wood. I Qualitative and quantitative studies of gaseous products by the heat decomposition of different kinds of wood impregnated with different chemicals. Setsuro Tamaru, Yoshiki Imai and Satoshi Momma. *J. Chem. Soc. Japan* 55, 30-42(1934).---About 30 anti-igniting chemicals,  $(\text{NH}_4)_2\text{HPO}_4$ ,  $\text{H}_3\text{PO}_4$ ,  $(\text{NH}_4)_2\text{SO}_4$ , etc., were tried. These chemicals decreased the gaseous formation from the thermal decompn. of wood, especially below red heat. The prevention of gaseous formation by the chem. treatment was greater in wood than in pure cellulose at 500°, but this effect was reversed when they were heated at 700°. Therefore, the lignin, and not cellulose, in wood is attacked at 500°. Different chemicals did not give the same effect, but, with the same chemical, the more the wood was impregnated, the less was the gaseous formation by heat. II. Physicochemical studies on the heat decomposition of different kinds of wood and the properties of the solid products. Setsuro Tamaru and Haruo Sakurai. *Ibid.* 43-52.---The rate of decompn. of wood by heat treatment is estd. There is a discontinuity in gaseous and charcoal formation from wood at 310-20° if heated at high temp. for many hrs. Quick heating of wood in a white hot furnace caused the loss of C as volatile gas and decreased the rate of carbonization. The charcoal showed less d. and hardness, while slow heating gave a product of high d. and hardness. Wood impregnated with  $\text{ZnCl}_2$ ,  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ , etc., gave less contraction on heating and gave charcoals of high d. and hardness. Carbonization of wood without any oxidation

process caused the formation of inactive C; active C was not formed by heating the wood below 550° even when it was impregnated with  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ ; impregnation with  $\text{ZnCl}_2$  produced activation at low temp. III. Expansion of small wooden test piece by absorption of moisture; velocity and equilibrium of expansion. *Ibid.* 53-65.---Drying of wood in air at 150° for 90 min. or steaming in an autoclave at 150° (4.7 atm. pressure) for 45 min. gave no change in the expansion of wood with addn. of moisture but heating in air at 200° for 2 hrs. or impregnation in boiling oil caused a change. Heating in air at 200° for 2 hrs. caused a change in wood itself, including discoloration. A method for estg. accurately the rate of increase in length by moisture absorption is described. Change in moisture equil. caused an increase in length  $S$  in time  $t$ . The relation of  $S$  and  $t$  can be expressed by the equation,  $S = a \log t + b$ . Consts.  $a$  and  $b$  are discussed from the standpoint of adsorption formula. The relation between the velocity of increase in length  $dl/dt$  by the change of moisture from  $h_1$  to  $h_2$  can be expressed by the formula  $dl/dt = k(h_2 - h_1)/t$ , where  $t$  is the time measured from the moment of increase in moisture. K. Kitsuta

Further investigation of the penetration of liquids into wood. J. H. Sutherland, H. Wyatt Johnston and O. Maass. *Can. J. Research* 10, 36-72(1934); cf. C. A. 24, 5490.---The rate of penetration of water through heartwood, pressure and temp. remaining const., shows an initial fairly rapid decrease followed by a gradual decrease to a const. rate. With unseasoned sapwood, the rate of penetration increases to a max., after which it slowly decreases. With seasoned sapwood the rate decreases with elapsed time. Pre-soaking for periods up to 7 days does not affect the equil. rate of penetration. The initial rate is lower with pre-soaked than with air-dry wood. Pre-soaking does not hasten the attainment of an equil. rate. Rate of penetration is fairly const. for heartwood specimens of the same kind taken from the same transverse section of a tree. Unseasoned sapwood is more than 200 times as permeable as heartwood from the same tree. White spruce, black spruce and red pine heartwoods show about the same penetrability at low pressures. At higher pressures red pine, cedar, tamarack and balsam become much more permeable than white spruce at the same pressure. Unseasoned sapwoods show increasing penetrability in the order hemlock, balsam, red pine, white spruce. Observed apparent penetration radially and tangentially through heartwood is less than 9% of that in the longitudinal direction. In sapwood the rate of radial and tangential penetration is less than 2% of that in the longitudinal direction. Tangential penetration of white spruce sapwood is probably greater than radial penetration. Rate of longitudinal penetration increases with decrease in thickness of the specimen. A large increase in rate is noted after the thickness becomes less than 1 fiber length. This is suggested as a method of obtaining an approximation to the av. fiber length. Rate is not inversely proportional to thickness, but decreases more rapidly with increasing thickness because of loss of pressure head in passing pit membranes. Rate of penetration increases with increase in pressure differential. The rate of penetration is proportional to pressure in white spruce but increases much more rapidly than proportionately with balsam, tamarack, cedar and red pine. Magnitudes of pressure and back pressure have no effect on rate of penetration, or time to reach an equil. rate, if pressure differential remains const. Penetrability is not altered permanently by the application of pressure. Rate of penetration increases with temp. Temps. above 70° have a permanent effect on the penetrability. Intensive drying of wood increases its penetrability. Sucrose solns. cause a decrease in rate of penetration greater than that expected from viscosity considerations. Molar NaOH increases the permeability of heartwood specimens of greater than 1 fiber length, and decreases that of sapwood and very thin sections of heartwood. Molar HCl decreases the rate of penetration through heartwood, but has little effect on

that through sapwood. Gases penetrate seasoned heartwood and sapwood easily. Pre-soaked heartwood strongly resists penetration by gases. Short lengths of unseasoned or pre-soaked sapwood are fairly easily penetrated by gases. All the evidence points to the absence of any valve action on the part of pit membrane tori. A new theory has been advanced to account for the phenomena ordinarily ascribed to valve action.

J. W. Shipley  
Paper-making qualities of woods from Cameroons. P. Heim de Balsac, A. Parveaud and L. Lefèvre. *Bull. agence gén. colonies* 26, 1432 7(1933).—"Ilomba" (*Pycnanthus Kongo* Warb.) was cooked 7 hrs. at a pressure of 3.5-4 kg. per sq. cm., with 5.5% of NaOH (on the wt. of the wood) at a concn. of 7°Bé. It yielded 42.3% of hard-bleaching pulp suitable for the production of ordinary grades of paper. "Esoula" (*Placodiscus pseudostipularis*, Radlk.) cooked 11 hrs. at a pressure of 3.5-4 kg. per sq. cm., with 3.5% of NaOH (on the wt. of the wood) at a concn. of 6°Bé, yielded 27.1% of hard-bleaching pulp suitable only for low-grade papers. "Naliangavele," cooked 6 hrs. at 3.5-4 kg. per sq. cm. with 6°Bé. NaOH, yielded 42% of hard-bleaching pulp that gives a rather weak paper.

A. P.-C.  
Notes on the purity and permanence of wood fibers. Charles A. Blaisdell and Jessie E. Minor. *Paper Ind.* 15, 512 14(1933).—The aging or permanence properties of a very white facial tissue made of highly bleached sulfite wood fiber and of a cream-colored towelling made of unbleached sulfite wood fiber were investigated by detg. Cu no. and absorbence before and after subjection to oven aging (10 hrs. at 100°) or to light aging (exposure for 1 hr. to a Victor x-ray ultra-violet light at a distance of 10 in. and a temp. of 38°). Conclusions: The original Cu no. of papers of this type gives no clue as to the permanence quality of the paper. A marked change of Cu no. with oven or light aging may be considered as indicative of a marked loss of absorbence quality with normal aging. Changes of absorbence quality with oven aging are due to both drying out of moisture and a chem. degradation of the fibers.

A. Papineau-Couture  
Effects of beating on cellulose fibers. James d'A. Clark. *Paper Trade J.* 97, No. 26, 25-31(1933).—C. gives a review of current theories on beating and "hydration," attempting to bring them together into a simple composite theory which satisfactorily explains the different phenomena. Some expl. data on pulp treatment and results on the adhesion of viscose sheets when pressed together under different moisture conditions indicate that cellulose is probably subject to "partial soly." when wetted with H<sub>2</sub>O to form a kind of mucilage and offers a field for further investigation. The following theory, somewhat similar to that of Campbell (*C. A.* 24, 1976, 26, 5416), is advanced: The structure of cellulose fibers is porous, hygroscopic and elastic; the lateral bonds between the rod-like elements formed by the OH groups are not very strong and have a chem. affinity for water; when immersed in H<sub>2</sub>O the fibers swell and the component parts are loosened, certain of the OH groups combining with H<sub>2</sub>O, this destroying these particular bonds and forming a potentially adhesive layer; beating cuts, bruises and flexes the fiber, opens it up further and softens and fibrillates it; when the sheet is formed the fibrils of all dimensions intertwine and the whole is compacted to a greater or less degree by the effects of surface tension; when the paper is dried the combined H<sub>2</sub>O is driven off and mutual OH linkages form to hold the structure together, aided, perhaps, by any other effective noncellulosic materials present. The strength of the sheet primarily depends on the effectiveness with which the fibers and fibrils are prevented from slipping along and between one another, and not on direct tensile effects, which also explains the important function of fiber length on the strength of the sheet. Reply. W. Boyd Campbell. *Ibid.* 98, No. 3, 33-4(1934). Reply. James d'A. Clark. *Ibid.* 34.

Strength evaluation of pulp for paper manufacture. Erich Richter. *Zellstoff u. Papier* 13, 431-4, 476 80(1933); cf. *C. A.* 27, 5069. —A discussion of the bursting, tearing and folding strength, Cu no. and freeness detns. of the pulps in relation to their use in paper mfg.

S. I. Aronovsky  
The exchange of cations in strong sulfite pulp. Carl DuRietz. *Zellstoff u. Papier* 13, 558 60(1933); 14, 17 18(1934); *Svensk Kem. Tids.* 45, No. 8, 185 90(1933).—Sulfite pulp is a typical "acidoid," i. e., although insol. because of its high mol. wt. and fiber structure, it contains "sol." but "anchored" acid groups which can fix cations. The pulp is thus analogous to zeolites, permittes, humus acids and other cation-exchanging colloids. The acid groups which give this pulp its "acidoid" character are: (1) the SO<sub>3</sub>H group, strongly acid and completely ionized; (2) weaker acid groups of the carbonate type; and (3) phenolic or other weakly acidic groups. The displacement of the equil. between 2 unequal ions, with increasing diln., favors the multivalent ion, i. e., a pulp said. with Na<sup>+</sup> will exchange them readily for Cu<sup>++</sup>, but not in the opposite direction. In comparing various cations it is remarkable how little difference there is between the various ions of the same valence group. The ash of the pulp may be changed to any desired compn. with suitable salt solns., or it may be entirely eliminated by means of acids. On drying, the stability of the pulp is low against H<sup>+</sup> and in the presence of those cations whose solns. show a strong degree of hydrolysis. These relations complicate the results of the usual *pH* detn. The *pH* values depend not only on the H<sup>+</sup> content of the pulp but also on the concns. of the various other ions which can displace and "activate" the H<sup>+</sup>. For the detn. of the degree of pulping by the "acid no." of Kullgren the following simplified method is proposed: The sample removed from the digester is quickly treated with a Cu salt soln., washed with distd. water, suspended in a KCNS soln. to which a few grains of KI is then added and the suspension titrated with 0.01 N Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> with starch as the indicator.

S. I. Aronovsky  
Comparison of sheet machines for pulp evaluation. R. H. Doughty and C. E. Curran. *Paper Trade J.* 97, No. 25, 38 44(1933).—A comparison of 5 different machines for making pulp test sheets (British standard, Swedish or Sandberg, Valley, Williams and U. S. Forest Products Lab.) showed that the actual differences between machines, either in true values, reproducibility of results, or duplicability of test sheets, are remarkably small, much more significance attaching to the procedures of pressing and drying the sheets, or to other operations subsequent to formation, than to the operation of sheet making by itself.

A. Papineau-Couture  
Production of half-pulp from straw without pressure. M. Resh, L. Skulskaya and A. Rubenkina-Goer. *Unterlagen Inst. (Moscow) Ausgabe II*(1933); *Zellstoff u. Papier* 14, 56-7(1934).—The effects of chemicals and their quantities, of liquor concn. and of temp. were studied on the production of half-stuff from straw without pressure. Expts. with Ca(OH)<sub>2</sub> (24 hrs. at 15°) and Na<sub>2</sub>CO<sub>3</sub> (3 hrs. at 80°) gave poorer results than those obtained with NaOH. Alk. smelt liquors, from the regeneration of the monosulfite and kraft processes, were also used, the ratio of NaOH to Na<sub>2</sub>S being varied. The optimum results were obtained at 80° for 1-2.5 hrs. with NaOH + Na<sub>2</sub>S equal to 10-17% of the dry straw. Bleaching expts. gave poor results.

S. I. Aronovsky  
Bleaching rag pulp. S. A. Fotiev and S. Bogdanov. *Unterlagen Inst. (Moscow) No. 4/31; Zellstoff u. Papier* 14, 21(1934).—Slow bleaching results in good strong fibers, while fast bleaching weakens the fiber. An increase of 10° in bleaching temp. doubles the speed of bleaching and

increases the consumption of bleaching powder 4-5%.

S. I. Aronovsky

Application of elementary statistical methods in the testing of pulp and paper. F. A. Simmonds and R. H. Doughty. *Paper Trade J.* 97, No. 25, 32-7(1933).—A demonstration of the application of elementary statistical methods to the testing of pulp and paper, showing that, if properly applied, they furnish valuable information as to the accuracy of test values, the significance of differences, and the comparative merits of operations or results.

A. Papineau-Couture

Precision of measurements, with pulp and paper applications. D. S. Davis. *Paper Ind.* 15, 505-8(1933).—A brief discussion of the 3 principal fields to which precision studies may be confined, with illustrations in each type taken from fields familiar to the pulp and paper technicians.

A. Papineau-Couture

Rapid method for the determination of moisture and consistency of insulating board pulp. Lionel K. Arnold. *Paper Trade J.* 98, No. 1, 40(1934).—A description of a technic using the xylene-distn. method, which has been found to give practically the same results as the ordinary drying method but requires only from 20 to 30 min. above the time required for weighing the samples. A. P.-C.

Investigation of various physicochemical factors which influence sulfite cooking. H. H. Saunderson and O. Maass. *Can. J. Research* 10, 24-35(1934); cf. C. A. 27, 3815.—The penetration of aq. sulfite solns. into differently shaped blocks of spruce wood was investigated and the effect of the shape, type of wood, and of the presence of imprisoned air detd. Measurements of the rates of diffusion of the constituents of  $\text{Ca}(\text{HSO}_3)_2$  solns. into pre-soaked blocks of wood showed that "free"  $\text{SO}_2$  diffused more readily than  $\text{Ca}(\text{HSO}_3)_2$ . Adsorption of  $\text{SO}_2$  and  $\text{Ca}(\text{HSO}_3)_2$  solns. by spruce wood was measured at 30° and 50°, and the influence of this factor on penetration was detd. The effect of penetration on delignification indicated the necessity of a satisfactory distribution of the lime salt at a low temp. to avoid localization of the lime during the pulping process. The relation of the findings to current practice in the sulfite mill is discussed.

J. W. Shipley

The sulfite cooking process. N. N. Nepenin and P. V. Khviyuzov. *Unterlagen Inst. (Moscow) Ausgabe II* (1933); *Zellstoff u. Papier* 14, 21-2(1934).—The relief gases consist of  $\text{SO}_2$ ,  $\text{CO}_2$  and N. The N is present in the relief gases until the end of the cook. The vol. of  $\text{CO}_2$  increases with temp. and totals 1.43% of the wood.  $\text{H}_2$ , CO and hydrocarbons are not present in the relief gases. The largest portions of the gases consist of  $\text{SO}_2$ . The free  $\text{SO}_2$  impregnates the wood more quickly than does combined- $\text{SO}_2$ . The absorption of the free  $\text{SO}_2$  takes place mainly in the early part of the cook. The S consumption increases with the increased  $\text{SO}_2$  content of the cooking liquor.

S. I. Aronovsky

New developments in pulp cooking. Erik Hägglund. *Zellstoff u. Papier* 13, 473-6(1933).—A brief review of the theories of sulfite cooking followed by a discussion of the effects of liquor circulation systems for the sulfite and alk. processes. The advantages of forced liquor circulation systems are cited.

S. I. Aronovsky

Stuff quality of sulfite cooks. E. Richter. *Zellstoff u. Papier* 13, 560-3(1933).—A discussion of the effects of the human element, acid fluctuation in the digester relief acid, age and moisture content of the wood, cooking time, etc., on the quality of sulfite pulp and of the paper into which it is made.

S. I. Aronovsky

Coordination of technical control, research and development with practical [paper] mill operation. K. A. Taylor. *Paper Trade J.* 98, No. 4, 33-6(1934).—An address outlining the main types of work done by a well organized technical organization. A recommended practice to be

<sup>1</sup> included in the Manual of Standards of the Tech. Assoc. of the Pulp & Paper Ind. is suggested.

A. P.-C.

Standardization of materials purchasing specifications. A. E. H. Fair. *Paper Trade J.* 98, No. 6, 43-4(1934)

A general outline of the progress made and desired relative to establishing specifications for such materials as wool, pulp, alum, sizes, felts, wires, coal and lubricants.

A. Papineau-Couture

<sup>2</sup> Preliminary notes on continuous refining. D. Manson Sutherland, Jr. *Paper Trade J.* 98, No. 4, 37-9(1934).—A discussion of continuous refining and of the results obtained in some preliminary mill-scale tests, indicating that: (1) Temps. higher than those normally experienced in batch refining are to be expected. (2) The refining actions now produced by the batch system can be obtained in 1 or more continuous machines which must be synchronized in capacity with the paper machine. (3) Continuous sizing, coloring and loading systems must be further developed to work in conjunction with continuous refining. (4) Some progress is being made in the development of continuous refining.

A. P.-C.

Consistency regulator and freeness recorder. E. J. Trimbe. *Pulp Paper Can.* 35, 12-13(1934).—A description of the Trimbe-Witham, Jr., consistency regulator and freeness recorder.

A. P.-C.

<sup>3</sup> The determination of the wool content of paper. Charles A. Blaisdell and Jessie R. Minor. *Paper Ind.* 15, 625-7(1934).—From a comparative study of the Kjeldahl and microscopic methods of detg. wool in paper, it is concluded that: (1) In mill beating more wool than cotton is lost; in the lab. stir method this loss amounts to almost 10 times as much for the wool as for the cotton. Any increase in the extent or intensity of beating is apt to give by analysis a lower percentage of wool in the finished product. (2) When a factor considerably larger than 2.0 is needed to bring agreement between the microscopic and Kjeldahl methods, it is probable that the Kjeldahl value has been increased by the adherence of structureless, N-contg. wool material to the fibers. (3) Where the machine water is recirculated, it is probable that the Kjeldahl value would be built up to approx. the same figure as that of the original furnish. (4) When the outer layer of the wool fiber has been gelatinized the under cortical layer tends to fibrillate, showing clearly under the microscope frayed ends as in cotton; but as they lack the strength to develop any long fibrils, they soon lose their structure, and it is this entire gelatinized mass which accounts for the discrepancy between the Kjeldahl and microscopic methods of analysis. (5) The microscopic method gives better concordance between different samples of the same lot than does the Kjeldahl method. (6) A microscopic dot-count method, with a factor of 2.0 for wool and 1 for cotton, gives results which are probably more nearly correct for the wool content of the finished paper than does the Kjeldahl method.

A. Papineau-Couture

Determination of acid-soluble iron in paper. Anon. *Paper Trade J.* 98, No. 3, 37(1934).—A description of the tentative standard method of the Tech. Assoc. of the Pulp & Paper Ind.

A. Papineau-Couture

<sup>4</sup> Automatic mechanical control and direct water system. Melvin R. Ware. *Paper Trade J.* 97, No. 26, 18, 21(1933).—A brief description of a system which is in successful operation on a machine making rag roofing stock. Complete re-use of white water is effected.

A. Papineau-Couture

Sizing and the paper machine. G. M. Papeterie 55, 222-6, 286 90, 334-42(1933).—A discussion of the retention of different types of size and of the physicochem. changes undergone by sizing agents on the paper machine and of their effects on sizing quality. Data are presented on the m. ps. of sizes pptd. under the same conditions as in mill practice (but in absence of fiber) and on the sizing quality of paper sized with Na resinate and with free-rosin size, resp., and dried under different conditions, they show that the greater uniformity and superiority of the sizing obtained with a 90-5% free-rosin size (contg. less than 3.5% total alkali), as compared with rosin-soap

size, is due at least in part to the fact that the free rosin deposited on the fibers actually melts or sinters on the driers, whereas the Al resinate does not. A. P.-C.

A review of the literature of sizing. E. Sutermeister. *Paper Trade J.* 97, No. 4, 18-25; No. 21, 26-31; No. 22, 20-5(1933); 98, No. 1, 25-31(1934). A. P.-C.

Liquid rosin and its utilization. W. Schmid. *Zellstoff u. Papier* 13, 571-2(1933).—Among other uses, the liquid rosin made from sulfate black liquor may be used in conjunction with bentonite and NaOH, in deinking old newspaper. S. I. Aronovsky

Beater addition of titanium pigments. Wm. R. Willets. *Paper Trade J.* 98, No. 6, 37-9(1934); cf. C. A. 27, 5973. —A discussion of Ti pigments when used as fillers in the beater. A. Papineau-Couture

Beater and jordan control. G. Lamont Bidwell, Jr. *Paper Trade J.* 98, No. 5, 33-5(1934).—Means are outlined whereby instruments may be used to control the freeness, consistency and other properties of pulp by mech. regulation of beater rolls and jordan plugs. A. P.-C.

Significant sheet properties for developing specifications for various papers and paperboards. P. K. Barrd. *Paper Trade J.* 98, No. 2, 40-6(1934).—An analysis of a survey on the use requirements of papers as expressed in sheet properties indicated: (1) the sp. properties considered of importance in setting approx. specifications for each class and grade of paper; (2) the order of importance or rating for each of the selected properties for each grade and class; (3) the grand order of importance or rating for each property as related to papers and paperboards (all classes as a group). A. Papineau-Couture

Bituminous emulsions in the manufacture of paper and boards. Henri Calmels. *Papeterie* 56, 58-60(1934). A crit. review of a few of the chief patents on the production of bituminized paper or board by the use of emulsions instead of by impregnation of the felted sheet. A. P.-C.

Determination of the amount of coating of mineral-coated paper. Anon. *Paper Trade J.* 98, No. 1, 37(1934). —A proposed revision of the official method of the Tech. Assoc. of the Pulp & Paper Ind. is described, suitable for the ordinary types of mineral coatings, and having an accuracy of 0.5 2%. A. Papineau-Couture

The use of latex in coated papers. W. H. Birchard. *Paper Ind.* 15, 561-3(1934). —Com. runs have shown the possibility of using latex in coated papers and thus producing a paper of improved properties for the printer at no increase in cost. The method of using latex in the coating "color" is described, and its advantages are briefly indicated. A. Papineau-Couture

The rate of drying of newsprint. F. W. Adams. *Paper Trade J.* 98, No. 1, 38-40(1934).—Application to the drying of newsprint of Montgomery's (C. A. 27, 3330) equations for drying rates of kraft paper showed that production and evapn. rates in drying newsprint increase with steam temp., and that they are considerably greater than for kraft and board. A. P.-C.

Drying paper and cellulose-containing raw materials in the laboratory. F. A. Simmonds. *Zellstoff u. Papier* 13, 135-6, 480 2, 518 9(1933).—See C. A. 27, 4075. S. I. A.

The analysis of paper ash containing titanium pigments. J. M. Jarmus and W. R. Willets. *Paper Trade J.* 98, No. 1, 41 3(1934).—A detailed description of the technique of the detn. of Ti in paper ash by reducing the soln. of the Ti salt in a Jones reductor and titrating with standard  $\text{Fe}^{+++}$   $\text{NH}_4$  sulfate soln. The technique to be followed in the presence of large amts. of Ba and in its absence (or in the presence of only small amts.), resp., are described. The procedure for a complete analysis of the ash in the absence of  $\text{BaSO}_4$  is also given. A. Papineau-Couture

Paper testing with barrier-film photocells. L. Bloch. *Zellstoff u. Papier* 14, 9-13(1934).—This instrument is useful not only for the optical testing of finished papers but it may also be used in the course of mfg. the paper to obtain uniform results. S. I. Aronovsky

The initial tear and through-tear resistance of papers. W. Brecht and O. Imset. *Zellstoff u. Papier* 13, 564-7(1933); 14, 14-16(1934).—The manual initial tear and

through-tear (ripping) tests are 2 fundamentally different testing procedures. Their results are not identical and they cannot be substituted for each other. The mechanics of the tearing resistances obtained by these 2 methods and a no. of diagrams are given. S. I. Aronovsky

Lacquered wrapping paper (waterproof) in rolls. Walter Sembritzki. *Zellstoff u. Papier* 13, 575(1933).—A brief discussion of waterproof wrapping paper made by coating one side of the paper. S. I. Aronovsky

Razek-Mulder color analyzer and its use for the measurement of pulp and paper color (Hatch, Hauff) 1. Tetraconiferylaldehydehydrosulfonic acid (Klason) 10. Artificial masses [products used for manuf. of films, wrapping sheets] (Brit. pat. 401,200) 18. Ethylene glycol phthalate [used as a plasticizer with nitrocellulose] (U. S. pat. 1,946,202) 10.

Jaffé, Albert: Geschichte der Papiermühlen im ehemaligen Herzogtum Zweibrücken mit besonderen Berücksichtigungen der allgemeinen Papiergeschichte sowie der Entwicklungs-geschichte der rheinpfälzischen Papierindustrie und der Wasserzeichentechnik. Pirmasens: Selbstverlag. 150 pp.

Cellulose. Francesco Carlo Palazzo and Fortunato Palazzo. Austrian 136,005, Dec. 27, 1933 (Cl. 55c). This corresponds to Brit. 388,656 (C. A. 27, 5974) but describes the use of slightly different concns. and conditions.

Cellulose. Jens W. A. Elling. Ger. 589,751, Dec. 13, 1933 (Cl. 55b. 2.01). A double digester in which the fibrous material is heated, circulated and reheated, is described.

Cellulose. Adolf Basler. Ger. 591,115, Jan. 17, 1934 (Cl. 55b. 1.10). Straw or like grass material is boiled for 1 2 hrs. with caustic alkali soln.  $\text{Ca}(\text{OH})_2$  is then added, and boiling continued for a short time.

Cellulose. Philippe J. Planquaert. Fr. 756,553, Dec. 12, 1933. Cellulose is extd. by impregnating wood with NaOH and then dry-heating it.

Cellulose. Umberto Pomilio. Fr. 756,626, Dec. 13, 1933. Vegetable material is treated in a continuous manner with a dil. soln. of NaOH and Cl, the material being caused to descend by gravity in a tower and the reagents being introduced at an intermediate point of the tower and passing in countercurrent to the material.

Bleaching cellulosic fibers. Roland Runkel. Ger. 591,111, Jan. 16, 1934 (Cl. 55c. 1). An aq. suspension of the fibers is treated first with caustic alkali soln. and Cl supplied together, and then with the same reagents supplied in turn. Further treatment with the reagents supplied together may follow. The fibers may be washed between the stages. An example is given.

Felted sheets of artificially crinkled cellulose fiber. Frank H. McCormick and George L. Schwartz (to E. I. du Pont de Nemours & Co.). U. S. 1,944,907, Jan. 30. Sheets suitable for making artificial leather are formed of felted artificially crinkled cellulose fibers impregnated with a mixt. of drying oil and bituminous material, the fibers having a freeness of 15 to 40 sec. and having the substantially circular form in cross section such as characterizes material treated with solns. of NaOH of mercerizing strength.

Manufacture of tubes from sheet cellulose material. Otto W. Dieffenbach. U. S. 1,944,970, Jan. 30. Various details of app. and operation are described.

Waterproofing cellulosic materials. Sylvania Industrial Corp. Fr. 756,477, Dec. 11, 1933. The materials are waterproofed by forming thereon a transparent film of wax, between 0.1 and 0.01 micron. The wax is deposited in the form of fine particles and heated. An intermediate layer contg. nitrocellulose, dibutyl phthalate and colza oil may be applied to make the wax adhere.

Esterifying cellulose. Robert E. Fothergill and Frederick C. Hahn (to E. I. du Pont de Nemours & Co.). U. S. 1,945,310, Jan. 30. Various examples with details of

procedure are given in which anhyd. HF (suitably in a proportion of 4 to 6 times the wt. of the cellulose under treatment and at a temp. of 0°) is used as a reaction medium in esterification of cellulose material such as cotton linters to produce cellulose acetate, acetobutyrate, acetolaurate, caproate-heptate, phthalate, nitrate, acetate-nitrate and ethylcellulose propionate, and the process is stated to be generally applicable for the production of numerous other simple and mixed cellulose esters which are mentioned.

**Cellulose esters.** Henry Dreyfus. U. S. 1,947,463, Feb. 20. In the production of cellulose esters containing hydroxyalkylacyl groups, cellulosic material such as cotton pretreated with formic acid is treated with hydroxyaliphatic acid anhydrides, such as glycolic anhydride (to form cellulose glycolates).

**Cellulose esters.** Eastman Kodak Co. Ger. 587,952, Nov. 13, 1933 (Cl. 120. 6). See Brit. 287,880 (C. A. 23, 512).

**Cellulose esters.** I. G. Farbenind. A.-G. Ger. 591,120, Jan. 17, 1934 (Cl. 120. 6). Addn. to 560,685 (C. A. 27, 1166). The process of Ger. 560,685 is applied to the prepn. of sol. esters of cellulose with satd. or unsatd. heterocyclic monocarboxylic acids, including heterocyclically substituted fatty acids. An example is given of the prepn. of a cellulose isonicotinate. Esters of cellulose with carboxylic acids of furane, coumarone, thiophene, pyrrole, pyrrolidine, indole, piperidine, pyridine, quinoline, isoquinoline, pyridazine, pyrazine and piperazine are stated to be obtainable.

**Cellulose esters.** Eastman Kodak Co. Ger. 588,876 and 588,877, Nov. 30, 1933 (Cl. 120. 6). See U. S. 1,946,620 and Brit. 304,278 (C. A. 23, 512).

**Organic esters of cellulose such as mixed cellulose stearyl, palmityl and acetyl derivatives.** Carl J. Malm (to Eastman Kodak Co.). U. S. 1,946,632, Feb. 13. Cellulose is treated with an acyl halide such as stearic and palmitic chlorides and the resulting product is subsequently acylated with an agent such as  $\text{Ac}_2\text{O}$  containing a lower number of C atoms than the acyl halide preliminarily used. Cf. C. A. 28, 635<sup>2</sup>.

**Use of esters such as the acetic, phthalic or succinic ester of trichloro-*tert*-butyl alcohol as a plasticizer with cellulose organic esters such as cellulose acetate.** Henry H. Smith (to Eastman Kodak Co.). U. S. 1,946,643, Feb. 13.

**Acetyl cellulose.** Michael Melamid. Ger. 589,545, Dec. 12, 1933 (Cl. 120. 6). The acetylation is carried out at 50-100 atm. pressure. In the example, cotton is treated with  $\text{Ac}_2\text{O}$ , glacial  $\text{AcOH}$  and concd.  $\text{H}_2\text{SO}_4$  at 50-100 atm. pressure.

**Treating cellulose esters such as cellulose acetate to reduce their viscosity.** Cyril J. Staud and Thomas F. Murray, Jr. (to Eastman Kodak Co.). U. S. 1,946,645, Feb. 13. The air-dried material is subjected to the action of a gas such as  $\text{SO}_2$  or  $\text{Cl}_2$ .

**Cellulose acetate compositions.** C. F. Boehringer & Soehne G. m. b. H. (Richard Müller and Alfred Lubke, inventors). Ger. 591,305, Jan. 20, 1934 (Cl. 39b. 12.01). Monohydroxybiphenyls are used as gelatinizing and softening agents for primary and secondary cellulose acetates.

**Rapid seasoning of transparent film base containing cellulose acetate.** Martin Marasco (to Dupont Film Mfg. Corp.). U. S. 1,947,419, Feb. 13. The material is bathed in  $\text{MeOH}$  and then dried under only enough tension to prevent wrinkling during the drying.

**Cellulose ester and ether compositions.** Soc. des usines chim. Rhône-Poulenc. Ger. 591,366, Jan. 20, 1934 (Cl. 39b. 12.01). See Brit. 373,704 (C. A. 27, 3818).

**Cellulose ethers.** Alfred S. Levesley and Frederick C. Randall (to Imperial Chemical Industries Ltd.). U. S. 1,944,896, Jan. 30. Cellulose ethers yielding low-viscosity solns. are obtained by digesting cellulose ethers such as cellulose benzyl or ethyl ethers yielding high viscosity solns. with dil. acids such as  $\text{HCl}$  or oxalic acid in the presence of a considerable quantity of a water-sol. salt such as  $\text{NaCl}$  or  $\text{Na citrate}$ .

**Use of  $\beta$ -phenoxy- $\beta'$ -chlorodiethyl ether as a plasticizing agent with cellulose organic esters such as cellulose acetate or acetate-propionate.** Thomas F. Murray, Jr., and Wm. O. Kenyon (to Eastman Kodak Co.). U. S. 1,946,635, Feb. 13.

**Cellulose derivatives.** Henry Dreyfus. U. S. 1,947,464, Feb. 20. Cellulose is treated with amino alkylating agents such as 3-acetamidobenzyl chloride or 2-(chloromethyl)benzylamine in the presence of an alkali such as  $\text{NaOH}$  to form derivs. such as *m*-acetamidobenzyl cellulose or *o*-(aminomethyl)benzyl cellulose.

**Cellulose derivative compositions.** Ennette F. Izard (to E. I. du Pont de Nemours & Co.). U. S. 1,947,008, Feb. 13. A cellulose deriv. such as cellulose nitrate, acetate or butyrate is used with an ester formed from a polyhydric alc. having 2-6 C atoms and a halogenated aliphatic acid having 2-4 C atoms, e. g., glyceryl di- or tri chloroacetate, which serves as a plasticizer.

**Reducing the viscosity of cellulose nitrate.** Roderick K. Eskew (to Dupont Viscoloid Co.). U. S. 1,946,067, Feb. 6. A pyridine base such as pyridine itself is employed as a viscosity-reducing agent, and after the treatment is removed by use of an aldehyde such as formaldehyde.

**Felt-like celluloid.** Ichirō Yoshida. Japan. 160,430, Apr. 5, 1933. An amyl acetate soln. of celluloid is formed into threads by passing through small holes. After partial drying the threads are collected and pressed into felt-like state. The product is used as a filter for acids or oils or as a separator in a primary cell.

**Pyroxylin sheet material.** Guy E. Alling (to Athol Mfg. Co.). U. S. 1,945,250, Jan. 30. A product suitable for use as a leather substitute, etc., is made by spreading a layer of pyroxylin soln. containing a plasticizer upon a substantially air-pervious sheet such as a textile web to which it will not firmly adhere, drying the layer, and stripping it from the sheet. App. is described.

**Covering articles with pyroxylin.** Wm. C. Hampton (to Crawford, McGregor and Canby Co.). U. S. 1,946,208, Feb. 6. Various operative details are described suitable for covering articles such as knobs or golf clubs, or the like with preformed pyroxylin coatings. Cf. C. A. 27, 3075.

**Viscose capsules.** Kalle & Co. A.-G. (Julius Voss, inventor). Ger. 589,575, Dec. 9, 1933 (Cl. 39b. 12.03). Shrunk opaque capsules are prepd. by treating viscose capsules containing insol. alk.-earth salts as pigment with aq. solns. of alkali carbonates. The capsule surfaces are then washed with dil. acid to remove the alk.-earth carbonate formed.

**Viscose spinning solution.** N. V. Hollandsche Kunstzijde Industrie. Dutch 31,214, Nov. 15, 1933. Excess  $\text{CS}_2$  (56 to 63 parts per 100 parts cellulose) is present in viscose of low cellulose content (5.5%); more  $\text{CS}_2$  is added for less cellulose. A thread of good strength is obtained (6 to 1 denier).

**Filaments, films, etc., from viscose.** Feldmühl: A.-G. vorm. Loeb, Schoenfeld & Co. Ger. 591,427, Jan. 22, 1934 (Cl. 29b. 3.02). Filaments, etc., of reduced luster are obtained by emulsifying in the viscose soln. a product obtained by treating an unsatd. fatty acid with a compd. of S and Cl. A product obtained from oleic acid and 1  $\text{C}^{60}$  of  $\text{S}_2\text{Cl}_2$  is suitable.

**Viscose rayon.** Gustav J. Nord. U. S. 1,945,330, Jan. 30. A mass of viscose rayon staple fibers is placed in a vat containing water in which there is placed about 2 lb. of olive oil and palm oil to every 100 lb. of the fibers, together with about 2 lb. salt or  $\text{Na}_2\text{SO}_4$ ; the bath is heated to about 55° and the mass is agitated for about 20 min., subjected to the action of a squeeze roll to set the kinks and squeeze the mass into a mat-like form, and then is dried at a temp. of about 80°.

**Rayon.** Algemeene Kunstzijde Unie N.V. Fr. 757,136, Dec. 20, 1933. The spinning soln. is caused to pass through an envelope of cotton wool or other fibrous material. **Rayon.** Kurashiki Kensyoku K. K. (Yoshio Moriwaki, inventor). Japan. 99,299, Feb. 1, 1933. Viscose

soln. contg. 1-10% of a soln. of solid paraffin in an org. solvent is emulsified with a suitable reagent.

**Rayon.** Kurashiki Kensyoku K. K. (Yoshio Moriwaki, inventor). Japan 99,832, Feb. 28, 1933. Rayon is prep'd. by treating a mixt. of alkali cellulose and 10% of org. compds. (such as benzene or the like, petroleum hydrocarbons, terpenes) with  $CS_2$ .

**Rayon, etc.** Uddelholms Aktiebolag. Skoghalls-Verken. Fr. 757,214, Dec. 22, 1933. Higher alcs., their derivs., sulfonation products or N compds., e. g., borneol or leophene are added to the fibrous materials or necessary agents used in the manuf. of rayon, films, ribbons, etc.

**Rayon, etc.** Henry Dreyfus. Fr. 757,224, Dec. 22, 1933. Threads, films, ribbons, etc., made from org. derivs. of cellulose are subjected during or after formation to the action of a relatively volatile solvent of the cellulose deriv., applied conjointly with a non-solvent of the deriv. and in the presence of a relatively small proportion of a solvent which, under the conditions, has a vapor pressure lower than that of the non-solvent applied. Thus, a soln. of cellulose acetate in acetone is extruded in a coagulating bath contg. dioxane 40.5, diacetone-alc. 5 and water 50-55%, or cellulose acetate threads are immersed in an aq. bath contg. dioxane 44.7 and methylglycol monoacetate 3.5%.

**Rayon from nitrocellulose solutions.** Jacques Delpech and Constantin Heinrich. Ger. 591,066, Jan. 16, 1934 (Cl. 29b. 3.03). See Fr. 698,423 (C. A. 25, 3168) and 39,153 (C. A. 26, 2317).

**Spinning pot for rayon.** Comptoir des textiles artificiels (Soc. anon.). Fr. 757,083, Dec. 20, 1933. Construction is described.

**Cover for rayon spinning.** Comptoir des textiles artificiels (Soc. anon.). Fr. 757,118, Dec. 20, 1933. Construction is given.

**Means for controlling the centrifuges in spinning rayon.** Barmer Maschinenfabrik. A.-G. Fr. 756,324, Dec. 8, 1933.

**Combined pot- and bobbin-spinning machine for rayon.** Kirkles Ltd., Arthur Bennett and Wm. Tong. Ger. 591,129, Jan. 17, 1934 (Cl. 29a. 6.01). This corresponds to Brit. 380,566 (C. A. 27, 4079).

**Cellulose ester and ether threads, ribbons, etc.** Henry Dreyfus. Brit. 401,335, Nov. 13, 1933. The dry spinning of filaments, etc., from cellulose esters and ethers of high viscosity characteristics is facilitated by prolonging the period during which the filaments, etc., extruded from the spinning nozzles, remain in a fluid state, as by retarding the evapn. of solvent therefrom during the early part of their travel or preferably by including in the spinning soln. at least 30% of a (partial) solvent of relatively low volatility or by using such a solvent as the solvent of the spinning soln. Solvents mentioned are the cyclic ether obtained from ethyleneglycol and  $CH_2O$ , dioxane, methyl-dioxanes, diox-tioxan, di-ethers of dioxidioxanes, diacetone alc.,  $MeEtCO$ , butyrene and Et lactate.

**Funnel and outlet tube, etc., for producing artificial threads from solutions.** Hugo Hofmann (to American Benberg Corp.). U. S. 1,917,159, Feb. 13.

**Artificial fiber.** Camille Dreyfus and William Whitehead (to Camille Dreyfus). Can. 339,291, Feb. 6, 1934. An insol. salt or oxide of Bi is incorporated in the dope or spinning soln. contg. an org. deriv. of cellulose. Generally the amt. of Bi comp'd added is 0.1 to 10.0% by wt. of the cellulose comp'd. present in the finished yarn. Fibers and yarns produced have a pleasing appearance and unproved textile properties.

**Bleaching of bamboo sheath.** Masakichi Shirota. Japan 90,783, Feb. 24, 1933. The bamboo sheath, softened with water, is treated with dil. HCl and bleaching powder soln.

**Digester and associated apparatus for cooking fibrous material to produce paper pulp.** Lloyd D. Smiley (to Chemipulp Process, Inc.). U. S. 1,945,205, Jan. 30. Various structural and operative details are described.

**Wood pulp.** Aimwell G. MacIntyre (to A. E. Staley Mfg. Co.). U. S. 1,945,862, Feb. 6. Digestion of wood in a liquor such as an acid or alk. soln. is effected in the

presence of a dispersing colloid other than that contained in the wood, such as a starch conversion gum.

**Apparatus for forming wood pulp with digester liquors such as acid sulfite solution.** Albert D. Merrill. U. S. 1,945,504, Jan. 30. Various structural and operative details are described.

**Cylindrical suction apparatus for dewatering wood pulp, etc.** Sverre Diesen. Ger. 591,468, Jan. 22, 1934 (Cl. 55d. 13.20).

**Nitrocellulose from wood pulp.** Ernest Tschudin. U. S. 1,945,101, Jan. 30. Wood pulp is treated with soda lye and  $CS_2$  to form a slightly gelatinous paste, the paste is formed into pellets, the pellets are immersed in a hardening soln. such as  $SO_2$  or  $NaHSO_3$  soln. and are then nitrated to form a product which may be used for explosives or other purposes.

**Bleached refined cellulose pulp.** George A. Richter (to Brown Co.). U. S. 1,945,202, Jan. 30. A bleached, refined, soft and absorbent cellulose pulp in unmercerized condition is derived from long raw fibers such as hemp, jute, china grass, ramie, manila and sisal, by a described digestion with NaOH soln. and has an  $\alpha$ -cellulose content of at least about 93% and can be converted into stable paper of greater tear resistance than papers prep'd. from the raw fibers. Cf. C. A. 27, 417.

**Paper pulp beating engine or refining engine.** Samuel Milne. U. S. 1,947,440, Feb. 13. Structural and mech. details.

**Hydrating mercerized paper pulp.** George L. Schwartz (to E. I. du Pont de Nemours & Co.). U. S. 1,944,900, Jan. 30. A product suitable for use in making artificial leather is prep'd. by treating mercerized but substantially unpurified paper pulp, of pentosan content above 5%, with water until the pulp is hydrated.

**Paper paste and pulp strainer.** Marcel Lamort (to Établissements E. & M. Lamort Fils). U. S. 1,945,492, Jan. 30. Structural and mech. features.

**Paper.** Charles I. Goessmann. U. S. 1,944,886, Jan. 30. Raw stock paper is impregnated with a nitrogenous colloid, and laminations are immediately formed of the impregnated stock prior to solidification, the laminated stock is chilled, then impregnated with a fixing agent such as alum or a chromate and the product is dried. App. is described.

**Paper.** Hector McVicker and Edwin F. Bearce (to Chillicothe Paper Co.). U. S. 1,945,118, Jan. 30. A marginal strip is severed from a paper sheet while on the wire, the severed strip is conveyed as a trim for an addnl. distance on the wire, then is removed, mixed with "white water" and the mixt. is returned to the system after the Jordan engines. Various app. features are described.

**Paper-making apparatus.** Frederick W. Vickery (to Vickery Inc.). U. S. 1,945,761, Feb. 6. Mech. details.

**Fourdrinier paper-making apparatus.** Frank M. Sanger (to Hagley and Sewall Co.). U. S. 1,946,592, Feb. 13. Mech. features.

**Paper-making machine (Fourdrinier type).** Wm. H. Millsbaugh. Ger. 591,249, Jan. 19, 1934 (Cl. 55d. 8.30). See Brit. 369,907 (C. A. 27, 3078).

**Electrically operated paper-making apparatus.** Akt.-Ges. Brown, Boveri & Cie. Ger. 591,441, Jan. 22, 1934 (Cl. 55d. 25).

**Steam-circulation system for paper-making machines.** V. I. B. Apparatchau-Ges. m. b. H. Ger. 591,302, Jan. 19, 1934 (Cl. 55d. 28.01).

**Suction box for paper-making machine.** Rohrbacher Lederfabrik Jos. Pöschl's Söhne A.-G. Austrian 135,846, Dec. 11, 1933 (Cl. 55b.). Addn. to 133,780 (C. A. 27, 4925).

**Drying felts for paper-making machines.** Thomas Hindle and Sam Lord. Brit. 401,468, Nov. 10, 1933. The felts are impregnated with a soln. or suspension of an alk. carbonate,  $Ca(OH)_2$  or  $CaCO_3$  to neutralize acid carried thereto by the paper web.

**Paper-mill hollander.** Helmut Banning. U. S. 1,946,347, Feb. 6. Structural features.

**Apparatus for regulating the consistency and indicating**

the "freeness" of paper-making stock. Geo. S. Witham, Jr. U. S. 1,945,968, Feb. 6.

Centrifuge for unfelted paper and cellulose. I. W. Erkens Maschinenfabrik und Eisengieserei. Ger. 589,878, Dec. 16, 1933 (Cl. 55d. 2.01).

Artificial fabric. George L. Schwartz (to E. I. du Pont de Nemours & Co.). U. S. 1,945,537, Feb. 6. Material such as may be produced by dispersing paper pulp with 8-35% NaOH soln. at room temp. and promptly washing out the caustic, is used in making sheets of artificially crinkled fibrous cellulosic material in which starch is absorbed and which are flexible exhibit very little paper-break and are strongly resistant to tear and suitable for use in bookbinding and for various other purposes. U. S. 1,945,538 relates to similar sheet material impregnated with rubber latex and coagulated.

Coating paper. The Champion Coated Paper Co. Ger. 591,442, Jan. 22, 1934 (Cl. 55f. 15.20). See Brit. 379,833 (C. A. 27, 3609).

Spraying apparatus for coating paper, etc. Russell S. Bracewell. U. S. 1,946,831, Feb. 13. Mech. features of an app. suitable for coating paper webs or the like with coloring materials, etc.

Carbon papers. Rinco A.-G. Fr. 756,897, Dec. 13, 1933. A fundamental color which does not combine with the support and which is free from fats or waxes is applied to the support and to the fundamental layer is applied a 2nd layer. Thus, the 1st layer may contain an aq. soln. of casein, Turkey-red oil, glycerol, lampblack and Prussian blue and the 2nd, stearic esters of glycol, water and  $\text{TiO}_2$ .

Coated paper. Charles L. Gabriel (to Commercial Solvents Corp.). U. S. 1,946,203, Feb. 6. Paper which may be used as a moistureproof wrapping is prepd. by coating with a compn. contg. a cellulose ester such as cellulose nitrate or acetate together with an ester formed from a "polybasic" acid esterified conjointly with poly-

and mono-hydric alcs. such as glycerol butyl (or benzyl) phthalate. U. S. 1,946,204 relates to paper coated with generally similar compns. such as may contain cellulose nitrate or acetate together with glycol butyl (or benzyl) phthalate. U. S. 1,946,205 relates to coating paper with cellulose nitrate or acetate or the like together with a neutral ester of a "polybasic" acid and a dihydric alc. such as ethylene (or propylene) glycol phthalate.

Copperized paper. Wm. R. Barber, Albert G. Natwick and Maurice W. Phelps (to Crown Willamette Paper Co.). U. S. 1,947,451, Feb. 20. Paper sheets are made of fiber carrying a ppt. of Cu o-phenylphenate which serves to adapt the paper for covering plants or wrapping fruit. U. S. 1,947,452 relates to paper contg. Cu resinate ppt. in its fibers.

Tracing paper. Harold M. Spurlin (to Hercules Powder Co.). U. S. 1,946,338, Feb. 6. A material capable of receiving ink, substantially transparent and waterproof and free from greasiness, comprises a thin sheet of substantially porous paper impregnated with and superficially coated with a compn. contg. nitrocellulose and a plasticizer such as tricresyl phosphate, etc.

Waterproof paper. Masuteru Kaneko (Sin'ichi Takeda, inventor). Japan. 99,125, Jan. 21, 1933. Paper is treated with a viscose soln.,  $(\text{NH}_4)_2\text{SO}_4$  soln. contg.  $\text{ZnSO}_4$  and finally with  $\text{H}_2\text{SO}_4$ . Cf. C. A. 27, 5978.

Plant for working up waste paper, cardboard, cellulose, etc. Fredrik Grewin. Ger. 591,145, Jan. 17, 1934 (Cl. 55a. 5.01). This corresponds to Brit. 393,824 (C. A. 27, 5978).

Waterproof paper or cardboard. The Richardson Co. Ger. 591,112, Jan. 16, 1934 (Cl. 55f. 11.01). See Brit. 341,542 (C. A. 27, 603).

Hot press for making smooth cardboard sheets. Karl Kubik and Edmund Saller. Ger. 591,152, Jan. 17, 1934 (Cl. 55d. 16.20).

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Investigation of dry explosion safety valves for solvent vapor-gas mixtures. A. Knodel and F. Nauck. Z. tech. Physik 15, 54-8(1934). -The effectiveness of gravel and glass balls as obstacles in the propagation of explosions is detd. for mixts. of air and  $\text{Et}_2\text{O}$ ,  $\text{Me}_2\text{CO}$ ,  $\text{C}_2\text{H}_6$ , PhMe and  $\text{CS}_2$ . Comparison is made with Davey and Kito screens.

Explosive (and non-explosive) reactions between nitrogen oxides and combustible gases. M. J. van der Wal. Rec. trav. chim. 53, 97-117(1934). -The explosive limits of various binary, and ternary mixts., as well as of the quaternary mixt. of  $\text{NO}$ ,  $\text{N}_2\text{O}$ ,  $\text{CO}$  and  $\text{H}_2$ , were detd. by means of a special glass app. which is described in detail. Numerous references to the literature are cited.

Solvenit as substitute for dynamite. V. Kachkarin. Neuheiten der Technik 1933, No. 4, 8; Nitrocellulose 5, 29.

The ability of explosives to decompose on ignition in vacuo. E. Burlot. Compt. rend. 197, 1223-5(1933). -B. has shown by a series of over 200 expts. that below a certain limit of pressure the complete decompn. of explosives (by combustion, deflagration or detonation) cannot be initiated by contact with flame or incandescent substance if the contact is of sufficiently short duration. This pressure is greater than 1 mm. for  $\text{Hg}(\text{ONC})_2$  and of the order of 0.02 mm. for  $\text{PbN}_3$ . A phase of combustion precedes the detonation of both of these explosives when ignition is effected by a fusible bridge wire. At a pressure of 0.05 mm.,  $\text{PbN}_3$  only partially decompd., leaving agglomerates of blackened  $\text{PbN}_3$  (cf. C. A. 28, 898).

The influences of electrical and magnetic fields upon "spin" in gaseous detonations. W. A. Bone. Nature 132, 348-9(1933); cf. C. A. 27, 3079. -Photographs were taken of  $2\text{CO} + \text{O}_2$  detonations in a tube of 1.25

cm. internal diam. fitted with a glass section in which a strong elec. field could be maintained between 2 electrodes (one of which was a ring-shaped silver mirror deposited on the inside of the tube) 30 cm. apart. In blank expts. with no field, the detonation flame passed through the glass section with a const. velocity of 1755 m. per sec. showing a normal "spin" with frequency of about 45,000 per sec. The velocity of the same flame entering and crossing a field of 3000 v. per cm. in the + to - direction fell to 1720 m. in crossing but rose again to 1760 m. on leaving the field; the velocity was thus slightly retarded between the electrodes but the "spin" was not appreciably affected. On reversing the polarity of the field so that the flame entered by its - boundary and crossed it from - to +, not only was the "spin" quickly and entirely suppressed, but detonation ceased, the flame speed being rapidly reduced from 1755 to 910 m. per sec. Moreover the magnitude of the effect depended on the strength of the field applied. A longitudinal magnetic field of 40,000 gauss over a length of 1.5 cm. or a 20,000-gauss field over 60 cm. caused a speed decrease of about 60 m. per sec. without, however, materially affecting the "spin."

Combustion of colloidal propellants. A. D. Crow and W. E. Grimshaw. Phil. Mag. 17, 161-72(1934); cf. C. A. 27, 1512. -The results of Muraour and Aunis (C. A. 27, 2302) are rejected. The use of crushers to det. max. explosion pressures is discussed. With suitable calibration, this method is satisfactory for max. pressure but not for indicating the development of pressure with time.

The temperature gradient in flames. Oliver C. de C. Ellis and E. Morgan. Trans. Faraday Soc. 30, 287-98(1934); cf. C. A. 27, 3611. -The characteristic thermochem. equation of the reaction is not completed near the surface of the explosion flame. Unless there is delayed

emission of heat the temp. must fall inward from the flame surface throughout the flame period; actually the temp. rises inward from the flame surface throughout the flame period when the reactions considered lead to equls. that shift exothermically under the condition of rising temp. and pressure, the rise in the gradient becoming more and more marked as the combustion proceeds; for a considerable portion of the flame period the temp. rises inward from the flame surface even when the reactions considered lead to equls. that shift endothermically under the condition of rising temp. and pressure. Thus, there is a lag on the completion of the primary action that is characteristic of the flame surface in the mixt. considered, and the phenomenon of "afterburning" is independently demonstrated in a new way. Math. analysis. R. R.

**The movement of flame in fire-damp explosions.** 11. P. Coward and R. V. Wheeler. *Safety in Mines Research Board (Gt. Brit.) Paper No. 82*, 59 pp. (1933). Flame is propagated at the highest speed (27 cm. per sec.) in mixts. of fire damp and air contg. 10% CH<sub>4</sub>, the speed falling off rapidly as the amt. increases or decreases. The speed of the flame is increased by movement of the mixt. Expansion due to the heat of the flame causes a streaming movement either ahead of, or behind, the flame. If movement is from a closed toward an open end, or in a gallery open at both ends, the movement is ahead of the flame and may increase its speed many fold. Expansion due to the heat of the flame introduces convection effects which enlarge the area of the flame surface and increase the flame speed. These effects increase with increase in vol. of explosive mixt.; hence the flame travels faster in a big space. Turbulence has the same effect; hence obstructions increase flame speed. Resonance of the gas column causes vibrations of the flame. This resonance can be reduced by narrow slits in the container. Variations in temp. and pressure are unimportant. Reduction of O<sub>2</sub> content reduces flame speed. Since small diam. reduce speed of flame, holes small enough will prevent passage of flame. Diam. of these holes depend on the compn. of explosive mixt. and the manner in which flame approaches them.

Alden H. Emery

**The prevention of ignition of fire damp by the heat of impact of coal-cutter picks against hard rocks.** M. J. Burgess and R. V. Wheeler. *Safety in Mines Research Board (Gt. Brit.) Paper No. 81*, 14 pp. (1933). The ignition of fire damp when a coal cutter pick strikes hard rock can be prevented by a continuous discharge into the cut of about 1 1/2 cu. ft. per min. of CO<sub>2</sub>. A. H. E.

**The ignition of fire damp by the filaments of broken electric lamp bulbs.** G. Allsop and T. S. E. Thomas. *Safety in Mines Research Board (Gt. Brit.) Paper No. 80*, 13 pp. (1933).—If the filament current is > 2 amp., the current must be cut off before the glass is broken to prevent ignition of fire damp. For current < 1 amp., the delay period is 0.12–0.02 sec. Vacuum bulbs are less safe than gas-filled bulbs of the same rating. The time of cooling of the filament is proportional to the current flowing through it.

Alden H. Emery

**Explosions in Kentucky coal mines January 1, 1844–June 30, 1933.** J. F. Davis and H. B. Humphrey. *Bur. Mines, Information Circ. 6754*, 21 pp. (1934). A. H. E.

**Mine explosions and fires in the United States during the fiscal year ending June 30, 1933.** D. Harrington and W. J. Fene. *Bur. Mines, Information Circ. 6761*, 19 pp. (1934). Alden H. Emery

**Progress in explosive shattering of minerals (Gross) 9. Explosions in sewers (Jessup) 14. Explosion and health hazards in sewage-works operation (Jones) 14. Zn-Cu alloy [for making ammunition cartridge cases] (Brit. pat. 401,147) 9.**

**Prettre, M.: L'inflammation et la combustion explosive en milieu gazeux.** Pt. 2. Les hydrocarbures. Paris: Hermann & Cie. 56 pp. P. 15. Cf. C. A. 27, 2814.

**Explosives.** I. G. Farbenind. A.-G. Brit. 401,307, Nov. 9, 1933. See Fr. 755,050 (C. A. 28, 1537<sup>a</sup>).

**Explosives.** Edward Whitworth and Imperial Chemical Industries Ltd. Brit. 401,723, Nov. 20, 1933. A mixt. of diethyldiphenylurea and dimethyldiphenylurea is used for gelatinizing and stabilizing solventless nitro-cellulose-nitroglycerin explosives, which may contain addnl. substances, e. g., di- or tri-nitrotoluene for ballistics, nitroguanidine for flashlessness, tetrabutyl stannate for antifouling.

**Explosive.** Nippon Kayaku Seizō K. K. (Syunji Teraï and Heizō Nanbō, inventors). Japan. 100,562, Apr. 13, 1933. The explosive is a mixt. of pure Fe powder (coated or uncoated with a waterproof film), combustible materials (such as C, starch, S), O-carriers (such as nitrates, chlorates) and powerful agents (such as nitroglycerin, nitrolycol, nitrocellulose). Fe powder is used as a heat generator.

**Blasting explosive.** Willard de C. Crater (to Hercules Powder Co.). U. S. 1,945,344, Jan. 30. Cryst. nitro-lactose is used together with an explosive salt such as NH<sub>4</sub>NO<sub>3</sub> and an oxidizing salt such as NaNO<sub>3</sub>. Wood pulp, TNT, DNT, etc., also may be added.

**Priming explosives.** Behn-Karlsruher Industrie-Werke A.-G. Fr. 755,549, Nov. 25, 1933. Trinitroresorcinate of Ba, free from water of crystn., is used along with other priming explosives for fuses and low-power munitions of all sorts.

**Nitrated-sugar explosives.** Harold A. Lewis (to E. I. du Pont de Nemours & Co.). U. S. 1,947,530, Feb. 20. A nitrated ketose such as nitrated levulose free from nitrated aldoses is used in soln. in a liquid nitric ester such as nitroglycerin, in dynamites, etc.

**Primers for explosive charges.** L'Air liquide (Soc. anon. pour l'étude et l'exploitation des procédés Georges Claude). Fr. 756,345, Dec. 8, 1933. The primers are composed of 2 sep. parts, a very small amt. of a chem. substance such as Hg fulminate which is placed in direct contact with the lighting means, and a combustible substance capable of absorbing a liquefied gas and of provoking, in this state, an explosive wave, e. g., cork flour. The amt. of the first component is less than that necessary, if alone, to start the explosive charge.

**Dynamite composition.** Clifford A. Woodbury (to E. I. du Pont de Nemours & Co.). U. S. 1,944,910, Jan. 30.

**A substantially "unbalanced" explosive compn. is prepd. comprising nitroglycerin and less than the normal amt. of nonexplosive or "dope" ingredients required to produce a finished dynamite compn.; a small proportion of nitro-cellulose is then added to increase the viscosity and hold the nitroglycerin from leakage, and addnl. "dope" ingredients are subsequently added.**

**Separating nitroglycerin from residual acids.** Arnold Schmid (to Karl Schmid). U. S. 1,946,414, Feb. 6. Emulsified material is passed horizontally through a vessel provided with inclined plates dividing the body of liquid into a series of longitudinal superposed layers communicating with each other at each end, so that the nitroglycerin as it seps. may pass upward along the under surfaces of the division plates toward the top of the body of liquid, where it is continuously drawn off, while the sepd. acid gravitates downwardly toward the lower portion of the vessel, where it is continuously discharged. U. S. 1,946,415 relates to a process in which a similar emulsion is continuously introduced into the upper portion of a quiescent inclined column of liquid of lower temp. than the introduced emulsion so that the emulsion cools during its descent and continuous sepn. is effected. App. is described. Cf. C. A. 27, 4403; 28, 1538<sup>a</sup>.

**Electric purification of gun cotton or other nitrated cellulose.** Kogorō Murakoshi. Japan. 100,065, March 13, 1933. Gun cotton or other nitrated cellulose immersed in water is treated for about 8 hrs. with alternating current (and sometimes d. c. in addn.) at 50 cycles, 1000–2000 v. and 1 amp. per sq. in.

**Protective coatings on soft metal bullets.** Hermann E. Gustav and Thorismund Gerlich. U. S. 1,944,884, Jan. 30. Bullets such as those formed of Pb or as Pb alloy are provided with an outer coating of a residual solute such as cellulose acetate or cellulose.

- Toy torpedo or "impact salute."** Joseph B. Decker (to Gertrude M. Decker). U. S. 1,945,217, Jan. 30. A container such as a cardboard tube is substantially filled with a mass of granular material such as gravel the particles of which are cemented to each other and to the walls of the container (suitably by S, glue or collodion) with explosive material filling the interstices of the mass.
- Loading shells with pyrotechnical material.** Warren G. Thrasher (to National Fireworks, Inc.). U. S. 1,946,042, Feb. 6. Various details of app. and operation are described.
- Blasting detonators.** Archibald C. Gooden, Godfrey Rotter and Edgar R. Deacon. Brit. 401,843, Nov. 23, 1933. The casing of detonators, in the contents of which Pb azide is present, is made of Cu (alloy) coated externally and internally with Pb, Sn or other metal or alloy resistant to Pb azide.

## 25 DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

- The absorption of dyestuffs by cellulose. II. The influence of temperature.** W. M. Carvie, L. H. Griffiths and S. M. Neale. *Trans. Faraday Soc.* 30, 271-8(1934); cf. *C. A.* 27, 5544.—Measurements were made of the absorption of 2 direct dyestuffs (*Chlorazol Fast Red K* and *Heliotrope 2B*) by viscose sheet and by cotton cloth over a range of temps. from 25° to 100°. The rate of diffusion of dye into viscose sheet is very roughly doubled for 20° temp. rise. The amt. of dye absorbed at equil. is very roughly halved for 30° temp. rise. At any given temp. the addn. of NaCl causes the rate of diffusion into viscose sheet to rise to a max. and then fall, whereas the absorption at equil. steadily increases. Viscose sheet normally takes up more dyestuff than cotton, but the difference decreases and is ultimately reversed when the absorption is reduced, either by raising the temp. or by reducing the amt. of added electrolyte. Reuben Roseman
- Lakes of vegetable dyes.** G. A. Bravo and A. D'Alberto. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 11, 326-53(1933).—A study was made of the effect of the  $p_H$  of the soln., during pptn., on lakes prep'd. by various combinations of soln. contg. one of the following: hematein, ext. of quercitron, cochineal, catechu, alizarin, with a soln. of one of the following salts:  $FeSO_4$ ,  $Cr_2(SO_4)_3$ ,  $CuSO_4$ ,  $KAl(SO_4)_3$ , double oxalate of Ti and K,  $MgCl_2$ ,  $CaCl_2$ ,  $SnCl_2$ . Curves showing the vol. of the ppt. as a function of  $p_H$  of the soln. are given and conditions of optimum pptn. indicated. In general, the lake becomes more gelatinous the higher the  $p_H$  during pptn. and in some cases it may even tend to become colloidal dispersed. Changes in  $p_H$  also greatly affect the color of the lake. Exposure of several of the lakes to the light of a Hg vapor lamp for 16 hrs. had only a very slight effect on their color. The use of such lakes in dyeing various types of fabric is briefly discussed. Also in *Industria chimica* 8, 1537-54(1933). J. W. Perry
- Tinctorial action of substances having a surface activity on naphthols of the AS group.** H. Gerstner. *Tiba* 11, 821-7(1933); cf. *C. A.* 26, 2867.—A further discussion with addnl. evidence of the merits of "Acorit." A. P.-C.
- $p_H$  determination in the dyeing industry.** Maurice Dérilère. *Tiba* 11, 907-17(1933); 12, 27-33(1934).—An explanation of the principle of the electrometric and colorimetric detn. of  $p_H$ , with a brief outline of its applications in the dyeing industry. A. Papineau-Couture
- The use of stainless steels in the dyeing industry.** Andre Michel. *Rev. gén. mat. color.* 38, 67(1934); cf. *C. A.* 28, 6474.—Most stainless steels which are resistant to HCl do not resist  $SnCl_4$ . A Cr-Ni-Mo steel is not attacked by  $SnCl_4$  of 30° Bé. at 20° and 50° for 122 hrs. Polished surfaces of stainless steels, Type 18-8, greatly reduce the decompn. rate of  $H_2O_2$  and in this condition, the latter is not decompd. more rapidly than by Al. Halsey E. Silliman
- Sanitation and vocational diseases: dyeing.** A. Thomas. *Russa* 8, 943-9(1933).—A brief outline of vocational hazards in the dyestuffs and dyeing industry and of sanitation measures by which they can be prevented or overcome. A. Papineau-Couture
- Chloramines and their use in the textile industry.** H. Tatu. *Tiba* 11, 883-7(1933).—A brief description of the prep'n. and prop'ties of activin or chloramine T ( $MeC_6H_4SO_2N(Na)Cl$ ) and peractivin ( $MeC_6H_4SO_2NCl_2$ ), with a brief review of their applications, particularly in the textile industry. A. Papineau-Couture
- Alkali and soap in the degumming of natural silk.** Tatu. *Russa* 8, 839-43(1933).—From a review of recent work on the subject it is concluded that: (1) presence of alkali is absolutely essential to obtain satisfactory degumming; (2) with our present knowledge, soap is the most suitable manner of supplying the required alkali. A. Papineau-Couture
- Delustering of acetate rayon goods. Use of phenol and of pine oils.** Jean Rolland. *Russa* 8, 933(1933).—A brief discussion of the precautions required to obtain good results. A. Papineau-Couture
- Polyvinyl compounds and their applications in the sizing of rayons.** M. Jeanny. *Russa* 8, 1017-21(1933); 9, 11-15(1934).—A review of recent literature and patents. A. Papineau-Couture
- A process for making artificial wool.** E. Pallas. *Kunststoffe* 23, 281-2(1933).—Jute is treated with a 25-30% KOH soln. for 30-45 min. at ordinary temp., then carefully bleached, treated with dil. acid and finally oxidized. J. W. Perry
- Permanent fireproofing of fabrics.** L. P. Michel. *Tiba* 12, 3, 5(1934).—Practical operating directions. A. Papineau-Couture
- Color removal on wool muslin.** R. Haller. *Tiba* 12, 23 7(1934).—A discussion of the use of Neolane dyes (Soc. for Chem. Industry, Basel) and of their merits for this purpose. A. P.-C.
- Combination of collagen with dyes (Bravo, Baldracco, et al.) 14. Textile finishes research (Stevens, Gaunt) 30. Use of rubber, in combination with textiles (Wurm) 30. Benzoyl derivs. of indigo (de Diesbach, et al.) 10. Clean sing compn. for use on fine fabrics (U. S. pat. 1,946,272) 18. 4,5-Dimethyl-7-chlorohydroxythionaphthene and its indigoid derivs. (U. S. pat. 1,945,923) 10. Persulfonic acid esters [products for treating textiles] (Ger. pat. 580,778) 10. Water-sol. condensation products [for treating fabrics] (U. S. pat. 1,946,430) 10. Benzanthrone 1 aldehyde (U. S. pat. 1,946,829) 10. Methylenecanthrone derivs. [products useful as vat dyes or intermediates] (Ger. pat. 591,496) 10.**
- Holsboer, H. B., and Lanzer, J.:** *Practisch Kleurstofonderzoek op de Vezel*. Enschede: Hoogere Textiel school. 72 pp. Reviewed in *J. Soc. Dyers Colourists* 50, 52(1934).
- Forschritte der Teerfarbenfabrikation und verwandter Industriezweige. Verbindungen ohne Farbstoffcharakter der organischen Technologie. Organische Farbstoffe. Verfahren der Faserveredelung.** Begun by Paul Friedlaender. Edited by Hans Ed. Fierz-David. Pharmaceutical part edited by Max Dohrn. Tl. 18, Hülft 1 and 2. (Covering the literature from Jan. to Dec. 1931). Berlin: J. Springer. 1548 pp. M. 392. Cf. *C. A.* 27, 2039.
- Dyes.** Durand & Huguenin A.-G. Brit. 401,137, Nov. 9, 1933. See Fr. 749,461 (*C. A.* 28, 6569).
- Dyes.** I. G. Farbenind. A.-G. Fr. 756,349, Dec. 8, 1933. Complex compds. of *o*-hydroxyazo dyes are prep'd

by diazotizing compds. of the formula  $\text{NH}_2(\text{AO})\text{XSO}_2\text{N}(\text{Z})_2$  (X is a  $\text{C}_6\text{H}_5$  or  $\text{C}_{10}\text{H}_7$  radical, A an alkyl, aryl or acyclic group and each Z is H or an alkyl, cycloalkyl, aralkyl or aryl radical, OA and  $\text{NH}_2$  are in *o*-positions with respect to one another) and combining with compds. contg. at least one  $\text{SO}_3\text{H}$  group, then treating the dyes obtained by chroming agents under such conditions that the A radical is eliminated. Several examples are given.

**Dyes.** I. G. Farbenind. A.-G. (Fritz Baumann, inventor). Ger. 589,638, Dec. 12, 1933 (Cl. 22b. 3.01). The dyes 1,4-diaminoanthraquinone-2,3,5-trisulfonic acid are prepd. by treating 1,4-diamino-2,3-dihaloanthraquinone-*x*-sulfonic acids with salts of  $\text{H}_2\text{SO}_4$ . In an example, 1,4-diamino-2,3-dichloroanthraquinone is sulfonated in the presence of  $\text{H}_2\text{BO}_3$  and a suspension of the product in water is treated with  $\text{Na}_2\text{SO}_4$ . Other examples are given. Cf. C. A. 28, 1540<sup>8</sup>.

**Dyes.** Durand & Huguenin A.-G. Ger. 589,566, Jan. 2, 1934 (Cl. 22e. 7.02). See Fr. 737,081 (C. A. 27, 1516).

**Dyes.** Scottish Dyes Ltd. Ger. 586,906, Oct. 27, 1933 (Cl. 22e. 6). See Brit. 317,428 (C. A. 24, 2306) and Brit. 332,907 (C. A. 25, 604).

**Azo dyes.** Gerald Bonhote (to Soc. pour l'ind. chim. à Bâle). U. S. 1,946,010, Feb. 6. Over a hundred examples (some with details of procedure for manuf.) are given of azo dyes of the general formula  $1,2,3-(\text{R}_1\text{OR}_2-\text{N}(\text{HO})(\text{R}_3\text{HNCO})\text{C}_{10}\text{H}_7)$  where  $\text{R}_1$  stands for an aryl nucleus of the benzene series or an aralkyl radical,  $\text{R}_2$  for an aryl nucleus of the benzene or naphthalene series, where further the O atom and the N atom of the 2 substituents of the benzene nucleus  $\text{R}_1$  stand in *o*-position to each other, and where at least one of the two radicals  $\text{R}_1$  and  $\text{R}_2$  contains a COOX group in which X means alkyl, which products are orange to red and brown powders, dissolve in pyridine to orange-red and blue-red solns., and yield when produced on textiles, orange to red and blue-red tints of good fastness. Among the components which are used are the ethyl ester of 2-amino-4-carboxylic acid-1,1'-diphenyl ether and 2,3-hydroxynaphthoic acid 2'-naphthalide, etc.

**Azo dyes.** Harold E. Woodward (to E. I. du Pont de Nemours & Co.). U. S. 1,947,027, Feb. 13. Disazo dyes suitable for coloring hydrocarbons and their halo-ecated derivs. are formed, e. g., from first components such as *p*-aminodibutylbenzamide, 2-aminoanisole-5-dimethylsulfonamide, *p*-aminodimethylbenzamide, *m*-aminodimethylbenzamide, *p*-aminobenzanilide, *p*-aminobenzovlethylaniline, 2-aminotoluene-4-dimethylsulfonamide, 2-aminoanisole-4-dimethylbenzamide and other dialkylamides of aminobenzoic acids, anisidine-, aniline-, toluidine-, or xylylene-sulfonic acids (in general, the lowest-melting aminodialkylbenzamides are preferred, and especially dibutylbenzamide), second components such as aminohydroquinone dimethyl ether, 1<sup>st</sup>-amino-2-naphthol methyl ether, cresidine,  $\alpha$ -naphthylamine, 1-amino-7-naphthol, 1-ammonaphthyl-6- or -7-dimethyl sulfonamide and other  $\alpha$ -naphthylamine derivs. which can couple in the 4-position and contain no carboxylic or sulfonic groups, and as last components  $\beta$ -naphthol, 2-hydroxy-3-naphthylamide, 1-amino-7-naphthol, 2-hydroxy-3-ethylnaphthamide, 2-hydroxy-3-phenylethylnaphthamide, 2-hydroxy-3-dibutylnaphthamide or the like. Several examples with details of procedure are given. Cf. C. A. 27, 4405. U. S. 1,947,028 relates to the production of monoazo dyes (having brilliant colors from yellow to orange) from a diazotized nitroaniline, having substituted thereon halogen, alkoxy or benzyloxy groups, coupled with a compd. having the general formula  $\text{RCOCH}_2\text{CONHC}_6\text{H}_4\text{Y}$ , in which R represents an alkyl, phenyl or benzyl radical, and Y represents an alkoxy, benzyloxy or benzyl radical. The products are suitable for use in printing inks and paints.

**Azo dyes.** I. G. Farbenind. A.-G. Brit. 400,922, Oct. 16, 1933. Azo dyes are made by coupling diazo or tetrazo compds. with an amino and (or) hydroxy coupling component to which an aliphatic radical of at least 10 C atoms is attached by means of a  $-\text{NH}-$ ,  $-\text{CO}-$ ,  $-\text{NHCO}-$

or  $-\text{NHSO}_2-$  group, where coupling components corresponding to 1 of the formulas  $\text{C}_{10}\text{H}_7(\text{OH})(\text{NHCOX})$  and  $\text{C}_{10}\text{H}_7(\text{OH})(\text{NHSO}_2\text{X})$  (X being a 10 or more C atom aliphatic radical) contg. a sulfonic group are used only for disazo dyes and for such monoazo dyes as contain a further radical of at least 10 C atoms in the diazo component. Any diazo compd. can be used, e. g., those of the  $\text{C}_6\text{H}_5$  and  $\text{C}_{10}\text{H}_7$  series including aralkyl, OH, alkoxy, halo,  $\text{NO}_2$ , carboxy and sulfo derivs. and diamino derivs. of biphenyl, benzophenone, diphenyl sulfone, diphenylurea, diphenylene ketone, carbazole, diphenylmethane, diphenyl ether, stilbene, azobenzene and derivs. thereof. The dyes are sol. in org. solvents and are suitable for coloring lacquers or artificial masses, e. g., celluloid. Among examples: (1) 1-naphthylamine-5, 7-disulfonic acid  $\rightarrow$  *p*-aminostearanilide of acetoacetic acid, (2) bis-anisidine  $\rightarrow$  oleyl-H acid; the dye may be treated in substance or in the dye bath with Cu salts, and (3) metanilic acid dodecylamide  $\rightarrow$  capryl-H acid.

**Azo dyes.** Imperial Chemical Industries Ltd. Fr. 756,741, Dec. 14, 1933. 1,3,5-Xylenol is combined with a diazo compd. of the  $\text{C}_6\text{H}_5$  or  $\text{C}_{10}\text{H}_7$  series, which contains no  $\text{SO}_3\text{H}$ ,  $\text{COOH}$  or OH groups, e. g., 5-nitro-2-anisidine or  $\alpha$ -naphthylamine. Cf. C. A. 27, 3830.

**Azo dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 757,039, Dec. 19, 1933. *o*-Aminophenols and their substitution products are caused to react with org. bases contg. at least one hydroxyalkyl group fixed to the N atom. Thus, 5-nitroaminophenol is diazotized and coupled with 1-( $\beta$ -hydroxyethylamino)-2-methoxy-5-methylbenzene, giving a dye which dyes acetate silk a reddish violet shade. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 757,084, Dec. 20, 1933. Complex azo dyes contg. Cr or Cu are prepd. by treating with Cl or Cu compds. azo dyes of the formula  $1,7,3-(\text{HO})_2(\text{HO}_2\text{S})\text{C}_{10}\text{H}_7\text{N}(\text{ROH})$  where R is the aryl group of a diazotized amine radical, the OH in which is ortho to the N. Examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. Fr. 757,123, Dec. 20, 1933. The dyes are prepd. by coupling either in substance or on the fiber or in the presence of an appropriate substratum for the prepn. of lakes, 2,6-dihalo-1,4-diaminobenzenes, monodiazoized in the 4-position, with arylamides of 2,3-hydroxynaphthoic acid or their derivs., substituted in the  $\text{C}_{10}\text{H}_7$  radical (the components being free from  $\text{SO}_3\text{H}$  and  $\text{COOH}$  groups). Thus, 2,6-dichloro-1,4-diaminobenzene  $\rightarrow$  2',3'-hydroxynaphthoyl-1-amino-2-ethoxybenzene gives a brown-red. Several examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Arthur Zitscher, inventor). Ger. 589,527, Dec. 8, 1933 (Cl. 22a. 1). Dyes insol. in water are obtained by coupling diazo compds. with 3-hydroxy-1,2-benzofluorenes, neither components contg. soly.-inducing groups. Thus, diazotized 1-amino-4-benzoylamino-5-methoxy-2-chlorobenzene is coupled with 3-hydroxy-1,2-benzofluorenone in dil. NaOH to give a dye useful for coloring pigment pastes. Another example and table of components and colors of dyes produced are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Werner Lange and Ulrich Dreyer, inventors). Ger. 589,636, Dec. 11, 1933 (Cl. 22a. 4). 1,3-Dihydroxybenzene or 1,3-dihydroxybenzenecarboxylic acid is coupled with 1 mol. of 2-nitro-1-amino-4-diazobenzene and 1 mol. of the same or another diazo or diazoazo compd. Thus, 2-nitro-1,4-diaminobenzene is diazotized and coupled with 1,3-dihydroxybenzene-5-carboxylic acid and diazotized 1-amino-4-nitrobenzene-2-sulfonic acid to give a dye which colors leather red-brown. Other examples are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Erwin Hoffa, Werner Kirst and Wilhelm Schumacher II, inventors). Ger. 589,637, Dec. 11, 1933 (Cl. 22a. 7). Dis- and poly-azo dyes, insol. in water, are prepd. by introducing an OH compd. into a tetrazo compd. in the presence of an acid, and then coupling with other components contg. no soly.-inducing groups, in acid, neutral or alk. mediums. Thus, cotton is treated with a soln. contg. 2,3-hydroxy-

naphthoylaminobenzene. The rinsed cotton is then treated with an acid soln. of benzene-1,4-bisdiazonium borofluoride. The resulting brownish red product is treated with a soln. of 2,3-hydroxynaphthoylaminobenzene. Other examples and a table of components are given.

**Azo dyes.** I. G. Farbenind. A.-G. (Karl Wiedemann, Heinrich Clingstein, Hans Krzikalla and Walter Kühn, inventors). Ger. 589,842, Dec. 15, 1933 (Cl. 22a. 2). Monoazo dyes contg. metal are prep'd. by treating dyes contg. 2,8-dihydroxynaphthalene-6-sulfonic acid as coupling component with a metal-yielding agent. Thus, 2-amino-1-hydroxybenzene-4-sulfonic acid is diazotized and coupled with 2,8-dihydroxynaphthalene-6-sulfonic acid. The resulting dye is dissolved in water and treated with  $\text{CrF}_3$  to give a dye which colors wool from an acid bath in fast reddish gray shades. Other examples are given. Cf. C. A. 27, 5194.

**Azo dyes.** I. G. Farbenind. A.-G. (Wilhelm Neelmeier and August Modersohn, inventors). Ger. 591,125, Jan. 17, 1934 (Cl. 22a. 1). New dyes are prep'd. by sulfonating 4,4'-dihydroxyazobenzene-3,3'-dicarboxylic acid, or its substitution products having alkyl or halogen in the 2-, 2', 6-, and (or) 6'-position, and (or) alkyl, halogen, or  $\text{SO}_3\text{H}$  in the 5- or 5'-position or the complex Cr compds. of any of these substances. Examples are given. The products are more sol. than the starting materials, and give clearer shades, which are sometimes more greenish.

**Azo dyes.** I. G. Farbenind. A.-G. (Hans Schindhelm and Richard Gast, inventors). Ger. 591,495, Jan. 22, 1934 (Cl. 22a. 13). Two mols. of an azo dye from diazotized 4-nitro-4'-aminostilbene (or dibenzyl)-2,2'-disulfonic acid are united by suitably modifying their  $\text{NO}_2$  groups. Thus,  $\text{NO}_2$  may be reduced to  $\text{NH}_2$  and 2 mols. of the product linked through a  $-\text{CO}-$  group, or the  $\text{NO}_2$  groups of 2 mols. may be partly reduced to form an azo or azoxy group. Substantive dyes having a strong affinity for vegetable fibers are obtained. The dyes may be subjected to any of the usual after-treatments for stilbene or azo dyes, e. g., oxidation, reduction, alkylation and conversion into complex metal compds. Examples are given.

**Azo dyes; dyeing.** Soc. pour l'ind. chim. à Bâle. Ger. 591,494, Jan. 22, 1934 (Cl. 22a. 1). Arylides of 2,3-hydroxynaphthoic acid are coupled in substance or on the fiber with diazotized aryl or aralkyl ethers of 2-amino-1-phenol-4- (or 5-) carboxylic acid esters or their substitution products. Red dyes are produced. Numerous examples are given. Cf. C. A. 27, 3830.

**Azo dyes; dyeing.** I. G. Farbenind. A.-G. (Max A. Kunz, Gerd Köchenderfer, Kuno Maurach and Walter Linbacher, inventors). Ger. 591,223, Jan. 19, 1934 (Cl. 22a. 1). Pyridinonaphthols or their substitution products are coupled with aromatic diazo compds., in substance or on the fiber, in the proportion of 1 mol. of diazo compd. for each OH group in the pyridinonaphthol. Dyes of various colors are produced. Numerous examples are given. The pyridinonaphthols may be prep'd. by alk. fusion from the corresponding sulfonic acids, which are obtainable from naphthylaminesulfonic acids by the method of Brit. 394,416 (C. A. 28, 1759).

**Azo dyes of the thiazole group containing metals.** Kichiji Takeuchi. Japan. 100,387, Apr. 4, 1933. Azo dyes of the thiazole group are prep'd. by coupling diazotized primuline with compds. obtained by heating a mixt. of aromatic compds. having OH and  $\text{CO}_2\text{H}$  groups in the ortho position and salts of Fe or Cr.

**Azo dyes containing chromium.** Fritz Straub and Hermann Schneider (to Soc. pour l'ind. chim. à Bâle). U. S. 1,946,951, Feb. 13. An azo dye of the general formula  $\text{HO}-\text{R}'-\text{N}=\text{N}-\text{R}''$  in which  $\text{R}'$  stands for a sulfonated naphthalene radical and  $\text{R}''$  a naphthol radical and in which the OH group is in *o*-position to the azo linkage, is caused to react in a medium the  $\text{pH}$  of which is not greater than 7.0 with an agent yielding Cr such as Cr fluoride and the medium is made alk. and the chroming is completed without sepu. of the chromiferous intermediate products formed. The Cr-contg. dyes

thus produced give fast dyeings and are suitable for making lakes.

**Disazo dyes.** I. G. Farbenind. A.-G. Fr. 756,808, Dec. 15, 1933. Diaminodiphenyl sulfones or their nuclear substitution products are tetrazotized and 1 mol. of the tetrazo compd. is coupled with 1 mol. of an *o*-hydroxycarboxylic acid of the  $\text{C}_6\text{H}_4$  series and 1 mol. of a 2-aryl-amino-8-naphthol-6-sulfonic acid.

**Vat dyes.** I. G. Farbenind. A.-G. Fr. 756,986, Dec. 18, 1933. Compds. obtained by condensing aceanthrenequinone or its derivs. with aromatic, aliphatic or alicyclic 1,2-diamines, substituted or not, are fused with caustic alkali and the products obtained are halogenated if desired. The condensation products have the general formula.

**Vat dyes.** I. G. Farbenind. A.-G. (Heinz Scheyer and Emil Schwamberger, inventors). Ger. 589,039, Dec. 20, 1933 (Cl. 22b. 3.04). Vat dyes contg. N are prep'd. by treating halogen derivs. of the products obtained by condensing anthrones with glyoxal (as in Ger. 550,712) with N compds. which contain at least 1 exchangeable H atom linked to the N. In an example, the dye obtained by condensing 2-chloroanthrone with glyoxal is treated with  $\alpha$ -aminoanthraquinone, calcined soda, CuCl and  $\text{PhNO}_2$  to give a dye coloring cotton from a yellowish brown vat in red-brown shades. Other examples are given.

**Vat dyes of the anthraquinoneacridone series.** Georg Kränzlein, Heinrich Vollmann, Hermann Boedeker and Hans Becker (to General Aniline Works). U. S. 1,911,086, Jan. 30. See Ger. 574,966 (C. A. 27, 4682) and Ger. 576,404 (C. A. 28, 9057).

**Vat dyes of the dibenzanthrone series.** Edward T. Howell (to E. I. du Pont de Nemours & Co.). U. S. 1,947,047, Feb. 13. Bluish green to yellowish green dyes are formed by reaction of dihydroxydibenzanthrone with alkylating agents such as contain the general grouping  $\text{Y}-\text{CH}_2-\text{CH}_2-\text{X}-\text{CH}_2-\text{CH}_2-\text{Z}$  in which X is an O atom, an imine group or radical or S atom, and wherein Y and Z both stand for the same or different strong acid radicals, for example, chloride, bromide, sulfate or arylsulfonate, which are characterized by their capacity of reacting with aryl hydroxy compds. to give ethers; or where one of the substituents Y and Z stands for a strong acid radical as defined, while the other stands for an ether or ester radical, such as O-alkyl, O-acyl or the like (in other words, alkylating agents characterized by the possession of such end groups that after complete reaction with dihydroxydibenzanthrone, a product will result containing the following grouping  $-\text{OCH}_2\text{CH}_2\text{XCH}_2\text{CH}_2-$  where X stands for O, S or an imine radical, and where one of the end O atoms is linked to a dibenzanthrone radical, while the other is linked to a H atom, an alkyl group, an acyl group or the like, or to the same or to a different dibenzanthrone radical). Several examples with details of procedure are given. Cf. C. A. 28, 1544.

**Dye compositions.** Alfred Hagenböcker and Rudolf Brune (to General Aniline Works). U. S. 1,945,484, Jan. 30. Preps. of thioindigoid dyes are prep'd. contg. 0.05-0.5 mol. proportion of an Fe, Cu, Zn or Sn salt such as  $\text{FeSO}_4$ ,  $\text{ZnSO}_4$  or  $\text{FeCl}_3$  which served to accelerate fixation of the dye.

**Dye preparation.** Imperial Chemical Industries Ltd. Ger. 587,509, Nov. 4, 1933 (Cl. 8m. 13). See Brit. 377,978 (C. A. 27, 4098).

**Dyes for cellulose esters and ethers.** Imperial Chemical Industries Ltd. Fr. 757,090, Dec. 20, 1933. Secondary disazo dyes contg. no  $\text{SO}_3\text{H}$  or  $\text{COOH}$  groups are prep'd. by combining a diazotized amine of the  $\text{C}_6\text{H}_5$  or  $\text{C}_{10}\text{H}_7$  series with a 2,5-dialkoxylaniline, diazotizing again and combining with an amine of the  $\text{C}_6\text{H}_5$  series, having 1 or

$\beta$ -hydroxyethyl groups in the amino group. Several examples are given. Thus, *p*-anisidine  $\rightarrow$  2,5-dimethoxyaniline  $\rightarrow$  *N*-ethyl- $\beta$ -hydroxyethylaniline gives a red on cellulose acetate.

**Anthraquinone dyes.** I. G. Farbenind. A.-G. Brit. 401,132, Nov. 9, 1933. See Fr. 748,571 (C. A. 27, 549-50).

**Blue basic dye.** The Head of the Tokyo Kôgyô Shikenjo (Morizô Yoshino, inventor). Japan. 99,537, Feb. 14, 1933. Addn. to 93,406 (C. A. 27, 1519). The dye is made by the reaction of PhNMe<sub>2</sub>, H<sub>2</sub>O, AcOH, MnO, and PhOH. Cf. C. A. 27, 1519.

**Indigoid dyes.** Soc. pour l'ind. chim. à Bâle. Fr. 756,401, Dec. 9, 1933. Dyes are obtained by oxidizing 3-oxythionaphthene contg. a halogen atom in the 4- or 7-position, an alkyl group in the 7- or 4-position, and an alkyl group in the 5- or 6-position, the 2 alkyl groups being meta to one another, or by condensing these compds. or their derivs. contg. a group capable of reacting in the 2-position, with components suitable for the production of indigoid dyes. The products may be halogenated. (Compds. of the 1st type include 7-chloro-4,6-dimethyl-3-(m. 111°), 4-chloro-5,7-dimethyl-3-(m. 118°), 7-bromo-4,6-dimethyl-3-, 4-bromo-5,7-dimethyl-2-carboxy-3-oxythionaphthene, the 2-(*p*-dimethylamino)anil of 7-chloro-4,6-dimethyl-3-oxythionaphthene, m. 253°, and 4-chloro-5,7-dimethylthionaphthenequinone. Compds. of the 2nd type include isatins, naphthatisatins, indoxyls, thionaphthenequinones, oxythionaphthenes and acenaphthenequinones.

**Oxazine dyes.** I. G. Farbenind. A.-G. Fr. 756,504, Dec. 11, 1933. Deep red, violet, blue and bluish green dyes are prepd. by heating to 150-300° a compd. of the

formula  $\text{CO.CX:C(NHRNH}_2\text{).CO.CX:C(NHRNH}_2\text{)}$  (X is H or halogen, R is an aromatic radical contg. at least 2 C<sub>6</sub>H<sub>4</sub> rings, one of which is joined to the NH group and the other to the NH<sub>2</sub>) in the presence of an acylating agent. Acylating agents may be used AcO, H<sub>2</sub>Cl, benzotrichloride or *p*-toluenesulfonyl chloride. The components may be boiled in a solvent of high b. p. with or without an oxidizing agent. The products may be used directly as pigments or converted by sulfonating to dyes sol. in water having a good affinity for vegetable fiber. The dyes have the formula I (Y signifies that they may contain acyl groups, Z that they may be sulfonated, R contains at least 2 C<sub>6</sub>H<sub>4</sub> rings as before, the O and N being joined to adjacent C atoms of one ring and the NH<sub>2</sub> being in the other ring). Examples are given.

**Pyranthronine dyes.** \* Wilfred M. Murch (to National Aniline and Chemical Co.). U. S. 1,945,405, Jan. 30. Vat dyes giving on cotton from the vat reddish violet to brownish violet shades changing on exposure to the air to reddish brown to yellowish brown are obtained by reacting pyranthronine with sulfuryl chloride in the presence of I and an aromatic nitro compd. such as PhNO<sub>2</sub>, removing the insol. chloropyranthronine which may be present in the reaction mass (suitably by partial cooling and filtering) and recovering the vat dyes from the residual reaction mass (as by concg. and further cooling). Cf. C. A. 27, 1193.

**Triarylmethane dyes.** I. G. Farbenind. A.-G. (Ottmar Wahl, Werner Muller, Adolf Kohn and Ernst Teupel, inventors). Ger. 590,748, Jan. 9, 1934 (Cl. 22b. 10). Addn. to 574,021 (C. A. 27, 3619). The process of Ger. 774,021 is modified by starting from *N*-arylaminoalkyl-sulfonic acids in which the sulfo group is linked to an

alkylene group higher than C<sub>2</sub>H<sub>4</sub>. An example is given of the prepn. of a dye from PhNBuCH<sub>2</sub>CH(SO<sub>3</sub>H)Me and *o*-chlorobenzaldehyde.

**1-Methylamino-4-aminonaphthoquinone.** Soc. pour l'ind. chim. à Bâle. Ger. 591,170, Jan. 17, 1934 (Cl. 22b. 3.02). See Brit. 396,662 (C. A. 28, 654\*).

**Dyeing.** I. G. Farbenind. A.-G. (Arthur Zitscher and Wilhelm Seidenfaden, inventors). Ger. 588,212, Nov. 14, 1933 (Cl. 8m. 12). Addn. to 560,797 (C. A. 27, 1204). In producing insol. azo dyes on the fiber by using antidiazotates, alkali and hydroxy compds., by the method of 560,797, alkali antidiazosulfonates of the general formula *p*-R.NH.C<sub>6</sub>H<sub>4</sub>N=N.SO<sub>3</sub>M are used, R denoting an alkyl, aralkyl or alicyclic residue and M an alkali metal. Thus, cotton is printed with a paste contg. Na 4-benzylamino-2,5-dimethoxybenzene-1-diazosulfonate, 2,3-hydroxynaphthoquinonaminobenzene, NaOH, thiodyglycol, Na<sub>2</sub>CrO<sub>4</sub>, water and starch-tragacanth thickening. The printed ware is dried, steamed, washed and rinsed. Another example is given.

**Dyeing.** Oranienburger Chemische Fabrik A.-G. (Kurt Lindner, inventor). Ger. 589,508, Dec. 8, 1933 (Cl. 8m. 3.01). Solns. of S dyes or vat dyes are made stable by addn. of highly sulfonated condensed sulfonic acids or sulfonates obtained by the action of halosulfonic acid on mixts. of natural fats, fatty acids or fat-like substances and condensable aliphatic or aromatic compds. such as hydrocarbons, alcs., phenols, lactones, ketones, etc. Thus crude oleic acid is mixed with C<sub>6</sub>H<sub>5</sub> and treated with ClSO<sub>3</sub>H. The product is then treated with alkali carbonate to give a dye-stabilizing prepn. Other examples are given.

**Improvement of dyeing with alkaline dyes.** Hikoji Satô. Japan. 100,531, Apr. 11, 1933. Addn. to 89,540 (Cl. 1. 25, 3176). Cloths or threads are treated with a dil. soln. of the astringent juice of the persimmon before dyeing with an alk. dye.

**Dyeing materials comprising cellulose acetate.** George H. Illis and Henry C. Olpin (to Celanese Corp. of America). U. S. 1,947,038, Feb. 13. Compds. such as *p*-tolyl-4-chloro-2-nitroaniline or the like are used for dyeing materials such as cellulose acetate fast yellow to orange shades.

**Dyeing animal fibers.** Hans Bucherer. Ger. 591,212, Jan. 18, 1934 (Cl. 8m. 11.01). Animal fibers are dyed with mordant dyes in baths contg. free NH<sub>3</sub>, with or without (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub>. The fibers may first be mordanted and then dyed, or the mordant and the dye may be applied from the same bath. The dyed fibers are preferably after-treated in a weak AcOH bath contg. a little K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>. Examples are given.

**Dyeing wool.** Soc. pour l'ind. chim. à Bâle. Ger. 591,315, Jan. 19, 1934 (Cl. 8m. 12). In dyeing wool by treatment in turn with an azo dye component and a diazo compd., improved results are obtained by first subjecting the wool to slight chlorination.

**Dyeing and printing.** Durand & Huguenin A.-G. Ger. 591,410, Jan. 20, 1934 (Cl. 8m. 3.02). In dyeing and printing with dyes of the *N*-dihydro-1,2,2',1'-dianthraquinonazine group, by processes involving the oxidation of an ester salt of the leuco compd. of the dye in an acid medium, no special precautions are taken to avoid over-oxidation, but instead the dyed material is brought to the required color by after-treatment with a reducing agent in a mild alk. bath. Examples are given.

**Compositions for use in dyeing and printing.** Mordecai Mendoza, Arthur G. Murray and Herbert B. Briggs (to Imperial Chemical Industries Ltd.). U. S. 1,947,433, Feb. 13. A compn. which is suitable for use in printing fabrics comprises stoichiometric proportions of the formaldehyde-bisulfite compd. of a primary arylamine free from azo groups such as 5-chloro-*o*-toluidine, aniline or *o*-anisidine and alkali nitrite and an arylamide such as the *o*-aniside of 2,3-hydroxynaphthoic acid.

**Printing with vat dyes.** I. G. Farbenind. A.-G. Fr. 756,817, Dec. 15, 1933. Moist materials printed with vat dyes and on which are found the dye, a thickener, an alkali and a hyposulfite or one of its derivs., are developed

by reducing the dye on the material as quickly as possible, preferably at a temp. below 100°. The dye is fixed on the material at a temp. below that used for the reduction. An app. is described which regulates the moisture.

**Printing cotton.** Sebastian Gassner and Hermann Berthold (to General Aniline Works). U. S. 1,945,221, Jan. 30. A printing paste is used comprising a vat dye and an alkali metal salt of a compd. such as an unsubstituted sulfonic or carboxylic acid of the benzene or naphthalene series, hydrogenation products, or alkyl-, hydroxy- or dialkylamino-substitution products of benzene or naphthalenesulfonic acids. Numerous examples are given.

**Printing cotton.** I. G. Farbenind. A.-G. and A. Carpmal. Brit. 372,828, May 12, 1932. Divided on 373,212 (C. A. 27, 4099) and addn. to 343,102 (C. A. 25, 5575). The process of 343,102 is extended to S dyes, which are converted into pastes suitable for cotton printing by reduction in the presence of H<sub>2</sub>O and glycerol or other H<sub>2</sub>O-sol. alc. and an alkali weaker than an alkali metal hydroxide. Hyposulfites, glucose and titanous salts may be used as reducing agents and hydrotropic agents, e. g., Na benzenesulfonate, benzylanilinesulfonates, may be added before, during or after the reduction. Among examples (1) the dye obtained by S fusion of carbazole-indophenol is reduced by Na hyposulfite in the presence of H<sub>2</sub>O, glycerol and NH<sub>3</sub> and (2) indocarbon CL is similarly reduced.

**Printing wool.** I. G. Farbenind. A.-G. (Max Zabel, Oskar Falek and Hans Seifert, inventors). Ger. 591,476, Jan. 22, 1934 (Cl. 8a. 1.02). Aminoacetic acid or a salt thereof is added to printing or discharge pastes used for coloring wool with vat dyes. Examples are given.

**Rotary machine for dyeing textiles.** Juan Rabassa. Fr. 756,954, Dec. 18, 1933.

**Apparatus for dyeing and other treatments of yarns and fabrics.** Peter W. Custers. Ger. 587,200, Nov. 1, 1933 (Cl. 8a. 9.70). Addn. to 569,612 (C. A. 27, 3833).

**Fibers.** Charles V. Rowell. Ger. 589,844, Dec. 15, 1933 (Cl. 29a. 7). App. for treating hemp, etc., with steam under pressure to produce spinnable fibers is described. Cf. C. A. 27, 5562.

**Treatment of fibers.** Sakumatsu Nishioka. Japan. 100,339, March 29, 1933. By treating fibers with a mixt. of gelatin soln., boric acid, paraformaldehyde, phenol-formaldehyde condensation product, alum and camphor, they are made strong, antiseptic, waterproof and lustrous.

**Vegetable fibers resembling silk.** Kiyoshi Watanabe and Kunji Ina. Japan. 99,070, Jan. 16, 1933. Vegetable fibers are treated with caustic alkali, water and a colloidal soln. of silk.

**Textile fabric.** Henry Dreyfus. U. S. 1,947,465, Feb. 20. A textile filling strand is formed of a plurality of individually twisted ends such as cellulose acetate temporarily maintained in parallel but untwisted relation by a removable bounding agent.

**Treatment of cloth and thread.** Ichitarô Syôji. Japan. 100,072, March 13, 1933. Cloth or thread is treated with a water-sol. condensation product of urea and HClHO heated at about 80° and treated with dil. acid (e. g., 0.3% H<sub>2</sub>SO<sub>4</sub>), washed with H<sub>2</sub>O and dried. The quality of the material is improved.

**Pretreatment of textiles for dyeing.** Sadaichi Imai (Ushinosuke Imai, inventor). Japan. 100,503, Apr. 10, 1933. Before dyeing red, cloth is treated with an aq. soln. of Na silicate and phosphate neutralized or made slightly acidic with dil. H<sub>2</sub>SO<sub>4</sub> contg. a sugar, glycerol or the like.

**Machine for treating textiles with chemicals.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. (Georg Wolff, inventor). Ger. 589,773, Dec. 14, 1933 (Cl. 8a. 5.01).

**Delustering fabrics containing cellulose derivatives such as cellulose acetate.** Camille Dreyfus. U. S. 1,947,002, Feb. 13. The fabric is thoroughly wetted by prolonged treatment with non-saponifying aq. liquids such as a non-saponifying aq. soap soln. and is then subjected

to the action of a delustering agent such as a soap soln. at higher temp.

**Liquid treatments of fabrics such as those comprising cellulose acetate.** George H. Ellis (to Celanese Corp. of America). U. S. 1,947,039, Feb. 13. In the treatment of materials in folded form with liquid such as scouring or dyeing soln., creasing is avoided by a preliminary treatment of the material with a non-saponifying aq. liquid such as hot very dil. soap soln. contg. Turkey-red oil for at least 2 hrs. while in unfolded form.

**Improving the resiliency of cellulosic textile fibers such as those of cotton or rayon.** Frank R. Redman (to Resilient Rayons, Inc.). U. S. 1,945,449, Jan. 30. The fibers are successively immersed in a bath of albuminous material such as gelatin soln. and in an insolubilizing agent such as formaldehyde and then dried while mechanically treated to sep. the fiber from each other.

**Conditioning yarns containing organic cellulose derivatives such as cellulose acetate, etc.** Frederick J. William and Herbert E. Martin (to Celanese Corp. of America). U. S. 1,945,959, Feb. 6. The yarns are rendered more amenable to knitting by treatment with a conditioning liquid contg. a liquid polyhydric alc. such as diethylene glycol and an oil such as castor oil together with a solvent such as BuOH.

**Treating artificial yarns, etc.** British Celanese Ltd. Brit. 400,988, Nov. 6, 1933. The flexibility of yarns, bristles, straws, etc., made of or contg. org. derivs. of cellulose is increased and their stability to storage improved by treatment with an alkyl ester of a hydroxybutyric acid, applied as such or dild. with a non-solvent for the cellulose deriv., e. g., H<sub>2</sub>O, triethylene glycol. In examples cellulose acetate yarn is treated with a mixt. of Et  $\alpha$ -hydroxybutyrate, diethylene glycol and H<sub>2</sub>O.

**Filaments and yarns.** Camille Dreyfus and William Whitehead (to Camille Dreyfus). Can. 339,118, Jan. 30, 1934. Filaments and yarns contg. an org. deriv. of cellulose are treated with a finely divided, insol. salt of a higher aliphatic acid in the presence of a swelling agent for the org. deriv. of cellulose. Suitable salts include stearate, oleate, palmitate, cerotate and claidate of Zn, Al, Mg, Ca, Sr and Ba. Swelling agents are Me<sub>2</sub>CO, HOAc, thiocyanates of Na, K or NH<sub>4</sub>, diacetone alc., etc. The treated filaments or yarns have a pleasing appearance and improved textile properties.

**Saponifying cellulose ester filaments, yarns fabrics, etc.** Henry Dreyfus. Brit. 400,996, Nov. 6, 1933. Loss of strength during sapon. is avoided by using sapon. media contg. oils which may be of mineral, vegetable or animal character or sol. oils such as sulfonated castor oil. In examples the baths consist of (1) aq. NaOH contg. Turkey-red oil, (2) a homogeneous aq. mixt. contg. triethanolamine, oleic acid and olive oil and, (3) an emulsion of light mineral oil in soap soln. contg. NaOH.

**Machine for sizing and finishing cotton and other yarns or threads.** George Hill. Brit. 401,327, Nov. 7, 1933. Divided on 400,808 (C. A. 28, 2198\*).

**Apparatus for the wet treatment of hanks.** Hans Wagner. Ger. 591,473, Jan. 22, 1934 (Cl. 8a. 8.01).

**Apparatus for the wet treatment of fabric webs.** Zittauer Maschinenfabrik A.-G. Ger. 591,474, Jan. 22, 1934 (Cl. 8a. 9.70).

**Apparatus for the wet treatment of rayon cakes.** Feldmühle A.-G. vorm. Loeb, Schoenfeld & Co. Ger. 591,131, Jan. 17, 1934 (Cl. 29a. 6.08).

**Apparatus for washing and after-treating rayon cakes.** Otto Jüntsch. Ger. 591,130, Jan. 17, 1934 (Cl. 29a. 6.08).

**Rayon of animal origin.** Gentô Yamanouchi. Japan. 99,190, Jan. 26, 1933. A soln. for rayon manuf. is prepd by dissolving silk or the like in a soln. of basic salts and hydroxides of alkali or alkali earth metals.

**Rayon.** Soc. pour la fabrication de la soie artificielle "Rhodiaseta." Fr. 756,832, Dec. 15, 1933. Threads which, even after a drawing above 100% still have an appreciable plastic stretch, are obtained by using dichloroethane as drawing liquid.

**Rayon.** The Viscose Co. Fr. 757,008, Dec. 10, 1933. A mat thread is obtained by adding  $\text{TiO}_2$  (0.1-5) and chlorobiphenyl (about 4.5%) to the spinning soln.

**Regeneration of silk thread.** Shigenosuke Tsuda. Japan. 99,164, Jan. 25, 1933. A colloidal soln. is prepd. by dissolving silk with a soln. of  $\text{Ca}(\text{NO}_3)_2$  and  $\text{NaSCN}$  or  $\text{Ca}(\text{SCN})_2$  or  $\text{NaI}$ . The fiber is regenerated by passing the colloidal soln. through a soln. of  $\text{Na}_2\text{SO}_4$  and  $\text{ZnSO}_4$  acidified with  $\text{H}_2\text{SO}_4$ .

**Treatment of silk thread.** Ken'ichi Kakeyama and Toyokichi Mukawa (Tamotsu Kanchako, inventor). Japan. 99,693, Feb. 22, 1933. Silk thread is passed through a cold aq. soln. of  $\text{NaOH}$ , milk and  $\text{NH}_4\text{OH}$ , to which an aq. soln. of  $\text{NaOH}$  and sesame oil is gradually added. The thread is then steamed and dried. Thread thus treated is suitable for making knitted goods.

**Degumming silk.** Wallerstein Co. Inc. Fr. 756,911, Dec. 18, 1933. Raw silk is impregnated with a protease prep., preferably in the presence of an impregnating agent, and dried without eliminating an appreciable amt. of its gum. The gum is afterward removed by immersion in hot water.

**Sizing silk.** Joseph Condamin. Fr. 756,510, Dec. 11, 1933. The silk is wound on perforated bobbins which are dipped into a sizing bath until said, and the excess liquid is removed by centrifuging.

**Coating fabrics with rubber or the like.** John McGavack (to Naugatuck Chemical Co.). U. S. 1,946,090, Feb. 6, 1933. Latex material is spread on an inclined upwardly moving band of material under the action of gravity opposed to the movement of the band. App. is described.

**Removing fatty and pitchy substances from animal**

**fibers.** Viktor Fluss. U. S. 1,947,522, Feb. 20. Animal fibers such as hair and wool are cleansed and rendered more readily feltable by treating with a solvent such as trichloroethylene at temps. below  $0^\circ$  at about atm. pressure or less, while preserving the fibers themselves intact.

**Treating woolen fabrics in order to improve them for fume bags, etc.** Edgar A. Slagle (to American Smelting and Refining Co.). U. S. 1,947,024, Feb. 13. The fabric is treated with a colloidal soln. of  $\text{BaSO}_4$ .

**Cleaning wool.** Walter Saare. Brit. 401,525, Nov. 16, 1933. Pitch and similar coloring materials are removed from sheep wool by treating with the vapor of a volatile solvent, e. g., hexalin, tetralin, trichloroethylene, cooling, expressing the condensed solvent by pressure and then washing the degreased wool with an alkali soln., e. g., a soap or soda soln.

**Apparatus for cleaning and sterilizing feathers.** Frank I. Klayman and Frederick R. Lawrence (Klayman to Louis Gordon). U. S. 1,945,290, Jan. 30. Various structural and operative details are described.

**Dry-cleaning preparation.** Dunlop Rubber Co. Ltd. Ger. 585,533, Oct. 4, 1933 (Cl. 30b. 13). See Brit. 358,584 (C. A. 26, 4127).

**Bleaching.** Soc. anon. pour l'ind. chim. à Bâle. Ger. 580,774, Dec. 13, 1933 (Cl. 8i. 2). See Fr. 743,925 (C. A. 27, 4102).

**Waterproof cloth.** Sannojo Ushiyama. Japan. 100,281, March 27, 1933. Addn. to 95,695 (C. A. 27, 3624). Cloth is waterproofed by painting a mixt. of glue and  $\text{NaOH}$  and a mixt. of linseed oil, Fe powder, etc., and powd. hair on both sides.

## 26 PAINTS, VARNISHES AND RESINS

A. H. SABIN

**International standardization in the field of paints.** C. P. A. Kuppelmeier. *Ind. Standardization* 4, 135-7 (1933). Alden H. Emery

**Casein paints.** F. C. Atwood. *Am. Paint J.* 18, No. 19, 48, et seq., No. 21, 17 et seq. (1934). G. G. S.

**The use of metallic zinc paint for the protection of metal surfaces.** H. P. Britsch. *Agr. Eng.* 14, 337 8 (1933).—Owing in part to its chem. compn. and in part to its unusual distensibility, metallic Zn paint affords much better adherence to Zn and Zn-coated surfaces than many other paints commonly used for this purpose. K. D. Jacob

**Standard methods of routine analysis of white pigments.** Am. Soc. Testing Materials A. S. T. M. Designation: D31-33; Am. Standards Assoc. A. S. A. No.: K15-1933, 12 pp. (1933). Alden H. Emery

**Standard methods of routine analysis of dry red lead.** Am. Soc. Testing Materials A. S. T. M. Designation: D39-33; Am. Standards Assoc. A. S. A. No.: K16-1933, 6 pp. (1933). Alden H. Emery

**The darkening of chrome oxide green at high temperature.** J. P. Saché. *Farben-Chem.* 5, 49-50 (1934).—The darkening of chrome oxide green at red heat is ascribed to the formation of a darker cryst. modification. G. G. S.

**Phenols as antioxidants in drying oils.** R. S. Hilpert and Cl. Niehaus. *Angew. Chem.* 47, 86-90 (1934).—Expts were made on the action of some phenols upon the drying of linseed oil and wood oil, with and without addns. of Co, Pb and Mn driers. Uniform conclusions could not be obtained. Exptl. results and twelve references are given. Karl Kammermeyer

**Recent developments in the nitrocellulose-lacquer industry in 1933.** H. Schmidt. *Nitrocellulose* 5, 23-6 (1934).—A review. E. M. Symmes

**Crystal japan finish on metal.** C. F. Scribner. *Ind. Finishing* 10, No. 4, 26-30 (1934).—Crystal japan can be applied directly on metal or wood; it gives hard and attractive finishes which make rough surfaces appear smooth. The crystal size is controlled by the heaviness

of the coat. Special oven conditions and baking schedules are outlined. Crinkle japan is a similar attractive finish which requires somewhat different baking conditions. D. Thuesen

**Baked finishes on die castings.** C. F. Scribner. *Ind. Finishing* 10, No. 4, 30-40 (1934).—Practical suggestions for obtaining better finished products are given. D. T.

**Fundamentals of the production and use of processed fossil gums.** Wilhelm Krumbhaar. *Official Digest Federation Paint Varnish Production Clubs* No. 134, 43 8 (1934).—The running process of fossil gums must be conducted so that the percentage of dibasic acids will not be excessively reduced. Mastication between steam-heated rollers renders copals more sol. and fusible. After running, the processing is completed by neutralization of the acids with  $\text{MgO}$  or  $\text{CaO}$ , or by esterification with glycerol. Copal esters are sol. in petroleum spirits and in oils. Varnishes contg. them give off no odor after baking, have good  $\text{H}_2\text{O}$  resistance and are compatible with all pigments. G. G. Sward

**Tornesit.** R. A. Coolahan. *Official Digest Federation Paint Varnish Production Clubs* No. 133, 39-42 (1934).—"Tornesit" is stable at temps. up to  $100^\circ$ ; decompn. is not serious until  $135^\circ$  and at  $150^\circ$  it begins to char. "Hercolyn," chem. plasticizers, blown linseed oil and bodied tung oil are suitable plasticizers. Amberols, coumarones, alkyds, ester gums and dammar may be used with Tornesit. A wide range of pigments may be used. Tornesit coatings have proved successful in various places about a nitrocellulose factory. G. G. Sward

**Linoleum (not requiring) treatment in the drying house.** Felix Fritz. *Kunststoffe* 23, 234-5 (1933).—Various practical means are described for hastening or eliminating the process of drying linoleum after applying the linoleum mass to the jute background. J. W. Perry

**Determining when printed linoleum is ready for use.** A. I. Kogan and P. A. Sikar. *Farben-Chem.* 5, 50-3 (1934).—Abrasion resistance is considered better than tackiness as a measure of the dryness of printed linoleum. There is described an abrasion-resistance device in which

an abrasive block (a mixt. of molten S and emery) is moved to and fro over the surface under test. G. G. S.

**A new fossil resin—Kiscellite.** L. Zechmeister, G. Tóth and A. Koch. *Centr. Mineral. Geol.* A1934, 60-1; cf. C. A. 22, 47, 4085.—The brownish green resin had hardness of about 2, sp. gr. = 1.186,  $n_D^{20}$  = 1.5418, m. p. indefinite. On heating,  $H_2S$  is evolved. Analysis: C 84.47, H 11.12, S 3.99, ash 0.31, sum = 99.89%. This is the first natural resin found which contains no O.

Michael Fleischer

**Applications of countercurrent mixers in the artificial-resin industry.** Paul Wicssner. *Kunststoffe* 24, 3-5 (1934).—Descriptive with diagrams. J. W. P.

**Rapid determination of the pressure required in molding articles from artificial resins.** K. Brandenburger. *Kunststoffe* 23, 253-4 (1933).—A nomograph to facilitate calcs. is given and its use explained with examples. J. W. P.

**The influence of the material of the apparatus on the condensation of artificial resins.** K. Brandenburger and Ernst L. Marx. *Kunststoffe* 24, 32 (1934).—The material used in making app. for prepg. artificial resins affects not only the color of the product but also the rate of condensation. J. W. Perry

**New fillers for artificial-resin masses.** K. Brandenburger. *Kunststoffe* 23, 204-5 (1933).—Tests with various org. fillers, e. g., ground wood, small bits of paper, etc., revealed that the use of cotton-silver imparted the best mech. properties to articles prepd. from artificial resins. J. W. Perry

**Resins and resinous substances (Rollett, Petter) 10.** Furnace for oxidizing Pb to Pb oxide (Russ. pat. 1085) 1. Azo dyes [products used in printing inks and paints] (U. S. pat. 1,947,027) 25. Esters of higher acids and alcs. [used in coating compus.] (U. S. pat. 1,944,887) 10. Condensation products [for lacquers] (Brit. pat. 401,237) 13. Artificial masses [products used for manuf. of lacquers] (Brit. pat. 401,200) 18.

**Paint.** Torazô Kamata (Kikuzô Kamata, inventor). Japan. 99,138, Jan. 24, 1933. A mixt. of linseed oil (7), Turkey-red oil (3) and white wax (1) is heated at 50-200° and then is mixed with talc (5-10).

**Paint for ship.** Isaburô Toda. Japan. 99,773, Feb. 24, 1933. The paint is prepd. by heating copal gum, tar oil, asphalt, graphite, mica, etc.

**Bituminous paint.** Samuel W. Sparks (one-third each to Robert T. Lytle, Lawrence W. Stoffel and Price S. McPherson). U. S. 1,945,869, Feb. 6. A paint which is suitable for use on various materials comprises the reaction products of bituminous rock,  $HNO_3$ ,  $H_2SO_4$  and collodion.

**Minium paint.** Nippon Kakô Penki K. K. (Nobumasa Nogami, inventor). Japan. 99,858, March 1, 1933. Minium is mixed with a volatile solvent soln. of metallic soap of linoleic acid or other aliphatic acids.

**Water paint.** Herman A. Scholz and Wilbur S. Randel (to U. S. Gypsum Co.). U. S. 1,947,497, Feb. 20. A paint suitable for use on interior walls, etc., after admixture with water and linseed oil comprises a mineral filler such as a tremolite and dolomite mixt. 59.7, casein 6, a Ti pigment 20,  $ZnO$  3, Irish moss 0.1, hydrated lime 9, borax 2 and tribromophenol 0.2 part. U. S. 1,947,498 (Herman A. Scholz (to U. S. Gypsum Co.)) relates to a dry compn., forming a smooth mixt. with water and permanently stable in storage, comprising casein particles coated with oil together with sufficient anhyd. Na borate to serve as a latent solvent for the casein, and which also may contain  $NaF$ , lime or  $K_2Cr_2O_7$ , etc.

**Painting.** Wilhelm Lühl. Ger. 591,084, Jan. 16, 1934 (Cl. 75c. 10). A priming compn., on which water paints or oil paints or both in turn can be applied, comprises an unboiled vegetable oil 40-65, glycerol or like alc. 30-55, and spermaceti about 5%, together with an optional amt. of a mineral filler other than  $CaCO_3$ .

**Surface treatment of magnesium and its alloys to form a coating to which paint, etc., will adhere.** Edward C. Burdick and Wm. H. Gross (to Dow Chemical Co.). U. S. 1,947,122, Feb. 13. The surface is subjected to the

action of a soln. of a di-H phosphate such as that of  $Na_2$  and a compd., such as the Na salt of chromic, tungstic or metavanadic acid.

**Wood filler.** James F. Walsh (to Celluloid Corp.). U. S. 1,947,438, Feb. 13. A cellulose ester such as cellulose nitrate or acetate 100, is used with a substantially nonvolatile liquid modifier such as dibutyl phthalate, 35-60, a comminuted org. filling material such as wood flour 250 and a volatile solvent such as alc. and acetone 600-640 parts.

**Pigment.** Carl J. Harbert (to Harshaw Chemical Co.). U. S. 1,945,809, Feb. 6. See Brit. 393,474 (C. A. 28, 351<sup>1</sup>).

**Pigments.** Julian T. Baldwin (to Sandura Co.). U. S. 1,946,052, Feb. 6. For coating the surface of a pigment such as lithopone comprising a metal compd. adapted to react with fatty acids, it is subjected to hot oxidized fatty acid vapors such as those from soy-bean oil to form a thin film of soap of the metal and the oxidized fatty acid on the surface of the pigment. U. S. 1,946,053 relates to a pigment coated with a film formed of the Zn soap of blown soy-bean oil. U. S. 1,946,054 relates to a process involving dissolving a water-sol. soap of an oxidized acid such as oxidized linoleic acid in an aq. suspension of a pigment and adding a metallic salt such as  $ZnSO_4$  which will react with the water-sol. soap to form a water-insol. soap to coat the individual particles of the pigment. U. S. 1,946,055 relates to a pulverulent pigment such as lithopone the particles of which are coated with a soap (such as the Zn soap) of an oxidized acid (such as oxidized linoleic acid) having more than 7 C atoms in its chain.

**Pigments.** Albert Sander. Fr. 756,415, Dec. 9, 1933. Dyes or pigments are made by reaction of a salt of Zn or Cd or a mixt. thereof on an org. compd. of S, to form a metal sulfide. S compds. include compds. of thiocarbonic acid, xanthates, thiocarbamides, isothiocyanates and thiocarbamilides.

**Pigments.** "Kolloidchemie" Studiengesellschaft m. b. H. Johannes B. Carpozow, Robert Lenzmann, Martin March and Hermann Sanders. Ger. 588,447 Nov. 21, 1933 (Cl. 22f. 10). Addn. to 555,714 (C. A. 26, 6153). The method of 555,714 for making pigments is applied to a mixt. of sea ooze and org. dyes. Thus, crude aniline oil contg.  $PhNH_2$  and toluidine is intimately mixed with sea ooze *in vacuo* and dried. The product is oxidized by exposure to air or treatment with  $H_2O_2$ , to give a brownish red to wine-red pigment. Other examples are given.

**Pigments.** I. G. Farbenind. A.-G. (Erich Korinth and Georg Meder, inventors). Ger. 589,783, Dec. 14, 1933 (Cl. 22f. 10). Inorg. pigment is prepd. by mixing  $ZnO$  with one or more colored oxides of the type  $MO$ ,  $M$  denoting a metal, and heating till a solid soln. or mixed crystals are produced. Thus,  $ZnSO_4 \cdot 7H_2O$  and  $MnSO_4 \cdot 4H_2O$  crystals are ground and intimately mixed. The mixt. is heated to glowing to drive off  $SO_2$  and water and is reduced to the  $MnO$  stage by heating in an atm. of CO or  $CO_2$ . A bright brown pigment results. Other examples are given.

**Pigments.** Pál Zelenka. Hung. 107,940, Jan. 2, 1934. Melted metal or alloy is sprayed under pressure against a heated gas or air current (or, if desired, in the same direction as the current). The heat of the current vaporizes the metals and the vapors are oxidized by some method.

**Pigments from exhausted gas-purifying masses.** Gyula Baranyi. Hung. 107,461, Dec. 1, 1933. The free and org. S and carbonizable org. matter of the mass are evapd. and ignited. Disintegrated iron particles or ignited lime may also be added. Yellow, brown and red pigments are obtained in different parts of the furnace; dark-red material, e. g., is formed in the hottest portion, at 500-650°. Cf. C. A. 27, 4107.

**Lithopone.** Wm. C. Hooey and Edmund J. Flynn (to New Jersey Zinc Co.). U. S. 1,945,551, Feb. 6. Aq. solns. of BaS and  $ZnSO_4$ , at least one of which contains a precipitable Mg compd. in soln., such as  $MgSO_4$ , are brought together, and the main reaction is terminated before an appreciable amt. of Mg compd. is pptd. Cf. C. A. 27, 2830.

**zinc sulfate.** Silesia Verein chem. Fab. (Peter Schüssler and Paul Hegenberg, inventors). Ger. 591,280, Jan. 19, 1934 (Cl. 22f. 7). Roasted ores contg. Fe and Zn are treated with  $H_2SO_4$  of 50–80°Bé. and then calcined in an oxidizing atm. at a temp. below the decompn. temps. of  $ZnSO_4$  and  $Fe_2(SO_4)_3$ , e. g., below 450°. The product is lixiviated and filtered, and the filtrate is treated with ZnO or  $ZnCO_3$  to ppt.  $Fe(OH)_3$ . The soln. of  $ZnSO_4$  is filtered, and the residue of  $Fe(OH)_3$  is calcined at 400–500°.

**Cadmium yellow.** Silesia Verein chemischer Fabriken Fr. 757,225, Dec. 22, 1933. Clear Cd yellow, tending toward the green is made by mixing the  $CdS$ , pptd. and dried, with  $ZnS$  or material contg.  $ZnS$ , e. g., lithopon, and afterward heating the mixt. to 350–450°.

**Iron-containing black pigment.** Béla Moskovits. Hung. 107,553, Dec. 1, 1933. An org. material, e. g., sawdust, is added to Fe oxide or material contg. it. The org. matter forms reducing gases during dry distn. The cooled product is treated by magnetic sepn. and then ground to powder.

**Titanium white.** Hartmut W. Richter. U. S. 1,947,226, Feb. 13. In the hydrolysis of highly acid solns. of  $TiO_2$  in  $H_2SO_4$  to produce a ppt. suitable for conversion into a pigment, the temps. and pressures necessary for hydrolysis are lowered by adding a soln. of more basic Ti sulfate contg.  $H_2SO_4$  and  $TiO_2$  in a ratio by wt. of less than 1.8:1.0.

**Zinc white.** Zinkhütte Neu-Erlaa G. m. b. H. Ger. 589,593, Dec. 11, 1933 (Cl. 22f. 4). App. for producing the above pigment by distg. Zn and burning the resulting Zn vapor is described.

**Ink.** Matahei Shinozaki. Japan. 99,701, Feb. 22, 1933. A mixt. of gallnut ext., dil.  $H_2SO_4$ , dil. oxalic acid, ferric oxalate,  $FeSO_4$  and  $Al_2(SO_4)_3$ , and an aniline dye is kept at 1–2° until impurities are pptd. The time of manuf. is thus very much shortened.

**Printing ink.** I. G. Farbenind. A.-G. (Ernst Knebel, Arthur Hügel and Heinrich Steimeyer, inventors). Ger. 591,456, Jan. 22, 1934 (Cl. 15f. 7.01). Sol. condensation products of polyhydric alcs. with polybasic org. acids are used as components of inks for plain or relief printing.

**Gravure ink.** Kizydō Kawamura. Japan. 99,782, Feb. 27, 1933. The ink is prepd. from metallic alginates, wax, resin, oil, higher fatty acid, pigment, etc.

**Mimeograph ink.** Shinjirō Horii. Japan. 99,266, Feb. 1, 1933. The ink is a mixt. of oils (such as linseed, castor or soy-bean oil), wax, soap of org. bases (such as ethanol-amine oleate or hydroxyethylamine naphthenate), dyes or pigments and water. It does not corrode metals.

**Stamp ink.** Tōyō Seikan K. K. (Iwao Siga, inventor). Japan. 100,572, Apr. 15, 1933. The ink is prepd. by dissolving induline in crude cresol or MeOH.

**Linseed-oil substitute.** Hakodate Seiyū K. K. (Kintarō Hashimoto, inventor). Japan. 100,422, Apr. 6, 1933. A hydrocarbon oil (such as light oil) contg. absorbed  $H_2S$  is heated with animal and soy-bean oils, while air is bubbled into the mixt.

**Promoting the drying of oils and varnishes.** Hōnen Seiyū K. K. (Mitsuo Nakamura, inventor). Japan. 99,478, Feb. 10, 1933. Addn. of about 5% of aromatic ketones, aldehydes or their derivs. promotes the drying of oils or varnishes. Acetophenone, benzophenone, benzaldehyde and salicylaldehyde are examples.

**Accelerator for drying of oils and varnishes.** Hōnen Seiyū K. K. (Mitsuo Nakamura, inventor). Japan. 99,977, March 7, 1933. Addn. of about 5% of a phenol ether (such as isosafrole or anethole) accelerates the drying of oils and varnishes.

**Coating composition.** Herbert A. Endres (to The Goodyear Tire and Rubber Co.). Can. 339,070, Jan. 30, 1934. One hundred lbs. of the chlorostannic acid reaction product of rubber is mixed with 10 lbs. of carbon black on cooled mill rollers until a homogeneous sheet is obtained. This is dispersed in 50 gallons of solvent naphtha and 5 lbs. of tung oil. This coating compn. has unusual resistance to the deleterious action of acid, alk., saline

and other corrosive solns. Other pigments as  $ZnO$ ,  $BaSO_4$ ,  $TiO_2$ , lithopons,  $Al_2O_3$ ,  $Fe_2O_3$ , and org. dyes may be added to the rubber conversion product on the mixing rollers. Solvents such as turpentine,  $CCl_4$ ,  $CS_2$ ,  $CHCl_3$ , petroleum solvents and coal-tar solvents may be used. Cf. C. A. 28, 9177.

**Coating compositions.** Imperial Chemical Co. Ltd., Arthur Hill, Rowland Hill and Eric E. Walker. Brit. 401,309, Nov. 9, 1933. A binuclear dihydric phenol, derived from *o*-cresol and ketones, e. g.,  $Me_2CO$ , cyclohexanone, or aldehydes other than  $CH_3O$ , e. g.,  $AcH$ , butyraldehyde,  $BzH$ , is condensed with  $CH_2O$  or a compd. contg. a reactive  $CH$  group in an acid medium and the product is dissolved in a drying oil, e. g., tung, to yield a coating compn. In examples  $\alpha,\alpha,4,4'$ -dihydroxy-3,3'-dimethyldiphenylcyclohexane,  $\alpha,\alpha,4,4'$ -dihydroxy-3,3'-dimethyldiphenylbutane, or  $\beta,\beta,4,4'$ -dihydroxy-3,3'-dimethyldiphenylpropane is condensed with  $CH_2O$  in the presence of methylated spirits and  $HCl$  and the initial condensation product of *o*-cresol and  $AcH$  in the presence of  $HCl$  is condensed with  $CH_2O$  in the presence of  $HCl$ .

**Coating composition.** Paul Friedrich. Fr. 756,481, Dec. 11, 1933. A compn. for application to metals, wood, stone or paper is made by mixing tar and coal-tar pitch with the addn. of chlorinated aliphatic hydrocarbons and a mixt. of homologs and derivs. of  $C_6H_6$ , the mass being energetically agitated and submitted to pressure. One example contains tar 70, pitch 13, trichloroethylene 3 and homologs and derivs. of  $C_6H_6$ , 11 kg.

**Coating composition from drying oil, phenolic and aldehydic materials.** Adolf Heck (to Cook Paint & Varnish Co.). U. S. 1,947,414, Feb. 13. A compn. suitable for use on elec. app., etc., comprises reaction products of an oxidized drying oil such as oxidized linseed oil with about equal amts. of a phenol and aldehyde in the presence of an alk. catalyst (the mol. ratio of the aldehyde to the phenol being less than 1.0 but greater than 0.25), the products being sol. in toluene, xylene, etc. U. S. 1,947,415. See Can. 329,051 (C. A. 27, 1530).

**Coating compositions suitable for application by spraying.** Erik Rotheim. U. S. 1,945,998, Feb. 6. A coating compn. (which is maintained under pressure) comprises a nonvolatile coating material, such as a cellulose ester in a solvent, and a liquefied gaseous material such as  $MeCl$  or isobutane dissolved in the compn. in a quantity sufficient to produce a sol. said. with the gaseous compd. under a pressure of several atm. at ordinary temp.

**Lacquers.** Theodor Kotthoff. Ger. 588,231, Nov. 15, 1933 (Cl. 22h. 3). Addn. to 575,789 (C. A. 27, 4942). Oil lacquers obtained as in 575,789 by heating oils and resins, are extd. with an org. extn. agent such as alcs., esters or ketones, and the residue is worked up into a lacquer. Thus,  $PhOH \cdot CH_2O$  resin, wood oil and linseed oil are heated to form a lacquer. This is extd. with a mixt. of  $BuOH$  and iso- $PrOH$ . The residue, 80–85%, is worked up into a lacquer. Other examples are given.

**Oil varnish.** Tokyo E. C. Kōgyō K. K. (Yūtarō Inada, inventor). Japan. 100,206, March 22, 1933. Varnish is made by heating a mixt. of drying oil, natural resin (such as amber, copal) or artificial resin and about 0.1% Se. Burning of the mixt. during heating is prevented by addn. of Se.

**Cellulose lacquer.** Asahi Garasu K. K. (Yoshitaka Amenomiya, inventor). Japan. 100,441, Apr. 6, 1933. The lacquer is prepd. from a cellulose ester or ether contg. a metallic hydroxide, which is obtained by treating a cellulose ester or ether soaked in an aq. soln. of a metallic salt with an aq. soln. of an alkali.

**Coating copper with cellulose acetate lacquer.** Benest R. Taylor and Harry I. Davis (to Eastman Kodak Co.). U. S. 1,946,647, Feb. 13. Cu is treated with a hot alk. soln. such as a 2% soln. of  $NaOH$  and then washed, dried and coated with a cellulose acetate lacquer contg.  $H_3PO_4$ .

**Nitrocellulose lacquer.** Theodore F. Bradley (to Ellis-Foster Co.). U. S. 1,946,479, Feb. 13. Nitrocellulose is used with a solvent such as  $BuOAc$  and toluene together with phthalic anhydride and sufficient addn.

crystallizable org. acid such as benzoic acid to exert a plasticizing effect. Cf. C. A. 27, 5560.

**Apparatus for applying enamel to wire and heating it.** Henry M. Larsen (to Western Elec. Co.). U. S. 1,947,476, Feb. 20. Various structural and operative details are described.

**Apparatus for baking enamel on wire.** Emerson Pugh (to Western Elec. Co.). U. S. 1,947,545, Feb. 20. Various structural and operative details are described. U. S. 1,947,546 (Raymond L. Reading (to Western Elec. Co.)) and U. S. 1,947,547 (Hal F. Fruth (to Western Elec. Co.)) also relate to app. of the same general character and purpose.

**Oven for drying lacquered articles.** Carl C. Wilcox (to Studebaker Corp.). U. S. 1,946,923, Feb. 13. Structural and operative details of a drying app. in which there may be maintained an atm. that does not support combustion.

**Ornamenting.** Karel R. van Staal. Brit. 401,507, Nov. 16, 1933. The surface of plates, with a wooden surface (which may be covered with a thin paper layer) and consisting of 1 or more layers, is improved by treating with a soln. of artificial resin(s) to which a plasticizer has been added, drying and hot-pressing between polished metal plates under not more than 25 kg. per cm.

**Airplane wings.** Soc. des vernis perl. Fr. 756,948, Dec. 18, 1933. The wings are impregnated with a soln. of halogenated rubber in toluene which may contain a color or Al bronze. Acetylcellulose or nitrocellulose varnish is then applied and a 2nd application of the 1st soln. may be given.

**Floor finish.** Frank H. Lyons (to E. L. Bruce Co.). Can. 339,024, Jan. 30, 1934. A floor finish comprises as a base, linseed oil 313, tung oil 94, gloss oil 130, naphtha 365 gallons, paraffin wax 724, zinc stearate 50 lb. and 50% by vol. of xylene.

**Polymerized oil.** Velvet Sekken K. K. (Seki Zenda, inventor). Japan. 100,462, Apr. 6, 1933. A polymerized oil is prepd. by heating a mixt. of a fish oil and 0.4-0.5% NaHSO<sub>3</sub> in a closed vessel at about 275°.

**Oil for linoleum.** Suekichi Otaka. Japan. 100,264, March 25, 1933. A trichloroethylene soln. of castor oil as the main constituent is used together with mineral, vegetable or animal oil, wax or resin.

**Linoleum.** Dubois & Kaufmann G. m. b. H. Ger. 591,158, Jan. 17, 1934 (Cl. 8, 1). The linoleum ordinarily used in the manuf. of linoleum is replaced wholly or in part by factice, prepd. by treating a fatty oil with S or S<sub>2</sub>Cl<sub>2</sub>. The resin ordinarily used may be replaced by a synthetic resin prepd. from C<sub>10</sub>H<sub>8</sub> and S<sub>2</sub>Cl<sub>2</sub>. Specific compns. are described.

**Condensation products.** I. G. Farbenind. A.-G. (Eduard Mütch and Georg Kraemer, inventors). Ger. 587,037, Oct. 28, 1933 (Cl. 12, 26.02). Addn. to 547,517 (C. A. 26, 3686). The method of 547,517 for producing oily or resinous products is varied by condensing the esters obtained by treating higher unsatd. acids with alkylene oxides, with polybasic acids or their derivs., polyhydric alcs. being added if desired. Thus, linseed-oil acid is treated with C<sub>2</sub>H<sub>4</sub>O and the product condensed with phthalic anhydride. Other examples are given.

**Resins.** Imperial Chemical Industries Ltd., Arthur Hill, Rowland Hill and Eric E. Walker. Brit. 401,290, Oct. 30, 1933. Oil-sol. resins are prepd. by condensing together in an acid medium CH<sub>2</sub>O, or a polymer thereof, and a substituted phenol, contg., in the *p*-position, an alkyl group of more than 1 C atom and, in 1 *o*-position, H,

alkyl or aralkyl. In examples *p*-isobutylphenol, 2,4-dibenzylphenol, *p*-benzylphenol and *p*-*tert*-amylphenol are condensed with CH<sub>2</sub>O in presence of HCl. The products may be dissolved in oils, e. g., tung, linseed, and solvents, with or without Co linoleate, to give a varnish.

**Resins from phthalic anhydride, glycerol and fatty acids from castor oil.** Adolf Heck (to Cook Paint & Varnish Co.). U. S. 1,947,416, Feb. 13. Castor-oil fatty acids are distd. under a reduced pressure of about 30 mm. at temps. of about 260-70° and 50-100 parts of the distd. acids are mixed with phthalic anhydride 100 and glycerol 50 parts, the mixt. is heated to 180-230° until it becomes clear and, until an elastic, light-colored, substantially nontacky resin is obtained on cooling which is sol. in benzene, toluene, etc., and suitable for use as a coating compn.

**Synthetic resins.** Frank A. Apgar and Arthur Runyan (to Sinclair Refining Co.). U. S. 1,945,719, Feb. 6. Unsatd. components of cracked petroleum distillates about 90% or more of which boil below about 230° are polymerized to produce polymers b. about 300° or higher, oils of lower b. p. are sepd. from the polymers and the latter are resinified with a phenol, an aldehyde and a condensing agent.

**Synthetic resin.** Frederick S. Granger (to Combustion Utilities Corp.). U. S. 1,946,459, Feb. 6. For producing a potentially reactive synthetic resin, a mixt. comprising an alk. phenolate soln. and an aldehyde is permitted to react without heating for 3 hrs. or longer and the material is then heated to above 60°, and neutralized with a dil. acid to ppt. the synthetic resinous product.

**Synthetic resins.** Wilhelm Kraus. Austrian 135,858, Dec. 11, 1933 (Cl. 39a). Resins which can be hardened by heat and pressure are prepd. by condensing phenol, acetone and CH<sub>2</sub>O in an alk. medium, or first in an alk. medium and then in an acid medium. Examples are given.

**Synthetic resins.** Allgemeine Elektrizitäts-Ges. Ger. 591,479, Jan. 22, 1934 (Cl. 12, 26.02). Resins which harden without application of heat are prepd. by heating with aliphatic alcs., contg. more than 2 OH groups, the hardenable condensation products obtained in known manner from a polyhydric aliphatic alc., a polybasic acid, and a fatty oil, with or without a monobasic acid, e. g., a resin or fatty acid. Thus, a condensation product from glycerol and phthalic anhydride may be heated to 200-220° with linseed oil and then to 240-260° with glycerol. Other examples are given. Cf. C. A. 28, 920<sup>1</sup>.

**Synthetic resins.** Adrien Pinel. Fr. 756,896, Dec. 16, 1933. Molding powders are obtained by reducing resins to impalpable powders by dissolving them in an alk. soln., pptg. and washing with water. The resins are mixed with inert materials while moist.

**Synthetic resins.** Soc. pour l'ind. chim. à Bâle. Fr. 757,038, Dec. 19, 1933. A primary aromatic amine or a salt thereof is caused to react with more than 2 mols. of CH<sub>2</sub>O in the presence of a large amt. of a strong mineral acid, preferably at a relatively high temp. The product is washed, dried and compressed by heating under pressure. Fillers, plasticizing agents, etc., may be added.

**Synthetic resin molding compositions.** Fritz Schmidt. Ger. 591,045, Jan. 16, 1934 (Cl. 39b, 22). Urea or a urea deriv. and CH<sub>2</sub>O (or a reagent which yields CH<sub>2</sub>O), or initial condensation products of the urea-CH<sub>2</sub>O type, are kneaded at a moderate temp. with a material capable of swelling, e. g., casein, cellulose or starch, until a dry homogeneous compn. which can be molded directly is obtained. Softening or gelatinizing agents or solvents may be kneaded into the mixt. Examples are given.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**Transition points of mixtures of cow butter and cacao butter.** David W. Horn and Margaret Alberta Wilson. Am. J. Pharm. 106, 59-61 (1934); cf. C. A. 23, 5052-3.—The transition point of cacao butter is a sensitive charac-

teristic of that substance and is certainly affected by the presence of some foreign fats. The discussion in the present paper relates to the effect of added cow butter upon the transition point of cacao butter. In mixts. of cacao

butter and cow butter at intervals of 20% or less throughout the range of concns. between 100% cacao butter and 100% cow butter, the transition points were well defined until the percentage of cow butter approached 80%. As far as 70% there is a linear relation between transition point and the percentage of cow butter in the mixed fat. This linear relation is expressed by the equation,  $y = -0.165x + 29.2$ .

W. G. Caessler

**The melting points of the fat mixtures of margarine.** M. Sandomirskii and O. Mikhailovskaya. *Masloboino-Zhirovoe Delo* 1933, No. 4, 14-16.—Tables and diagrams show the effect of the addn. of sunflower- and cottonseed oils on the m. p. of hydrogenated oils. E. B.

**Photochemical studies of rancidity.** Mayne R. Coe and J. A. LeClere. *Ind. Eng. Chem.* 26, 245-8 (1934).—Oils properly protected from light do not give reliable color tests for rancidity, and oils remain free therefrom even though they have a peroxide value equal to or higher than that of an unprotected rancid oil if they have been protected with black or green paper transmitting light delimited by 4900 to 5800 Å. Such oils have not shown organoleptic rancidity after 7 months. The results of expts. with cottonseed and corn oils support the view that oxidative rancidity may be due to photochem. action of light on a compd. which probably exists simultaneously in the oil or is produced from compds. which give rise to the formation of peroxides. E. Scherubel

**Production of cottonseed oil.** A. E. Williams. *Crushing & Grinding* 2, 3-5 (1933).—W. reviews the crushing of cottonseed and extn. of the oil. Alden H. Emery

**The adsorption of sunflower oil by the hulls.** J. Kolpakov. *Masloboino-Zhirovoe Delo* 1933, No. 4, 19-22.—The anatomical structure of the sunflower seed hulls is very favorable for adsorption phenomena. Expts. showed that 16.6-18.5% of oil can be adsorbed by the hulls. Elias Bielouss

**Oil from Solanacea seeds.** S. I. Ivanov and A. J. Lutenberg. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* 3, 219-38 (1933).—Henbane and thornapple, common weeds in Russia, yield seed oils similar to tobacco-seed and tomato-seed oils; the alkaloids in the seeds are not oil-sol. and the oils are both non-toxic and edible. The max. oil content of the seeds occurs at a middle stage of ripeness; acid no. and I no. also decrease as ripening progresses. Annual production of oil from 50 tons of thornapple seed and 25 tons of henbane seed is planned in Russia. Julian F. Smith

**Walnut oil in Russia.** S. I. Ivanov and E. E. Berdichevskii. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* 3, 246-50 (1933).—Walnut oils from widely distant parts of the U. S. S. R. vary but little in compn. Climatic temp. is an important factor only during the active growing season. Like soy beans and peanuts, the nuts are rich in protein and poor in cellulose. The acid compn. of a representative sample is: linoleic 62.7, oleic 17.6, linolenic 10.0, satd. acids 9.4%.

Julian F. Smith

**Cedar-nut oil of western Siberia.** S. I. Ivanov and S. B. Resnikova. *Schriften zentral. biochem. Forschungsinst. Nahr.-Genussmittelind.* 3, 239-45 (1933).—Oil from nuts of *Pinus cembra* L. (western Siberia) contained oleic acid 32.40-35.82, linoleic acid 31.12-34.23, linolenic acid 16.57-27.75% as its major acid components. Linolenic acid content is highest in the most northern climate. For the best com. utilization of the oil further study of the influences of growing conditions and a better understanding of the biochemistry of the oil are needed. J. F. S.

**Chemical composition of tunny-liver oil.** Tetsuo Tomiyama. *Bull. Agr. Chem. Soc. Japan* 9, 141-7 (1933).—The liver of *Thunnus orientalis* in spring time was ground with anhyd.  $\text{Na}_2\text{SO}_4$  and extd. with petr. ether. The oil obtained from the ext. was analyzed; it had acid value 28.0, sapon. value 177.6, ester value 149.6, I value 175.6, Ac value 31.5, Hehner value 89.8, Reichert-Meisler value 2.2, Polenski value 0.5,  $d_{20}^{20}$  0.924, unsaponifiable matter 1.6%, and m. p. 28-9°. The following acids were isolated: oleic 30, arachidonic 20, stearic 7, clupanodonic 22, palmitic 19, myristic acid 5% and a small amt.

of linoleic acid. The administration of 9 mg. of the oil per day to one albino rat was sufficient to cure vitamin A deficiency. Y. Kihara

**Polysulfonation and purification of oils.** J. Abramovitch. *Tiba* 11, 803-11 (1933).—In order to obtain higher sulfonation products than can be obtained by direct treatment of oils by  $\text{H}_2\text{SO}_4$ , the oil may be chlorinated (oils having a high content of unsatd. acids are treated with  $\text{Cl}_2$  gas, preferably not above 30-40°, to obtain the dichlorinated acids; oils with a low unsatd. acid content are treated with  $\text{SOCl}_2$  to obtain the acid chlorides, which are sepd. by distn. at about 125-30°, the chlorinated deriv. (or acid chloride) is sapond. with aq.  $\text{NaOH}$  to obtain the corresponding di- or tri-hydroxy acid, and the latter is treated with the theoretical amt. of 66° Bé.  $\text{H}_2\text{SO}_4$  at not over 28-30°. A dry trihydroxy acid heated for about 3 hrs. at 125-50° thickened considerably, presumably because of formation of lactones and (or) lactides, and careful sulfonation of the cooled reaction product with  $\text{H}_2\text{SO}_4$  yielded a disulfonated tri- or tetrahydroxy alc. (this reaction was obtained once; but all subsequent attempts to repeat it were unsuccessful). A. P.-C.

**A new type of catalyst for the hydrogenation of oils.** Bug, Volokitin and Igumov. *Masloboino-Zhirovoe Delo* 1933, No. 4, 16-17.—An alloy of Ni and Al treated for a short time with  $\text{NaOH}$  represents a valuable stationary catalyst for the hydrogenation of oils. The  $\text{NaOH}$  (by its action on the Al) roughens the surface of the alloy, and thus increases its active area. The  $\text{NaOH}$ -treated alloy does not require an anodic oxidation with subsequent reduction by  $\text{H}_2$ , and is not sensitive to the usual poisons ( $\text{H}_2\text{S}$ , etc.), whereby the usual frequent regenerations are eliminated. Alloys contg. 27% Ni showed the highest activity. Low hydrogenation temps. (200° and less) can be applied with this alloy. Elias Bielouss

**The effect of electrolytes on rosin soaps.** A. Laptev and E. Arensham. *Masloboino-Zhirovoe Delo* 1933, No. 4, 11-13.—Contrary to the accepted view, the rosin soaps can be readily salted out by moderately concd. (10%)  $\text{NaCl}$  solns. Elias Bielouss

**The value of silicate of soda as a detergent.** III. Siliceous silicate in water containing calcium bicarbonate or carbon dioxide. John D. Carter and Wm. Stericker. *Ind. Eng. Chem.* 26, 277-81 (1934); cf. *C. A.* 26, 806.—Unsoiled cloths and cloths soiled with C black, burnt amber, raw amber or  $\text{Fe}_2\text{O}_3$  were washed simultaneously with 0.2% detergent solns. (detergent =  $\text{Na}$  oleate or  $\text{Na}_2\text{O}$ : 3.25 $\text{SiO}_2$  or a mixt. of the two) at 60° in the laundrometer; the detergent solns. were made up in (1) distd. water, (2) water contg.  $\text{Ca}(\text{HCO}_3)_2$  equiv. to 85.7 parts  $\text{CaCO}_3$  per million or (3) water contg. enough  $\text{CO}_2$  to give a  $pH$  between 4 and 5; after rinsing and drying of the washed cloths, their reflecting power was detd. with a photometer. The  $\text{Ca}(\text{HCO}_3)_2$  caused a greater loss in efficiency of the detergents than the  $\text{CO}_2$ , both in washing the soiled cloths and in preventing deposition on the unsoiled cloths; the silicate and silicated soaps were less affected in this respect than the soap. In general for the 4 pigments, the mixts. of silicate and soap tested were superior to silicate under all conditions tried; these mixts. were equal or superior to the soap in the presence of the  $\text{Ca}(\text{HCO}_3)_2$  or  $\text{CO}_2$ , but the mixts. rich in silicate were inferior to soap in distd. water. Oscar T. Quimby

**Double-bond titration** (Frognier, van Goetsenhoven) 7.  
**Action of lipolytic bacteria on natural fats** (Collins) 11C.  
**Oleoresinous pine tree product for use in resin soap manuf.** (U. S. pat. 1,945,421) 22.

**Distilling fats, etc.** Metallgesellschaft A.-G. and Wilhelm Genescke. *Fr.* 756,397, Dec. 8, 1933. In distg. fats, etc., of high b. p., reflux of condensation products in the upper part of the distn. chamber is prevented by the use of 2 bell-shaped members mounted so as to form a space between them which remains filled with still gas, the upper member serving to collect the condensation products, while the still air between the 2 members insulates the upper member from the heat of the lower part of the

chamber. A suitable opening is made for the upward passage of vapors.

**Sulfonated fats or aliphatic acids.** I. G. Farbenind. A.-G. (Ferdinand Münz, inventor). Ger. 591,196, Jan. 18, 1934 (Cl. 120.23.01). Unsaid. aliphatic acids or their esters are treated with an excess of fuming  $H_2SO_4$ . The reaction may be effected in a solvent, e. g.,  $CCl_4$ , at a low temp. Examples are given. The aq. solns. of the products are stable to hard water and to boiling with mineral acid.

**Preventing oxidation of fats and oils and petroleum hydrocarbons.** Hōnen Seiyu K. K. (Mitsuo Nakamura, inventor). Japan. 99,257, Jan. 30, 1933. Oxidation is prevented by adding to the oils hydrazine, amino or hydroxy compds. of thymol, or a prephenyl or allyl deriv. of phenol contg. an alkyl ether group larger than ethyl.

**Apparatus for separating crystals from fats and oils.** Taiji Ōhashi and Ikki Hachiya. Japan. 99,769, Feb. 24, 1933. Diagrammatical.

**Apparatus for extracting fats, etc., from materials, e. g., wool, cotton fabrics, fish, with volatile solvents.** Shio Hitoshi. Brit. 400,613, Oct. 23, 1933.

**Apparatus for extracting fats, oils and waxes.** Lothar Martinus. Fr. 756,424, Dec. 9, 1933.

**Apparatus for continuous extraction of oils and fats.** Minoru Maki. Japan. 99,064, Jan. 16, 1933. Diagrammatical.

**Apparatus for continuous and automatic extraction of olive oil.** Fermin Martinez-Huarte. Fr. 756,628, Dec. 13, 1933.

**Apparatus for recovering oils and fats from water.** Alfred E. Ridley. Fr. 756,642, Dec. 13, 1933.

**Recovery of oil from Japanese acid clay used for purification of oils.** Sanpei Kurahashi. Japan. 99,667, Feb. 21, 1933. An aq. soln. of a sulfonate of an alkylated aromatic hydrocarbon is used to recover oil contained in the waste acid clay.

**Apparatus and process for the extraction of oil from oil-containing fruits.** Fried. Krupp Grusonwerk A.-G. Brit. 401,550, Nov. 16, 1933.

**Extraction of castor oil.** J. Geysen. Belg. 395,785, May 31, 1933. The seeds are crushed and treated with a solvent, the soln. is filtered, and the solvent distd.

**Hydrogenation of oils and fats.** Nippon Chissohryō K. K. (Aiji Honda, inventor). Japan. 99,101, Jan. 18, 1933. In hydrogenation of highly unsatd. oils, wholly or partly hydrogenated oil is added and the whole is treated with  $H_2$  in the presence of a catalyst. By this means the reaction is completed at a lower temp., and thus the life of the catalyst is prolonged and the quality of the product improved.

**Recovery of waste nickel catalyst.** Hokkai Yushi Kōgyō K. K. (Gorō Kimura, inventor). Japan. 99,594, Feb. 16, 1933. Waste Ni catalyst used for the hardening of oils is dissolved in  $H_2SO_4$  contg.  $HNO_3$ . To the soln.  $NaOH$  or  $Na_2CO_3$  is added in such amt. that Ni is not pptd. but most of the Fe and other impurities are pptd. After sepn. from the ppt., the soln. is heated with a small amt. of an oxidizing agent (such as  $KMnO_4$  or  $Na_2O_2$ ), by which the remaining Fe is pptd. From the filtrate, Ni is recovered as hydroxide with caustic alkali.

**Device for testing the rate of oxidation of oils and fats.** Ivor M. Colbeth (to Baker Castor Oil Co.). U. S. 1,944,926, Jan. 30. Structural details.

**Adsorbent for decolorizing oils and fats.** Daniel S. Belden and Wm. Kelley (to Filtrul Co. of Calif.). U. S.

1,946,124, Feb. 6. An activated clay pulp is mixed with a substantial proportion of finely divided clay in air-dried condition, the mixt. is heated to 100–315° until an exothermic reaction occurs, and the mixt. is then quenched in 3–5 parts by wt. of hot, softened water, agitated to move sol. salts, and then dried. Cf. C. A. 27, 2800.

**Dispersion and stabilization of oils.** M. Ernott. Belg. 395,761, May 31, 1933. Carbonation sludge, such as sugar-house scum, is used as dispersing and stabilizing agent.

**Deodorization of oils.** Shigezō Nunomura. Japan. 100,091, March 13, 1933. Oils are deodorized by agitation with crushed ginger and  $H_2O_2$ .

**Reducing the oil content of soy-bean meal.** Louis W. Haas and Herbert O. Renner (to J. R. Short Milling Co.). U. S. 1,947,200, Feb. 13. Preliminary to pressing the meal, its moisture content is adjusted to about 10% in order to facilitate cold pressing and production of a meal suitable for use in bread making.

**Apparatus for drying olive marc.** Mauricio (Soc. anon.). Fr. 756,554, Dec. 12, 1933.

**Apparatus for the manufacture of Turkey-red oil.** Hiroshi Koide. Japan. 99,338, Feb. 3, 1933. The neutralization of sulfonated oil is effected in steps.

**Luting for metal containers.** Paul Fassbender. Ger. 589,568, Dec. 19, 1933 (Cl. 22i. 1). A luting for metal containers for oil, fats, etc., consists of a mixt. of finely powd. cereal meal and satd. or highly concd. aq. soln. of hygroscopic salts such as  $MgCl_2$  or  $CaCl_2$ .

**Soaps.** Henkel & Cie. G. m. b. H. Fr. 757,012, Dec. 19, 1933. Alcoholic ethers formed from di- or tri-hydric aliphatic alcs. and alkyl radicals of high mol. wt., and contg. at least one free OH, e. g., monododecyl or monooctadecyl ether of glycerol, are added to soaps, creams and cosmetic preps. to obtain superfatted products.

**Soap compositions.** Stanislaw Pilat (Jaroslaw Sereda, inventor). Austrian 135,828, Dec. 11, 1933 (Cl. 23b). Org. solvents are incorporated into soaps with the aid of mineral-oil sulfonic acids or their salts or derivs. Thus, the solvent may be emulsified in water with the aid of the sulfonic acids, and the emulsion mixed with soap, or a solvent contg. the sulfonic acids in soln. may be mixed with soap.

**Soft soap.** Camille Deguide. Fr. 756,883, Dec. 16, 1933. Sapon. is effected in an autoclave which has stirring means and is steam-heated.

**Honey soap.** Kiichiro Yasukawa. Japan. 100,046, March 10, 1933. Addn. to 91,067 (C. A. 26, 1466). A mixt. of honey, egg, salicylic acid and powd. soap is specified.

**Soap.** Victor Scheffer. U. S. 1,946,765, Feb. 13. See Ger. 575,790 (C. A. 27, 4946).

**Apparatus for drying and crusting soap.** John E. Pouton, Baker Perkins Ltd. and Anciens établissements A. Savy, Jeanjean et Cie. Brit. 401,285, Oct. 26, 1933.

**Apparatus for making hollow floating soap.** Grete Sax. Austrian 135,983, Dec. 27, 1933 (Cl. 23b).

**Detergent composition.** R. Thoen. Belg. 398,380, Sept. 30, 1933. Suitable solvents (e. g., benzine) are added to Turkey-red oil or other sulfonated oil.

**Wetting, cleansing and dispersing agents.** I. G. Farbenind. A.-G. Ger. 589,511, Dec. 8, 1933 (Cl. 120.23.02). Addn. to 577,428 (C. A. 27, 4043). The hydrocarbon oxidation products obtained as described in Ger. 524,354 (C. A. 25, 3664) are treated with sulfonating agents other than concd.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

Some of the problems now facing the Research Bureau of the Philippine Sugar Association. George H. Bissinger. *Sugar News* 15, 19–24 (1934).—Entomol., pathol. and botanical problems and suitable packaging of sugar are discussed. Cellophane attracts cockroaches. L. C. The "Tucumán" sugar-cane seedlings. Results of the

1932 and 1933 experiments. Wm. E. Cross. *Rei ind. agr. Tucumán* 23, 135–64 (1933).—The purity analysis, yield of cane and sugar per hectare of the most promising Tucumán seedlings are given for the crop years 1932 and 1933, also average of plant and ratoon crops for certain seedlings up to 1933. Of the series 1–1100, the

varieties Tuc. 407, 454, 472 and 544 compare well with P. O. J. 36. In the series 1101-1424, the best varieties (Tuc. 1376, 1111, 1406 and 1422) seem superior to P. O. J. 36. In addn. to harvest data, the parentage and characteristics of the 1931 and 1932 seedlings (Tuc. 1501-1800 and 1801-2418, resp.) are briefly described.

Nelson McKaig, Jr.  
2878 P. O. J. and 2883 P. O. J. planting and harvesting experiments in the Victorias sugar-cane district. Carlos L. Locsin. *Sugar News* 15, 8-15(1934). L. Cusachs

A new source of industrially marketable sucrose. Marcel Lamy-Torrilhon. *Compt. rend. acad. agr. France* 19, 992-4(1933).—See C. A. 28, 1563. J. R. Adams

The purity of sugar-house juices in relation to the activity of a lactobacillus. V. Bolcato. *Ind. succar. ital.* 27, 8-11(1934).—The amt. of acid formed is an indication of the nonsugar content of the juice and hence is applicable to the study of different methods of defecation. This relation does not hold for molasses. L. Cusachs

Accumulation of color in massecuite during boiling. L. E. Fleishman and G. K. Virskaya. *Nauk. Zapiski Tsukrovoi Prom.* 10, No. 33, 121-7(1933).—The color of sugar depends on the amt. and quality of nonsugars. With a higher nonsugar content in the massecuite the color of the sugar increases. A decrease of one hr. in boiling time decreases color of the sugar by 22%. White and green sirups used for boiling and also as feed liquor increase the color of sugar. V. E. Baikow

The action of oxygen in the decomposition of alkaline solutions of sucrose. M. I. Nakhmanovich, S. L. Berman, M. S. Plakhotnik, I. I. Pletnik. *Nauk. Zapiski Tsukrovoi Prom.* 10, No. 32, 1-24(1933); cf. C. A. 28, 672. —CO<sub>2</sub>-free air, blown through a 15% soln. of refined sugar heated with 0.4% CaO up to 90 during 3 hrs., decomps. 4.57% of sucrose. This was accompanied by formation of 0.77% Ca salts and decrease in alk. to 0.27% CaO. Unpurified air decomps. a smaller amt. of sucrose. The control expt. (with no air blown through the soln.) showed very little decompn. of the sugar. Decompn. is greater when the soln. contains a greater amt. of CaO. Heating of the soln. under the same conditions for 2, 4, 8, 16 and 24 hrs. with periodic addn. of Ca(OH)<sub>2</sub> for reestablishment of initial alk. showed that the process of oxidation is most intensive during the 1st 4 hrs. In the 1st hr. 0.8-0.8% of sucrose was decompd. During 24 hrs. of oxidation 10.6% of the sucrose was decompd., 2.4% of Ca salts were formed and the color of the soln. attained 5 Stammer units. Without reestablishment of the initial alk., only 5.76% of sucrose was decompd. and 1.1% of Ca salts formed during 24 hrs. The color increased only up to 1.1 Stammer unit. The heating of a soln. in absence of air decompd. 2.19% of sucrose after 24 hrs. The greater amt. of CaO in soln. increased the amt. of sucrose decompd. Without reestablishment of initial alk. the decompn. of sucrose is much slower. The effect of the air on more concd. solns. (30-60%) is much weaker. With increase of the temp. from 40° to 100° under the same conditions, decompn. of sucrose increased from 1.44 to 4.1% and the Ca salts increased from 0.075 to 0.445%. The color increased. During manuf. the presence of the air during heating of the alk. solns. of sucrose may be the source of undetd. chem. losses. In order to decrease these losses it is advisable: (1) to control the satn. gas and check the amt. of contained O; (2) to exhaust the gas and to speed up the carbonation process, and also to control the temp. during the defecocarbonation; (3) in a process of microfloatation to replace the air by CO<sub>2</sub>. V. E. Baikow

A preliminary note on the single-pan method of manufacturing "Khandasari" sugar. D. R. Sethi and B. N. Sarkar. *Agr. Live-stock India* 3, 448-58(1933).—The chem. changes occurring during the boiling of cane juice in open pans were studied. The loss of sucrose by inversion was small during the 1st 45 min. of heating when the temp. did not exceed 102°, but thereafter the losses were increasingly large, particularly during the last 15 min. of the final stage of *rab* making when the temp. was 114°. The acidity of the juice showed little or no change

during the 1st 15 min. of boiling but it increased thereafter. The 1st sugar recovered contained an av. of 92.7% sucrose and 2.75% glucose. K. D. Jacob

Drying of granulated sugar. L. I. Roman'yuk. *Nauk. Zapiski Tsukrovoi Prom.* 10, No. 33, 47-9(1933).—A sugar-drying installation at the Veselo-Podolyanskii sugar factory (Russia) is described and illustrated. V. E. Baikow

Errors in the determination of sugar in the beet. E. Parisi. *Ind. succar. ital.* 26, 565-71(1933); cf. Carboni and Borghi, C. A. 27, 5567. L. Cusachs

Results of experiments on manufacturing sugar from dried beets. D. I. Zaretskaya, A. I. Lityago and I. I. Shetzkko. *Trans. Central Sci. Research Inst. Sugar-Ind.* 6, 14-175(1930).—Conclusion: White sugar of good quality can be obtained with losses not exceeding the losses in manuf. from fresh beets. The following technical scheme is suggested: Each cell of a diffusion battery is charged with 75 kg. of dry cosettes per hectoliter. The sugar is extd. by water at 70-5°. The diffusion juice is neutralized by addn. of milk of lime in each cell. The loss in the pulp is 0.4% on the wt. of the pulp and the loss in water 0.2% on the wt. of the water. The amt. of juice is 50-60% on the wt. of raw beets. The diffusion juice heated up to 85° is limed with 1.5-2.5% CaO (on the wt. of raw beets) in the form of milk of lime of 25°Bé.

The length of defecation is 20 min. Defecated juice is carbonated to an alk. of 0.05-0.06%, heated to 95-100° and filtered. The filter-press mud contains 1.0% of sugar and 50% of water on the wt. of mud. The filter-press mud is washed with 150% of water of which 50% is used for prepn. of the milk of lime and 50% for addn. to the juices and 50% is left in the mud. The yellow sugar is melted in carbonated, filtered juice. In case of accumulation of a high amt. of Ca salts soda is added. The juice is treated with 0.2% Kieselsoluh (on the wt. of raw beets) and sulfited to an alk. of 0.01%. Then the juice is reheated to 95-100° and filtered. This juice is boiled for 10 min. at 103°. The boiled juice is filtered and evapd. to 65° Brix. The sirup is filtered through filter bags and boiled in vacuum pans for a first-strike massecuite of 92° Brix. The hot massecuite is centrifuged, washed with water and steamed. The yield of white sugar is 50% on the wt. of the massecuite. The run-off is boiled for a second-strike massecuite of 92° Brix. It is dild. in crystallizers to 91° Brix. After 72 hrs the massecuite is centrifuged and the yellow sugar obtained is washed with water and steamed. The molasses is pumped to the tanks and washings are used as last feed liquor in boiling the massecuite of a second strike. The yellow sugar is melted in carbonated filtered juice. V. E. Baikow

Experiments on regeneration of bone char. I. F. Zelikman and K. K. Iyubitzkii. *Nauk. Zapiski Tsukrovoi Prom.* 10, No. 33, 21-35(1933).—In order to regenerate the max. decolorizing capacity of bone char the following scheme based on lab. and semifactory-scale expts. was proposed: washing of the chars with tap water (free from suspended matter), 800-1000% of water based on the wt. of char, at 75-90°. Dry chars must be heated at 500-600° for 60-90 min. Periodic treatment of chars by HCl in order to remove CaCO<sub>3</sub> is necessary. When CaSO<sub>4</sub> accumulates in the bone char the treatment by soda or NaOH and HCl is required. The chem. regeneration must be followed by thermal regeneration. V. E. Baikow

The specific gravity of dextrin. W. Hönisch. *Chem.-Ztg.* 58, 76(1934).—The sp. gr. of absolutely dry dextrin cannot be found in the literature. The sp. gr. of com. dextrin was detd. by the pycnometric method, with xylene as the liquid. D<sub>20</sub> for very fine white, 1.593; for very fine yellow, 1.527; superior yellow, thick-boiling, 1.561; thin-boiling, 1.542. The sp. gr. changes with the variety and the method of prepn. A mean value of 1.556 may be assumed. The sp. gr. of each variety should be detd. E. R. Rushton

Saccharification of starch. A. Tychowski. *Przemysl Chem.* 17, 65-74(1933).—The saccharification of dextrans by malt or barley diastase is due chiefly to  $\alpha$ -diastase; the

action of a mixt. of purified  $\alpha$ - and  $\beta$ -diastase is considerably less than that of the unpurified malt ext., this pointing to the presence of activators in the latter; such activators are also present in aq. exts. of yeast. The concn. of maltose in the reaction mixt. does not affect the equil. point, the attainment of which depends solely on exhaustion of hydrolyzable dextrins. H. C. A.

**The flow of starch pastes. III. The effect of soaps and other electrolytes on the apparent viscosity of hot starch pastes.** W. A. Richardson and R. Waite. *J. Textile Inst.* 24, T383-410(1933); cf. *C. A.* 22, 4315.—The apparent viscosity of sago, farina and maize starch pastes prep'd. under standardized conditions was measured by observing the flow through a capillary tube under application of the pressure required to maintain a standard driving force for each unit of surface of the inner wall of the tube. The viscosity was found to depend on the rate of stirring and the age of the paste. In general the viscosity decreases with age. The very high initial viscosity of the farina paste fell rapidly as stirring was continued. The comparatively low initial viscosity of the sago paste decreased less rapidly, while that of the maize paste which is intermediate between the sago and the farina decreased least rapidly of the 3. The rate of change of viscosity on storage depends on the  $p_H$  of the paste. The sago pastes were most stable around  $p_H$  7-8; the farina at about  $p_H$  5; and the maize between  $p_H$  4.5 and 6.5. For higher acidities or alkalinities (except when soap was added), the viscosities of the resp. starches decreased at an increasing rate with increasing acidity or alkali. When Cu stirrers were used instead of stainless steel, the pastes had lower viscosities and higher rates of change with time, apparently because of the dissolved Cu acting catalytically. When the pastes in which the acidity was controlled by the addn. of buffer salts, acids or alkalis were compared 60 min. after the start of an expt., the highest viscosity was obtained in the region  $p_H$  4-5. At higher acidities and between this region and neutrality, there is a progressive decrease in viscosity. As the alkali increases, maize and farina pastes continue to exhibit lower viscosities, but the alk. sago pastes are not less viscous, and in certain circumstances may be more viscous than the neutral pastes. Farina pastes are much more sensitive to the addn. of neutral salts than sago, which are only slightly affected. Farina is also sensitive to salts used in buffer mixts. with the result that farina pastes in which the acidity is controlled by buffers have a much lower level of viscosity than those prep'd. from farina and water alone. In low concns., soaps behave toward sago pastes like mild alkalies and lower the viscosity; as the soap concn. is increased, the viscosity reaches a min., and then rises rapidly. The min. occurs in a 5% paste at a soap concn. of about 0.15% of the paste, but the rapidity of the initial fall and subsequent rise depends on the kind of soap. The effect cannot be ascribed to increasing alkali alone but to some specific action between the soap and the starch. Four per cent farina pastes behave similarly to 5% sago pastes, but with 2% farina pastes, the viscosity continues to fall with increasing soap concn. up to the limit of concn. used in the expts. Castor-oil soap lowers the viscosity of sago

1 pastes at all concns. up to 0.6% of the paste. In addn., soaps have a considerable stabilizing effect on starch pastes. Tallow alone has no effect on the viscosity of a sago paste, but if soap is present, the effect of the tallow is to counteract that of the soap. In mixts. of sago and farina of the same total starch content, both unbuffered and buffered at  $p_H$  5, the viscosity increases with increasing farina content. The stability of these mixts. varies with their compn. A mixt. of 3 parts sago to 1 part farina is more stable than either starch alone or a mixt. of any other proportion. Ruby K. Worner

**Agriculture of sugar cane in Queensland (Kerr) 15.** Sugar cane and sugar-cane soils (Turner) 15. Effects of time of planting and of fertilizer mixts. on the curly-top resistant sugar-beet variety U. S. No. 1 in Idaho (Skuderna, et al.) 15. [Rept. on] agriculture [treating cane seed] (Verret, Mangelsdorf) 15. Crystn. [of sugar] (Fr. pat. 756,621) 13. App. for drying beet slices with furnace gases (Austrian pat. 136,027) 1.

**Molasses.** N. V. Industriele Maatschappij Voorheen Noury & van der Lande. Fr. 757,125, Dec. 20, 1933. An acid or alkali is added to a molasses soln. to make it neutral or slightly acid and it is then clarified by centrifuging.

**Degrading carbohydrates.** Hans Schlubach. Ger. 587,495, Nov. 4, 1933 (Cl. 12o. 6). Addn. to 554,699 (C. A. 26, 6176). In degrading highly polymerized carbohydrates by treatment with compressed HCl, the method of 554,699 is improved by treating the degradation products with a stream of dry or moist gas, such as air, at ordinary or raised temps., to remove the residual HCl.

**Filtering in cornstarch manufacture.** Eugene Staritzky (to Dorr Co., Inc.). U. S. 1,946,039, Feb. 6. In corn starch manuf., for filtering the various grades of by-products as obtained from wet sepn. steps, a primary layer of the coarser by-products is formed upon a filter element under suction, and the fine by-products are allowed to filter upon the primary layer. App. is described.

**Starch paste.** Stephen Jozsa and Herbert C. Gore (to Standard Brands Inc.). U. S. 1,947,295, Feb. 13. In prep'g. a starch paste of high stability and low viscosity, starch is gelatinized by cooking in water and the hot starch paste is subjected to the action of a high-speed mixer until its viscosity has been lowered to an extent such that the outflow time of a 5% cold soln. from a standard 100-cc. pipet is about 200 sec. or lower.

**Soluble starch or dextrin.** Dengorô Mori. Japan 100,061, March 10, 1933. Dried and powd. starch is treated with Cl<sub>2</sub>, HCl or HNO<sub>3</sub>, etc. When an aq. soln. of these acids is used, the amt. of the water contained should not exceed about 10% of the starch used.

**Some practical observations on the molding of pickled sheep skins.** L. S. Stuart and R. W. Frey. *J. Am. Leather Chem. Assoc.* 29, 113-18(1934).—Molding in transit was traced to acid absorption by cask wood which raised the  $p_H$  value above the crit. point for mold growth. In gelatin-dextrose broth a strain of *Penicillium* grew

at  $p_H$  1.8 and NaCl 4%; a strain of *Alternaria* grew at  $p_H$  2.4 and NaCl 12%. Acidity is further reduced by mold growth. Use of 0.025% *p*-nitrophenol or a more acid pickle is recommended. H. B. Merrill

**Hide powder. II. Report of the commission of the international association of tannery chemists.** F. Stather. *Collegium* 1933, 451-3; cf. *C. A.* 26, 2342.—Tannin analyses in 1928, 1930 and 1933 with the same ready-chromed hide powder did not show any change in the powder. I. D. Clarke

**Astringency of tan liquors and tanning processes.** E. W. Merry. *Leather World* 25, 682(1933); *J. Am.*

*Leather Chem. Assoc.* 29, 128-9.—If percentage of tannin is plotted against percentage of nontannin for a series of suspender liquors, the slope of the resulting curve at any point shows the relative tannin-nontannin take-up of the pelt in the corresponding liquor. The curve should be flat (much nontannin absorbed) in the first suspenders and steep in the later suspenders. A flat curve indicates a mellow tannage and a steep curve a harsh or astringent tannage. The tannin-nontannin curve for the yard should be watched carefully. H. B. M.

**Technology of tanning. I. Historical introduction.** Frederick L. Hilbert. *Hide & Leather* 87, No. 10, 15-22, et seq. (1934). H. B. Merrill

**The tanning action of sulfite-cellulose extracts.** Wilhelm Vogel. *Collegium* 1933, 524-31.—Sulfite cellulose has a tanning action, but is commercial of value only in mixts. contg. less than 1/3 of it. Sole leather tanned with sulfite cellulose had a degree of tannage of only 35-40, upper leather of 40-55. I. D. Clarke

**Committee on qualitative tannin analysis.** O. Gerngross and H. Herfeld. *Collegium* 1933, 411-8. A review. I. D. Clarke

**Detection and determination of sulfiting in quebracho tannin extracts.** Otto Gerngross and Hans Herfeld. *Collegium* 1933, 602-9.—The Auerbach (*C. A.* 26, 4501) and Stathur-Lauthmann (*C. A.* 26, 5781) methods both gave reproducible results. Fixed S by the former was about twice that by the latter method, which agrees with the observation of Bergmann and Pajarheff (*C. A.* 25, 5155). Fairly satisfactory results were obtained on mixts. contg. sulfite cellulose by preliminary removal of the latter with aniline-HCl. I. D. Clarke

**A new auxiliary apparatus for tannery use.** Josef Starling. *Collegium* 1933, 538-40.—The app. consists of a 20-cm. tube contg. a stirrer, heating coil and thermostat. It can be put in a corner of a tan vat to stir and heat the liquor, yield is increased and time of tanning is decreased. I. D. Clarke

**Bleaching of vegetable-tanned leather.** H. Phillips. *Leather World* 25, 802 (1933); *J. Am. Leather Chem. Assoc.* 29, 129.—The use of bleaching exts. is upheld on the grounds that (1) they do not introduce  $H_2SO_4$  into the leather; (2) they do not reduce its strength, (3) they permit the fulfillment of the demand for a low-cost leather of limited life, and (4) they ensure a leather of mellow cut and supple grain. H. B. Merrill

**Recent results on the determination of bating value.** K. H. Goeller. *Collegium* 1933, 517-51.—A gravimetric hide-powder method is described, it is not affected by  $NH_4$  salts. I. D. Clarke

**Bating and dyeing. XIV. Theory of mineral tanning.** R. Elöd and Th. Schachowsky. *Collegium* 1933, 701-19, et *C. A.* 27, 2599.—Theories of Cr tanning are reviewed; most of them are not entirely in agreement with exptl. facts. Stasny and Pokala (*C. A.* 26, 6176) found a C which was very similar to hide powder in absorption of Cr salts, but this C has a high ash and after extrn. with acid combines with very little basic Cr sulfate. Development of theory requires a study of distribution of the mineral tannin within the individual hide fiber. The tanning action on gelatin of complex Co salts was studied both by the boiling test on films and the absorption spectra of solns. Stable complexes, as shown by no change in the absorption spectra of water or gelatin solns. after several days, did not tan; easily decompd. complexes all had tanning action.  $Co(OH)_2$ , all tetrammine and one pentammine salt tanned. **XV. Theory of leather dyeing.** 1. R. Elöd and A. Kohnlein. *Ibid.* 751 (63).—In dyeing collagen with acid dyes first acid and then dye is absorbed; as the dye is absorbed the acid anion is forced out as is required by the Donnan equil. The rate of absorption and quantity of acid dye absorbed by isoelec. collagen depend very largely on the  $pH$  of the bath and is a max. at  $pH$  1.3. There is a max. absorption for each  $pH$  and lowering the  $pH$  at once increases this max. The only explanation for this is that the amino groups are only partially in the free condition; the no. of free groups and their activity depend on the  $pH$ . In-

creasing the bath vol. does not increase absorbed dye. Salt decreases the rate of absorption of dye and aids attainment of equil. **XVI. Theory of leather dyeing.** 2. R. Elöd and H. Hünsel. *Ibid.* 763-72.—For dyeing studies, Cr leather must be exhaustively neutralized on the residual acid in the leather will mask the results. Dye absorption and  $pH$  of the bath are closely related as would be expected for a chem. reaction between the dye and the amino groups of collagen. Only dyeing on the acid side of the isoelec. point is "water fast"; on the alk. side there is only absorption or impregnation and the dye can be easily washed out with aq. solns. of the same  $pH$ , but if this leather or collagen is acidified and amino groups are freed, the dye is fixed. Substantive dyes dye only the surface of Cr leather because the dye mol. is large, diffuses slowly and the reactivity is greater than the rate of diffusion. I. D. Clarke

**The combination of collagen with dyes. II.** G. A. Bravo and F. Baldracco. *Collegium* 1933, 772-8; *C. A.* 26, 4501.—The Procter-Wilson formula represents the data for the absorption of acid dyes by hide powder better than the adsorption formula; the action is chem. The combining wt. of collagen for acid dye is about 1104 instead of 739 as found for direct dyes. Basic dyes were only slightly absorbed by hide powder. I. D. Clarke

**Report of the commission on leather analysis concerning the determination of acid in vegetable-tanned leather.** L. Jablonski. *Collegium* 1933, 523-4.—Proposal is made to make the Imies-Kubelka method official. I. D. Clarke

**A new method for determining nitrogen in leather.** C. van der Hoeven. *Collegium* 1933, 532-8.—The hydrogenation method of ter Meulen and Hesslinga ("Nouvelles methodes d'analyses chimiques organiques," *C. A.* 26, 2144) is simpler, more rapid and more accurate than the Kjeldahl method. I. D. Clarke

**Rate of drying chrome leather.** O. A. Ilougen. *Ind. Eng. Chem.* 26, 333-9 (1934).—In practice, rate of drying decreases directly with the decrease in free  $H_2O$  content of the leather and inversely with the thickness. Free  $H_2O$  is the total minus equil.  $H_2O$  for the temp. and relative humidity employed. Values for equil.  $H_2O$  are detd. at 80° and 120°F. for relative humidities of 0-90%. For drying in an air current passed vertically over the surface of the skins, an equation is developed experimentally:  $dW/d\theta = -0.282 \cdot L \cdot G^{0.66} \cdot W \Delta H$ , where  $W$  = free  $H_2O$ ,  $\theta$  = elapsed time,  $G$  = mass velocity of air,  $L$  = av. thickness of skins, and  $\Delta H$  = unsatn. of air. Examples of solution of problems by this equation are given. H. B. Merrill

**Water in leather.** F. H. Humphreys. *Leather World* 25, 358 (1933); *J. Am. Leather Chem. Assoc.* 29, 124-5.—Freshly flayed hide contains about 70%  $H_2O$ , mostly bound. Tanning is interpreted as a replacement of this bound  $H_2O$  by lyophilic colloids, such as vegetable tannins and Cr compds. This must be done without distortion of the fiber. The various steps of vegetable tanning are discussed from this point of view. H. B. Merrill

**Requirements of an ideal filling process for sole leather.** W. Petrie. *Leather World* 25, 360 (1933); *J. Am. Leather Chem. Assoc.* 29, 126-8.—Four commonly used processes are described and discussed; none is wholly satisfactory. In a new process conditioned leather is (1) drummed with a 9 to 1 mixt. of cellulose ext. (soda base) and cod oil for several hrs., (2) piled 1 or more days, (3) drummed briefly with a little cod oil, and (4) hung to dry. This process is claimed to fulfil the 7 listed requirements of (1) cheapness, (2) being self-contained, (3) freedom from detrimental chemicals, (4) ease of regulation, (5) adaptability to any reasonable degree of loading, (6) yielding a leather resistant to oxidation, and (7) to excessive washing out. The thorough drumming with cod oil is responsible for (7) and some other desirable qualities imparted by the process. H. B. Merrill

**The oiling (stuffing) of belting-leather, fat distribution, use of hardened fats.** Leopold Pollak. *Gerber* 59, 80-1, 89-90, 100-2 (1933). A study was made of the

- effect of the compn. and properties of the fat mixt. used in stuffing belting leather on its quality. It appears important to use fat mixts. of high m. p. but with a low viscosity at the stuffing temp. Although belting leather can be advantageously stuffed with mixts. contg. hardened fats, their exclusive use is not recommended. Data on the phys. properties of leather samples stuffed with 4 different fat mixts. and on the distribution of the fat in the leather are given. J. W. Perry
- Bookbinding leathers. L. G. Kitcat. *Leather World* 25, 37(1933); *J. Am. Leather Chem. Assoc.* 19, 124.—A review of causes of decay. Cf. Innes, C. A. 26, 8186; 27, 4436. H. B. Merrill
- Factors affecting the currying properties of oils, fats and waxes. H. Phillips. *Leather World* 25, 256(1933); *J. Am. Leather Chem. Assoc.* 29, 124-5.—Fats that "wet" leather easily are those forming oriented films on the surface of the fibers; this enables the oil to penetrate the interfibrillar spaces. Presence of  $H_2O$  assists penetration of fat, by enlarging channels between fibers, providing the fat forms an orientated film on  $H_2O$ . Drumming assists penetration. Hot drum stuffing permits the use of higher-melting greases and waxes when it is desired to lubricate the fibers as well as fill the spaces. Some animal or vegetable fat should be included to penetrate the smaller capillaries. Vegetable and animal oils especially if unsatd. undergo hydrolysis, oxidation and polymerization in leather. This may cause spew. Presence of vegetable tannin is believed to check oxidation and perhaps polymerization of unsatd. oils. Some cases of cod-oil spews are attributed to adulteration with more highly unsatd. oils, but in many cases the cause is excess of free fatty acid or presence of Fe in the leather. Inert mineral greases and waxes are more suitable than true fats for heavily filled, waterproofed leather. H. B. M.
- The histology of the corium and the grain. G. C. Heringa. *Collegium* 1933, 749-54.—A lecture. I. D. C.
- Recent methods of dealing with insect pests. M. E. Robertson. *Leather World* 25, 582(1933); *J. Am. Leather Chem. Assoc.* 29, 128.—General methods are suggested for trial in the control of hide infestation by beetles. H. B. Merrill
- The action of pancreatin on gelatin and collagen. M. Bergmann, G. Pojarlieff and H. Thiele. *Collegium* 1933, 581-5.—Review. A test for the tannage of leather may be based on the fact that sulfo acids from a tannage with sulfited exts. or syntans increase the action of trypsin on leather. I. D. Clarke
- Introduction of the notion of  $p_H$  in the study of glues and gelatin. Maurice Dérivé. *Tiba* 11, 813-21 (1933).—A general discussion and explanation. A. Papineau-Couture
- Methods of testing animal glue. E. Pallas. *Techn.-Ind. Schweiz. Chem.-Ztg.* 16, 234-6(1933). D. B.
- Morphology and fine structure of collagen fibers (Künzel, Prakte) 11A. Felted sheets of cellulose fiber [for making artificial leather] (U. S. pat. 1,944,907) 23. Hydrating mercerized paper pulp [for making artificial leather] (U. S. pat. 1,944,906) 23. Pyroxylin sheet material [leather substitute] (U. S. pat. 1,946,250) 23. Azo dyes [for leather] (Ger. pat. 589,636) 25.
- Treating hides and skins for unhairing, cleaning and bating. Emil Lenk and Felix Lippner (to American Cyanamid & Chemical Corp.). U. S. 1,946,218, Feb. 6. A substantially pure culture of *Es. coli communis* or *Staphylococcus pyogenes albus* is used.
- Retanning chrome leather. Thomas Blackadder (to Röhm & Haas Co.). U. S. 1,945,461, Jan. 30. Without neutralizing the leather prior to retanning, it is treated with a synthetic tanning material such as condensed aromatic sulfonic acids, aromatic sulfonic acids of high mol. wt. or resins peptized in aromatic sulfonic acids.
- After-treatment of tanned leather. Max Bergmann. U. S. 1,947,513, Feb. 20. Leather tanned or treated with vegetable tanning agents, before being washed-out, is treated with an aq. soln. of a urca-aldehyde condensation product which serves to fix the residual vegetable tanning substances.
- Leather. Abatan (Soc. à r. l.). Fr. 756,550, Dec. 11, 1933. Dehaired skins are treated in a bath contg. quinone or hydroquinone, an acid salt of Al or Mg and an alkali hyposulfite, the mixt. giving rise to a Na alum which seps. the fibers of the skin, and to S which becomes interspersed between the fibers and keeps them apart. The skins are then treated with Cr alum and NaOAc.
- Leather substitute. Johannes Klasi. Brit. 401,140, Nov. 9, 1933. A substitute for leather which may be used as wash leather, packing material, for bookbinding or as wall facing is made by forming vegetable or like fiber into a fleece with fibers as free as possible from parallelism, laying layers thereof in zigzag formation on one another, wetting, compressing, spraying with a colored rubber emulsion, drying and vulcanizing.
- Artificial leather (rubberized sheet material). Frank O. Woodruff (to Beckwith Mfg. Co.). U. S. 1,945,173, Jan. 30. A multi-ply sheet of fiber such as leather fibers and cellulosic fibers is formed contg. rubber latex coagulated not only in the plies but also between the individual plies as a film serving to integrate the plies (the film being substantially continuous with the latex coagulated in the plies). App. is described.
- Preserving glue. Edgar C. Britton and Lindley E. Mills (to Dow Chemical Co.). U. S. 1,946,057, Feb. 6. About 0.05% or more of a polychlorophenol or an alkali or alk. earth metal salt such as a salt of 2,4,5-trichlorophenol is added to a glue to serve as a preservative.

### 30—RUBBER AND ALLIED SUBSTANCES

C C DAVIS

- The process of assimilation and formation of rubber in *tau-sagiz*. V. A. Novikov, A. I. Grechushnikov, Ya. P. Barmenkov and A. K. Nosov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 78-80 (in English 80-2); *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, 1353-81.—Rubber formation in *tau-sagiz* increases with the intensity of light, with a temp. increase from 10° to 28°, and with the moisture content of the leaves up to 77%, giving a daily yield of 4 g. per 100 g. of dry leaf material. Accumulation is partially counteracted, unless coagulation takes place, by enzymic decompn. F. H. Rathmann
- Higher alcohols in rubber compounding. W. B. Wiegand. *Can. Chem. Met.* 18, 24-9(1934).—Exptl. data show varying results in improved rubber compounding. Pretreatment of C black with higher fatty acids indicates no advantages, as judged by the resulting stress-strain curves, tensile values, etc. Higher alcs. are entirely without the activating action of fatty acids. Their softening action is greater than that of stearic acid but less than that of pine tar, and this action is not accompanied by a retardation in curing or by any general degradation of phys. properties after cure which characterize the free use of pine tar. The inclusion up to 2% (on the rubber) of higher fatty alcs., with a proportionate reduction in pine tar, improves the curing and phys. properties, without change of consistency of the raw stock. The present high costs of these higher alcs. make questionable their economical application in rubber. W. H. Boynton
- Determination of the specific gravity [of rubber products]. N. Ban. *Chem.-Ztg.* 57, 415(1933).—In detg. d. by the hydrostatic balance, the difficulty of air bubbles forming on the surface of the material may be obviated by adding 0.1% of a wetting agent (Nekal BX or Igepon T) to the water used for immersion. B. C. A.
- Textile finishes research. H. P. Stevens and R. Gaunt. *Bull. Rubber Growers' Assoc.* 15, 651-66(1933).—The

object of the investigation was to find a means of utilizing latex or rubber dispersions in sizes for calico printing, dyeing and stiffening. Addn. of latex to starch-clay-olein sizes made the finish less easily removed by washing. The technic used by Hauser and Hünemörder in studying the penetration of threads by latex (cf. *C. A.* 27, 2600, 6015) was unsatisfactory, and a new better method is to soak thread in latex, dry, stain with boiling satd. alc. Sudan III, dry, embed in a paraffin wax-stearic acid mixt, cut and mount in glycerol jelly. Without a wetting agent, there was almost no penetration, but with all com. wetting agents tested, there was complete impregnation of the threads (not of each fiber). Neither preliminary swelling of the fibers nor surface xanthation aided penetration.  $C_6H_6$  solns. of rubber penetrated the threads but not into the fibers. Treatment with latex of cloth for shower-proofing gave insufficient protection for practical utility, except with a coating made from chlorinated rubber in  $C_6H_6$ . Data show the water absorption of cloth treated with latex. Various types of substances were ineffective in overcoming the tackiness of latex-treated cloth, as was preliminary dialysis of the latex, but prolonged immersion in hot water was successful, though the product had an increased capacity for water absorption. There is preferential absorption by cloth of the serum, i. e., of the components, so that the dried product contains a disproportionately high quantity of non-rubber substances, which in turn probably account for the tackiness. This may be prevented by squeezing wet. Dyeing expts. led to uncertain results. Addn. of vulcanizing agents to the latex before impregnation and heating of the impregnated fabric overcame tackiness by the formation of a vulcanized impregnation. Expts. aimed at the use of latex in a variety of com. products are described briefly, e. g., the impregnation of stockinette with latex, in which case the product has phys. properties of promise for bandages, etc.

C. C. Davis

The use of rubber in combination with textiles. Erich Wurm. *Chem.-Ztg.* 58, 53 5 (1934).—An illustrated description of the manuf. of various products. C. C. D.

The stability of hard rubber against aggressive liquids. St. Reuter. *Chem. Fabrik* 1933, 375 6. The results of tests at 20° (8 weeks) and at 70° (8 days) of 6 varieties of hard rubber with 23 acid or alk. solns. are tabulated; also tests of 2 varieties of soft rubber with the same solns. In most cases they were considered to be practically stable.

J. H. Moore

The impact resiliometer. Paul Lupke. *Vanderbilt News* 3, No. 6, 10-14 (1933).—The new instrument which is described and illustrated is based on the 3 principles that: (1) the height of fall times the wt. of the falling sample is the energy of impact; (2) the height of rebound times the wt. is the energy recovered; and (3) value (2) divided by (1) is the resilience (fractional). Since the strain is momentary, the result is the *impact resilience*. Tabular and graphical data show the results obtained with different vulcanizates and their relation to the comps. and other phys. properties.

C. C. Davis

Effect of paraffin oil on raw rubber and the gel "poly-prene-sulfur" at different degrees of vulcanization. P. Buère and J. Grigorou. *Rev. gén. caoutchouc* 10, No. 96, 1 6 (1933). A series of samples of rubber, beginning with raw rubber and including undervulcanized, normal vulcanized and overvulcanized rubber, was immersed in paraffin oil at room temp. and the increases in wt. and vol. were measured. Absorption was greater by the raw rubber, and diminished progressively to a state of overvulcanization.

C. C. Davis

Oil-resisting rubber. W. J. S. Naunton, Maldwyn Jones and W. F. Smith. *Trans. Inst. Rubber Ind.* 9, 169-90 (1933).—In studying the effect of varying substances on the oil resistance of vulcanized rubber, the state of cure was taken into account by testing all mixts. in the uncured, optimum and overcured states. Because of the slowness at 20° and the severity and continued vulcanization at 100°, 55° was chosen for the tests. Preliminary tests showed that Diesel fuel oil, transformer oil, spindle oil,

linseed oil and butter diminished in severity in the order given, and the final test adopted was 6 days in Diesel oil at 55°. The sensitivity to oil was judged by the increase in wt. (based on the rubber). Excessive mastication lowered the oil resistance, and the highest resistance was shown by vulcanizates made directly from latex. The latex products were rendered still more resistant by glyptal resin, gelatin, glue, casein and methylcellulose, with increasing effectiveness in the order given. In masticated rubber, glue had no protective effect. With increasing times of vulcanization the oil resistance of a "soft-rubber" contg. S and diphenylguanidine increased to a max. and then diminished slowly, but with enough S to form hard rubber, the resistance increased progressively to the hard rubber state. Tetramethylthiourea disulfide without S gave vulcanizates, the oil resistance of which increased continuously through overvulcanization, whereas with S the resistance diminished at high overcures. However, the resistance with S was greater than without it. Rubber vulcanized with  $C_6H_5(NO_2)_2$  was more oil resistant than that vulcanized with S, and the resistance increased continuously with the time of vulcanization. Rubber vulcanized without accelerator was as oil resistant as an accelerated mixt. of high strength, but its general phys. condition after treatment was worse. There was little difference among various accelerators at the optimum cures. Based on the same vol., Mg carbonate imparted more oil resistance than did gas black, ZnO or  $CaCO_3$ , but in all cases the protective effect was small. Gas black was particularly effective in rubber vulcanized with  $C_6H_5(NO_2)_2$ . Softeners in general reduced the oil resistance, but glue had no deleterious effect. A study of surface treatments showed that varnishes are unsatisfactory because of mech. sepn., whereas immersion in Br water increased the oil resistance until the rubber was stretched or abraded. Coumarone resins,  $PhOH-HClO$  resins, alkyl resins, glyptal resins and chlorinated rubber were all unsatisfactory. In high concns. ethylene polysulfide resin ("Thiokol") was extremely effective, except for the objections of odor and thermoplasticity. Duprene mixts. were far better than rubber mixts. (cf. Hayden and Krishnan, *C. A.* 28, 9294). Since hard rubber is completely oil resistant, mixts. of hard rubber and Duprene give flexible products highly resistant to oil and satisfactory in aging.

Aluminum drums for chemicals. H. V. Churchill. *Chem. Industries* 34, 215-16(1934). E. H.

Equipment in the inorganic chemical industry. Bruno Waeser. *Chem. App.* 20, 139-40, 149-51, 173-6, 182-3 (1933).—Brief summaries of the process and equipment used in the manuf. of  $\text{Na}_2\text{CO}_3$ ,  $\text{NaOH}$ ,  $\text{Cl}_2$ ,  $\text{HCl}$ ,  $\text{Na}_2\text{S}$ ,  $\text{H}_2\text{SO}_4$ , and  $\text{NH}_3$ , are given with references to some patents and manufacturers. Cf. *C. A.* 27, 2005 M. C. Rogers

A rapid and accurate semi-automatic delivery pipet M. W. Jennison. *Am. J. Pub. Health* 24, 59(1934).

Attachment for facilitating the observation of menisci of liquids. A. M. Belousov. *J. Applied Chem.* (U. S. S. R.) 6, 381-2(1933).—Construction details and a drawing of the app. are given. A. A. Bochtlingk

Gas-washing bottle. A. M. Belousov. *J. Applied Chem.* (U. S. S. R.) 6, 383(1933).—The wash bottle is constructed according to the Tishchenko principle and is characterized by the interchangeability of the intake and outlet. A. A. Bochtlingk

Theoretical principles relating to continuous distillation columns. J. Pétiard. *Bull. assoc. chim. sucr. dist.* 50, 62-75(1933).—Formulas are derived expressing the thermal relations for the sepn. of the constituents of a binary liquid mixt. fed to the middle of a single-column plate still. In practice, conditions differ widely in some respects from the ideal assumptions made, and some corrections are suggested to render the formulas more valid. B. C. A.

Distillation and evaporation by means of heat pumps (vapor recompression). Bruno Schulz. *Chem. App.* 20, 151-2(1933).—A short discussion of the use of vapor recompression for evaporators. M. C. Rogers

A calorimeter for burning chlorine and bromine derivatives. M. M. Popov and P. K. Shirokikh. *Z. physik. Chem.* A167, 183-7(1933).—A calorimeter for detg. the heat of combustion of  $\text{Cl}$  and  $\text{Br}$  derivs. was constructed and tested. Roy H. Hächler

A rapid electrolyzer. H. Brintzinger, A. Rothhaar and H. G. Beier. *Kolloid-Z.* 66, 183-8(1934); cf. *C. A.* 21, 2410; 25, 2350.—An app., incorporating a high membrane surface, means for using increased temp., and means for applying an elec. field, is described. Comparison is made with the Pauli electrolyzer, and data on various membranes and current consumption are presented. A. Fleischer

Improved form of Sprengel tube. A. D. Gardiner. *Analyst* 59, 172.—The under surface of the arms of the Sprengel tube is made of white enamel glass. W. T. H.

New accessories for a microscope for microchemical work (capillary holder, microchemical manipulator) and some notes on qualitative micro-electrolysis. Herbert Aller. *Mikrochemie* 14, 219-44(1934).—So much interest has developed in microchem. work that special app. has been devised which is here described. The general technique of such work is discussed because, it is felt, much of the failure to obtain satisfactory results has been due to want of skill on the part of the operator rather than to defects in the methods. W. T. H.

A micro manipulator for pure culture and microchemical work. G. W. Fitz. *Science* 79, 233-4(1934). E. H.

A universal ebullioscope and its applications. W. Swietoslawski. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, 177-81.—A combination of differential

ebullioscope with fractionating column is described with directions for its use in detg. the purity of a solvent or azeotropic mixt., the purity of a solute, or the compn. of an azeotropic mixt. C. D. West

High-speed centrifuge. W. DeW. Gurnan. *Rev. Sci. Instruments* [N. S.], 4, 450-3(1933).—The shape of air ports, the most effective angle of the jets, the design of rotor grooves, and the proper conditions of max. speed have been investigated. B. C. A.

Copper-to-glass seals. H. de Laszlo. *J. Sci. Instruments* 10, 296-7(1933).—Cu tubing is turned down to a feather edge, coated with  $\text{Na}_2\text{B}_4\text{O}_7$ , and sealed to the inside of a glass tube. B. C. A.

Dependence of the lag of thermometers on the viscosity of the indicator liquids used in them. Walter Grundmann. *Physik. Z.* 34, 75-7(1933); cf. *C. A.* 28, 933<sup>a</sup>.—From tests on thermometers filled with creosote,  $\text{EtOH}$ ,  $\text{C}_6\text{H}_6$ ,  $\text{C}_6\text{H}_{11}\text{OH}$ , and  $\text{Hg}$ , thermometric lag depends on, among other factors, the viscosity of the liquid used. The effect is particularly noticeable with creosote. E. J. Rosenbaum

The pumping speed of diffusion pumps which use an organic substance. Hans Klumb and Heinz O. Glimm. *Physik. Z.* 34, 64-5(1933).—Vacuum-pump oil, dibutylphthalate, and 2 paraffins m.  $42^\circ$  and  $68^\circ$  were compared with  $\text{Hg}$  as pumping liquids. The pump oil and the lower-melting paraffin evolved too much gas to be useful. The dibutylphthalate and the higher-melting paraffin were as efficient as  $\text{Hg}$ , provided the fore-vacuum was  $10^{-4}$ - $10^{-5}$  mm. No decompn. or reaction with  $\text{Hg}$  was observed. E. J. Rosenbaum

Apparatus for detecting poison in the air. N. Muć and D. Kenig. *Bull. soc. chim. roy. Yougoslav.* 4, 121-3(1933). G. S. Stanatoff

Detection of small leaks in high-vacuum apparatus. F. R. Terroux and W. H. Watson. *Can. J. Research* 8, 412-13(1933).—An app. is described for examg. each seal in turn until the faulty one is detected. It is based on the principle that the rate of leak depends on the pressure differential prevailing across the faulty seal. A Pyrex tube capable of evacuation is placed over the seal to be tested. On evacuation any leak will be observed by the change in the pressure differential across the joint. J. W. Shipley

The use of a selenium barrier-film photocell for measurement of very weak intensities. H. C. Hamaker and W. F. Reezhold. *Physica* 1, 119-22(1933).—A Se photocell (18 mm. sensitive surface) illuminated on the front with monochromatic light was for a c. d. of  $2-4 \times 10^{-9}$  amp. very slow to come to a const. value (several mins.), depending on light intensity and color. The return to zero is also influenced. This observation agrees with work of Brown (*C. A.* 6, 20, 827). For weak intensities Se cells are unsuitable. B. J. C. van der Hoeven

Comparison of vacuum and gas-filled [photoelectric] cells. G. A. Boutry and J. Orcl. *Compt. rend.* 198, 808-10(1934); cf. L. Capdecombe, *Compt. rend.* 198, 402-4(1934).—It is pointed out that O. had proposed the use of such cells for mineralogical work long ago (cf. *C. A.* 21, 217). The doubt as to strict proportionality between the current and the light flux in gas-filled cells is due to the difficulty of obtaining 2 strictly comparable fluxes of light, an accuracy of 1% being the practical limit; hence the claim to an accuracy of 0.25% for vacuum cells is

doubtful. The max. potential safely applicable diminishes as the flux of light increases, but should never exceed 80 v.

C. A. Silberrad.

Schöbel's heating oven for determining carbon and hydrogen by the Pregl method. H. Lieb. *Mikrochemie* 14, 268-4(1934).—A heating chamber composed of glass and made by Schott and Gen. of Jena is described which is suitable for keeping the  $PbO_2$  layer of the combustion tube at a temp. above  $170^\circ$  and below  $200^\circ$ . W. T. H.

Rotary furnace. Peters. *Chem.-Ztg.* 57, 643-4(1933).—The heating of materials which must not come in direct contact with fire gases is effected by the use of a cruciform gas flue dividing the furnace drum into segments, designed for pasty materials, or by the use of several inner tubes contg. the material to be heated, if this is granular. High gas velocities and correspondingly small units are possible and dust losses are avoided. B. C. A.

Temperature regulation of furnaces and thermostats. R. Fonteyne. *Natuurw. Tijdschrift* 15, 226-8(1933).—A sparkless triode relay is described. B. J. C. v. d. H.

Mercury-in-glass thermoregulator. C. C. Coffin. *Proc. Nova Scotian Inst. Sci.* 18, 213-14(1934).—A thermoregulator capable of controlling bath temps. within  $0.001^\circ$  consists of a closely wound spiral or helix of flattened, thin-walled glass tubing filled with Hg. Each end of the coil has a vertical extension long enough to rise above the surface of the bath. One of these ends in a capillary contg. a fixed contact. The other has a stopcock below the bath surface. This is for the purpose of regulating the amt. of Hg in the system. The second contact is fused in this tube below the stopcock. The advantage of this regulator lies in the fact that the ratio of surface area to vol. is so high and the speed of vol. change is so great. C. H. Peet

Glass stills for laboratory and other work. Rust Keller. *Brit.* 401,883, Nov. 23, 1933.

Containers for chemicals. I. G. Farbenind. A.-G. *Fr.* 757,719, Dec. 30, 1933. Vessels for containing  $SO_2$  or halogen derivs. of  $H_2SO_4$  are made of or lined with Al or Al alloys.

Filling bodies for washing-towers. Adolf Erganz. *Ger.* 591,820, Jan. 27, 1934 (Cl. 12a. 1.03).

Bubble-tower plate. K. F. Pavlov. *Russ.* 31,415, Oct. 31, 1933. Construction details.

Apparatus for mixing substances in suspension with chemical reagents. Zellstoffabrik Waldhof. *Fr.* 757,634, Dec. 29, 1933.

Mixer for liquids. B. F. Makeev. *Russ.* 31,416, Oct. 31, 1933. Construction details.

Mixing apparatus suitable for use with liquids, solids and gases. Joseph E. Jewett (to National Aniline and Chemical Co.). U. S. 1,947,851, Feb. 20. Various structural and operative details are described.

Apparatus for commingling soap and water, etc. Clifford M. Larson (to Sinclair Refining Co.). U. S. 1,947,994, Feb. 20. Various structural, mech. and operative details are described.

Electric circuit for measuring hydrogen-ion concentration or making electrometric titrations. Alfred Uhl. *Austrian* 136,517, Feb. 10, 1934 (Cl. 42a).

Closures for the discharge openings of mixing machines, edge-runners, etc. Ludwig Eirich and Joseph Eirich. *Brit.* 401,570, Nov. 16, 1933.

Tower suitable for cooling water by air currents. Barton H. Coffey (to Cooling Tower Co.). U. S. 1,948,980, Feb. 27.

Stirring apparatus. Aktiengesellschaft Kühnle, Kopp & Mausch and Karl Foerster. *Brit.* 401,583, Nov. 16, 1933.

Temperature-control device. Francis H. McCormick (to The British Thomson-Houston Co. Ltd.). *Brit.* 402,243, Nov. 30, 1933.

Continuous rotary filter construction and operation. George W. O'Keefe (to Filtration Engineers, Inc.). U. S. 1,948,947, Feb. 27.

Means for coupling flexible tubes for filtering gases. Victor Roeder. *Ger.* 592,474, Feb. 10, 1934 (Cl. 50a. 6).

Gas filter and dust collector suitable for treating air or

other gases. Emmett F. Annis. U. S. 1,949,002, Feb. 27. Various structural, mech. and operative details are described.

Air filter. Richard R. Halstead. U. S. 1,948,791, Feb. 27.

Air filter. James K. Hammond (to American Air Filter Co.). U. S. 1,949,540, March 6.

Oil-containing device for screening and filtering air to remove dust, etc. Wilfred W. Lowther (to Donaldson Co.). U. S. 1,949,212, Feb. 27. Structural details.

Oil filter. Francis F. Emory. U. S. 1,948,654, Feb. 27. Filters for organic liquids. I. G. Farbenind. A.-G. (Martin Müller-Cunradi and Otto Ambros, inventors) *Ger.* 591,757, Jan. 26, 1934 (Cl. 12a. 27). Org. liquid are recovered from foam-like solid masses by pressing the latter against filters. Thus, the product formed by treating  $Fe_2O_3$  and water with Na isopropylsulfonate is dried, reduced and sintered, treated with  $SiO_2$  and further dried, to form a suitable filter mass.

Filtering medium. Victor Benjamin. U. S. 1,949,644, March 6. A medium suitable for filtering oils comprises a coherent and porous unburned solid body capable of retaining its solidity when immersed in water, composed of a solidified mixt. of unaltered "rice ash," a water-setting cement reactive with the rice ash, and water.

Filter cloths for rotary suction filters. Maschinenfab. Buckau R. Wolf A.-G. *Ger.* 592,290, Feb. 5, 1934 (Cl. 12a. 16.02). Constructional features are described.

Filter-bed tiles. John W. E. Norman, Brit. 401,776, Nov. 23, 1933. Tiles of rectangular shape have 1 or 2 openings in the center, recesses in each side and legs of pentagonal cross section at each corner, the openings, recesses and legs being tapered to prevent the filtering medium from becoming jammed.

Apparatus for separating carbon dioxide from smoke and other gases. Jean Mauclet. *Fr.* 757,537, Dec. 28, 1933.

Device for the separation of liquids such as water from air in pipe lines. John D. MacLachlan (to Mac Ad Co.) U. S. 1,948,180, Feb. 20. Structural details.

Magnetic separators of the trough or tray type. Sydney Morris. *Brit.* 401,430, Nov. 16, 1933.

Magnetic ore separator. Percy H. Thomas. U. S. 1,948,080, Feb. 20. Mech. features.

Flotation apparatus for separating solids. Charles Le Chatelier. *Fr.* 757,461, Dec. 27, 1933.

Apparatus for separating solids of different specific gravities (such as coal and refuse) by agitating with liquids. Thomas M. Chance. U. S. 1,949,242, Feb. 27. Various structural and operative details are described.

Centrifugal separating apparatus. Eugene C. Saint-Jacques. *Brit.* 401,630, Nov. 16, 1933. Addn. to 367,194 (Cl. A. 27, 1551).

Continuously working centrifuge. I. M. Abramovich and K. N. Reimer. *Russ.* 31,379, Oct. 31, 1933. Construction details.

Cellular rotary drying drum. Cyrille A. Defemme. *Ger.* 592,112, Feb. 2, 1934 (Cl. 82a. 21.02).

Rotatable elongated drier and associated apparatus for removing oil from thermatomic carbon. Carroll Miller (to Thermatomic Carbon Co.). U. S. 1,947,780, Feb. 20. Various structural and operative details are described.

Apparatus for evaporating salt solutions, etc. Rischer Wyss Maschinenfab. A.-G. *Ger.* 592,289, Feb. 5, 1934 (Cl. 12a. 2).

Pan for evaporating brine. Preussische Bergwerks- und Hütten-A.-G., Zweigniederlassung Salz- und Braunkohlenwerke, Abteilung Saline Schönebeck (Elbe). *Ger.* 591,532, Jan. 24, 1934 (Cl. 12a. 1).

Heating apparatus for evaporators, etc. Ges. für Drucktransformatoren. (Koenemann - Transformatoren) G. m. b. H. *Ger.* 588,582, Feb. 2, 1934 (Cl. 12a. 1).

Apparatus for distilling and rectifying liquids. Messer & Co. G. m. b. H. *Ger.* 592,345, Feb. 6, 1934 (Cl. 12a. 5).

Apparatus for treating liquids with gases. K. P. Likhushin and L. D. Neresov. *Russ.* 31,417, Oct. 31, 1933. Construction details.

Apparatus for cooling and carbonating liquids with solid carbon dioxide. Louis Stark. Austrian 136,291, Jan. 25, 1934 (Cl. 17c).

Apparatus for mixing carbon dioxide and liquids. Mathias J. Kautz. Ger. 583,843, Nov. 27, 1933 (Cl. 6b. 20).

Apparatus for contact treatment of mutually insoluble liquids of different specific gravities such as in dephenolizing ammonia water with benzene. Heinrich Schöneborn (to Koppers Co. of Del.). U. S. 1,949,696, March 6. Various structural, mech. and operative details are described, of an app. comprising a vertical chamber with agitators mounted on a vertical central rotatable shaft.

Apparatus and method for releasing the pressure on viscous liquids. Schofield Labrow and Imperial Chemical Industries Ltd. Brit. 401,722, Nov. 20, 1933. Pressure upon liquids contg. solids in suspension, e. g., the products of the destructive hydrogenation of carbonaceous materials, is released by allowing the liquid to flow from the pressure chamber through a relatively long constricted passage formed by a channel or groove at the interface between a cylinder and a cooperating piston, the cylinder and piston being normally stationary.

Device for measuring the ratio of the ingredients in a mixture of gases or liquids such as "laughing gas" and oxygen. Eugen Schweitzer (to I. G. Farbenind. A.-G.). U. S. 1,947,923, Feb. 20. Two gases or liquids are admitted to opposite ends of an inner horizontal tube connected to an outer surrounding jacket or exit tube by perforations spaced longitudinally of the tube, and the position of a freely movable ball in the inner tube indicates the mixing proportions of the two gases or liquids.

Gas-pressure regulator. George M. Denning (to Air Reduction Co.). U. S. 1,948,027, Feb. 20. Structural and mech. details.

Apparatus for compacting fibrous materials (such as those mixed with latex) under pressure. Ernest Hopkinson (to Naugatuck Chemical Co.). U. S. 1,949,472, March 6. Structural and mech. features.

Valve protector for gas cylinders such as those for holding oxygen, nitrogen or acetylene. Gebhard Jaeger. U. S. 1,948,966, Feb. 27. Structural details.

Drills and associated devices for taking samples of materials such as in drilling wells. Sosthene Robichaux and George J. Barrett. U. S. 1,948,631-2, Feb. 27. Structural details.

Filling units of material carrying copper and vanadium compounds, etc., suitable for use in gas purifiers, etc. Wilbert J. Huff, Oscar W. Lusby and Lloyd Logan. U. S. 1,947,777, Feb. 20. Structural details.

Blow chamber and associated apparatus for producing rock and mineral wools. Edward R. Powell (to Banner Rock Corp.). U. S. 1,948,395, Feb. 20. Structural and mech. features.

Mercury boiler. Wm. L. R. Emmet and Bevis P. Coulson, Jr. (to General Elec. Co.). U. S. 1,948,371, Feb. 20.

Pressure still header. Samuel H. Edwards (to Standard Oil Co. of Calif.). U. S. 1,948,028, Feb. 20. Mech. features.

Header for tubular heat-transfer apparatus suitable for tube stills, etc. Harry M. Hope (to Alco Products, Inc.). U. S. 1,948,380, Feb. 20.

Valve-protecting device for gas containers such as cylinders for holding oxygen, nitrogen or acetylene. Henry Wayer and Gebhard Jaeger. U. S. 1,948,953, Feb. 27. Structural details.

Apparatus for coating sheet material. Cyril W. Bonnicksen and Protectoglass Ltd. Brit. 402,807, Dec. 4, 1933.

Blowpipe tip suitable for cutting with oxygen and a combustible gas. Lorn Campbell, Jr. U. S. 1,949,780, March 6.

Portable comparison photometer which can be used as a telephotometer for measuring the atmospheric transmission factor of light. Eric A. H. French. Brit. 401,426, Nov. 16, 1933.

Photometric apparatus for measuring the transparency

of a fluid. Light Sensitive Apparatus Corp. Brit. 401,514, Nov. 16, 1933.

"Glossimeter" suitable for testing the gloss of various surfaces. August H. Pfund. U. S. 1,949,619, March 6. Structural, mech. and optical details.

Apparatus for delivering measured quantities of granular material. James W. Pitt. Brit. 401,079, Nov. 9, 1933.

Device for delivering measured quantities of liquid. Oliver Coughtrie. Brit. 402,132, Nov. 27, 1933.

Means for controlling automatically the temperature of the gas or vapor filling of a discharge device. John H. Payne (to The British Thomson-Houston Co. Ltd.). Brit. 402,147, Nov. 30, 1933. Addn. to 401,379 (C. A. 28, 2226).

Cam-operated apparatus for controlling the proper sequential operation of industrial processes such as working of rubber. Edward B. Foote (to Taylor Instrument Cos.). U. S. 1,949,199, Feb. 27. Mech. features.

Jet pulverizers for minerals, etc. International Pulverizing Corp. Brit. 401,512, Nov. 16, 1933.

Ball mills. Fried. Krupp Grusonwerk A.-G. Brit. 402,289, Nov. 30, 1933.

Ball-and-ring mills. Babcock & Wilcox Ltd. Brit. 401,888, Nov. 23, 1933.

Ball-and-ring mills. Babcock & Wilcox Ltd. Brit. 402,244, Nov. 30, 1933.

Disk mills for cereals or substances of fragmentary nature. Geo. E. Smith. Brit. 402,217, Nov. 30, 1933.

Apparatus (with receptacles and overflow pipes arranged at successively lower levels) for gravity separation of materials such as in coal purification with sodium thiosulfate solution. Francis I. du Pont. U. S. 1,949,117, Feb. 27. An app. is described with supports for the sepg. containers so that they can be successively moved through the treating system.

X-ray apparatus. Julius J. Grobe and Arthur J. Kizaur (to General Elec. X-Ray Corp.). U. S. 1,947,846, Feb. 20. Structural and mech. details.

X-ray apparatus. Oscar H. Pieper. U. S. 1,949,760, March 6. Structural details.

X-ray tube. Albert Bouwers (to N.-V. Philips' Gloeilampenfabrieken). U. S. 1,949,005, Feb. 27.

X-ray tube. Thomas H. Forde. U. S. 1,949,463, March 6.

Cathode-ray tubes. Radioaktiengesellschaft. D. S. Loewe and Kurt Schlesinger. Fr. 757,658, Dec. 30, 1933.

Gas-filled cathode-ray tubes. Manfred v. Ardenne and Siegmund Loewe. Brit. 401,727, Nov. 20, 1933.

Luminescent tube. Frederick R. Balcar (to Air Reduction Co.). U. S. 1,949,069, Feb. 27. A tube contg. Ne also contains sufficient Kr or Xe to alter the color of the emitted light.

Light-sensitive cell. Ray S. Lyon (to United Research Corp.). U. S. 1,948,766, Feb. 27. Structural details.

Discharge apparatus. Thomas E. Allibone and Associated Electrical Industries Ltd. Brit. 401,738, Nov. 20, 1933. Graded high potentials in phase are applied to the sections of a cascaded discharge tube, e. g., a cathode tube, by an impulse generator.

Discharge tubes, e. g., Röntgen-ray tubes. C. H. F. Muller A.-G. Brit. 401,988, Nov. 23, 1933.

Electric discharge tubes. John H. O. Harries. Fr. 757,620, Dec. 29, 1933.

Electric discharge tubes. N. V. Philips' Gloeilampenfabrieken. Fr. 757,631, Dec. 29, 1933.

Electric discharge tubes. Elektrische Glühlampenfabriken Joh. Kremenezky. Austrian 136,204, Jan. 25, 1934 (Cl. 21a). When a conductive substance, e. g., a gettering metal, is vaporized in a discharge tube, its

condensation on certain parts of the tube may form an undesired elec. connection between different elements of the tube. This possibility is now obviated by coating the parts in question with  $MnO_2$ ,  $KClO_3$  or other substance which, when heated above the normal working temp. of the tube, will liberate O or another reagent capable of combining with the conductive substance to form a nonconductive substance.

Luminous electric discharge tube. Victor J. Francis

and John W. Ryde (to General Elec. Co.). U. S. 1,948,261, Feb. 20. Various details are described of a tube with a filling including a metal vapor such as Hg and operating with a "high pressure" discharge.

High-tension discharge tubes. C. H. F. Müller A.-G. Fr. 757,629, Dec. 29, 1933, and 757,681, Dec. 30, 1933.

Discharge devices having a hot cathode and an internal control electrode, provided with means, responsive to thermal radiation from the cathode, for preventing the discharge until the cathode has reached a predetermined temperature. Allgemeine Elektrizitäts-Gesellschaft (to International General Electric Co., Inc.). Brit. 401,828, Nov. 23, 1933.

Electrical discharge device suitable for use as a television receiving lamp. Dewey D. Knowles (to Westinghouse Elec. & Mfg. Co.). U. S. 1,948,720, Feb. 27. Various details are described of a device contg. a "noble gas" such as Ne mixed with H and having electrode which may be formed of Ni or Ta and which are spaced apart by a distance so small that a potential impressed across them causes a glow on one of the electrodes but no glow between them.

Emissive cathodes. Ernst Waldschmidt. U. S. 1,949,094, Feb. 27. The surface of a W wire is purified and it is heated in an oxidizing atm. to produce a coating comprising the higher W oxides; this coating is reduced in a reducing atm. comprising "water-steam" and H, to pure WO<sub>3</sub>, and an alk. metal is vaporized onto the WO<sub>3</sub> coatings. An arrangement of app. is described.

Electron-emissive cathode. Anton Lederer (to Ernest A. Lederer). U. S. 1,948,445, Feb. 20. For making a cathode which has a more const. and more lasting electron emission than "thoriated tungsten," an intimate mixt. is formed contg. Th and 50-100 times as much Os as Th, and the mixt. is heated in a non-oxidizing environment to above the m. p. of Th to form an intimate and uniform

alloy of Th and Os; the temp. is then raised close to the m. p. of Os to consolidate the material and render it pliable when cold.

Thermionic valves. Stephen P. de Laszlo. Brit. 401,740, Nov. 20, 1933.

Thermionic valves. The M-O Valve Co. Ltd. and Ernest C. R. Gant. Brit. 401,778, Nov. 23, 1933.

Thermionic valves. Telefunken Gesellschaft für drahtlose Telegraphie m. b. H. Brit. 401,859, Nov. 23, 1933.

Thermoelectric-couple material. Otto Hermann (to Thermo Elec. Co.). U. S. 1,947,595, Feb. 20. A neg thermoelec. element contains Sb 61-4, Zn 35-7 and Bi 0.5-2.0% and may be used with a pos. element such as an alloy of Cu 55 and Ni 45%.

Furnace for gaseous, liquid or pulverulent fuels. D. Siebenmann. Swiss. 166,145, Feb. 16, 1934 (Cl. 136).

Converters. Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. (Adolf Vogt, inventor). Ger. 591,040, Jan. 25, 1934 (Cl. 40a. 10.30). The interior surfaces of converters are given a high-melting coating of oxide. The converters are coated with metal which is then oxidized by blowing in O with steam, and the oxide layer is finally fused.

Rotary kiln or drying drum with internal partition. Friedrich Meyer. Ger. 592,258, Feb. 3, 1934 (Cl. 80a. 14.10).

Emptying device for shaft kilns for lime, etc. Albert Eberhard. Ger. 592,259, Feb. 5, 1934 (Cl. 80a. 16.20). Addn. to 553,485 (C. A. 26, 4510).

Blowpipe burner, consuming acetylene only. Idhis M. Evans. Brit. 401,663, Nov. 15, 1933.

Apparatus for catalytic heating. Frank A. Howard (to Standard Oil Development Co.). U. S. 1,948,298, Feb. 20. Various structural details are described of an app. suitable for use with a liquid fuel such as that of an automobile engine and a catalyst for the purpose of heating a radiator, engine, etc.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWN

P. A. Levene. Lawrence W. Bass. *Ind. Eng. Chem., News Ed.* 12, 105(1934).—Biography, with portrait.

Fritz Haber. Bonhoeffer. *Chem.-Ztg.* 58, 205-6 (1934).—Obituary.

Alfred Fabian Hess. Glanzmann. *Z. Vortragsforschung* 3, 1(1934).—Obituary notice.

In memory of D. I. Mendeleev. I. A. Kablukov. *J. Chem.-Ind. (Moscow)* 1934, No. 1, 25-9.—The life of Mendeleev and the history of the periodic table are described.

Frederick Walton. Centenary of the birth of the inventor of linoleum. R. D. Hodgson. *Chemistry & Industry* 1934, 214-16.

Discovery and early history of platinum in Russia. B. N. Menshutkin. *J. Chem. Education* 11, 226-9 (1934).

Grecian and Roman stucco, mortar and glass. Wm. Foster. *J. Chem. Education* 11, 223-5(1934); cf. C. A. 27, 2609.

The progress of modern alchemy. J. Velíšek. *Chem. Listy* 27, 66-9, 84-8. The effects of very penetrating radiations produced by bombarding He with alpha particles upon the removing of protons from the nucleus of paraffin and related substances are discussed. The work of Rutherford and Chadwick is discussed. Frank Mareah

Special exercises for students in general chemistry. III. Crystal growth. G. Bryant Buchanan. *J. Chem. Education* 11, 229-31(1934); cf. C. A. 28, 97.

Types of graphic classifications of the elements. II. Long charts. O. N. Quam and Mary Battell Quam. *J. Chem. Education* 11, 217-23(1934); cf. C. A. 28, 1232.

A program for organic chemistry in the liberal arts col-

lege. J. B. Culbertson. *J. Chem. Education* 11, 23, 4(1934).

Browne's "Hydriothaphia" with a reference to adipocere. Wm. H. Barnes. *Isss* 20, 337-43 (1934).—Sir Thomas Browne's "Hydriothaphia, Urne-Buriall, or, a Brief Discourse of the Sepulchrall Urnes Latently Found in Norfolk," first printed in 1658 and probably written two years earlier makes mention of a "fat concretion," "coagulated large lumps of fat" of "the consistence of the hardest castile soap" which was found "in a Hydriothaphia body buried 10 years in a churchyard." This is probably the earliest reference to the material which Fourcroy observed in 1750 when the *Cimetière des Innocents* at Paris was cleaned out. He studied the substance and named it "adipocera".

Lavoisier's early work in science—1763-1771. A. N. Meldrum. *Isss* 19, 330-63(1933). II. *Ibid* 20, 390-425(1934).

The atmospheric ozone at Pic du Midi by direct observation of the sun. J. Gault. *Compt. rend.* 198, 492-4 (1934); cf. C. A. 27, 5592.-The quantity of O<sub>3</sub> in the atm. above Pic du Midi was detd. with a visual spectro photometer. On Aug. 18, 1933 the O<sub>3</sub> above the peak was equiv. to a 0.158 cm. layer of pure O<sub>3</sub>, on the 24th, 0.165 cm., and on the 28th, 0.260 cm. This O<sub>3</sub> seemed to be partly (8-30%) diffused through the whole atm. and partly (70-92%) coned. in a relatively thin layer located from 18 to 45 km. above the peak.

Composition of the air in the stratosphere. A. F. Kapustinskii. *Compt. rend. acad. sci. U. R. S. S. (N. S.)*, 1, 108-9(in German 109)(1934).—The "Stratostat U. S. S. R." flight results show that the compn. of the atm. at 19 km. altitude is the same as at sea level. This is due to an equil. between the gravitational and the thermal tendencies toward variable compn.

Characteristics of the newly discovered lakes on the northern delta of the Volga River, the Deshsheshak, Bekesh-Sor and others. V. I. Nikolaev and B. I. Stepanov. *J. Applied Chem.* (U. S. S. R.) 6, 436-49 (1933).—The lye of the Deshsheshak and Bekesh-Sor lakes found under a layer of solid salt deposit was composed of (in July, 1931)  $\text{CaSO}_4$  below 0.10,  $\text{MgSO}_4$  7.17,  $\text{MgCl}_2$  15.08,  $\text{MgBr}_2$  0.12,  $\text{KCl}$  0.11 and  $\text{NaCl}$  6.73%; the solid crust contained  $\text{NaCl}$  98.10,  $\text{CaSO}_4$  0.94,  $\text{MgSO}_4$  0.23,  $\text{MgCl}_2$  0.48, insol. 1.26 and  $\text{H}_2\text{O}$  4.20%. The May, 1932, lye had the following compn.:  $\text{CaSO}_4$  0.20,  $\text{MgSO}_4$  1.05,  $\text{MgCl}_2$  1.57,  $\text{KCl}$  0.08 and  $\text{NaCl}$  24.02%. The mineral astrakanite found on the bottom of the Bekesh-Sor lake contained  $\text{MgSO}_4$  84.75,  $\text{Na}_2\text{SO}_4$  38.11,  $\text{NaCl}$  41.82,  $\text{H}_2\text{O}$  31.78% and insol. 1.02%. Its lye was composed (May, 1932) of  $\text{MgSO}_4$  1.29,  $\text{MgCl}_2$  1.25,  $\text{KCl}$  0.11,  $\text{MgBr}_2$  0.01 and  $\text{NaCl}$  28.29%, while it had the following compn. on July 17, 1931:  $\text{CaSO}_4$  0.10,  $\text{MgSO}_4$  8.65,  $\text{MgCl}_2$  8.69,  $\text{KCl}$  0.24,  $\text{KBr}$  0.01 and  $\text{NaCl}$  12.27%. The high content of some of the lakes in  $\text{NaCl}$  is remarkable. Many analytical data are given and the crystn. procedure for various salts is discussed.

A. A. Boetlingk  
The Batalpashinskii salt lake. P. N. Lashchenko and A. I. Morozova. *J. Applied Chem.* (U. S. S. R.) 6, 416-34 (in English 434-5) (1933).—The Batalpashinskii salt lake holds 4,500,000 cu. m. of water with about 700,000-750,000 tons of dissolved  $\text{Na}_2\text{SO}_4$ , the latter having a concn. range of 5-37°Bé, and a fairly const. ratio of  $\text{Na}:\text{Mg}$  and  $\text{Cl}:\text{SO}_4$  ions. Mirabilite is pptd. during the cold season and the compn. of the water fluctuates accordingly. It receives its salt from the ground waters, which are nearly of the same compn. as the lake water. The ground water on its way to the lake changes its compn. because of a reaction taking place between the  $\text{CaSO}_4$  and the colloidal Na particles present in the soil. Absorption by the mud on the bottom of the lake and in the water is of great importance. This lake cannot be used for the production of  $\text{NaCl}$  and  $\text{MgCl}_2$ .

A. A. Boetlingk  
Mass, electrostatic charge and constants of attraction. I. N. Longinescu. *Bul. soc. române fis.* 35, 161-7 (1933).—In a crit. consideration of basic units 2 classifications are proposed: (1) *Atomic units*. The neutron is the unit of mass, being the smallest electrically neutral unit. For the unit of electrostatic charge the charge of the proton or electron is taken. (2) *Scientific units*.—The g. is the unit of mass. A quantity equiv. to 98,500 coulombs is the unit of electrostatic charge. Based on these units the ratio between the Coulomb and the Newton consts. of attraction is  $1.3 \times 10^{10}$ . Calvin Brous

Interconversion of atomic and weight percentages. J. S. Marsh. *Metals & Alloys* 5, 48 (1934). D. S.

Determination of the atomic weight of molybdenum. Raymond Latité. *Compt. rend.* 197, 1730-1 (1933).— $\text{MoO}_3$  was purified by distn. with  $\text{HCl}$  gas in a Pyrex flask, and condensed in quartz; only the middle fraction is collected. The product was dissolved in  $\text{NH}_3$  soln., evapd. to dryness, treated with  $\text{HNO}_3$  and then heated in a current of  $\text{O}_2$  at  $400^\circ$ . The white oxide was sublimed in quartz above  $793^\circ$ . The product thus obtained was heated in a quartz boat in a stream of  $\text{H}_2$  at  $800^\circ$ , the  $\text{H}_2$  being replaced at the end of 10 hrs. by  $\text{A}$ , and the furnace cooled. The boat and  $\text{Mo}$  were weighed in an atm. of  $\text{A}$  or  $\text{N}_2$ . Seven expts. gave  $\frac{\text{Mo}}{\text{MoO}_3} = 0.66669 \pm 0.00001$ .

Reoxidation of the  $\text{Mo}$  gave the ratio  $\frac{\text{Mo}}{\text{MoO}_3} = 0.66668 \pm 0.00001$ , which gives an at. wt. of 96.01  $\pm$  0.01. L. W.

The periodic system of the elements. VIII. P. Petrenko-Kritchenko. *J. Gen. Chem.* (U. S. S. R.) 3, 587-9 (1933); cf. C. A. 28, 1688<sup>9</sup>.—The heats of formation of compds. of the alkali metals and of the alk. earth metals with  $\text{O}$ ,  $\text{S}$  and  $\text{F}$ ,  $\text{K} < \text{Ca}$ ,  $\text{Rb} < \text{Sr}$ ,  $\text{Cs} < \text{Ba}$ . For compds. with  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{I}$  and  $\text{Se}$ ,  $\text{K} > \text{Ca}$ ,  $\text{Rb} > \text{Sr}$ ,  $\text{Cs} > \text{Ba}$ . Within each metallic group the relations are: for compds. with  $\text{O}$ ,  $\text{S}$  and  $\text{F}$ ,  $\text{Na} > \text{K} > \text{Rb} > \text{Cs}$ ,  $\text{Ca} > \text{Sr} > \text{Ba}$ .

1 With  $\text{Cl}$ ,  $\text{Br}$ ,  $\text{I}$  and  $\text{Se}$ ,  $\text{Na} < \text{K} < \text{Rb} < \text{Cs}$ ,  $\text{Ca} < \text{Sr} < \text{Ba}$ . Breaks in the curves representing periodic change in the properties of the elements occur because these changes are affected by 2 factors, the at. wt. and the no. of atoms, one playing a dominant role. Such breaks occur more frequently with change in the at. wt. in the case of the univalent metals than they do in that of the bivalent ones.

Lewis W. Butz

2 The relations between crystal lattice and atomic chemistry with respect to the periodic system of the elements. Ernst Sommerfeldt. *Centr. Mineral. Geol.* A1934, 33-46; cf. Reinicke, C. A. 26, 5233, 5808. M. F.

Electron optics and electron microscopy. E. Brüche. A. E. G. Mitt. 1934, 45-7; cf. C. A. 28, 947<sup>1</sup>.—Nine illus. A review. C. G. F.

Ionization potential and energies of formation of non-polar molecules. J. Savard. *Compt. rend.* 198, 751-3; J. phys. radium 5; 27-36 (1934); cf. C. A. 28, 694<sup>1</sup>.—D (energy of union) calcd. from the relation previously deduced agrees with the value detd. thermochemically or spectrographically for  $\text{H}_2$ ,  $\text{N}_2$ ,  $\text{C}_2$ ,  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{HCl}$ ,  $\text{Cl}_2$ ,  $\text{SO}_2$ ,  $\text{HCN}$ ,  $\text{C}_2\text{N}_2$  and  $\text{O}_2$ . The results with the 4 last point to  $\text{S}_2$  and  $\text{S}_8$  in S vapor,  $\text{H}_2\text{C}:\text{N}$  in  $\text{HCN}$ ,  $\text{N} \text{ C.C N}$  in  $\text{C}_2\text{N}_2$  and  $\text{O O}$  rather than  $\text{O O}$  in  $\text{O}_2$ . C. A. Silberrad

Comparison of quantum-theoretical formulas for electric double refraction with experiment. Th. Neugebauer. Z. Physik 86, 392-410 (1933).—The results of a theoretical paper (Z. Physik 73, 386 (1931); C. A. 27, 4724) agree as a whole with the general character of the exptl. results. The theory is extended to polyatomic mols. R. P.

Magnetic birefringence of gaseous oxygen. Tsai Belling. *Compt. rend.* 197, 1615-16 (1933).—Under the action of a magnetic field of about 45,000 gauss/cm. compressed  $\text{O}$  acquires a neg. birefringence, proportional to the pressure. The Cotton-Mouton const. is about  $-4.8 \times 10^{-14}$  at 100 kg./sq. cm. I. G. Vanden Bosch

Thermal variation of the magnetic birefringence of nitrobenzene, benzene and carbon disulfide. Antoine Goldet. *Compt. rend.* 197, 1612-14 (1933).—The relative variations of birefringence near  $20^\circ$  were found to be 1/144.6, 1/400 and 1/235 per degree for  $\text{C}_6\text{H}_5\text{NO}_2$ ,  $\text{C}_6\text{H}_6$  and  $\text{CS}_2$ , resp. Measurements were carried out with the same tube, current and field but with the yellow Hg line with  $\text{C}_6\text{H}_5\text{NO}_2$  and the green Hg line with  $\text{C}_6\text{H}_6$  and  $\text{CS}_2$ . E. G. Vanden Bosch

The change of resistance of single crystals of gallium in a magnetic field. I. W. J. de Haas and J. W. Blom. *Physica* 1, 134-44 (1933).—In continuation of similar work on Bi (Shubnikov and de Haas, C. A. 24, 5196; 25, 241; de Haas and van Alphen, C. A. 25, 855) the relation between high diamagnetism and resistance change in a magnetic field was studied for Ga. It has, like Bi, a vol. decrease on melting during which the diamagnetism disappears (Ehrenfest, C. A. 20, 1170). Ga monocystals were made with well-developed faces of the rhombic (pseudotetragonal) crystal; the length of the monocystal rod coincided with the "tetragonal" axis. Of 2 samples the less pure one (spectroscopically) had a larger change in resistance with magnetic field. The measuring wires were spot-welded to the crystal, a horizontal revolving Weiss magnet was used; the Ga rod was set vertical; the temp. was that of liquid  $\text{H}_2$ . Tables and curves are given of  $R/R_0$  with various orientations of magnet and field strengths (up to 22,300 gauss), temp.  $20.4^\circ$  down to  $9.9^\circ$  abs. The rotational curves, simple sine type at low field strength, become more complicated with secondary maxima and minima for higher field strength and lower temps. B. J. C. van der Hoeven

9 Magneto-thermoelectric effects in nickel and iron: experimental laws. A. Perrier and T. Kousmine. *Compt. rend.* 198, 810-12 (1934).—The differences,  $\Delta E$ , between the thermoelec. power of couples consisting of a nonmagnetic metal and Ni or Fe unmagnetized, and of couples of the same metal and Ni or Fe magnetized parallel,  $\parallel$ , or perpendicular  $\perp$ , to the direction of the temp. gradient are plotted against the magnetic field ( $H$  55.6-1800 gauss).  $\Delta E$  is pos. (i.e. indicates increase in ther-

molec. power) or neg. according as  $H$  is  $\parallel$  or  $\perp$ , and much greater when it is  $\parallel$ . In Ni the curves rise with increasing  $H$  approx. hyperbolically to a satn. limit; in Fe they attain a max. and then decline, also toward a limit. C. A. S.

Ferromagnetism of  $\gamma$ -Fe<sub>2</sub>O<sub>3</sub>. J. G. Koenigsberger. *Naturwissenschaften* 22, 90(1934).—Sachse (C. A. 27, 4972) has recently rejected the possibility of ferromagnetic Fe<sub>2</sub>O<sub>3</sub>. K. repeatedly found hematite crystals of remanence up to 1.9 c. g. s. units, more than can be accounted for by the Fe<sub>2</sub>O<sub>3</sub> content (1.52%); furthermore for magnetite the Curie point of the susceptibility  $CP_K$  coincides with that of the coercive force  $CP_C$  at 585°, for hematite  $CP_K = 650^\circ$ ,  $CP_C = 730^\circ$ . Magnetization heating to 585° and demagnetization were applied to 9 samples of hematites and magnetites, artificial and natural. Fe<sub>2</sub>O<sub>3</sub> with magnetite and pure magnetite are demagnetized completely by this process; for hematite itself, however, the remanent magnetism is only partly weakened (36–40% remains), likewise for titanomagnetite and titanohematite (ilmenite). Hence under natural conditions  $t \geq 200^\circ$ ,  $p \geq 40$  atm. a ferromagnetic trigonal  $\gamma$ -Fe<sub>2</sub>O<sub>3</sub> is actually found (cf. Baudisch and Welo, C. A. 27, 5600; Danilov, et al. C. A. 27, 2858).

Paramagnetism of some rare earth ions. C. J. Rodden. *J. Am. Chem. Soc.*, 56, 648–9(1934).—The magnetic susceptibility at room temp. was measured for Pr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·8H<sub>2</sub>O, Nd<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·8H<sub>2</sub>O, Nd<sub>2</sub>O<sub>3</sub>, NdFe(CN)<sub>6</sub>·4H<sub>2</sub>O, Sm<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·8H<sub>2</sub>O, Sm<sub>2</sub>O<sub>3</sub> and Yb<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·8H<sub>2</sub>O. The results agree with Van Vleck's theory. A screening const. of 34 is preferred for Sm.

Diamagnetic susceptibility of helium. Felix J. Wisniewski. *Acta Phys. Polonica* 2, 23–9(1933) (in French).—Generalized mechanics are applied for the calcn. of the diamagnetic const. of He, on the basis of Bohr's model. Calcd. and exptl. values agree.

The dielectric coefficients of gases. II. The lower hydrides of C and Si, O, N, oxides of N and C and fluorides of Si and S. H. E. Watson, G. Gundu Rao and K. L. Ramaswamy. *Proc. Roy. Soc. A* 143, 558–88(1934); cf. C. A. 25, 5320.—The dielec. consts. of 17 gases were measured at 2 or 3 temps. and their elec. moments deduced from the results. Only C<sub>2</sub>H<sub>6</sub>, CO, NO and N<sub>2</sub>O have measureable elec. moments, the value for N<sub>2</sub>O being discussed in relation to suggested structures for the mol. Compressibilities were also detd. by making measurements at different pressures. The construction and calibration of a precision variable condenser capable of measuring a change in capacity of 0.4  $\mu$ F with an accuracy of 0.0001  $\mu$ F is described.

Change of the dielectric constant of nitrobenzene with temperature. A. Piekara and J. Mazur. *Acta Phys. Polonica* 1, 401–4(1932) (in French); cf. C. A. 27, 880.—Mazur's statement (C. A. 26, 2358) that liquid PhNO<sub>2</sub> exists in 2 modifications aroused active opposition (e. g. Piekara, C. A. 27, 2358). The present joint investigations of P. and M. do not indicate the existence of a second modification. The question of an allotropic state of PhNO<sub>2</sub> must be regarded as not definitely solved.

The dielectric constant of nitrobenzene and its moisture content. Arkadiusz Piekara. *Acta Phys. Polonica* 1, 405–9(1932) (in German); cf. preceding abstract.—Dried and recrystd. PhNO<sub>2</sub>, m. 5.74°, shows a normal dielec. const.-temp. curve, without an anomaly at 9.6°. Addn. of H<sub>2</sub>O has little effect upon  $\epsilon$ . The resonance method as a standard in measuring  $\epsilon$  is proposed.

Dielectric constants of polar solutions. Jeffries Wyman, Jr. *J. Am. Chem. Soc.* 56, 536–44(1934).—The dielec. consts.,  $\epsilon$ , of a no. of aq. solns. of ampholytes were measured. There is a linear relationship between molar concn. and  $\epsilon$ . The increases in  $\epsilon$  per mole of ampholyte are equal for the same ampholyte in different solvents. Thus, in polar solvents  $\epsilon$  is a nearly additive property. "A discussion is given of a possible interpretation of this in terms of the internal field, which, if valid, would allow of approx. ests. of polarization and elec. moments with polar solns." Both dielec. consts. and ds.

are given for many solns. of amino acids and peptides in polar solvents.

The electric moment of dioxane. C. H. Schwingel and E. W. Greene. *J. Am. Chem. Soc.* 56, 653–4(1934).—The total molar polarization ( $=24.5$  cc.) of 1,4-dioxane in the vapor state is independent of temp., hence 1,4-dioxane has zero elec. moment. W. B. K., Jr.

Two types of dielectric polarization. S. O. Morgan. *Trans. Electrochem. Soc.* 65, 8 pp.(preprint)(1934).

The real part of the dielec. const.,  $\epsilon'$ , of a material having a polarizability due either to dipoles or to heterogeneity should be a decreasing function of frequency, while the imaginary part,  $\epsilon''$ , should have a max., a type of behavior usually designated as anomalous dispersion. The frequency at which anomalous dispersion occurs is detd. by the time of relaxation,  $\tau$ , of the polarization. For dipole polarizations changes of  $\tau$  with temp. are due largely to changes in viscosity, while for Maxwell-Wagner polarizations the value of  $\tau$  depends upon the dielec. const. and cond. of the components of the dielectric. It is shown that for glycerol anomalous dispersion is observed at 30 cycles as well as at  $98 \times 10^6$  cycles with no apparent discontinuity at intermediate frequencies. The value of  $\epsilon''_{\text{max}}$  increases with decreasing temp. as predicted for dipole polarizations. For halowax and paper anomalous dispersion is also observed, but with the distinct difference from glycerol that the values of  $\epsilon''_{\text{max}}$  decrease with decreasing temp. This behavior is predicted for Maxwell-Wagner polarizations in a heterogeneous dielectric, one component of which has a considerably greater conductance than the other. It is indicated that the anomalous dispersion in halowax and paper is due to Maxwell-Wagner polarizations, while that in glycerol is due to dipoles.

Derivatives of normal pentane and normal heptane. III. Dipole moments of the bromoethoxy and the dibromo derivatives. Mary L. Sherrill, Martha E. Smith and Dorothy D. Thompson. *J. Am. Chem. Soc.*, 56, 611–14(1934); cf. C. A. 24, 2984.—The d., n, b. p. and dielec. const. were measured for a series of bromoethoxy and dibromo derivs. of pentane and heptane. The dipole moments of the pentane derivs. are close to the values of the corresponding heptane derivs.

Volume coefficients of expansion of several gases at pressures below one meter. J. B. M. Coppock and R. Whytlaw-Gray. *Proc. Roy. Soc. (London)* A143, 487–505(1934).—By the use of a Callendar const.-pressure air-thermometer, detns. were made of the vol. coeffs. of expansion of C<sub>2</sub>H<sub>4</sub>, CO<sub>2</sub>, N<sub>2</sub>O, NO, CO, Me<sub>2</sub>O, and SF<sub>6</sub>, at several pressures between the temp. limits of 25–60° in Series I, and 11–48° in Series II. Measurements were made with 2 expansion bulbs, one of glass and the other of fused SiO<sub>2</sub>. Those for CO<sub>2</sub>, N<sub>2</sub>O and C<sub>2</sub>H<sub>4</sub>, obtained in the glass vessel, when extrapolated gave values for the coeff. at zero pressure markedly greater than the accepted value, but those detd. in SiO<sub>2</sub> yielded results in close agreement with this const. This discrepancy is due to the greater adsorption on glass than on SiO<sub>2</sub> which, when easily condensable gases are used gives rise to appreciable errors.

Refraction and dispersion of gases and vapors. I. General introduction. K. Fajans. *Z. physik. Chem.* B24, 103–54(1934).—The purpose of the measurements and the development of the exptl. method are summarized. The subjects of refraction and dispersion are discussed with particular reference to the results of the following papers. II. Refraction and dispersion of air, hydrogen sulfide and water vapor in the visible region. J. Wust and H. Reindel. *Ibid.* 155–76.—A gas interferometer of the Zehnder type (*Z. Instrumentenk.* 11, 275(1901)) is described. Measurements were made with air, H<sub>2</sub>S and H<sub>2</sub>O, the latter at 130–150°. Refraction and dispersion agreed within the exptl. error with results obtained by earlier workers. This was used as a test of the performance of the interferometer. III. Refraction and dispersion of gaseous mercuric halides in the visible region. M. A. Bredig, Th. v. Hirsch and J. Wust. *Ibid.* 177–86.—Refraction and dispersion were measured at

340° for  $\text{HgCl}_2$ ,  $\text{HgBr}_2$ , and  $\text{HgI}_2$ . A measurement for  $\text{HgBr}_2$  at 440° shows that the temp. coeff. of refraction is less than 0.008% per degree. The mol. refraction is not the sum of the refraction of the free gaseous ions and the same conclusion is drawn for the mol. dispersion. This may be due to the non-noble-gas-like character of mercuric ions. IV. Refraction and dispersion of gaseous aluminum chloride and bromide in the visible region. M. A. Bredig and F. K. V. Koch. *Ibid.* 187-93.—Refraction and dispersion of  $\text{AlCl}_3$  and  $\text{AlBr}_3$  were measured at 230-300°. Decrease in refraction increases with increasing deformability of halide ion. A brief appendix discusses an arrangement for reducing vibrations in the interferometer. V. Refraction and dispersion of gaseous aluminum iodide in the visible region. F. K. V. Koch and H. Kohner. *Ibid.* 194-8.—Further improvements were made in the mounting of the interferometer. Refraction and dispersion measurements were made on  $\text{AlI}_3$ . The decrease in refraction in the formation of the mol. from free gaseous ions is smaller than was to be expected from the behavior of the chloride and bromide. This is probably attributable to the existence of double mols. of the type  $\text{Al}_2\text{X}_6$  and their complicated structure. VI. Refraction and dispersion in the visible region of a few gaseous halides of elements of the fourth group of the periodic system. P. Hölemann and H. Goldschmidt. *Ibid.* 199-209.—The slow changes in the zero point of the interferometer were investigated and found to be due to thermal effects from the oven. This was remedied and the refraction of  $\text{H}_2\text{O}$  vapor and  $\text{HgCl}_2$  again measured to test the interferometer. Refraction and dispersion were measured for  $\text{CCl}_4$ ,  $\text{SiCl}_4$ ,  $\text{SnCl}_4$ ,  $\text{SnBr}_4$ , and  $\text{SnI}_4$ . VII. Refraction and dispersion of stannous halides in the visible region. H. Goldschmidt and P. Hölemann. *Ibid.* 210-14.—Refraction and dispersion were measured for  $\text{SnCl}_2$ ,  $\text{SnBr}_2$ , and  $\text{SnI}_2$  at 700°. Although the dispersion for  $\text{SnCl}_2$  and  $\text{SnBr}_2$  could be represented by a formula with only one term there were deviations between calcd. and exptl. values for  $\text{SnI}_2$  that are attributed to the strong absorption of this compd. in the region investigated. The change of refraction in the formation of the mols. from free gaseous ions does not show the systematic gradation that is exhibited by numerous other compds. In the change from stannic to stannous halides there is a strong rise of the equiv. refraction that increases with increasing size of the anions. G. M. Murphy

Deviations from Paschen's law. S. P. McCallum and L. Klatzow. *Phil. Mag.* 17, 201 7(1934).—Min. sparking p. ds. between parallel plates were measured in He, Ne, A and Kr for various plate sepn. and gas pressures. The sparking p. d. was const. in He, while that in Ne, A and Kr increased as the ratio of the electrode area to the electrode sepn. decreased. This effect is ascribed to the lateral diffusion of the electrons, which is greater in Ne, A and Kr than in He. E. J. Rosenbaum

Flame temperatures in carbon monoxide and air mixtures. W. T. David and J. Jordan. *Phil. Mag.* 17, 172 81(1934).—The temp. produced by the inflammation of a CO-air mixt. at atm. pressure in a closed vessel was measured by a fine-Pt-Rd resistance thermometer. The temps. measured were in the range 1200-1800°. The max. temp. was reached when CO and O were present in their combining proportions. When the pressure was increased to 5 and 8 atms. the flame temps. were considerably greater. The difference between the wire temp. and the gas temp. is discussed. The temp. actually measured was less than that calcd., indicating an abnormality in the freshly burned gas. E. J. Rosenbaum

Statistics of polyatomic gases. Kálmán Széll. *Z. Physik* 86, 810-17(1933).—The deviations from classical statistics due to Fermi-Dirac or Bose-Einstein statistics (degeneracy) are, for polyatomic gases, negligible except under conditions such that the gas behaves practically like a liquid. R. Peierls

Diffusion of gases at high temperatures through porous materials. P. Brémont. *Compt. rend.* 196, 1651-3 (1933); cf. C. A. 27, 4144.—Expts. with unglazed porcelain and air,  $\text{CO}_2$ ,  $\text{H}_2$ ,  $\text{SO}_2$  and coal gas<sup>1</sup> between 17° and

700° show that the diffusion effects are not in accordance with the requirements of Graham's law. B. C. A.

Low-pressure data of state of nitric oxide and of nitrous oxide between their boiling points and room temperature. Herrick L. Johnston and Harry R. Weimer. *J. Am. Chem. Soc.* 56, 625-30(1934).—By means of a const.-vol. gas thermometer and an intercomparison of the known P-V-T data for  $\text{H}_2$  with the data of state obtained for NO between 122° and 308°K. and for  $\text{N}_2\text{O}$  between 197° and 298°K. the 2nd virial coeffs. were computed for each gas over the exptl. range of observations. These values were plotted as functions of temp. and compared with those calcd. from D. Berthelot's equation. Previous work on NO by Eucken and d'Or (cf. C. A. 26, 5002) is reviewed. H. S. v. K.

The critical miscibility of liquids. P. Brun. *J. chim. phys.* 31, 76-8(1934); cf. C. A. 27, 224.—Reply to P. Mondain-Monval (C. A. 27, 5624). E. R. Smith

Variations in volume of mixtures of water, ethyl alcohol, ether. Pierre Brun. *Compt. rend.* 197, 1637-8(1933).—Polemical with Mondain-Monval (C. A. 27, 5624). E. G. Vanden Bosche

Refractive dispersion of organic compounds. IV. Cyclohexene and 1,3-cyclohexadiene. C. B. Allsopp. *Proc. Roy. Soc. (London)* A143, 018-30(1934); cf. C. A. 26, 1839.—For cyclohexene  $n$  at 20° was detd. at 67 wave lengths between 6708 and 2420 Å., and for 1,3-cyclohexadiene  $n$  was detd. at 48 wave lengths between 6708 and 2940 Å. The data are represented by equations. Mol. extinction coeffs. for both compds. in soln. in cyclohexane are given. The partial refraction of the ultra-violet absorption band of 1,3-cyclohexadiene is much larger than that of cyclohexene, and is responsible both for the increase of  $n$  that accompanies the introduction of the second double bond into the 6-C ring and for a rapid increase observed in the  $n$  of cyclohexadiene at short wave lengths. Allen S. Smith

Surface free energy of liquids and liquid mixtures. Yonezo Morino. *Sci. Papers, Inst. Phys. Chem. Research* (Tokyo) 23, 49-117(1933).—The surface tensions of  $\text{C}_6\text{H}_6$ ,  $\text{CCl}_4$ ,  $\text{C}_6\text{H}_5\text{Cl}$ ,  $\text{Et}_2\text{O}$ ,  $\text{EtOAc}$ ,  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{PrOH}$ ,  $\text{HOAc}$  and binary mixts.  $\text{C}_6\text{H}_6$ -PhMe,  $\text{C}_6\text{H}_6$ - $\text{CCl}_4$ ,  $\text{PhMe}$ - $\text{CCl}_4$ ,  $\text{C}_6\text{H}_6$ -PhCl,  $\text{PhMe}$ -PhCl and  $\text{CCl}_4$ -PhCl were measured by the Ramsay-Shields capillary-rise method in the temp. range of 20° to 170°. An app. for measuring the surface tension and the liquid d. on the same sample is described. Katayama's formula (cf. C. A. 10, 994) holds for the surface tension of the normal liquids. Expressions are deduced that extend this to binary mixts. van der Waals equation of state can be extended to binary mixts. and expressions obtained for the consts.  $a$  and  $b$ . An isothermal relation between mol. surface free energy and compn. is derived that agrees well with expts. of other investigators. Various equations expressing the dependence of surface tension and other related properties on compn. as proposed by Pavlov, Volkmann, Poisson and Worley are special forms of M.'s more general expression. The abnormality of the surface tension of alcs. is explained on the assumption that liquid alcs. are binary mixts. of single and triple mols. in equil. Explanations of abnormalities in the observed values of vapor pressure,  $b$ ,  $p$ , and heat of vaporization of alcs. are attempted on a similar assumption. L. H. Reyerson

Relations among the maximum vapor tensions of some organic groups. I. Emanoil Lucatu. *Bul. soc. române fiz.* 35, 127-8(1933).—Data are compiled to establish the relation: On increasing the no. of C atoms of an org. series by arithmetic progression, the vapor tensions corresponding to the compds. decrease in a geometric progression which varies with the temp. in a linear manner. Calvin Brous

Amorphous metal layers. H. Zahn and J. Kramer. *Z. Physik* 86, 413-20(1933).—Thin layers of various metals deposited electrolytically change irreversibly in cond. at a definite temp. This change is attributed to a transition from an amorphous to a cryst. state. Expts. made with a condenser contg. a thin metal film show satn. when sub-

jected to very intense elec. charge. These expts. confirm the postulated amorphous state. R. Peierls

The increase in electrical conductance of crystalline substances upon approaching the melting point. M. Le Blanc and E. Möbius. *Z. Elektrochem.* 40, 44-6(1934).—Previously reported work (cf. C. A. 28, 961<sup>1</sup>) is extended to  $\text{AgNO}_3$  (thrice recrystd. and dried over  $\text{CaCl}_2$  in *vacuo*) m. 209.01  $\pm$  0.01°. The finely powd.  $\text{AgNO}_3$  was compressed to a pellet under pressure of 200 kg. and its cond. measured in a specially designed app. maintained in an oven at 193°. The Pt crucible contg. the  $\text{AgNO}_3$  under a pressure of 4 kg. was heated electrically. The less the impurity ( $\text{H}_2\text{O}$ ) the lower the cond. The effects of traces of  $\text{Ag}_2\text{SO}_4$  ( $10^{-4}$  mols./g.) on cond. were readily detected. E. R. Schierz

The free mobility of lead ions in amicronic crystals of lead sulfate. I. M. Kolthoff and Charles Rosenblum. *Phys. Rev.* 45, 341(1934).—Freshly formed microscopic crystals of  $\text{PbSO}_4$  have a spongy structure. They consist of primary cryst. particles (of 1000 to 10,000 mols.) sepd. by fine capillaries through which Th B ions can move freely, but which are impervious to wool violet (4BN). On aging, the internal surface decreases. Pb ions can move freely through the primary particles and cause a homogeneous distribution of Th B through the entire system; it is concluded that Pb ions can move freely through the amicronic primary particles. With crystals of  $\text{PbSO}_4$  up to 1 by 2  $\mu$ , Th B was uniformly distributed through the entire cryst. ppt. by shaking with a radioactive Pb soln. 3 min. immediately after the formation of the ppt., or in 17 hrs., starting 50 min. after pptn. Gerald M. Petty

The superconductivity of zinc. W. H. Keesom. *Physica* 1, 123-7(1933)(Comm. Leiden 230a).—A no. of metals (wires wound on glass tubes) were studied as to supercond. at extremely low temps. (method C. A. 26, 4514). A phosphor-bronze wire resistance thermometer was used; its calibration curve has an inflection point at 2.3° abs. Zn (Bur. Standards) hammered at 300°, drawn to 0.7 mm. and rolled to a flat band has a higher residual resistance at 4° abs. than former Zn samples, probably because of stresses; the vanishing point of the resistance lies at 0.79° abs. For Cd the residual resistance  $R/R_0 = 0.00080$ , it is not superconductive at 0.73° abs. For Au  $R/R_0 = 0.00259$ , not superconductive at 0.78° abs. For Pt  $R/R_0 = 0.0091$ . For Pt as compared with Al this is contrary to Dorfman's rule (C. A. 27, 4506) of a low product of Hall coeff. and elec. cond. for superconductive metals. Cu, as evident from the phosphor-bronze used, is not superconductive at 0.75°. B. J. C. v. d. H.

Electrical conductance and other similar characteristics in binary aggregates. Karl Lichtenecker. *Z. Elektrochem.* 40, 11-14(1934).—The summarizing report of G. S. von Frey in this field (cf. C. A. 26, 3710) is supplemented with a new proof based on Grunisen's relation ( $W = W_0 f(T)$ ), that the logarithmic mixing law is a limiting case of the exponential law.  $W$  = resistance. E. R. Schierz

Crystal structure and electric properties. II. Lattice structure and conductivity of bismuth monocrystals in transverse magnetic fields. O. Stierstadt. *Z. Physik* 85, 310-31(1933); cf. C. A. 27, 2357. III. Lattice structure and conductivity of bismuth monocrystals in longitudinal magnetic fields. *Ibid.* 897-707.—Measurements of the elec. resistance of different specimens of Bi crystals with different orientations of the axes show that it follows the same symmetry as all other properties of the crystal. This is a convenient way of detg. the orientation of a given specimen without cutting it and also of detg. the symmetry class without making x-ray photographs. R. Peierls

Lattice structure of the lithium-cadmium alloys. E. Zintl and A. Schneider. *Z. Elektrochem.* 40, 107(1934); cf. C. A. 27, 2407.—Polemical with A. Baroni (C. A. 28, 1645<sup>1</sup>). Curtis L. Wilson

Crystal structure of enargite ( $\text{Cu}_3\text{AsS}_4$ ). Katsutoshi Takané. *Proc. Imp. Acad.* (Tokyo) 9, 524-7(1933).—Laue photographs indicate that enargite belongs to the orthorhombic holohedral class. Rotation reflection

photographs about [001], [010] and [100] give  $a_0 = 6.39 \pm 0.05$  A.,  $b_0 = 3.68 \pm 0.05$  A., and  $c_0 = 6.15 \pm 0.05$  A. This leads to axial ratios  $a:b:c = 1.734:1:1.674$ , which is double for the  $b$  and  $c$  axes given by Groth. The unit cell contains one mol. of  $\text{Cu}_3\text{AsS}_4$ ,  $V_h^{12}$  is the space group, leading to positions  $(m_1, 1/2, p_1)$ ;  $(\bar{m}_1, 1/2, \bar{p}_1)$ ;  $(m_1 + 1/2, 0, p_1 + 1/2)$ ;  $(\bar{m}_1 + 1/2, 0, \bar{p}_1 + 1/2)$  for the 4  $\text{CuAs}$ , and  $(m_2, 0, p_2)$ ;  $(\bar{m}_2, 0, \bar{p}_2)$ ;  $(m_2 + 1/2, 1/2, \bar{p}_2 + 1/2)$ ;  $(\bar{m}_2 + 1/2, 1/2, p_2 + 1/2)$  for the 4 S.

Louis Waldbauer

The structure of the trithionate group,  $(\text{S}_3\text{O}_6)^{2-}$ . W. H. Zachariasen. *J. Chem. Physics* 2, 109-11(1934). The unit cell of  $\text{K}_2\text{S}_3\text{O}_6$  contains 4 mols. and has the dimensions  $a = 9.77 \pm 0.04$  A.,  $b = 13.63 \pm 0.04$  A.,  $c = 5.76 \pm 0.02$  A. The space group is  $Pnam$  ( $V_h^{12}$ ). In  $(\text{S}_3\text{O}_6)^{2-}$  2 of the S atoms form 4 bonds with 3 O and 1 S directed tetrahedrally; the third S forms only 2 bonds, both with S atoms at an angle of 103°. The deviation from 90° is attributed to repulsion between the S atoms. The S-O distance is 1.50 A., and S-S 2.15 A. P. S. Roller

The  $\text{Si}_2\text{O}_7$  chains in space groups  $V_h^{12}$  and  $C_{2h}^{12}$ . Tetsuichi Ito. *Proc. Imp. Acad.* (Tokyo) 9, 526-30(1933), cf. C. A. 27, 3651.—The compd.  $\text{HNaBeSi}_2\text{O}_7$  exists as epididymite in rhombic form, and as eudidymite in monoclinic form. Chains are built up of linked tetrahedra of Si and O atoms of compn.  $\text{Si}_2\text{O}_7$ . The chains are joined into a sheet by a sharing of half the no. of O atoms on the fringe by adjoining chains, by placing centers of symmetry on those points lying midway between every 2 atoms on one of the O layers of the chain. Blocks joined at the edges might represent a sheet. In 3 dimensions, there should be one above the other, but in 2 forms: (1) the successive sheets are parallel to each other; (2) the successive sheets are in the mirror-image relation. If 1.3 A. is assumed as the O-ionic radius with close packing, 2 arrangements contg. 24 Si and 56 O atoms are obtained; arrangement (1) corresponds to  $C_{2h}^{12}$  (monoclinic), (2) to  $V_h^{12}$  (rhombic). Epididymite corresponds to (2).

L. Waldbauer

The crystal structure of  $\text{BPO}_4$  and  $\text{BaSO}_4$ . Gustav E. R. Schulze. *Z. physik. Chem.* B24, 215 40(1934), cf. C. A. 27, 5605.  $\text{BPO}_4$  and  $\text{BaSO}_4$  have the same crystal structure with the space group  $S_6^2 - I^4$ . Consts. for the crystals are:  $a = 4.332 \pm 0.006$ ;  $4.458 \pm 0.006$  A.,  $c = 6.640 \pm 0.008$ ;  $6.796 \pm 0.008$  A.;  $d = 2.802$ ;  $3.660$ ,  $R = 12.87$ ;  $15.54$  for  $\text{BPO}_4$  and  $\text{BaSO}_4$ , resp., in which  $R$  = mol. refraction and  $a$  and  $c$  are the crystal lattice consts. G. M. Murphy

Thermodynamic diagrams of liquid helium. W. H. Keesom and A. P. Keesom. *Physica* 1, 128-33(1933), (Suppl. Leiden, 76b).—A d. table for liquid He ( $T = 1.25^\circ$  to  $4.20^\circ$  abs.,  $p = 1$  to 35 atm.) and a set of isobars and isopycnals as well as curves for their 3 differential coeffs. are given for He. The discontinuities at the passing of the  $\lambda$  curve (transition point) are evident.

B. J. C. van der Horven

Remarkable optical properties of the alkali metals. R. de L. Kronig. *Nature* 133, 211-12(1934); cf. C. A. 28, 946<sup>1</sup>.—A modification of Zener's interpretation (C. A. 28, 1275<sup>1</sup>) of the optical behavior of the alkali metals observed by Wood (C. A. 27, 5240). Gerald M. Petty

The supposed allotropy of liquid nitrobenzene. Ernst Cohen and L. C. J. te Boekhorst. *Z. physik. Chem.* B24, 241-58(1934); cf. C. A. 27, 642.—Pure  $\text{PhNO}_2$  was prepd. by 2 different methods and had a m. p. in a dry H atm. of  $5.76 \pm 0.01^\circ$ . Measurements of  $d$  and viscosity were made between  $3^\circ$  and  $20^\circ$  and the results were fitted to a quadratic equation. The sp. vol.,  $v_s = 0.81769 + 6.634 \times 10^{-4} t + 4.8 \times 10^{-7} t^2$  and the fluidity,  $f_s = 31.98 + 0.80348 t + 0.002742 t^2$ . Samples of  $\text{PhNO}_2$  contg. enough  $\text{H}_2\text{O}$  to lower the m. p. to  $5.58^\circ$  and  $5.57^\circ$  were used to measure  $d$  and viscosity, resp., and the results obtained fell upon a curve that was parallel to the curve obtained with the dry compd. No sign of a discontinuity were noticed in any case, which contradicts the results of Wolfke and Masur (C. A. 26, 2355<sup>1</sup>). Since the latter

claim similar results with  $\text{Et}_2\text{O}$  and  $\text{CS}_2$ , their expts. should also be repeated with very pure samples of these compounds.

G. M. Murphy

The dependence of volume and solidification point of carbon tetrachloride upon thermal pretreatment. Wilhelm Brill and E. Nümann. *Z. Elektrochem.* 40, 8 10 (1934).—Results previously reported (cf. *C. A.* 26, 5240) are in error. The vol. change was due to retention of air by the  $\text{CCl}_4$  and the variation of f. p. to hysteresis of the Beckmann thermometer.

F. R. Schier

Adsorption and capillary condensation. A. A. Sluichkovitzkil. *Kolloid-Z.* 66, 139-47 (1934). If the adsorption potential,  $A$ , is considered as the sum of 2 potentials,  $I$ , caused by the adsorbent, and  $\pi$ , caused by the meniscus of the adsorbate, vapor adsorption isotherms may be divided into 4 classes: (1)  $F > A$ , corresponding to a very thin film of adsorbate; (2)  $F = A$ , to which Polanyi's theory applies, and the forces between adsorbent and adsorbate are greater than the intermolecular adsorbate forces; (3)  $F < A$ , the transition field, in which present methods of isotherm prediction fail; and (4)  $A = \pi$ , and  $F$  very small compared to  $\pi$ , to which the theory of capillary condensation applies. For cases 2, 3 and 4, an expression is derived for evaluating the equation,  $Q_1 = \ln(P_0/P_1)/\ln(P_0/P_2)$  (cf. Lindau, *C. A.* 26, 5810), in which  $P_0$  and  $P$  are the satd. and partial vapor pressures of liquids 1 and 2, resp. It satisfactorily expresses the data of the literature, especially in the intermediate field 3, as shown by the constancy of  $Q_0$ . Statistical vol. characteristics calculated by the capillary condensation theory (cf. Kubelka, *C. A.* 26, 355) are not real.

Arthur Fleischer

The relation between activated and van der Waals adsorption. John Howard. *Trans. Faraday Soc.* 30, 278-57 (1934), cf. *C. A.* 26, 949. It was found experimentally that gas adsorbed on the surface of  $\text{Cr}_2\text{O}_3$  in an activated form markedly decreases the van der Waals adsorption that can occur at a given temp. Activated adsorption is a true surface phenomenon, and cannot be attributed to impurities on the surface or to diffusion and soln. in the interior. Exptl. results indicate that the *para*  $\text{H}_2$  conversion occurs, at low temps. among mols. adsorbed on the surface of a catalyst by van der Waals forces, and at high temps. by activated adsorption.

R. R.

The sorption of hydrogen by reduced nickel I. Quantities of hydrogen adsorbed by, and diffused in, pure and contaminated reduced nickel, isothermal adsorption lines, and heat of adsorption. Shun-ichiro Iijima. *Sci. Papers, Inst. Phys. Chem. Research (Tokyo)* 22, 285-300 (1933).—The adsorption of  $\text{H}_2$  by reduced Ni is due to both adsorption and diffusion. Quant. distinction is drawn between the amt. of  $\text{H}$  adsorbed and the amt. diffused. Isotherms showing the quantities of  $\text{H}$  adsorbed under low pressures agree with the Freundlich equation. Heats of adsorption are calcd. by means of the Clapeyron equation, and an av. of 16,850 cal./per mole is obtained. Reduced Ni that was brought into contact with air before the adsorption studies showed lower adsorptive capacity for  $\text{H}$ . The heat of adsorption in one such case was 6479 cal./per mole.

II. Adsorption of hydrogen by reduced nickel at low temperatures. *Ibid.* 23, 34-43.—Adsorption of  $\text{H}$  under low pressures by reduced Ni was measured at 100°, 19°, 0°, -45.2°, -78.5°, -112° and -183.5°. The results of Nikitin (cf. *C. A.* 20, 3255) at 19° were not confirmed. Ni and  $\text{H}_2$  did not form a compd. at 19°. Isobars all showed maxima between 0° and 20°, and minima were found between -80° and -180°. The lower the equil. adsorption pressure the lower the temp. of the min. Irregularities in the isothermal at -183° are accounted for on the basis of local heating of the adsorbent due to adsorption of large quantities of  $\text{H}$ . The isothermal is smooth when  $\text{H}_2$  is admitted slowly. III. Heat treatment of reduced nickel and its relation to the sorption velocity and to the quantity of hydrogen sorbed. *Ibid.* 164 72.—Reduced Ni was successfully heat-treated in  $\text{H}_2$  for 1 hr. at temps. ranging from 300° to 500°. Between each heat treatment the adsorptive capacity for  $\text{H}$  at 0° and 20.8 cm. pressure was measured. Increasing temps. of heat treatment shortened the time necessary for ad-

sorption to reach equil. and diminished the quantity of  $\text{H}$  adsorbed. The velocity with which  $\text{H}$  diffused into reduced Ni was unaffected by heat treatment up to 500°.

L. H. Reyerson

Vapor retentivity of active charcoal. I. Dependence of retentivity on the magnitude of vapor content of the charcoal. Franz Krczil and Herbert Wejroch. *Kolloid-Z.* 66, 155-63 (1934).—Retentivity was detd. by a dynamic method at 20° by passing dry air at the rate of 500 cc./sq. cm./min. through a charcoal satd. with  $\text{C}_2\text{H}_6$  and noting the rate of loss with time. The charcoals used were Acticarbene Ordinaire, Acticarbene NC 35, Acticarbene Supérieur and Auerkohle, dried at 120°. During the initial loss, the rate curve was steeper the higher the original adsorption. There was no relation between the losses at 500 and 900 l. of air and order of satn. capacities.

Arthur Fleischer

Adsorption and adsorbent quantity. II. Adsorption of dyes by hydrophilic adsorbents. T. P. Pankova-Kwizel. *Kolloid-Z.* 66, 148-55 (1934); cf. Rabenstein, *C. A.* 27, 2079.—Adsorption anomalies were noted in the isotherms of methyl violet and acid violet B on neg. and pos.  $\text{Al}(\text{OH})_3$  and on  $\text{SiO}_2$  gel. In the acid violet-neg. adsorbent system, the anomalies are due to an apparent adsorption due to decreased surface hydration, along with dispersity changes in opposite directions produced by increase in charge and dehydration. In the methyl violet- $\text{SiO}_2$  system, the anomalous max. is due to the charge decrease, causing coagulation and dehydration.

A. F.

Adsorption of electrolytes on crystalline surfaces. Effect of sign of charge on adsorbent. L. de Brouckère. *Compt. rend.* 198, 822-4 (1934); cf. *C. A.* 27, 4981.—Pptd.  $\text{BaSO}_4$  is pos. when aq.  $\text{H}_2\text{SO}_4$  is poured rapidly into aq.  $\text{BaCl}_2$ , neg. when aq.  $\text{BaCl}_2$  is added slowly to aq.  $\text{K}_2\text{SO}_4$ . The log  $\pi/\log C$  ( $\pi$  being the amt. of electrolyte adsorbed,  $C$  concn. of soln. thereof at equil.) curves for  $\text{KCl}$ ,  $\text{KI}$  and  $\text{NaCl}$  with neg.  $\text{BaSO}_4$  are similar to those previously obtained with pos.  $\text{BaSO}_4$ , and agree with the hypothesis of a unimol. layer. The differences for low concn. indicate that the cations are now in contact with the (neg.)  $\text{BaSO}_4$ . In both cases the phenomenon is consistent with the adsorption, being wholly or partly due to electrostatic action.

C. A. Silberrad

The effect of salts on the adsorption of cupric ions by ferric hydroxide. J. Hubert Hamence. *Trans. Faraday Soc.* 30, 299-303 (1934); cf. Toporescu, *C. A.* 14, 3030.—The adsorption of small quantities of  $\text{Cu}$  by  $\text{Fe}(\text{OH})_3$ , and the effect of salts upon the adsorption were studied in some detail. The av. value for  $\pi$  in the adsorption equation,  $a = k\pi^{1/n}$ , was 1.7, in agreement with Toporescu's results. Equil. is established immediately after the coagulation of the  $\text{Fe}(\text{OH})_3$ . The greater the concn. of  $\text{NH}_4^+$  (1) the less the adsorption of the  $\text{Cu}$  ions and (2) the lower the rate of coagulation. Salts of Na and K exert very little effect on the adsorption.  $\text{NH}_4^+$  salts have a considerable effect; with sufficient  $(\text{NH}_4)_2\text{SO}_4$  the adsorption is reduced to 0. Colloidal  $\text{Pb}(\text{OH})_2$  is readily adsorbed by  $\text{Fe}(\text{OH})_3$ , and if sufficient  $\text{Pb}$  salt is present no adsorption of the  $\text{Cu}$  results.

Reuben Roseman

Rate of heating of wires by surface combustion. W. Davies. *Phil. Mag.* 17, 233-51 (1934).—The rate of heating of Pt, Pd, Au and Ag wires in mixts. of  $\text{H}_2$ ,  $\text{CO}$  and air was studied by using the elec. resistance of the wires as a measure of their temp. For Au and Ag wires, no heating due to surface combustion was found in any mixt. of  $\text{H}_2$  or  $\text{CO}$  with air. Surface combustion begins with Pt and  $\text{H}_2$  at 200°, Pd and  $\text{H}_2$  at 120°, Pt or Pd and  $\text{CO}$  at 400°. When mixts. of  $\text{H}_2$  and  $\text{CO}$  are used, the  $\text{CO}$  suppresses the low-temp. reaction of  $\text{H}_2$ . The data are explained in terms of the Langmuir adsorption activation theory. The rate at which the combustion reactions occur is limited by diffusion. Since the concn. of combustible gas is greatly reduced near the heated wire an explosion can occur only when the temp. of a layer of gas rich enough to be inflamed is raised to the ignition point.

E. J. R.

The burning of graphite on osram filaments in a current of gas. V. Silvonen. *Ann. Acad. Sci. Fennicae A38*, No. 2, 34 pp. (1933) (in German).—An at.-O adsorbent is

formed when a current of  $H_2O$  vapor acts upon C at low glowing temps. It vaporizes immediately as CO or is oxidized to  $CO_2$  by  $H_2O$  vapor.  $CO_2$  can slowly oxidize the graphite under glowing conditions to CO; the CO, formed primarily from O, can be oxidized at high temps. by  $H_2O$  vapor when adsorbed on a finely porous C surface. When  $H_2O$  vapor at room temp. acts upon a brightly glowing graphite filament, the formation of CO decreases with increasing temp.  $CO_2$  under the same conditions causes a vaporization of CO above  $1400^\circ$ . The mol. heat of vaporization of the loose CO groups is 17 kg.-cal. Oxidizing a filament, which has been poisoned by CO, with O under similar conditions yields CO exclusively above  $900^\circ$ . The mol. heat of vaporization of CO is 24.5 kg.-cal. If the filament is not poisoned,  $CO_2$  and 2CO are formed between  $800^\circ$  and  $1400^\circ$ . The same products of reaction appear above  $1500^\circ$  in a current of O as primary vaporization of CO. At lower temps.  $CO_2$  and CO are formed.

A. E. Beitlich

Extension of the duration period of  $\beta$ -phenyl- $\beta$ -chloroethylamine on charcoal. H. Freundlich and G. Salomon. *Helv. Chim. Acta* 17, 88-98(1934); cf. C. A. 28, 399<sup>3</sup>.—The rearrangement of  $PhCHClCH_2NH_2$  (I) to styrenimine-HCl (II) in alk. soln. is highly restricted at a charcoal-water interface, the inhibition increasing with diminishing surface concn. A similar heterogeneous reaction on blood charcoal takes place in the rearrangement of  $BrCH_2CH_2NH_2$  (III) to ethylenimine-HBr (IV) (C. A. 24, 3487). Since the heterogeneous reaction of I shows, within a definite temp. range, a greater dependence on the temp. than in the homogeneous system, it is conceivable that only those mols. of I suffer rearrangement that are driven from the boundary surface by thermal pressure. The velocity of the rearrangement from I to II was measured for limited surface concns. between  $0^\circ$  and  $37^\circ$  on charcoal and on carboraffin. Comparison of the dependence of temp. of the heterogeneous reaction with the temp. coeff. of the homogeneous reaction showed that there is heterogeneous reaction at the blood charcoal- $H_2O$  boundary surface and that the temp. coeff. of the heterogeneous reaction is at least as great as the coeff. of the homogeneous reaction. The temp. coeff. of the reaction on carboraffin is, however, smaller than that of the homogeneous reaction and thus the reaction actually takes place at the boundary surface. This smaller temp. coeff. of the heterogeneous reaction corresponds to a smaller heat of activation, which has been previously observed in the rearrangement of III to IV on blood charcoal and in similar ring closures in org. solvents. Possible explanations of these phenomena on the grounds of restricted motion in the adsorbed layer and catalytic effects are discussed. C. R. Addinall

The adsorption of copper sulfate by sphalerite and its relation to flotation. S. Frederick Ravitz and W. A. Wall. *J. Phys. Chem.* 38, 13-18(1934).—The quantities of Cu adsorbed by sphalerite of various particle sizes from a 0.02 M  $CuSO_4$  soln. are equiv. to surface films of CuS many mols. thick. If  $T$  is the apparent "thickness" (i. e., no. of monomol. layers) of the surface film and  $d$  the av. particle size in microns, the "thickness" of the surface film decreases with decreasing particle size in accordance with the equation  $T = (d/0.37)^{0.608}$ . The results are explained satisfactorily by the theory of the mosaic structure of crystals. The Cu ions are assumed to penetrate between the elementary blocks of sphalerite crystals and to form a unimol. layer of CuS on the external surface. If the individual blocks were liberated, only the amt. of Cu required to form a unimol. film is adsorbed. Extrapolation of the above equation to  $T = 1$  indicates that the size of these blocks is 0.37 micron. The larger the particles, the more crevasses between the blocks there are for Cu ions to diffuse into and hence the greater the apparent film thickness. Oscar T. Quimby

The electrokinetic (zeta) potential of thin metal films. Grant W. Smith and L. H. Ryerson. *J. Phys. Chem.* 38, 133-51(1934).—The streaming-potential method was employed for detg. the  $\zeta$  potentials of the systems  $Ag-Ag^+$  and  $Ni-Ni^{++}$ , with metallized  $SiO_2$  gels prep. by adsorption of complex ions of  $NH_4$  on the gel and reduction

to the metallic state. Fundamental differences were found between the  $\zeta$  and Nernst potentials for these systems. J. H. Moore

Phase-boundary potentials of monolayers of long-chain fatty acids. N. W. H. Addink and Eric K. Rideal. *J. Chem. Physics* 2, 144(1934).—On compressing a liquid expanded film of myristic acid to areas between  $40A^2$  and  $20A^2$  a high phase-boundary potential is observed which decreases with time. During this decrease the film is heterogeneous. After 4-5 hrs., when the area is  $25A^2$ , the film becomes homogeneous. The time is diminished to  $1\frac{1}{2}$  to 2 hrs. on adding tannic acid to the soln. P. S. Roller

Phase-boundary potentials of monolayers of fatty acids on metals. L. Jacobs. *Trans. Faraday Soc.* 30, 303-10(1934); cf. C. A. 27, 4461.—The adsorption of fatty acids by metal surfaces can be followed by measurement of the phase-boundary potential. Uniform spreading from a solvent can be obtained on a dry metallic surface. The *sp. surfaces of sheet Au, Ag and Pt* were evaluated. With myristic acid evidence of different 2-dimensional phases, as the surface concn. is increased is presented; the limits of existence of the phases were verified by an optical method. Reuben Roseman

The capillary depression of mercury in wide tubes. A. Klemenc and O. Bankowski. *Naturwissenschaften* 22, 10-11(1934).—The capillary depression of Hg was measured by light interference (Michelson interferometer) in wide tubes. For a tube width of 30 mm. (Jena app. glass no. 2) the depression was 0.002 mm.; for 40 mm. width it was less than 0.0002 mm. B. J. C. van der Hoeven

Capillary activity and association of aqueous solutions. H. Cassel. *Naturwissenschaften* 22, 60(1934).—Direct measurement of the adsorption of sol. substances on the water-air interface by the bubble method (cf. Gans, C. A. 25, 2345) gave results for *p*-toluidine and iso-AmOH solns. twice those expected from capillary curves by the Gibbs equation. C. attributes this to double mols. B. J. C. van der Hoeven

Physical chemistry of wetting and flotation processes XI. Wetting ability of aqueous solutions of surface-active substances on paraffin. P. Rebinder, Marie Lipetz and Marie Rimskaia. *Kolloid-Z.* 66, 212-19(1934); cf. C. A. 28, 1906<sup>9</sup>.— $B_{11}$  and  $B_{21}$ , in which  $B = \cos \theta$ , the contact angle, were measured at the interface paraffin-aq. soln. for various solutes including fatty acids, alcs., phenols, amines, xanthates and soaps. On a paraffin surface, change to a hydrophilic condition occurs because of a "reversed" orientation of the adsorption film, i. e., the polar groups are oriented away from the surface. The inversion concns., at which  $B = 0$ , correspond very nearly to equal surface energy decreases for reagents of a homologous series and show a close relation between wetting activity and surface activity. Traube's rule is obeyed.  $B_{11}$ -concn. curves show a greater wetting than  $B_{21}$ -concn. curves, which is readily explained by orientation of films. In the  $B_{11}$  case, the drop of water is coated with an adsorption film with hydrocarbon groups outward and these wet the paraffin easily. In the  $B_{21}$  case where an air bubble is brought to a paraffin surface immersed in aq. soln., the paraffin and air interfaces meet with polar groups oriented toward each other, requiring a rearrangement of orientation. The theoretical wetting curve was calcd. from surface-tension measurements in the system air-molten paraffin-heptylic acid soln. The shape of this equil. curve agreed with the exptl. curves. Arthur Fleischer

Colloid correlation principle. S. C. Blacktin. *Chemistry & Industry* 1933, 544-5.—The mode of growth of colloidal aggregates in smokes and of the degradation of dust particles is related to their gravitational distribution in the atm. B. C. A.

Sedimentation of molecules in centrifugal fields. The Svedberg. *Chem. Rev.* 14, 1-15(1934).—A description of S.'s method for detg. mol. wts. of proteins. References. Louise Kelley

Validity of the Clausius-Mosotti law in emulsions. W. S. Urbanski. *Acta Phys. Polonica* 1, 411-12(1932)

(in German).—Polemical with Piekara (*C. A.* 27, 3658).

**The aggregation of colloidal electrolytes from transport number and conductivity measurements:** Some benzidine dyes. Conmar Robinson and John L. Moilliet. *Proc. Roy. Soc. (London)* A143, 630-63(1934).—Transport nos. and conductivities of benzopurpurine 4B, its isomer prep'd. from *m*-tolidine, and Bordeaux Extra were measured over a range of concns. Conclusions: The 3 dye soles. contain neg. micelles, more mobile than the simple anions. Appreciable amts. of bound Na are included in the micelles of benzopurpurine 4B and its isomer but not in those of Bordeaux Extra. The micelles of the 4B dye are more stable than those of the other 2 and do not break down on diln., as do those of the others, into simple ions. The no. of simple R radicals included in the mean effective micelle of each dye is in the order 4B > meta > Bordeaux Extra.

**Dielectric constants of colloidal systems.** Erich Heymann. *Kolloid-Z.* 66, 229-35(1934).—Review. A. F.

**Effects of silicic acid sol on the solubility of phosphate.** Shigeru Osugi and Komao Saegi. *J. Agr. Chem. Soc. Japan* 9, 810-30(1933).—SiO<sub>2</sub> sol was prep'd. by pouring water glass into HCl. The addn. of SiO<sub>2</sub> sol increased the solubilities of Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub>, AlPO<sub>4</sub>, and FePO<sub>4</sub> in H<sub>2</sub>O. The concn. of SiO<sub>2</sub> sol was parallel to the increase of the soly. When SiO<sub>2</sub> sol was added to sand or to soil similar effects were observed.

**Production of "colloidal single crystals."** Alexander Goetz. *Phys. Rev.* 45, 282-3(1934).—Small particles that have more than one axis of max. paramagnetism, such as graphite may be oriented by rotating the container of the suspension within the magnetic field about an axis parallel to the direction of the [0001] axis which one wishes to obtain for the suspension (see *C. A.* 26, 1843; 27, 4998).

**New data on the effect of traces of sodium sulfide in the preparation of colloidal gold by the formalin method (the Au<sub>2</sub> of Zeigmondy).** Preparation at room temperature. Raúl Wernicke and Raúl Birabén Losson. *Anales asoc. quim. Argentina* 21, 149-55(1933); cf. *C. A.* 25, 859, 27, 1561.—In prepg. Au<sub>2</sub> at boiling temp. it is difficult to obtain uniform results. At room temp., in the presence of Na<sub>2</sub>S in quantities as low as 10<sup>-10</sup> molar, concordant results are obtained.

**A new theory of ferric oxide hydrosols.** W. F. Fair, Jr. *J. Phys. Chem.* 38, 19-34(1934).—Fe hydrosols are thought to be formed by progressive hydrolysis of Fe salts and the law of mass action is applied to such equilibria. Flocculation is interpreted in the light of chem. reactions governed by soly.-product relationships. In peptization expts. on Fe<sub>2</sub>O<sub>3</sub>, it is shown that weak acids, as HOAc, propionic and butyric, peptize little more than equiv. amts. of Fe but an all amts. of chloride greatly increase the amt. peptized.

**A method of preparing colloid-soluble iron oxide and the properties of its hydrosol.** A. v. Buzágh. *Kolloid-Z.* 66, 129-37(1934).—Fe<sub>2</sub>O<sub>3</sub> is pptd. from boiling 5% FeCl<sub>3</sub> soln with slight excess of NH<sub>3</sub>, heated with H<sub>2</sub>O at 150-60° for 4 hrs., yielding a brick-red granular ppt. I. Washing I by decantation forms a stable sol but it can be washed free from electrolyte on a suction filter without peptization. On dialysis the sol flocculates when electrolyte-free. I can be dried without loss of peptizability. The electrolyte-free ppt. is peptized by dil. FeCl<sub>3</sub> or HCl. The washed, dried ppt. consists of pure Fe<sub>2</sub>O<sub>3</sub> with less than 0.01% Cl. Peptization by alkali hydroxide gives sols with neg. particles. The ppt. rule applies, and the sol with highest concn., 2.8% Fe<sub>2</sub>O<sub>3</sub>, results when 4 g. of ppt. is treated with 100 cc. of H<sub>2</sub>O contg. 0.06% Cl. Fe<sub>2</sub>O<sub>3</sub> pptd. hot and autoclaved is more highly dispersed and easily peptized than cold-pptd. Fe<sub>2</sub>O<sub>3</sub>. Autoclaving with mother liquor makes a product difficult to free from Cl. FeCl<sub>3</sub> peptizes by adsorption, shows an optimum concn. and closely parallels the  $\zeta$ -potential curve. The sol is highly electro-sensitive. Examin. in the ultramicroscope shows decidedly lyophobic particles, with lively Brownian movement, and particle sizes from 20 to 70  $\mu$ .

**The behavior of the sols with electrolytes is consistent with the hydrophobic properties.** The sols show no thixotropy. Coagulation values with NaNO<sub>3</sub> and NaCl increase rapidly with concn. to a const. max. value, indicating a change in the elec. properties of the elec. double layer. With Na salts of SO<sub>4</sub>, IO<sub>3</sub>, and PO<sub>4</sub>, the relation is linear. Quant. expts. show a replacement of Cl by the multivalent anion, the amt. depending on sol and anion concns. With excess of flocculating reagent all of the Cl was replaced.

**Rhythmic precipitation with organic precipitants.** J. E. Heck and M. G. Mellon. *J. Phys. Chem.* 38, 85-93 (1934).—Agar gels and acid, basic and neutral silicic acid gels were prep'd. contg. various org. precipitants used in analytical chemistry. To the set gels N or satd. solns. of different salts were added. In most cases ppts. were obtained with different types of structure upon which light had little or no effect.

**A new regularity of periodic reactions in gels.** P. F. Mikhalev, V. Nikiforov and F. M. Shemyakin. *Kolloid-Z.* 66, 197-200(1934).—The equation,  $\lambda v = \text{const.}$ , in which  $\lambda$  is the distance between rings and  $v$  is the actual spreading velocity of the diffusion field, has a formal analogy to de Broglie's wave equation. The equation represents the data for the diffusion of AgNO<sub>3</sub> into dichromate in gelatin, Pb(NO<sub>3</sub>)<sub>2</sub> into KI in agar, Na<sub>2</sub>HPO<sub>4</sub> into CaCl<sub>2</sub> in gelatin, and AgNO<sub>3</sub> into Na<sub>2</sub>HAsO<sub>4</sub> in agar or gelatin. The const. varies from 2.10 to 2.51  $\times 10^{-8}$  sq. cm./sec. for the above systems.

**Formation of Liesegang rings by electrolysis.** E. Banderet. *Compt. rend.* 198, 821-2(1934); cf. *C. A.* 27, 4152.—The rings obtained by B.'s electrolytic method obey Veil's law, i. e.  $\sqrt{\delta} = an + b$ , in which  $\delta$  is the distance between the *n*th and (*n* + 1)th rings and *a* and *b* are consts. The effect of continued application of the e. m. f. is shown.

**The orientation of the micelle in unstretched agar films (preliminary report).** Ichiro Sakurada and Keiroku Futuno. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 162-3(1934); cf. Sakurada and Futuno, *C. A.* 27, 3373; 28, 947.—Röntgen photographs of specially prep'd. films of com. agar show that the micelle is either rod-like or leaf-like. Reducing the water content to 20% by freezing gave a Röntgen spectrum showing 7 interference lines. Powd. agar gave a picture somewhat similar to those obtained by Katz and Derksen (*C. A.* 26, 4227) with an agar gel of 9% water content.

**Some experiments with ordinary gelatin in contact with solutions of potassium dichromate and chromic acid.** M. Chanoz and P. Ponthus. *Compt. rend. soc. biol.* 115, 522-6(1934).—Gelatin was placed in solns. of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> contg. various proportions of CrO<sub>3</sub>, and the effects on swelling, cond., polarization, electroosmosis and salt concn. were observed.

**Dielectric constant and conductivity of aqueous solutions of gelatin.** A. Piekara and B. Piekara. *Compt. rend.* 198, 803-5(1934).—With a gelatin "for emulsions" electro-dialyzed for 2-3 days at 0°, the dielec. const.,  $\epsilon$ , and cond.,  $\kappa$ , were det'd. for concns. 0.51-1.2%.  $\epsilon$  for a soln. of gelatin exceeds that of H<sub>2</sub>O, and increases with increased concn., the excess over that of H<sub>2</sub>O increasing with temp. Both  $\epsilon$  and  $\kappa$  of the sol exceed those of the gel under the same conditions. Both show thermal hysteresis (cf. *C. A.* 23, 4393; 25, 2345).

**Measurement of the arc temperature from C<sub>2</sub> bands. The transition probability of vibrational transitions.** D. Th. J. ter Horst and G. Krijgsman. *Physica* 1, 114-18(1933).—The temp. measurement of the C arc in air of Ornstein et al. (*C. A.* 24, 2671; 25, 5842) from CN bands (6500° abs.) was checked from the C<sub>2</sub> spectrum. From the intensity curve a corrected (for plate sensitivity at 5165 Å.) temp. of 6000° abs. was found. If this same temp. is assumed for the distribution of the vibrational states the ratio of the vibrational transition probabilities is  $A_{00}:A_{11} = 100:50$  from an intensity ratio of the 2 band heads:  $I_{00}:I_{11} = 3.00$ . This result is in good agreement with quantum mech. calcns. of Wurm (*C. A.* 27, 24) and

leads to a variation of the nuclear distance  $\Delta r = 0.044 \text{ \AA}$ .

B. J. C. van der Hoeven

Adsorption and swelling of cellulose in electrolyte solutions of varying concentrations. Kiso Kanamaru. *Kolloid-Z.* 66, 163-75 (1934); cf. *C. A.* 25, 3805, 4700.—Cellophane was washed in boiling distd. water until the  $p_H$  was const. (prepn. I). Two samples were subjected to a pretreatment with 1% NaOH or 1% HCl (prepn. II and III, resp.). The  $p_H$  after adsorption by washed I in HCl,  $H_2SO_4$ , and NaOH solns. was detd. with a H electrode. Plotting H and OH ions adsorbed against the  $p_H$  yielded two curves tending to become asymptotic at  $p_H$  7.4, which is an apparent isoelec. point. At this point the swelling is 63% and hence the point is not a true isoelec. point but one at which hylotropic adsorption occurs. For samples II and III this point lies at  $p_H$  8.15 and 5.20, resp. The swelling- $p_H$  curves show maxima and minima in acid and alk. solns.; swelling is less in  $H_2SO_4$  than in HCl solns. Swelling and  $\zeta$ -potential curves are parallel in KCl solns.  $AlCl_3$  solns. reverse the charge of the cellulose with a true isoelec. point at  $p_H$  4.65. A. F.

Paradoxical salt polarity in the presence of colloids. Rudolf Keller. *Kolloid-Z.* 66, 205-11 (1934).—A classification of neutral salts into two groups with respect to their relations in the presence of biocolloids is based on anodic or cathodic migration in the Furth app. under high voltage, Hofmeister ion series, Loeb ion antagonism, Wicowski's tissue and fluid salts, and capillary analysis. The cathode migration group includes Li, Na, Ca (under some conditions),  $SO_4$ , and  $PO_4$ . The anode migration group includes Rb, Cs,  $NH_4$ , Mg; unionized Ca, Cl, Br and  $H_2O$  are often pos. Arthur Fleischer

The solubility of iodine in vapors of its solvents. Wilhelm Brüll and W. Ellerbrock. *Z. anorg. allgem. Chem.* 216, 353-66 (1934).—At satn. the concn. of I was detd. in air, N, O,  $CH_4$ , and  $CO_2$ . Similar measurements were made in the vapors of  $CS_2$ ,  $CHCl_3$ ,  $CCl_4$ , and  $C_6H_6$ . In all cases the concn. at satn. was the same at the same temp. and agreed with literature data. In  $Et_2O$  vapor I dissolved slowly to form  $Et_2O \cdot I_2$ . At high ether concns. a brown product sepd. from the vapor satd. with I. Similar results were obtained with vapors of other solvents such as  $Me_2CO$ , MeOH and EtOH which dissolve I to give a brown soln., rather than the violet of true soln.

Foster Dee Snell

Solution freezing as a method investigating some problems of pure chemistry. X. Mixtures containing active alkylsuccinic and  $\alpha$ -chlorobutyric acids. Jean Timmermans and J. van der Haegen. *Bull. soc. chim. Belg.* 42, 448-60 (1933); cf. *C. A.* 27, 652.—dl-Hexylsuccinic acid, m.  $87.3^\circ$ , was resolved with brucine into the d-acid, m.  $83.2^\circ$ ,  $[\alpha]_D$   $14.3^\circ$ , but not the l-acid. dl-Propylsuccinic acid, m.  $100.5^\circ$ , treated with strychnine gave the d-acid, m.  $93.9^\circ$ ,  $[\alpha]_D$   $9.6^\circ$ , only. M.-p. curves indicate that mixts. of d-hexylsuccinic and d-propylsuccinic acids form a continuous series of mixed crystals with a min., while mixts. of l-hexylsuccinic and d-propylsuccinic acids form an equimol. addn. combination. Treating l-hydroxybutyric acid (K salt  $[\alpha]_D$   $-3.9^\circ$ ; iso-Bu ester,  $-7.7^\circ$ ) with  $PCl_5$  gives l-chlorobutyric acid,  $[\alpha]_D$   $-8.6^\circ$  (K salt  $[\alpha]_D$   $-6.7^\circ$ , iso-Bu ester,  $-10.5^\circ$ ), while  $PCl_5$  gives d-bromobutyric acid,  $[\alpha]_D$   $3.8^\circ$  (K salt,  $[\alpha]_D$   $2.9^\circ$ , iso-Bu ester,  $6.7^\circ$ ). F.-p. curves of various binary mixts. are appended and interpreted. A. L. Henne

Determination of densities and refractive indexes of solutions at higher temperatures. G. Pesce and P. Hölemann. *Z. Elektrochem.* 40, 1-5 (1934).—By use of specially designed pycnometers (25 cc.) (one of "supremax" glass, one of quartz) built on the principle of a dilatometer with Hg as the retaining liquid, a method of detg. d. of solns. with an accuracy of  $\pm 0.00002$  at temp. to  $85.0^\circ$  was developed. At  $24.92^\circ$ ,  $44.86^\circ$ ,  $64.88^\circ$  the ds. of  $CCl_4$  are, resp., 1.58461, 1.54566, 1.50562 and those of AcOH 1.04384, 1.02136, 0.99857;  $d_{40} = 0.97550$ . The app. for detg.  $n$  with a Pulfrich refractometer previously reported (cf. *C. A.* 25, 5334) was improved to yield an accuracy  $\pm 0.000014$  up to  $85^\circ$ . E. R. Schierz

The compressibility of aqueous solutions. Edith H.

1 Lanman and Beveridge J. Mair. *J. Am. Chem. Soc.* 56, 390-8 (1934).—With the Harvard technic the compressibility coeffs. of LiCl, NaCl, KCl, HCl, NaOH, KOH, AcOK and AcOH were detd. at  $25^\circ$ , between 100 and 300 megabars. B. A. Soule

The apparent molar volume of dissolved electrolytes. II. The pressure coefficient of apparent molar volumes. W. Geffcken. *Z. physik. Chem.* A167, 240-4 (1933); cf. *C. A.* 25, 4765.—At a sufficient diln. the apparent compressibility of a salt in soln. depends on the apparent molar vol. Roy H. Baechler

Polarizability and molar refraction of the alkali ions. R. Schoppe. *Z. physik. Chem.* B24, 259-62 (1934).—Mol. refraction and polarizability were calcd. by the method of Wolf and Herzfeld (*C. A.* 21, 532). The results are compared with those obtained by Fajans and Joos and Mayer. For the mol. refraction and polarizability the results are: 0.0610, 0.0243; 0.38, 0.152 1.8, 0.74; 3.43, 1.38; 6.25, 2.38 for Li, Na, K, Rb, Cs ions, resp. The mol. refraction for the alkali halides was also recalcd. and is compared with expt. G. M. M

The formation and properties of precipitates. Theory of coprecipitation. I. M. Kolthoff. *Chem. Weekblad* 31, 102-3 (1934); cf. *C. A.* 26, 5798.—The classification of occurrences in connection with copptn. is given in more detail. HgS has a strong catalytic effect on the pptn. of ZnS from supersatd. solns. E. Schotte

The partial pressures of formic and acetic acids above some aqueous solutions, and their partial molar free energies at 1.0 molal concentration. Wm. A. Kaye and George S. Parks. *J. Chem. Physics* 2, 141-2 (1934).—The partial pressures at  $25^\circ$  over 5 solns. between 0.5 M and 2.89 M are given. The partial molar free energy of formation in 1.0 M soln. is calcd. to be  $-87,690 \text{ cal}$  for HCOOH and  $-96,320 \text{ cal}$  for AcOH. P. S. Rollet

Cryoscopic determination of total hydration of ions of nickel chloride. O. Hun. *Compt. rend.* 198, 740-2 (1934); cf. *C. A.* 27, 4154.—By the same method the hydration of the ions in 0.5 M  $NiCl_2$  corresponds to  $NiCl \cdot 28.5H_2O$ ; and in 0.25 M  $NiCl_2$  to  $NiCl_2 \cdot 33.1H_2O$ . C. A. Silberrad

Cryoscopic determination of total hydration of ions of barium chloride. E. Rouyer. *Compt. rend.* 198, 742-4 (1934); cf. preceding abstr.—Similarly the hydration of the ions in 0.5 M and 0.25 M  $BaCl_2$  corresponds, resp., to  $BaCl_2 \cdot 26.1$  and  $BaCl_2 \cdot 29.1 H_2O$ . C. A. Silberrad

Constitution of hydrobromic acid solutions of cobalt and copper salts. P. Job. *Compt. rend.* 198, 827-8 (1934); cf. *C. A.* 27, 2083.—Examd. in similar fashion HBr solns. of Co and  $Cu^{++}$  salts indicate the presence of the ions  $[CoBr]^+$  and  $[CoBr_2]^-$  and  $[CuBr]^+$  and  $[CuBr_2]^-$ . The equil. consts. are, resp.,  $5 \times 10^{-3}$  and  $1.1 \times 10^{-3}$ , and  $6.3 \times 10^{-3}$  and  $6 \times 10^{-4}$ ; those of  $[CoCl]^+$  and  $[CoCl_2]^-$   $4.5 \times 10^{-3}$  and  $2.9 \times 10^{-4}$ . C. A. Silberrad

Electrolytic conduction in aqueous solutions. A. C. D. Rivett. *Rept. Australian and New Zealand Assoc. Advancement of Sci.* 21, 420-31 (1933).—Liversidge lecture, 1932. E. R. Smith

Mixed electrolytes. II. The proof of a new method of measuring electrical conductivity. V. K. Semenchenko, B. V. Erofeev and V. V. Serpinski. *Z. physik. Chem.* A167, 188-96 (1933). See *C. A.* 27, 3382. III. The electrical conductivity of mixed electrolytes. V. K. Semenchenko and V. V. Serpinski. *Ibid.* 197-208.—See *C. A.* 28, 1605. Roy H. Baechler

Constancy of the viscosity of strong lithium chloride solutions at low velocity gradients. G. W. Scott Blair and R. K. Schofield. *Phil. Mag.* 17, 225-9 (1934); cf. *C. A.* 26, 3159.—Previous measurements of the viscosity of concd. LiCl solns. were in error because of the creep of the soln. under rubber sleeves that held the capillary of the viscometer in place. When the joints were sealed the data were in accord with Poiseuille's law. Measurements of the damping of the rotational oscillation of a cylinder immersed in a LiCl soln. showed no anomaly, although the max. velocity gradient was only 0.003 sec.<sup>-1</sup>. E. J. R. Using solubility data in the determination of activity coefficients of acid molecules in chloride solutions. Erik

Larsson. *Swensk Kem. Tids.* 45, 236-45(1933); cf. C. A. 21, 8206, et seq.—The activity coeffs. of  $\text{BzOH}$ ,  $n\text{-C}_6\text{H}_4(\text{OH})\text{CO}_2\text{H}$ ,  $o\text{-}$  and  $m\text{-C}_6\text{H}_4\text{ClCO}_2\text{H}$ ,  $\text{PhC}(\text{OH})(\text{O}_2\text{H})$ ,  $p\text{-C}_6\text{H}_4(\text{OMe})\text{CO}_2\text{H}$  and  $\text{PhCH}_2\text{CO}_2\text{H}$  are calcd. from their solubilities in  $\text{NaCl}$  and  $\text{KCl}$  via log  $f_\pm = h\kappa$ .

A. R. Rose

The potentials in electrolytes containing foreign ions. (1) Eain and M. Lozmanova. *Z. physik. Chem.* A167, 209-20(1933).—The potentials were measured at the boundaries  $\text{Au}|\text{CuSO}_4$ ,  $\text{Au}|\text{Cu}(\text{NO}_3)_2$ ,  $\text{Au}|\text{AgNO}_3$  as well as the corresponding potentials  $\text{Cu}|\text{CuSO}_4$ ,  $\text{Cu}|\text{Cu}(\text{NO}_3)_2$ ,  $\text{Ag}|\text{AgNO}_3$ . The Au potential is a linear function of the metal of the electrolytic cation. The potential may be explained on the basis of power of adsorption.

Roy H. Baechler

Current density-potential curves. V. Sihvonen and O. Rnwald. *Acta Chem. Fennica* B6, 74(1933).—Simultaneous measurements of current potentials on anodes and cathodes were made in  $\text{NaOH}$  soln. with high and low c. d. in a special cell with diaphragm and rotating  $\text{Ni}$  and  $\text{Fe}$  electrodes. The c. d.-potential curves could be expressed by the formula  $\epsilon = \epsilon_0 + a \ln d + a\beta d$ , in which the coeff.  $\epsilon$  and the absorption coeff.  $\beta$  decreased with increasing temp. and concn. of the soln.

A. E. B.

Determination of normal potentials. M. Quintin. *Compt. rend.* 198, 718-20(1934).— $\Delta H$ , the heat of the reaction at concn.  $c$ , is a linear function of  $c$  for the cell  $\text{Cu}$  (amalgam two phases) $|\text{CuSO}_4(c)|\text{HgSO}_4|\text{Hg}$ , and extrapolated to  $c = 0$  gives  $\lim_{c \rightarrow 0} \Delta H = 18,640 \text{ cal./g. mol.}$  The normal potential,  $E_0$ , given by the equation  $E_0 = -\lim_{c \rightarrow 0} \Delta H / nF + T \lim_{c \rightarrow 0} dE_0/dT$  ( $E_0 = E_0$  when  $c = 0$ ), is  $0.4042-0.00050 T$ . Both Lewis' and La Mer's methods are unsatisfactory (cf. C. A. 27, 3873).

C. A. Silberrad

A study of the effect of an electric field on the potential at a metal-solution interface. H. K. McClain and H. V. Tartar. *J. Phys. Chem.* 38, 161-70(1934).—Expts. with very small electrodes of pure Au and Pt wire in various solns. contg. electrolytes other than Au and Pt salts showed that the potential against the soln. is only slightly affected by an elec. field of moderate strength. Changes that do occur may be caused by any 1 of several factors, and it is concluded that in cataphoresis expts. with Au and Pt soln. both the Nernst and  $\zeta$  potentials of the metals against the solns. are unchanged by the elec. field. Twenty-seven references.

J. H. Moore

Theory of glass electrodes. Philipp Gross and Otto Halpern. *J. Chem. Physics* 2, 136-40(1934).—A glass electrode is considered schematically to be a difficultly sol. electrolyte that absorbs  $\text{H}_2\text{O}$  and salts. A distribution potential exists at the boundary surface. Quant. agreement with exptl. potentials is obtained by using only one empirical const. Calcns. based on diffusion potentials were not satisfactory.

P. S. R.

Thermodynamics of aqueous sodium sulfate solutions from electromotive-force measurements. Herbert S. Harned and John C. Hecker. *J. Am. Chem. Soc.* 56, 650-3(1934).—The e. m. f. of the cell  $\text{Pb}(\text{Hg})|\text{PbSO}_4(s)|\text{Na}_2\text{SO}_4(m)|\text{Na}_2\text{Hg}|\text{Na}_2\text{SO}_4(0.05)|\text{PbSO}_4(s)|\text{Pb}(\text{Hg})$  was measured at  $0-40^\circ$  from a  $\text{Na}_2\text{SO}_4$  concn. of 0.05  $M$  to satn. Activity coeffs. were calcd. from the Debye-Huckel equation. The value of the apparent ionic diam.  $u$  is const. at 3.5 Å. Relative partial molal heat contents and sp. heats are tabulated.

E. J. Rosenbaum

Thermodynamic study of dilute thallous chloride solution by electromotive-force measurement of the cell  $\text{Ti-Hg}|\text{TiCl}(m)|\text{AgCl}(s), \text{Ag}(s)$ . I. A. Cowperthwaite, V. K. La Mer and J. Barksdale. *J. Am. Chem. Soc.* 56, 514-9(1934).—By combining e. m. f. data for this cell with data for the cell  $\text{Ti-Hg}|\text{Ti}_2\text{SO}_4(m)|\text{Ti}(s)$ , the e. m. f. of the cell  $\text{Ti}(s)|\text{TiCl}(m)|\text{AgCl}(s), \text{Ag}(s)$  was detd. at  $0-50^\circ$ , with concns. from 0.0005  $M$  to satn. For cell I at  $25^\circ$ ,  $E^\circ = 0.55833 \text{ v.}$ ,  $dE^\circ/dT = 6.646 \times 10^{-4}$ ,  $-\Delta F^\circ = 12,877 \text{ cal.}$  and  $-\Delta H^\circ = 8307 \text{ cal.}$  The Debye-Huckel limiting law is confirmed for the region of high diln. When the ion size parameter  $a$  is assumed to be 0.98 Å. the Gronwall, La Mer and Sandved equation fits the data. If  $a$  is assumed to be 3 Å. and the mass-action const. is 0.31,

a const. value is obtained for  $E^\circ$ . Partial molal heats of diln. of  $\text{TiCl}$  at  $25^\circ$  and  $12.5^\circ$  are tabulated.

E. J. Rosenbaum

Reversibility of oxidation-reduction systems derived from carbohydrates. R. Wurmer and J. A. de Loureiro. *Compt. rend.* 198, 738-40(1934).—The reversibility of oxidation-reduction systems consisting of reduced carbohydrates in neutral or alk. soln. or of ascorbic acid is demonstrated by the agreement between the normal potentials detd. electrometrically, and those detd. colorimetrically by detg. the amt. of a leuco deriv., e. g., of methylene blue, capable of being reoxidized (for which latter a convenient arrangement is described). The prior result as regards ascorbic acid was due to the use of an acid not freshly recryst. and so contg. traces of "redoxine" (characterized by a band at 2780 Å. in a soln. of  $pH$  7 or 2650 in one of  $pH$  1). (Cf. C. A. 27, 4468; Borsook and Kellieley, 28, 806<sup>1</sup>.)

C. A. Silberrad

Oxidation-reduction properties of glucides formed out of contact with oxygen. Nelicia Mayer-Reich. *J. chim. phys.* 31, 9-42(1934); cf. C. A. 27, 3657.—The oxidized form of the oxidation-reduction product formed in solns. of glucides is not stable. The system is, however, reversible, as shown by electrometric titration. Attention is drawn to the theory that one of the essential parts of respiration is that of maintaining the cellular medium at a const. level of oxidation-reduction.

E. R. Smith

The equilibrium in the reaction  $\text{Cl}_2 + \text{Br}_2 = 2\text{BrCl}$ . Harold G. Vesper and G. K. Rollefson. *J. Am. Chem. Soc.* 56, 620-5(1934).—The dissocn. const. of  $\text{BrCl}$  as reported in the literature is probably 30-60% too high. Accurate values for the dissocn. const. and the extinction coeff. of  $\text{BrCl}$  were obtained by using the green He lines with center of gravity at  $0.502 \mu$ . For this wave length the ratio  $\alpha_{2.01}/\alpha_{2.02}$  is about 0.1; hence  $\alpha = \log I_0/I$  for  $\text{BrCl}$  can be readily measured. The value for  $K$  in the reaction  $2\text{BrCl} = \text{Br}_2 + \text{Cl}_2$  at  $28^\circ = 0.107 \pm 0.002$  and  $\alpha$  (for a layer of 1 cm. corrected to 1 atm. and  $0^\circ$ ) =  $0.384 \pm 0.006$ .

H. S. v. K.

Chemical equilibria of reactions between hydrocarbons. V. Constants of equilibria of the reactions:  $\text{C}_6\text{H}_5\text{CH}_3 + 3\text{H}_2 \rightleftharpoons \text{C}_6\text{H}_{11}\text{CH}_3$ ;  $\text{C}_6\text{H}_5\text{C}_2\text{H}_5 + 3\text{H}_2 \rightleftharpoons \text{C}_6\text{H}_{11}\text{C}_2\text{H}_5$ ;  $n\text{-C}_6\text{H}_{13} + 3\text{H}_2 \rightleftharpoons n\text{-C}_6\text{H}_{17}$ . A. A. Vvedenskii, S. G. Vinnikova, V. R. Zharkova and B. M. Funduller. *J. Gen. Chem.* (U. S. S. R.) 3, 718-28(1933); cf. C. A. 27, 2369.—The consts. of the equilibria of the reactions of hydrogenation of  $\text{PhMe}$ ,  $\text{PhEt}$  and  $\text{PhPr}$  were detd. within  $200-300^\circ$  in the presence of Pd catalysts. The data agree with the following equations:  $\log K_p = 10970/T - 20.387 \pm 0.053$  for  $\text{PhMe} + 3\text{H}_2 \rightleftharpoons \text{C}_6\text{H}_{11}\text{Me}$ ;  $\log K_p = 9620/T - 18.041 \pm 0.049$  or  $\log K_p = 10,970/T - 20.526 \pm 0.088$  for  $\text{PhEt} + 3\text{H}_2 \rightleftharpoons \text{C}_6\text{H}_{11}\text{Et}$ ;  $\log K_p = 9875/T - 18.560 \pm 0.084$  or  $\log K_p = 10,970/T - 20.569 \pm 0.105$  for  $\text{PhPr} + 3\text{H}_2 \rightleftharpoons \text{C}_6\text{H}_{11}\text{Pr}$ . Under similar conditions  $\text{PhMe}$  is hydrogenated more thoroughly than  $\text{C}_6\text{H}_5$ ;  $\text{PhEt}$  and  $\text{PhPr}$  are hydrogenated equally thoroughly but less so than  $\text{C}_6\text{H}_5$  and  $\text{PhMe}$ .

Chas. Blanc

Kinetics and mechanism of decomposition of hydrocarbons. I. Thermal decomposition of hexane at atmospheric pressure. A. I. Dintzes and A. V. Frost. *J. Gen. Chem.* (U. S. S. R.) 3, 747-58(1933); cf. C. A. 28, 2169<sup>1</sup>.—Hexane (I) (from  $\text{PrOH}$ ), b.  $68.8-9.2^\circ$ ,  $n_D^{20}$  1.3749, was heated at  $525-65^\circ$ , the duration of the reaction being 0.1-90.8 sec. with 3-8% decompn. of I. The thermal decompn. of I began at  $520^\circ$ . Results of detns. of the gases and the unsatd. liquid compds. lead to the following conclusions:  $\text{C}_6\text{H}_{14} \rightarrow \text{C}_2\text{H}_6 + \text{H}_2$  (1);  $\text{C}_6\text{H}_{14} \rightarrow \text{CH}_4 + \text{C}_5\text{H}_{10}$  (2);  $\text{C}_6\text{H}_{14} \rightarrow \text{C}_2\text{H}_4 + \text{C}_4\text{H}_{10}$  (3);  $\text{C}_6\text{H}_{14} \rightarrow \text{C}_2\text{H}_2 + \text{C}_4\text{H}_8$  (4);  $\text{C}_6\text{H}_{14} \rightarrow \text{C}_2\text{H}_6 + \text{C}_3\text{H}_6$  (5);  $\text{C}_6\text{H}_{14} \rightarrow 2\text{C}_2\text{H}_6 + \text{C}_2\text{H}_4$  (6);  $\text{C}_6\text{H}_{14} \rightarrow \text{C}_2\text{H}_6 + \text{C}_3\text{H}_8$  (7);  $\text{C}_6\text{H}_{14} \rightarrow 2\text{C}_2\text{H}_6$  (8). The primary decompn. of I follows 1, 2, 3 and 4, and is always accompanied by a secondary decompn. of the type  $\text{C}_n\text{H}_{2n+2} \rightarrow \text{C}_m\text{H}_{2m+2} + \text{C}_{n-m}\text{H}_{2n-2m+2}$ , viz., 6, 6, 7 and 8, with only 1 tertiary reaction:  $\text{C}_6\text{H}_{14} \rightarrow 2\text{C}_2\text{H}_6$  as a result of the decompn. of  $\text{C}_6\text{H}_{14}$  formed in the process. The correlation of velocities of the primary reactions is almost independent of temp. and degree of decompn. With increasing degree of decompn. the relative quantity of products

of secondary decompn. noticeably increases. The energy of activation of primary decompn. of I within the limits 525-65° is  $E = 64,500 \pm 1,500$  cal. and the dependence of the velocity upon temp.  $\log K_1 = 14.22 - 14,105/T = 0.081$ . Chas. Blanc

The oxidation of graphite by electrical discharges. V. Sihvonen. *Ann. Acad. Sci. Fennicae A38*, No. 3, 22 pp. (1933) (in German).—Elec. discharges of high-tension d. c. between 2 close parallel graphite and Pt electrodes cause 2 reversible reactions:  $\text{CO}_2 + \text{Pt} \rightleftharpoons \text{CO} + \text{Pt}_2\text{O}$  and  $\text{CO}_2 + \text{C}_s \rightleftharpoons 2\text{CO} + \text{C}_{s-1}$ . Under moderate elec. discharges a linear elec. equil. with respect to the pressures of CO and  $\text{CO}_2$  is reached, which is shifted toward  $\text{CO}_2$  by  $1/2$  of the value of the equil. const. if the Pt acts as cathode after changing the polarity. Intensive a.-c. discharges cause homogeneous disocn. of  $\text{CO}_2$ :  $2\text{CO}_2 = 2\text{CO} + \text{O}_2$ . No oxidation of the anode could be observed in O atm. With weak a.-c. discharges in O of low pressure the surface of the graphite that was covered with the at. O adsorbent was attacked. Equations of the reactions caused by various elec. discharges in different atms. are given. A. E. Beitlich

The oxidation of graphite by Röntgen rays. V. Sihvonen. *Ann. Acad. Sci. Fennicae A38*, No. 4, 13 pp. (1933) (in German).—Two reactions, similar to the ones observed with elec. discharges (see preceding abstr.), were found when graphite was exposed to Röntgen rays in  $\text{CO}_2$  or CO atm. of low pressure. Treatment in O atm. yielded first  $\text{CO}_2 + 2\text{CO}$ , then  $2\text{CO}_2 + 2\text{CO}$ . With very low O pressure, the oxidizing effect of the rays was active only on direct exposure of the graphite. A. E. B.

Autoxidation of stannous chloride. IV. Effect of some nonaqueous solvents. Robert C. Haring and James H. Walton. *J. Phys. Chem.* 38, 153-60 (1934); cf. *C. A.* 27, 2881-2.—F.-p. measurements show complex formation between  $\text{SnCl}_2$  and HCl in dioxane. A mol. compd. between  $\text{SnCl}_2$  and dioxane in the ratio of 1:1 was found. The autoxidation of  $\text{SnCl}_2$  in dioxane and in benzyl alc. increases linearly with acid concn. until the acid concn. is nearly the same as that of  $\text{SnCl}_2$ , and then becomes const. The chloro-acid complex is the form in which oxidation occurs. Induced oxidation of dioxane and benzyl alc. also occurs. Several pos. and neg. catalysts have the same effect, qualitatively in aq. and nonaq. solns. I. J. Patton

Calcium carbide and calcium cyanamide. Birger W. Nordlander. *Tek. Tid. Uppf. C, Kemi* 64, 9-16 (1934).—Gelhaar's conclusions regarding the mechanism of the reaction between  $\text{CaC}_2$  and N (cf. *C. A.* 27, 4470) are based on misinterpreted observations. His observations on the effect of the particle size of  $\text{CaC}_2$  show that the reaction is heterogeneous rather than homogeneous. The equation for the diffusion velocity of a gas through a compact layer of solid is  $w = K\sqrt{i}$ , ( $w$  = wt. of diffused gas per sq. cm. that has reacted with the substance in the time  $t$ ). Application of an adaption of the equation for the system  $\text{CaC}_2/\text{N}$  to G.'s measurements shows that the reaction velocity is detd. solely by the diffusion velocity of N through the  $\text{CaCN}_2$  formed. G.'s theory that the increase in the reaction velocity with temp. depends on an ionization of N is invalid. The true degree of ionization at 1000° is normally about  $10^{-22}$  and in a Ni tube it is even less,  $10^{-24}$ . On the other hand, the effect of temp. fully agrees with expectation for a diffusion process. The only logical explanation of the increase in the reaction velocity which takes place on addn. of certain compds. is the ability of the latter to increase the diffusion velocity of N through a loosening or sintering of the  $\text{CaCN}_2$  formed. The increase in the reaction velocity which G. observed in the expts. with Ni tubes is attributed to the ability of this metal to remove CO from the reaction chamber either by direct absorption or formation of  $\text{Ni}(\text{CO})_4$ . Twenty-five references. D. Thuesen

The "temperature-independent factor" of unimolecular reactions. G. Salomon. *Helv. Chim. Acta* 16, 1354-60 (1933).—If the velocity of a reaction of the 1st order depends on the solvent, any value of the temp.-independent

factor  $Z$  and the heat of activation  $E$  of the Arrhenius equation  $k = Ze^{-E/RT}$  is possible. The value  $Z \approx 10^{14}$ , theoretically established by Polanyi and Wigner for unimol. reactions, is exptly. confirmed; it is valid for decompn. reactions and rearrangements of mols. that consist of about equally heavy atoms. Exptly. detd. deviations may be due to a steric factor or to disturbance of the unimol. course. Louise Kelley

Kinetics of thermal cis-trans isomerization. III. G. B. Kistiakowsky and Walter R. Smith. *J. Am. Chem. Soc.* 56, 638-42 (1934).—For the homogeneous, unimol. isomerization of isostilbene to stilbene, the rate const.  $k = 6 \times 10^{12} e^{-43800/RT}$  per sec. at pressures above 5 mm. At least 12 oscillators participate. At 330°, equil. is reached at 93% stilbene. Diethyl maleate and dimethyl citraconate undergo homogeneous decompn. at 300°; the isomerization of the latter resembles that of dimethyl maleate (*C. A.* 26, 3985). H. A. Beatty

Kinetic study of aqueous formaldehyde solutions. I. The polymerization reactions of K. Hess and co-workers Motoi Wadano, Carl Trogus and Kurt Hess. *Ber* 67B, 174-90 (1934).—The depolymerization of paraformaldehyde in aq. soln. is interpreted as a first-order reaction limited by an equil. The rate was followed by interferometer and cryoscopic measurements. The rate as a function of  $p_{\text{H}_2}$  has a flat min. between 2.6 and 4.3. MeOH reduces the reaction velocity. G. B. Taylor

The acid nature of aqueous formaldehyde solutions Motoi Wadano. *Ber.* 67B, 191-7 (1934).—Potentialmetric titration curves of HCHO vary with the purity of the sample, and have the same general shape as a curve with  $\text{HCO}_2\text{H}$ . The presence of acid in all HCHO solns must be taken into account in interpreting disocn. consts. G. B. Taylor

Decomposition of malic acid by sulfuric acid. Robert E. DeRight. *J. Am. Chem. Soc.* 56, 618-20 (1934).—The velocity of the reaction between malic acid and concd  $\text{H}_2\text{SO}_4$  was detd. by measuring the vol. of  $\text{CO}_2$  evolved. As the quantity of  $\text{H}_2\text{O}$  present is increased, the velocity of the reaction first increases and then decreases markedly.  $\text{SO}_2$  is also an inhibitor. The rate of decompn. is accounted for in terms of Taylor's theory of neg. catalysis. E. J. Rosenbaum

Kinetics of the thermal reaction of gaseous alkyl iodides with hydrogen iodide. Richard A. Ogg, Jr. *J. Am. Chem. Soc.* 56, 526-36 (1934).—The reactions of MeI, EtI and  $n$ -PrI with HI were investigated at 250-320° and pressures up to 0.5 atm. The results are expressed by the equation  $d(I_2)/dt = K_1(\text{RI})(\text{HI}) + K_2[(\text{RI})(\text{HI})/(\text{HI}) + (I_2)]$ . This rate equation is explained by a mechanism involving a bimol. metathesis between alkyl iodide and HI (rate const. =  $K_1$ ) and a concurrent unimol. decompn. of alkyl iodide into alkyl radical and I (rate const. =  $K_2$ ). For MeI and EtI  $K_2$  falls off at low pressures. Walter B. Keighton, Jr.

The kinetics of the decomposition of the trichloroacetates in various solvents. Frank H. Verhoek. *J. Am. Chem. Soc.* 56, 571-7 (1934).—The rates of decompn. of aniline trichloroacetate were detd. in  $\text{H}_2\text{O}$ , EtOH and PhNH<sub>2</sub>, and those of Na and Ba trichloroacetates were detd. in  $\text{H}_2\text{O}$  and in EtOH. The rates increase in the orders given. The mechanism suggested is the unimol. decompn.  $\text{CCl}_3\text{COO}^- = \text{CCl}_3^- + \text{CO}_2$  followed by  $\text{H}^+ + \text{CCl}_3^- = \text{CHCl}_3$ , and oxidation to chloride ion. In 3 cases  $k$  increases as decompn. proceeds. This is attributed to changes in the degree of ionization. Temp. coeffs for the decompn. in the several solvents indicate that the stability of the  $\text{CCl}_3\text{COO}^-$  ion is detd. by its solvation. Walter B. Keighton, Jr.

Allotropic varieties of calcium. P. Bastien. *Compt. rend.* 198, 831-3 (1934); cf. *C. A.* 25, 2355.—Breaks in the cooling, thermolec. power and dilatation curves, and sudden changes in hardness at 240-265° (there is considerable hysteresis), and 430-440° indicate 3 allotropic modifications. C. A. Silberrad

Cooling curves of sodium stearate in the presence of electrolytes. E. Angelescu and Dem. M. Popescu. *Kolloid-Z.* 66, 175-83 (1934); cf. *C. A.* 24, 3693, 3941.

and K chlorides, bromides, iodides, acetates, thiocyanates, palmitates and propionates were detd. and results expressed in terms of  $(T - T_0)/C$ , in which  $T$  and  $T_0$  are the break-points with and without salt, resp., and  $C$  is the molar salt concn. All Na salts except the palmitate raise  $T$  and above 0.05  $N$ , the ratio is const. K salts have a smaller effect and often lower  $T$ . Acetates and propionates raise  $T$  strongly, indicating a salting-out effect. The heats of gelatinization and heat cond. of the gel were calcd. While Fischer's theory (cf. C. A. 17, 2908; 23, 3144) is confirmed, an extension is necessary to explain the special effects, such as that of acetate and propionate, where degree of hydration is small.

Arthur Fleischer  
Electrical conductivity and equilibrium diagrams of binary alloys. IX.—The system magnesium thallium. (C. Grube and J. Hille. *Z. Elektrochem.* 40, 101-6 (1934); cf. C. A. 28, 959<sup>1</sup>.—The compd.  $Tl_2Mg$ , m. 385°,  $TlMg$  m. 345°. The peritectic reaction forming  $TlMg_2$  takes place at 390° between 28.57-34.5 atoms %  $Tl$ .  $TlMg$  and  $Mg$  form a eutectic at 80 atoms %  $Tl$  and 202°.  $Tl$  dissolves  $TlMg$ ; the  $\beta$  solid soln. contains 95.2 atoms %  $Tl$  at 202°, and decomposes into a eutectoid at 160° and 96.73 atoms %  $Tl$ . The  $\alpha$  solid soln. contains 98.7 atoms %  $Tl$ .

Curtis L. Wilson  
The nature of the solid phase in the system antimony-bismuth. W. F. Ehret and M. B. Abramson. *J. Am. Chem. Soc.* 56, 385-8 (1934).—Microscopic and x-ray diffraction exams. show that Sb-Bi alloys of all compos. consist of only one phase when properly annealed above the m. p.

B. A. Soule  
The partially miscible pair aniline-water. Paul Mondvain-Monval and Hélène Schlegel. *Compt. rend.* 197, 1632-4 (1933).—Above 168° mixts. of  $PhNH_2$  and  $H_2O$  are miscible in all proportions. Below 77° layers rich in  $PhNH_2$  have the greater d., while above this temp. the aq. layer is the denser. A capillary tube was suspended in the mixt. so that one end was in each layer; the capillary rise  $h = kT/(d - d')$ , in which  $k$  is a const. and  $d - d'$  is the difference in density of the two liquids.

E. G. Vanden Bosche  
Variation in the thermal behavior of methane at 20.4° absolute as a phase transformation of the second order. K. Clusius and A. Perlick. *Z. physik. Chem.* B24, 313-27 (1934).—Phase transformations of the 2nd order as defined by Ehrenfest (C. A. 27, 5235) were found in  $CH_4$  at 20.4° abs. The sp. heat was measured between 15° and 25° abs.; the mol. heat dropped from 81 to 13 cal. at the transition point. The pressure dependence of the temp. of discontinuity was followed up to 195 kg. per sq. cm. The optical properties of solid  $CH_4$  at low temp. were investigated with a polarization microscope.

C. M. Murphy  
The equilibrium of the quaternary system:  $Na_2SO_4$ -( $NH_4$ ) $_2$  $SO_4$ - $NH_4H_2PO_4$ - $H_2O$ . A. P. Belopolski and N. P. Aleksandrov. *J. Applied Chem.* (U. S. S. R.) 6, 390-114 (in German 414-15) (1933).—The equil. of the quaternary system  $Na_2SO_4$ -( $NH_4$ ) $_2$  $SO_4$ - $NH_4H_2PO_4$ - $H_2O$  was investigated at 0-15° to ascertain the possibility of treating mother liquors by the "ammonia method" obtained in the carbonation of the ammonia solns. of  $Na_2SO_4$ . The results are presented in graphs of space configurations, the character of which shows that both isotherms belong to the same type of equil. The isotherms are characterized by the following crystn. regions: (a) mirabilite, (b) thenardite, (c) the double salt  $Na_2SO_4 \cdot (NH_4)_2SO_4 \cdot 4H_2O$  and (d)  $(NH_4)_2SO_4$ . At the quintuple points the regions in contact with each other are, at point  $N$  mirabilite, thenardite and the double salt; at point  $R$ , which is located in the area of the higher  $NH_3$  concns., thenardite,  $(NH_4)_2SO_4$  and the double salt. The last point is that of decompn. of the double salt under the influence of  $NH_3$ . For the decompn. of the double salt at 0° an  $NH_3$  concn. of 65.25 g. per 100 g. of  $H_2O$  is needed. At lower temps. lower concns. of  $NH_3$  are needed for decompn. of the double salt. For practical utilization of the equil. diagrams, there is given a series of soly. curves that correspond to an identical concn. of the  $NH_3$  in g. per 100 g.  $H_2O$ . The theoretical

material proves that for the prepn. of a fertilizer with 18-20% of  $N$  mirabilite must first be sepd. from the soln. by cooling.

A. A. B.  
Double decomposition in the absence of a solvent. XVII. Reciprocal systems with a single surface of crystallization. A. G. Bergman and N. S. Dombrovskaya. *J. Gen. Chem.* (U. S. S. R.) 3, 729-34 (1933); cf. C. A. 24, 2367; 28, 2250<sup>1</sup>.—Possible variations in the form of crystn. surfaces in various combinations of continuous solid solns. of binary systems entering the compn. of the reciprocal system are discussed. For systems with a single surface interpretation is difficult, but in the case of division of the crystn. surface within the reciprocal system into sep. planes of crystn. caused by disintegration of the solid solns. or complex formation, all the interrelations become more simple. Examples of a system with a single surface are:  $AgCl + NaBr \rightleftharpoons AgBr + NaCl$ ;  $NaCl + KBr \rightleftharpoons NaBr + KCl$  and  $NaBr + KI \rightleftharpoons NaI + KBr$ . The last 2 systems have on all 4 sides continuous solid solns. with minimums, because of which with the complete reversibility of the reciprocal pair, the crystn. surfaces of these systems have a cup-like form.

XVIII. Reciprocal system with a single surface of crystallization.  $AgCl + NaBr \rightleftharpoons AgBr + NaCl$ . N. S. Dombrovskaya. *Ibid.* 735-41.—The reciprocal system  $AgCl + NaBr \rightleftharpoons AgBr + NaCl$  is the first one investigated in which there are a single crystn. plane and 4 binary salts forming continuous solid solns. and sepg. in the form of isomorphous crystals. According to the thermal effect (5.1 Cal.) and the curvature of the isotherms, the stable pair is  $AgBr + NaCl$ . Within the system is observed the isotherm curvature, causing "inflow" on the crystn. surface as a result of the lowered reciprocal soly. of the components of the stable pair. The inconcurrence of the "inflow" with the plane of the stable diagonal cut of  $AgBr-NaCl$  is the analog of the ridge shift of the crystn. surfaces of the stable components, appearing in many irreversible-reciprocal systems, e. g.,  $Ag_2SO_4 + 2TiNO_3 \rightleftharpoons 2AgNO_3 + Ti_2SO_4$ ;  $Ag_2SO_4 + Ti_2Cl_2 \rightleftharpoons Ag_2Cl_2 + Ti_2SO_4$ ;  $Ag_2SO_4 + Ti_2Br_2 \rightleftharpoons Ag_2Br_2 + Ti_2SO_4$ ;  $Na_2SO_4 + MgCl_2 \rightleftharpoons 2NaCl + MgSO_4$ . In such systems the shift of the max. from the plane of the stable cut indicates some decompn. in the fused state.

XIX. Reciprocal system:  $NaI + KBr \rightleftharpoons NaBr + KI$ . A. P. Obukhov. *Ibid.* 787-91.—The crystn. surface of the reciprocal system represents one continuous surface shaped like a flat cup with 2 raised edges adjacent to the side binary systems, and is related in its external characteristics to the first type of the first class in the classification of B. and D. In the system  $NaBr + AgCl \rightleftharpoons AgBr + NaCl$ , consisting of continuous solid solns., of which  $NaBr + NaCl$  and  $AgBr + AgCl$  have a min., while  $AgBr + NaBr$  and  $AgCl + NaCl$  have not, there was observed a shift of the reaction toward a more stable pair of  $NaCl + AgBr$ , which is related to the thermochem. reaction effect of 5.1 (cf. B. and Palkin, *Tech. entkloped. sprav.* 7, No. 7, 198-9; 203-7, figs. 13, 16, 17 and 19). XX. Melting-point diagrams of the ternary systems:  $NaCl-NaBr-NaI$  and  $KCl-KBr-KI$ . V. P. Radishchev. *Ibid.* 843-51.—The fusion diagrams of the 2 systems showed a close resemblance. The surface *liquidus* (Jancke, C. A. 4, 705) of both systems represents 1 crystn. plane of the ternary solid solns., which near the binary system of chloride-iodide is split into 2 planes of limited ternary solid solns. The curve of the joint crystn. of the 2 kinds of limited ternary solid solns., beginning in the eutectic p. of the binary system of chloride-iodide is terminated within the system at higher temps., and, therefore, shows an upward course. According to the classification of Jancke the 2 systems must be related to the 2nd type of systems with ternary solid solns. and a sphere of limited solid solns., taking its origin from the binary system with invariant point. The system of the K salts has a flatter crystn. surface than that of the Na salts. The curve of joint crystn. of the 2 solid phases in the 1st system is shorter than in the 2nd. These facts indicate a more complete isomorphism and a greater stability of the solid solns. in the system of K salts than in that of Na salts. XXI. Irreversible-reciprocal system:  $2NaCl + K_2CO_3 \rightarrow 2KCl + Na_2CO_3$ . *Ibid.* 852-64.—The

diagram of the reciprocal system obtained by thermal analysis discloses a shift of the reaction in the direction of formation of  $2KCl + Na_2CO_3$ , which agrees with the pos. thermal effect of the formation of this pair of salts (7.3 cal. or 3.65 cal. based on the equiv.). The system must be related to the class of the irreversible-reciprocal systems of the classification of B. and D. The decompn. of the continuous solid solns. of the binary systems ( $K_2Cl_2$ - $Na_2Cl_2$  and  $K_2CO_3$ - $Na_2CO_3$ ) on adding a 3rd component was observed only for the chlorides. The solid solns. of the carbonates are stable also within the reciprocal system. The surface *liquidus* of the system is formed by only 3 fields:  $K_2Cl_2$ ,  $Na_2Cl_2$  and the solid solns. of  $K_2CO_3$ - $Na_2CO_3$ . Of the ternary systems, into which the investigated system is decompd. at the stable diagonal cut, one represents the ternary eutectic ( $Na_2Cl_2$ - $K_2Cl_2$ - $Na_2CO_3$ ), and the other a system with continuous solid solns. of 2 components in which the 3rd does not dissolve ( $K_2Cl_2$ - $K_2CO_3$ - $Na_2CO_3$ ). XXII. Irreversible-reciprocal system:  $K_2SO_4 + Li_2Cl_2 \rightarrow K_2Cl_2 + Li_2SO_4$ . O. S. Dombrovskaya. *Ibid.* 1007-16.—This system is irreversible-reciprocal with the equil. shifted in the direction of the stable pair  $Li_2SO_4$ - $K_2Cl_2$ , which is also indicated by the thermal coeff. of decompn. (+6.4 Cal.). The 2 decompn. products are sepd. at the metastable diagonal cut. Characteristic is the deflection of both ridges of the stable components from the planes of the stable diagonal cut. XXIII. Reciprocal systems:  $Cs_2Cl_2 + K_2SO_4 \rightleftharpoons Cs_2SO_4 + K_2Cl_2$ ;  $Rb_2Cl_2 + K_2SO_4 \rightleftharpoons Rb_2SO_4 + K_2Cl_2$ . *Ibid.* 1017-25.—The 2 systems supplement the series of reciprocal systems, in which pairwise 2 salts form continuous solid solns., and the other 2 pairs simple eutectics, *vis.*  $Ag_2Cl_2 + HgBr_2 \rightleftharpoons Ag_2Br_2 + HgCl_2$ ;  $AgCl + KBr \rightleftharpoons AgBr + KCl$ ;  $AgBr + KI \rightleftharpoons AgI + KBr$  and  $Ag_2SO_4 + Na_2Cl_2 \rightleftharpoons Ag_2Cl_2 + Na_2SO_4$  (Bergman and Palkin, *loc. cit.*). While the investigated systems together with the system  $Ag_2Cl_2 + HgBr_2$  belong to the series of reciprocal systems, the system  $AgCl + KBr \rightleftharpoons AgBr + KCl$  is a transition to the continuous system, the representative of which for the given type of systems is the system:  $AgBr + KI \rightarrow AgI + KBr$ . The system  $Rb_2Cl_2 + K_2SO_4 \rightleftharpoons Rb_2SO_4 + K_2Cl_2$  represents the 1st sub-type of the system with 2 surfaces, the eutectic line of which has no min. In the system:  $Cs_2Cl_2 + K_2SO_4 \rightleftharpoons K_2Cl_2 + Cs_2SO_4$ , because of the considerable thermal reaction effect and the lower isomorphism than in the K-Rb system, there is a very deep min. on the eutectic line, and also some shift of the decompn. reaction toward the somewhat more stable diagonal pair  $Cs_2Cl_2$ - $K_2SO_4$ , which is shown by a corresponding curvature on the isotherms of the plane of isomorphous sulfates. Such a curvature of isotherms is not observed in the system:  $Rb_2SO_4 + K_2Cl_2 \rightleftharpoons K_2SO_4 + Rb_2Cl_2$ . XXIV. Irreversible-reciprocal system: sodium chloride-lithium sulfate. M. A. Kiochko. *Ibid.* 1028-39.—The surfaces of solidification and the diagrams of side binary systems of the reciprocal system:  $Li_2Cl_2 + Na_2SO_4 \rightarrow Li_2SO_4 + Na_2Cl_2$  were detd. The diagram of "compn.-temp. of m." of the binary system  $LiCl$ - $Li_2SO_4$  is given for the first time. The direction of reaction and the character of double decompn. in the system were detd. An investigation must be made of the reciprocal systems between the m. p. of each compn. and abs. 0 to obtain a clear conception of transformations proceeding in the system at all temps during its stable existence. C. B.

The para-hydrogen transformation on carbon surfaces at low temperatures. K. W. Rummel. *Z. physik. Chem.* A167, 221-39(1933).—A statistical method is described for following the ortho-para H conversion on C surfaces at low temps. With C from different sources the effects of contamination, gas satn. and activation on catalytic activity were studied. Catalysis is not due to impurities. Treatment with H, O or N at room temp. depressed the low-temp. catalysis in contrast to previously reported acceleration produced by satn. with O at the temp. of liquid air. Pressure-temp. relations were established. Most of the C surface is catalytically effective but not all parts are equally so. A small portion is subject to poisoning. The conversion is unimol. The para-ortho

change has a weakly pos. temp. coeff.; the ortho-para change has a neg. temp. coeff. Roy H. Baechler

The emission of alkali atoms from various ammonia catalysts. A. Keith Brewer. *J. Chem. Physics* 2, 116 18(1934).—The quantity of alkali deposited from promoted Fe catalyst filaments on an Fe reference electrode was measured photoelectrically. Temps. were 675-760° at a pos. ion current of  $1 \times 10^{-6}$  amp. At first the no. of atoms leaving the surface far exceeds that of ions, but decays to a negligible value in the course of several min. Atom emission is increased by  $Al_2O_3$  in the catalyst, as is also the temp. for equiv. ion currents. Both atom and ion emission increase when sintering occurs. The atom emission is explained by lowering of the work function. P. S. Roller

The thermal conductivities of chemically related substances in the liquid state. A. Kardos. *Z. tech. Physik* 15, 79-82(1934).—A survey of existing data shows that in general thermal cond. decreases with increasing mol wt. J. B. Austin

The effect of accommodation on heat conduction through gases. B. G. Dickinson. *Proc. Roy. Soc. (London)* A143, 517-40 (1934).—A modification of the "hot-wire" method for detg. the thermal cond. of a gas is described in which the errors due to convection, effect of accommodation and the temp. discontinuity between the gas and solid surface surrounding the gas are eliminated by exptl. means in one operation, while the radiation correction is very small. By this method the conductivities and accommodation coeffs. were detd. for He, A, H, CO, O, air, N,  $N_2$ ,  $CO_2$ ,  $NH_3$  and  $SO_2$ . Morris Muskat

The heat conductivities of various liquids. A. Kardos. *Z. ges. Kälte-Ind.* 41, 1-6, 29 35(1934).—Data are given for the heat conductivities of  $CO_2$ ,  $MeCl$ ,  $SO_2$  and  $NH_3$  in the liquid state, from -15° to 30°. The heat cond in the crit. region is discussed. F. D. Rossini

Measurement of the specific heats of liquids by a cooling method. R. W. B. Stephens. *Phil. Mag.* 17, 297 312(1934).—The sp. heats of  $C_2H_6$  and  $C_3H_8$  were measured in the temp. range 5-15° by finding the rate of temp. decrease when the liquid was in a vessel in a cooling bath of known temp. The app. was calibrated with  $H_2O$ . An accuracy of 1-2% was attained. E. J. Rosenbaum

The heat content of mixtures of ammonia and water as a function of the composition and temperature. Karl Zinner. *Z. ges. Kälte-Ind.* 41, 21-9(1934).—The exptl. method, app. and procedure are described and data are given in tabular and graphic form for the range -70° to 180° and 0 100%  $NH_3$ . F. D. Rossini

Thermal chemical measurements of the oxides of copper, rhodium, palladium and indium. Lothar Wohler and N. Jockum. *Z. physik. Chem.* A167, 169-79(1933).—The heat of formation of  $CuO$  as calcd. from the exptl. value for its O tension did not agree with the accepted value. The heat of formation was detd. by reduction with H and compared with the theoretical value. Analogous measurements were made on Rh, Pd and Ir. The close agreement of the calcd. and exptl. values indicated the greater reliability of the data as compared with those previously obtained. Roy H. Baechler

The heat of formation of mixed crystals of potassium chloride and potassium bromide. II. M. M. Popov and S. F. Yavorovskaya. *Z. physik. Chem.* A167, 180-2 (1933); cf. *C. A.* 24, 3423.—In studying the effect of time of crystn. on the heat of formation it was found that homogeneous crystals are obtained when 20 g. of the salt is crystd. in not less than 1 1/2 hrs. The method of cooling does not affect the heat of formation but the period of tempering does. By grinding the salts it was impossible to obtain mixed crystals whose heat of formation agreed with that of crystals obtained from the liquid phase. Roy H. Baechler

The thermochemistry of iron. Walter A. Roth and F. Wienert. *Arch. Eisenhüttenw.* 7, 455-60(1934).—The heats of formation of the Fe oxides were redetd. from pure synthetic materials; methods are described in detail. The heats of reaction, at 20.7°, were found to be:  $Fe + 1/2 O_2 = FeO + 64.6 \pm 0.1$  kg. cal.;  $8Fe + 2O_2 =$

$\text{Fe}_2\text{O}_3 + 266.74 = 0.24 \text{ kg. cal.}$ ;  $2\text{Fe} + 1\frac{1}{2}\text{O}_2 = \text{Fe}_2\text{O}_3 + 195.14 = 0.24 \text{ kg. cal.}$ ;  $\text{FeO} + \text{Fe}_2\text{O}_3 = \text{Fe}_3\text{O}_4 + 6.94 = 0.84 \text{ kg. cal.}$ ;  $\text{Fe} + 1\frac{1}{2}\text{Cl}_2 = \text{FeCl}_3 + 93.54 = 0.24 \text{ kg. cal.}$ ;  $\text{Fe}_2\text{O}_3 + 3\text{Cl}_2 = 2\text{FeCl}_3 + 1\frac{1}{2}\text{O}_2 + 8.07 = 0.44 \text{ kg. cal.}$  A comparison with older values is added.

M. Hartenheim

The heat of dissociation of  $\text{Bi}_2$  determined by the method of molecular beams. Cheng Chuan Ko. *J. Franklin Inst.* 217, 173-99(1934).—Method, app. and procedure for detg. the velocity spectrum of Bi atoms and  $\text{Bi}_2$  mol., and for detg. the vapor pressure of Bi are discussed. The data obtained are: heat of dissociation of  $\text{Bi}_2$ ,  $77.1 \pm 1.2 \text{ kg. cal.}$ ; vapor pressure of Bi,  $\log_{10} P_{\text{mm}} = -(52.23 \times 195.26/T) + 8.56$ , between  $1100^\circ$  and  $1220^\circ\text{K}$ . F. D. Rossini

Calculation of the heat of dissociation of gaseous  $\text{KCl}$ ,  $\text{KBr}$ ,  $\text{KI}$ ,  $\text{NaCl}$ ,  $\text{NaBr}$ ,  $\text{NaI}$  and  $\text{LiI}$  into atoms from thermal and optical data. Appendix: The heat of vaporization of potassium and lithium. H. Beutler and Hilde Levi. *Z. physik. Chem.* B24, 263-81(1934).—Thermochem., phys. and optical data are used in a Haber-Born cycle to calc. the heats of dissociation. Results are:  $\text{KI}$  76.0,  $\text{KBr}$  90.3,  $\text{KCl}$  101.2,  $\text{NaI}$  70.7,  $\text{NaBr}$  87.7,  $\text{NaCl}$  97.5,  $\text{LiI}$  75.3 kg. cal., with an error of  $\pm 1.6$  for the Na and K salts and  $\pm 3.0 \text{ kg. cal.}$  for  $\text{LiI}$ . The results are compared with those obtained by other investigators. Electron affinities are also calcd. The heats of sublimation of K and Li are also calcd. by means of the chem. const. and found to be, resp.,  $21.42 \pm 0.2$  and  $33.3 \pm 0.8 \text{ kg. cal.}$  G. M. M.

Thermodynamic derivation of the Boltzmann formula. N. Barbulescu. *Bul. soc. române fiz.* 35, 69-73(1933).—Theoretical.

F. D. Rossini

Formula for reduction of an experimental heat of combustion to the corresponding isothermal heat of combustion. L. J. P. Keffler. *J. chim. phys.* 31, 1-8(1934).—The correction term  $[1.7a + 7.75b + 2.5(c + d)/M] W' - 0.52 W / \Delta t$  is derived, in which  $a, b, c, d$  are the nos. of atoms of C, H, O, N, resp., in a substance of mol. wt.  $M$

of which  $W'$  g. burned in a bomb calorimeter produce a temp. rise of  $1^\circ$ .  $W$  is the mass in g. of standard  $\text{BzOH}$  required to produce  $1^\circ$  rise in temp. and  $\Delta t$  is the actual rise observed.

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

W. ALBERT NOYES, JR.

Evolution of the electron theory, according to Langevin. Jean Ullmo. *Scientia* 55, 103-17(1934).—An address.

L. E. Gilson

The theory of the magnetic electron of Dirac. L. de Broglie. *Arch. sci. phys. nat.* 15, 405-83(1933); cf. C. A. 27, 2374 5.—A review is given of the general assumptions on which the Dirac theory of the electron is based, and of the implications of the theory. The significance of mean values derived from the theory is pointed out and the question of the conformity of the Dirac equations to the requirements of relativity is discussed in some detail.

Morris Muskat

The existence of a proton with negative charge; the constitution of the nucleus of the isotope of hydrogen. Ioan I. Placinteanu. *Bul. soc. române fiz.* 35, 95-102(1933); cf. C. A. 27, 5631.—A neg. proton may be obtained either through disintegration of a photon with great energy (about  $10^9 \text{ e. v.}$ ) or through coupling of a neutron with a neg. electron. The pos. and neg. protons may be considered as complex particles formed from the union of neutrons, primary particles of matter, with pos. and neg. electrons, elementary units of electricity. By applying the uncertainty relation,  $\Delta D \cdot \Delta q \sim h/mc$  for the coeff.  $D$  of reflection of a particle of mass  $m$  on the potential barrier, to electrons and protons an explanation of the great affinity of neutrons for pos. electrons is obtained. Between 2 neutrons the potential  $\pi e^2/r$  exists. The union of 2 neutrons and a pos. electron constitutes the nucleus of  $\text{H}^2$ . Its calcd. mass ( $m_{\text{H}^2} = 2m_n + m_e = 2.0120$ ) is in accord with experience, 2.0130, the calcd. mass defect being  $2m_e$ .

Calvin Brou

Approximate representation of the wave functions of interpenetrating orbits. V. A. Pok. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 241-4(in German 244-7)(1934). Math.

F. H. Rathmann

Results of calculations of atomic wave functions. II. Results for  $\text{K}^+$  and  $\text{Ca}^+$ . D. R. Hartree. *Proc. Roy. Soc. (London)* A143, 506-17(1934); cf. C. A. 27, 5239.—The results of calcns. of at. wave functions by the method of the "self-consistent field" are presented for  $\text{K}^+$  and  $\text{Ca}^+$ . Addnl. results are also given for  $\text{Cu}^+$ .

Morris Muskat

The distribution of wave function and characteristic value among the individual electrons of an atom. T. Koopmans. *Physica* 1, 104-13(1933)—The Fok method (*Z. Physik* 61, 126(1930)) is applied.

B. J. C. van der Hoeven

Importance of kinetic energy of electrons for interatomic forces. H. Hellmann. *Z. Physik* 85, 180-90(1933).—The exchange forces predicted by quantum theory and responsible for chem. bonds between atoms can be qualitatively understood by treating the electrons classically, taking into account the (unclassical) fact that each electron occupies a region of volume  $h^3$  in phase space. Whenever the space available for the electron is decreased, its kinetic energy increases. Two electrons can occupy the same region only if their spins point in opposite directions. This point of view gives a simple picture of the dependence of interatomic forces (chemical forces) on distance. However, this picture must not be taken too literally because, although it gives an approx. correct result for the value of the energy, it leads to wrong predictions as to how this energy is made up of kinetic and potential energy. The same holds for perturbation methods of all kinds. A formula is derived to calc. potential and kinetic energy separately, if only the total energy and its dependence on atomic distance are known.

R. Pederis

Selective photoeffect. M. V. Savost'yanova. *Uspekhi Fis. Nauk* 14, 7-34(1934).—A review discussing selective photoeffect as an optical phenomenon and its observance

with films on metals, non-metals, mono- and polyatomic layers, and complex layers. Twenty-three diagrams illustrate various systems. F. H. Rathmann

The electron theory of metals. A. Sommerfeld. *Naturwissenschaften* 22, 49-52(1934).—A review and discussion of certain features of the electron theory of metals.

B. J. C. van der Hoeven  
A new photoelectric phenomenon. Quirino Majorana *Atti accad. Torino, Classe sci. fis., mat., nat.* 68, 114-34 (1933); cf. *C. A.* 27, 5000. A. W. Contieri

Studies on some photoelectrically conductive substances. I. Some properties of a photoelectrically conductive thallium cell. Chika Asai. *J. Chem. Soc. Japan* 55, 153-8(1934).—The Tl cell in the darkness is a good insulator. The sensitivity of the cell is proportional to the intensity of light. Electric fatigue does not take place when the direct current is smaller than  $10^{-3}$  amps. A. c. at 100 v. does not cause electric fatigue. The sensitivity of the cell is easily spoiled by exposure to strong white light. The cell is more sensitive toward red or infra-red light. In this case elec. fatigue does not occur. II. Temperature effect on the electric resistance of the photoelectrically conductive selenium. *Ibid.* 159-67.—In the darkness between  $17^{\circ}$  and  $109^{\circ}$ , the elec. resistance of Se decreases with the rise of temp. The photoelec. cond. decreases with the rise of temp. and finally disappears at about  $140^{\circ}$ . T. Katsurai

Photocathode and barrier-film effect. P. Görlich. *Naturwissenschaften* 22, 11-12(1934).—Rectifier effects are obtained with composite photocathodes ( $\text{CaO-Cs-Ag}$ , *C. A.* 28, 32<sup>a</sup>) as well as a photocurrent ( $10^{-7}$ - $10^{-8}$  amps. per lumen). On one cathode an external photoeffect (with auxiliary potential) and a barrier effect (without potential) can be observed simultaneously from their additive currents. B. J. C. van der Hoeven

The surface ionization of potassium on tungsten. M. J. Copley and T. E. Phipps. *Phys. Rev.* 45, 344-5(1934).—The surface ionization of K on W and W-O surfaces was detd. at temps. up to  $2550^{\circ}\text{K}$ . Application of the modified Saha equation to the data suggests that a factor, which multiplies the exponential term and cancels at least in part the statistical weights ratio, has been omitted. The work function of W, detd. independently of the thermionic emission, is between 4.50 and 4.57 electron v. Gerald M. Petty

Continuous electron radiation in gas discharges. Wolfgang Finkelnburg. *Phys. Rev.* 45, 341-2(1934); cf. *C. A.* 27, 4733.—The total intensity and intensity distribution of the continuous gas spectra emitted by all condensed discharges are not dependent, to a first approximation, on the electrode material or the medium through which the discharge passes. Their intensity increases with the c. d. This is analogous to the observed property of the continuous spark spectra, in which the intensity of the electron radiation is proportional to the c. d. and the ion density, and is, to a first approximation, independent of the individual properties of the ions. Gerald M. Petty

Electron release in cathode spots of an arc discharge. F. Lüdi. *Z. Physik* 82, 815-32(1933).—Current theories fail to explain the release of electrons from cathode spots, and an attempt is made to explain it as due to collisions of the 2nd kind of multiple charged pos. ions. B. C. A.

Investigation of thin films of organic substances by electron diffraction. C. A. Murison. *Phil. Mag.* 17, 201-25(1934).—The substances studied were tap grease, petrolatum, paraffin wax, heavy thermostat oil,  $\text{C}_{20}\text{H}_{42}$ ,  $\text{C}_{26}\text{H}_{54}$ , picein, tallow, lard, tripalmitin,  $\alpha$ -bromostearic, palmitic and stearic acids and benzyl phthalate. From the spacing in the diffraction pattern of some of these substances an av. distance of 2.56 Å. was obtained which is considered to be the distance between alternate C atoms in a long-chain mol. The backing of the film did not affect the pattern obtained. The mols. of most of the substances studied are extensively oriented. The discontinuities at the film-vacuum and the film-backing interfaces cause the orientation. The theory of the various types of patterns observed is given. The orientation of a hydrocarbon mol. is the more pronounced, the

longer is the mol. Greases are oriented more markedly than are pure substances. The lubricating value of a film is related to the degree of orientation of the mols. in it. E. J. Rosenbaum

Symbols and names for the hydrogen isotopes. Robert S. Mulliken. *Science* 79, 228-9(1934). E. H.

Isotopy of hydrogen. Heavy water. E. Bamann. *Suedent. Apoth.-Ztg.* 74, 115-16(1934).—A review. W. O. E.

The manufacture of deuterium and its compounds. Wells A. Webb. *Ind. Eng. Chem., News Ed.* 12, 63 (1934). E. H.

Heavy hydrogen, a significant discovery. Ernest B. Ludlam. *Pharm. J.* 131, 741-2; *Chemist and Druggist* 119, 764-5(1933).—A lecture. S. Waldbott

New data on the positron. V. V. Shpolskii. *Uspekhi Fis. Nauk* 14, 125-9(1934).—A review. F. H. R.

Diffusion and absorption of positive electrons traversing matter. J. Thibaud and F. Dupré la Tour. *Compt. rend* 198, 806-8(1934); cf. *C. A.* 28, 1921<sup>a</sup>.—By applying the same method as used with Pt to screens of 17 other elements the range of positrons is shown to be in general equiv. to a passage through matter amounting to  $< 500$  mg. per sq. cm.,  $\mu/\rho$  being approx. const. and  $\approx 8.5$ . This value is also obtained by the same method (*mutatis mutandis*) for neg. electrons. Both behave alike until the positrons, after losing most of their kinetic energy, begin to disappear. C. A. Silberrad

The mass of the neutron and the stability of heavy hydrogen. Rudolf Ladenburg. *Phys. Rev.* 45, 224-5 (1934).—The literature on the calcn. of the mass of the neutron is reviewed. Radioactivity in heavy water indicates for  $\text{H}^3$  a transformation period greater than  $10^{14}$  years. This makes Livingston, Henderson and Lawrence's value of 1.0006 (*C. A.* 28, 966<sup>a</sup>) for the mass of the neutron improbable. Louis Goldman

Disintegration of beryllium by deuterons. H. R. Crane and C. C. Lauritsen. *Phys. Rev.* 45, 226-7(1934).—The mixt. of neutrons and  $\gamma$ -rays produced was analyzed by a comparison of the Pb and paraffin absorption curves. The disintegration is represented by the equation  $\text{Be}^9 + \text{H}^2 \rightarrow \text{B}^{10} + n^1 + \gamma$ . Louis Goldman

The emission of protons and neutrons from various targets bombarded by three million volt deuterons. Ernest O. Lawrence and M. Stanley Livingston. *Phys. Rev.* 45, 220(1934).—The neutron yield, given for 8 targets, and a roughly proportional proton yield vary inversely with the at. no. The change is attributed to deuteron and nucleus disintegration. Louis Goldman

Neutrons and magnetic nuclear moments. B. Venkatesachar and T. S. Subbaraya. *Z. Physik* 85, 264-7(1933), cf. *C. A.* 27, 1269.—From the assumption that of the protons and neutrons forming a nucleus as many  $\alpha$  particles as possible are combined in  $\alpha$ -particles and that the remaining neutrons are arranged in shells like the at. electrons, having both orbital and intrinsic magnetic moment, one can deduce values for the magnetic moments of the nuclei which seem to agree in general with those observed from hyperfine structure. The value of the magnetic moment of the neutron that has to be inserted in order to give the agreement is half a proton magneton (The result of Stern, giving 2.5 proton magnetons for the proton, seems not to be taken into account.). R. P.

Gamma-rays from carbon bombarded with deuterons. C. C. Lauritsen and H. R. Crane. *Phys. Rev.* 45, 345-6 (1934).—A very penetrating radiation was obtained from carbon bombarded with deuterons; it consists of very hard  $\gamma$ -rays. The process is probably represented by the equation  $\text{C}^{12} + \text{H}^2 \rightarrow \text{C}^{13} + \text{H}^1 + \gamma$ . G. M. P.

Bombardment of the heavy isotopes of hydrogen by  $\alpha$ -particles. Lord Rutherford and A. E. Kempton. *Proc. Roy. Soc. (London)* A143, 724-30(1934).—In investigating the structure of the deuteron and the mass of the neutron, expts. were made to det. whether the deuteron can be broken up into a neutron and a proton in the bombardment of  $\text{H}_2^3$  by the  $\alpha$ -particles from Po. The no. of neutrons produced by the bombardment of heavy water, if any, was less than  $1 \times 10^7$  of the no. of bombarding

$\alpha$ -particles. \*The max. range of recoil in air of the deuteron in a head-on collision with an  $\alpha$ -particle is about 7% greater than that of recoil of the proton. The stopping power for the  $\alpha$ -particle is the same in  $H_2$  as in H. No difference could be detected in a comparison of the scattering of  $\alpha$ -particles by  $H_2$  with that by H. Conclusion: The field of force surrounding the deuteron is sensibly the same as that of the proton. Allen S. Smith

Exchange of heavy hydrogen atoms between water and organic compounds. K. F. Bonhoeffer and R. Klar. *Naturwissenschaften* 22, 45(1934).—Between water and dissolved sugar only the OH hydrogen is exchangeable (cf. C. A. 28, 406<sup>7</sup>).  $CH_3$  hydrogen is not exchangeable in NaOAc. Mobile H of  $CH_2$  groups, e. g., keto-enol H, however, is exchangeable against water hydrogen. Pure aq. acetone solns. (keto) do not show exchange; after addn. of small amts. of Na (enol formation) exchange appears. The extent increases with the alkyl. B. J. C. van der Hoeven

Exchange of heavy hydrogen atoms between water and molecular hydrogen. K. F. Bonhoeffer and K. W. Rummel. *Naturwissenschaften* 22, 45(1934).—Efforts were made to catalyze the reaction between heavy water and ordinary  $H_2$  by Pt sponge. By shaking the mixt. under pressure, equil. is established in a few days. Agreement with theoretical expectations of being on the side of heavy water at room temp. and with a const. of 3 is found (cf. Oliphant, C. A. 28, 1265<sup>4</sup>; Horiuchi and Polanyi, C. A. 28, 1256<sup>1</sup>, 1254<sup>4</sup>). B. J. C. van der Hoeven

The concentration of  $H^2$  and  $O^{18}$  in heavy water. Walker Bleakney and Austin J. Gould. *Phys. Rev.* 45, 281-2(1934).—A mass spectrograph analysis showed that in  $H_2$  contg. 91 to 98%  $H^2$ , the ratio  $H^2:H^1$  is less than  $1:10^6$ . Accordingly, in ordinary  $H_2$ ,  $H^2:H^1$  is less than  $2:10^6$ .  $O_2$  collected from the cell which yielded 98%  $H^1$  showed the same ratio of  $O^{18}:O^{16}$  as in ordinary water, contrary to the results of Washburn, Smith and Frandsen (C. A. 28, 706<sup>7</sup>). Gerald M. Petty

The isotopic composition of sea water. Edward S. Gillilan, Jr. *J. Am. Chem. Soc.* 56, 406 8(1934); cf. C. A. 28, 377<sup>7</sup>.—Purified sea water has d. 1.0000023 times that of purified Cambridge (Mass.) tap water. The difference is believed due to a variation in isotopic compn. A method of measuring small differences of d. is described. B. A. Soule

Indications of a simple rule relating nuclear resonance levels with atomic number. Ernest Pollard. *Phys. Rev.* 45, 218-19(1934); cf. C. A. 27, 5023.—The energy for penetration of  $\alpha$ -particles into a nucleus by resonance with a "virtual" energy level inside rises linearly with the at. no. because the  $\alpha$ -particle forms a standing wave of const. radius within the potential barrier of the nucleus. Louis Goldman

Oxidation of mercury vapors under the influence of ultra-violet light. \*I. M. Frank. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1933, 146-7 (in English 147-8); cf. Dickinson and Sherrill, C. A. 20, 1954; Noyes, C. A. 22, 2717; 23, 3165; Leipunskii and Sagulin, C. A. 23, 1054, 5089.—In the oxidation of Hg vapors with O under the influence of ultra-violet, e. g., exciting the Hg atoms with the line 2537 Å., the reaction may follow the following course:  $Hg^* + O_2 \rightarrow Hg + O_2^*$ ;  $O_2^* + O_2 \rightarrow O_3 + O$ ;  $O_3 + Hg \rightarrow HgO + O_2$ , where  $O_2^*$  is an excited mol. in the state  $^2\Sigma$  or  $^2\Pi$ . The exptl. procedure carried out under subatm. pressure measured manometrically confirmed this assumption. The removal of short-wave light from the exciting rays has no effect on the reaction, but a decrease in the exciting rays has an adverse effect. The most effective lines are those of Al at 1880, 1935 and 1990 Å., which induce the formation of  $O_3$  and Hg is not needed under the above conditions provided that some  $O_2$  is already preformed. A. A. Boetlingk

The calculation of internal conversion coefficients of  $\gamma$ -rays. J. B. Fisk. *Proc. Roy. Soc. (London)* A143, 674-8(1934).—The internal conversion coeff. of  $\gamma$ -rays was calcd. for the  $L_1$  shell of Ra C, on the assumption that the nucleus radiates the field of a quadrupole. Previous K-shell results (cf. Taylor and Mott, C. A. 27,

896) were extended. Limiting values for the very soft  $\gamma$ -rays for the K and  $L_1$  shells, quadrupole and dipole, were obtained. The ratio of internal conversion in the K and  $L_1$  shells is about 1:6.7 for hard  $\gamma$ -rays, and remains nearly const. up to a value of  $\theta (= mc^2/h\nu)$  of 2. The theory predicts almost complete conversion in the  $L_1$  shell for the softest  $\gamma$ -rays which could be converted in this shell. Allen S. Smith

Measurements of the relative velocities of the  $\alpha$ -particles from radon, radium A and radium C'. G. H. Briggs. *Proc. Roy. Soc. (London)* A143, 604-17(1934); cf. C. A. 27, 3137.—The relative velocities of the  $\alpha$ -particles from Rn, Ra A and Ra C' were found by the direct deflection method to be in the ratios 0.84553:0.88403:1.00000, resp. The probable error is estd. to be one part in 80,000. Morris Muskat

The ratio of the actinium to the uranium branches in the uranium family. M. Francis and Cheng-da-Chang. *Compt. rend.* 198, 733-5(1934).—The U and Po were sepd. from 3 samples of Belgian Congo pitchblende and one of Colorado carnotite (cf. C. A. 26, 5007). Thin layers were prepd. by crushing in the usual way, by ultrasonic pulverization and (for U only) by electrolysis of aq.  $UO_2(NO_3)_2$  at 60° in presence of AcOH and  $NH_4OAc$ , and conversion of the resultant hydrate to  $U_3O_8$  at 700°. The ratio of the ionization currents, measured with a Pohl electrometer, was 0.023, giving as the ratio of the branches 0.04 (cf. Grosse, C. A. 27, 220). C. A. S.

Two new  $\alpha$ -radiators and a new radiation of unknown origin. G. Dieck. *Naturwissenschaften* 21, 800-7(1933).—From a great no. of measurements of the  $\alpha$ -rays from metal surfaces (Cu plate, Cu wire and Au wire,  $N_2$  atm.) 2 new  $\alpha$ -radiators were found with ranges 0.9 and 1.5 cm. in air. Identification of this radiation with the one of U isotopes (Wilkins and Rayton, C. A. 27, 6836) is uncertain. A novel corpuscular radiation was found; it reached satn. at 50 v. instead of 1200 v. and was independent of the material of the chamber wall. The total path of the rays lay inside the spherical chamber of 3.9 cm. radius. This radiation was perhaps due to secondary neutrons from cosmic radiation (Feather, C. A. 28, 1264<sup>4</sup>). It was similar to the neutron effect described by Locher (C. A. 28, 908<sup>4</sup>). B. J. C. van der Hoeven

Phenomena associated with the anomalous absorption of high-energy gamma radiation. II. L. H. Gray and G. T. P. Tarrant. *Proc. Roy. Soc. (London)* A143, 681-706(1934); cf. C. A. 26, 4241.—C, O, K, Cu, Fe, Sn and Pb emit a comparatively soft secondary  $\gamma$ -radiation when irradiated by the hard  $\gamma$ -rays of either Th C' or Ra C. The quality of the secondary radiation was studied by absorption methods. The absorption curve of the ordinary Compton scattered radiation (at 125°) was calcd. and also detd. with a C radiator. The observations are discussed. In attempting to interpret the observations in terms of nuclear structure, any hypothesis which implies that the major portion of the emission is a "characteristic radiation" of the absorbing system must be abandoned. III. *Ibid.* 706-24.—Conclusions which can be derived from results of expts. presented in part II regarding the proportion of the  $\gamma$ -ray energy absorbed by a nucleus which is emitted by it as radiation having a smaller quantum energy are discussed. Evidence was obtained that the secondary radiation was really a  $\gamma$ -radiation. Some new exptl. results of the isotropic distribution of this radiation, and of addnl. expts. made to det. the mechanism of the interaction are presented. A. S. S.

The calculation of the ionization caused by radon in a spherical volume. P. C. Capron. *Bull. soc. chim. Belg.* 43, 25-34(1934).—Mathematical. A. L. Henne

Quantitative experimental investigations on the decomposition of hydrogen sulfide by  $\alpha$ -particles. W. Mund, M. Schouwenaars and K. Devriendt. *Bull. soc. chim. Belg.* 43, 49-72(1934).—At low pressure, and with a small radiation intensity, the decompn. of gaseous  $H_2S$  by  $\alpha$ -particles has an ionic efficiency of 2.12; confirming Colmant's measurements (C. A. 27, 663). The ionic yield rises with increasing pressure (30% from 6 to 140 cm.). When the irradiation intensity becomes very

large, the ionic efficiency decreases (as much as 10% in the reported expts.). There is no reason to believe that, on the path of an isolated  $\alpha$ -particle, the chem. effect should not be strictly proportional to the ionization. Adding H to H<sub>2</sub>S lowers the ionic efficiency negligibly, as long as the proportion of inert gas remains lower than 10%.

A. L. Hanne

Distribution of radium in crystals of radiferous barium bromide. B. E. Marques. *Compt. rend.* 198, 819-21 (1934); cf. C. A. 27, 3665.—Two methods show a marked decrease in the relative amts. of Ra from the center to the periphery of a crystal of BaBr<sub>2</sub>·2H<sub>2</sub>O contg. RaBr<sub>2</sub> (cf. C. A. 23, 750).

C. A. Silberrad

Segregation of polonium in a bismuth crystal. Alfred B. Focke. *Phys. Rev.* 45, 219-20 (1934).—The no. of  $\alpha$ -particles emitted per unit time by a Bi crystal infected with Po while molten and cleaved parallel to the (111) planes is a discontinuous function of the effective distance from the crystal in air, showing segregation in layers parallel to the (111) planes.

Louis Goldman

Oil-soluble compound of polonium. M. Servigne. *Compt. rend.* 198, 731-3 (1934).—If an alk. soln. of Po is slightly acidified with alc. camphorcarboxylic acid and extd. with C<sub>6</sub>H<sub>6</sub> 40% of the Po passes into the C<sub>6</sub>H<sub>6</sub>, from which on centrifuging 22.2% seps. as a colloidal suspension. CHCl<sub>3</sub> or C<sub>6</sub>H<sub>6</sub> exts. about 40% of the Po when added to the product formed by adding H<sub>2</sub>O and camphorcarboxylic acid to dry Po hydroxide. H<sub>2</sub>O dissolves most of the Po resulting from the evapn. of such a (CHCl<sub>3</sub> or C<sub>6</sub>H<sub>6</sub>) soln. to dryness; olive oil if added to the soln. and the CHCl<sub>3</sub> or C<sub>6</sub>H<sub>6</sub> removed by heat will act in a similar way (cf. C. A. 25, 4760).

C. A. Silberrad

The chemical and physical-chemical properties of polonium. I. A chemical study of several compounds of polonium. M. Servigne. *J. chim. phys.* 31, 47-64 (1934).—Po was pptd. as the oxalate from dil. HNO<sub>3</sub> solns. contg. La, Y, Sc, Ca and Sr. The Po ppt. was entrained best, and about equally, by the La and Y; next by Sc; and rather poorly by Ca and Sr. The analogy with the trivalent elements gives further proof that the element is trivalent. Metallic acetylacetonates of the Al, Fe, In, group have the general formula M(Ac<sub>2</sub>CH)<sub>3</sub>; of the rare earth group, M<sub>2</sub>(Ac<sub>2</sub>CH)<sub>6</sub>; Th(Ac<sub>2</sub>CH)<sub>4</sub> distills with slight decompn. at 8-10 mm. and at 260-270°. The Po acetylacetonate distills at 10 mm. and at 230° with partial decompn.; it is sol. in org. solvents, and practically insol. in H<sub>2</sub>O. (cf. C. A. 27, 1559). G. M. P.

Radioactive thermal springs at Mangalia (Roumania), determinations made during August, 1932. T. Donescu. *Bul. bilunar soc. fis. romania* 1933, No. 56, 6-8.

G. T. Motok

Radioactive minerals from Shinden, Gifu Prefecture Satoyasu Iimori, Jun Uoshimura and Shin Hata. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 23, 209-11 (1934).—Weakly radioactive samples of allanite and gadolinite were found in a quarry in the granite region of Shinden. Analysis of the gadolinite showed 0.49% U<sub>3</sub>O<sub>8</sub> and 1.78% ThO<sub>2</sub>. Of the gadolinite 0.2 g. had a radioactivity nearly equal to that of 2 mg. U<sub>3</sub>O<sub>8</sub>. The allanite contained no U<sub>3</sub>O<sub>8</sub> but 1.55% ThO<sub>2</sub>. The microcline-perthite in which these minerals were embedded shows a brilliant thermoluminescence.

Oden B. Sheppard

Nature, effects and menace of radium poisoning in water. Leonard B. Loeb. *Water Works Eng.* 87, 217-18 (1934).—The dangers of the use of radioactive waters sold by nostrum vendors are pointed out. A dosage of  $2 \times 10^{-6}$  g. of Ra has been known to be fatal.

W. A. Moore

Nature of radiocolloids. Colloidal solutions produced from bismuth nitrate. M. Haissinsky. *Compt. rend.* 198, 580-3 (1934).—The degree of coagulation after 2-3 days of a series of solns. of Bi(NO<sub>3</sub>)<sub>3</sub> of equal concn. in Bi but varying  $\rho_H$  (1-14), or after 1-2 hrs. on addn. of an electrolyte, plotted against  $\rho_H$  gives a curve with 2 max. A similar curve is obtained on centrifuging such a soln. to which Th C or Ra E is added and plotting radioactivity against  $\rho_H$  (cf. C. A. 26, 367). Such behavior is inherent in compds. of Bi (and its isotopes Th C and Ra E), and

1 adsorption on impurities is of secondary importance, the Bi(OH)<sub>3</sub> forming a colloidal soln. in which it is positively charged (cf. C. A. 8, 297, 2805). The first max. follow, ionic soln. of Bi(OH)<sub>3</sub> with formation of Bi<sup>+++</sup>; the following min. is due to the action of HNO<sub>3</sub> as an electrolyte, the second max. to the peptizing action of H<sup>+</sup> in very low concn., followed by a decrease due to ionic soln. of Bi(OH)<sub>3</sub> to form bismuthate. C. A. Silberrad

The limits of validity of the Klein-Nishina equation 2 M. P. Bronshtein. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 272-3 (in German 273-5).—The upper limit is  $h\nu < 10^7$  e. v.

F. H. Rathmann

Atom disintegration by cosmic radiation. E. C. Steinke, A. Gastell and H. Nie. *Naturwissenschaften* 21, 898-9 (1933).—The pressure effect in atom disintegration by cosmic radiation (cf. C. A. 27, 5635) was found to be as high as 5% per mm. Hg for radiation penetrating 10 cm. Pb as against 0.2% per mm. Hg for the total cosmic radiation. The effect is attributed to a new, very soft cosmic radiation. The effect is not observed in the ionization by secondary radiation. The pressure effect is not noticeable inside a 30-cm. Fe wall. Many details are given.

B. J. C. van der Hoeven

Soft radiation on the Pic du Midi. H. Garigue. *Compt. rend.* 198, 764-5 (1934); cf. *Ibid.* 494.—Measurements with the author's app. of the soft radiation of terrestrial radioactive origin at the Pic du Midi (2860 m.) in July-Aug. and Nov.-Dec., 1933, show that this is about 4.5 times stronger in winter than in summer. C. A. S.

A high-intensity mass-spectrometer. W. R. Smythe, L. H. Rumbach and S. S. West. *Phys. Rev.* 45, 220 (1934).—A magnetic lens is described by which a current of 0.1 ma. of K<sup>40</sup> ions and a resolving power sufficient for Li were obtained.

Louis Goldman

The constant in the Compton equation. P. A. Ross and Paul Kirkpatrick. *Phys. Rev.* 45, 223 (1934).—An exptl. value of  $(0.02380 \pm 0.00003) \times 10^{-8}$  cm. was obtained for the const. specifying the wave-length modification of scattered x-rays as compared with the simple theoretical value of  $0.02415 \times 10^{-8}$  cm. and a theoretical value of  $0.02384 \times 10^{-8}$  cm. which R. and K. compute. I. G.

The relativistic photoelectric effect. Harvey Hall. *Phys. Rev.* 45, 216-17 (1934).—The relativistic quantum electrodynamics expression for the photoelectric cross section of a Dirac electron in the field of a nucleus is evaluated, giving for the total absorption from the K shell for lead for  $\lambda = 4.7$  X. U. a value of  $1.1 \times 10^{-24}$  sq. cm.

Louis Goldman

Atomic scattering factors for Röntgen rays as a problem of the dispersion theory (for the K-levels). H. Honl. *Ann. Physik* 18, 625-55 (1934); cf. C. A. 26, 5003. Math. The dispersion formula of Waller (C. A. 22, 912) is divided into two parts, the first corresponding to the geometric interference theory of at. scattering factors and the second to anomalous scattering by electron shells. This second part is developed on the basis of an addn. theorem for spherical functions according to the idea of multipoles. A parameter  $\kappa$  is introduced equal to  $2\pi a/\lambda$ , where  $a$  is the mean shell radius of the layer concerned. Calcn. of the relation of frequency is given for the dipole and quadrupole of the K shell. The calcd. at. scattering factor curves are in general in good agreement with recent measurements.

L. P. Hall

The structure of the K radiation of very light atoms A. Hautot. *J. phys. radium* [7], 5, 20-6 (1934); cf. C. A. 27, 5646.—An app. is described for studying the fine structure of the x-rays from light atoms. Results are given for the K rays of O, N, C, B and Be. The theory of Langer explains the structure of the rays observed for C and the heavier elements, while B and Be give anomalous radiations as well as continuous bands. The theory that these are due to a continuous energy spectrum of the valence electrons of B and Be in the crystal lattices is contradicted by the occurrence of a very sharp K $\alpha$  line for B and the fact that the structure of the B rays is the same for various B crystals. It is suggested that the anomalous B and Be radiations are due to unquantized forbidden transitions.

Morris Muskat

**Fine structure of the  $K_{\alpha}$  line of beryllium.** F. C. Chalklin. *Nature* 133, 293-4 (1934).—The  $K_{\alpha}$  line of Be consists of 2 diffuse components, sep'd. by 5.3 Å. The long-wave line is the strongest; it coincides with the 5th-order  $K_{\alpha}$  of O.

**An attempt to determine the influence of chemical bonds upon the absorption of x-rays.** A. Soltan. *Acta Phys. Polonica* 1, 317-28 (1932) (in French).—The absorption of x-rays by  $H_2O$  and gaseous and liquid O is det'd. by measuring the thickness of glass layers equiv. to the masses of O and  $H_2O$  per sq. cm. of the screen. The absorption coeffs. obtained are:  $H_2O$   $1.047 \pm 0.005$ , O,  $1.165 \pm 0.010$ ;  $H_2$  (calcd.)  $0.29 \pm 0.080$ . The results do not permit det'n. of a variation of the absorption coeff. of x-rays depending on the structure of the mol. This variation is camouflaged by expl. errors. J. W.

**Ionization of inert gases by x-rays.** E. Wilhelm. *Z. Physik* 83, 341-50 (1933).—The mean energy per ion pair produced is 27 electron v. for Ne and 24.6 for Ar; the values are independent of the ionizing wave length

**An improved x-ray measuring apparatus.** E. Hasche. *Z. tech. Physik* 15, 68-72 (1934).—A circuit using 2 tube-electrometers is described. J. B. Austin

**The x-ray absorption spectra of the alloy gold-copper.** Takeshi Hayashi. *Naturwissenschaften* 22, 90 (1934).—From the results of Coster and Veldkamp (*C. A.* 26, 1180) on the fine structure of the Au  $L_{III}$  and Cu  $K$  absorption spectrum in a Au-Cu alloy (50 at. %) it is concluded that the Au  $L_{III}$  absorption maxima of pure Au coincide with the Cu  $K$  absorption maxima of the alloy and vice versa, and that the Cu  $K$  minima of pure Cu coincide with the Au  $L_{III}$  minima of the alloy and vice versa. B. J. C. van der Hoeven

**X-ray spectroscopic studies of complex chemical structure problems.** IV. Otto Stelling. *Z. physik. Chem.* B24, 282-92 (1934); cf. *C. A.* 27, 1270.—X-ray absorption spectra were obtained for the compds.:  $MnCl_2 \cdot 2py$ ,  $MnCl_2 \cdot 2quin$ ,  $MnCl_2 \cdot 4tu$ ,  $MnCl_2 \cdot 4urea$ ,  $ZnCl_2 \cdot 2py$ ,  $ZnCl_2 \cdot 2quin$ ,  $ZnCl_2 \cdot 2an$ ,  $ZnCl_2 \cdot 2NH_3$ ,  $ZnCl_2 \cdot 3en + 2H_2O$ ,  $ZrCl_4 \cdot 8NH_3$ ,  $ZrCl_4 \cdot 2(pyHCl)$ ,  $CdCl_2 \cdot 2py$ ,  $CdCl_2 \cdot 2quin$ ,  $CdCl_2 \cdot 2an$ ,  $CdCl_2 \cdot 2pip$ ,  $CdCl_2 \cdot 3en + H_2O$ ,  $SbCl_3 \cdot 3an$ ,  $SbCl_3 \cdot 3quinHCl$ ,  $CeCl_3 \cdot 7H_2O$ ,  $(pyHCl)_2CeCl_3$ ,  $(quinHCl)_2CeCl_3$ ,  $(quinHCl)BiCl_3$ , where  $py$  = pyridine,  $quin$  = quinoline,  $tu$  = thiourea,  $an$  =  $PhNH_2$ ,  $en$  =  $(NH_2CH_2)_3$ ,  $pip$  = piperidine. Photometer curves of the band edges are shown and the results are discussed with relation to binding of the complex groups. G. M. M.

**The absolute intensity of the nebular lines.** E. U. Condon. *Astrophys. J.* 79, 217-34 (1934).—Formulas are developed for the transition probabilities of magnetic dipole and elec. quadrupole radiation in at. spectra. These are used to calc. the abs. intensities of the nebular lines due to transitions within the  $p^1$ ,  $p^1$  and  $p^4$  configurations. C. C. Kless

**"Doublet" intervals for  $H^1\alpha$  and  $H^2\alpha$ .** R. C. Gibbs and R. C. Williams. *Phys. Rev.* 45, 221 (1934).—The interval between intensity peaks is  $0.304 \text{ cm}^{-1}$  for  $H^1\alpha$  and  $0.317 \text{ cm}^{-1}$  for  $H^2\alpha$ , discrepancies with theory of 6 and 2%, resp. Louis Goldman

**Anomalous dispersion of the doublet  $H\alpha$  of ionized calcium.** L. Puccianti. *Nuovo cimento* 10, 373-82 (1933).

**The  $K$  line ( $\lambda$  3933.7) has an intensity 1.98 times that of the  $H$  line ( $\lambda$  3968.5). The app. is described. J. B. A.**

**Reversibility of red line of cadmium.** A. Pérard. *Compt. rend.* 198, 727-9 (1934).—An improved Cd vapor lamp is described showing more readily the reversal of the Cd red line, and its resolution into 2 components. The possible error due to this renders the Cd red line of doubtful value as an international standard of length. C. A. S.

**The mean lives of excited neon atoms.** J. H. E. Griffiths. *Proc. Roy. Soc. (London)* A143, 588 (1934).—A method of measuring the av. lives of the excited states of Ne is described, in which a Kerr cell is used to find the lag between the emission of light and the current in a high-frequency discharge in Ne. It is shown theoretically how this lag should depend on the av. life of the state. The results obtained agree with the theory if

allowance is made for a small lag between the excitation and the current in the discharge tube. The values of the av. life measured ranged from  $3.9 \times 10^{-8}$  seconds for the line  $\lambda$  5853 to  $20 \times 10^{-8}$  seconds for  $\lambda$  6402, and it is shown that lines originating from the same upper level give the same value of the av. life. The method possesses the advantages that it may be used for any atom whose spectra can be produced in a high-frequency discharge, and that sufficient light is produced to enable a spectrograph to be used. Morris Muskat

**The fluorescence of a mixture of cadmium and zinc vapors.** R. Śpiwankiewicz. *Acta Phys. Polonica* 1, 345-50 (1932) (in German).—The fluorescence of a mixt. of Cd and Zn vapors, excited by intense light, *e. g.*, sparks between different metals as Cd, Zn, Bi, Mg, Al and Fe, is yellow green and takes place already at  $450^\circ$ . Its intensity increases with the rise of temp. At  $900^\circ$  it is less visible because of the radiation of the oven. The spectrum obtained at  $780^\circ$  shows a continuous band extending from 4850 to 6400, with a max. at 5200 Å. In pure vapor of either Zn or Cd this band does not exist. The main region of excitation of the fluorescence of the Cd-Zn vapor mixt. lies between 2300 and 2150 Å.

**Degree of polarization of fluorescence of mercury vapors.** A. Kastler. *Compt. rend.* 198, 723-5 (1934); cf. *C. A.* 28, 409<sup>a</sup>.—The degree of polarization,  $P = (I - i)/(I + i)$ , where  $I$  and  $i$  are, resp., the intensities of light vibrating vertically and horizontally in the fluorescent lines 4048, 4358 and 5461 produced by incidence of 2537 and 4358 from a Hg arc in various states of polarization and unpolarized (in this case with a magnetic field in the direction of the incident beam), on Hg vapor, has been calc'd. The calc'd. results for the last case show qual. agreement with the expl. results, and vary greatly with temp. J. Wiertelak

**Degree of polarization of fluorescence of mercury vapor in presence of nitrogen.** A. Kastler. *Compt. rend.* 198, 814-16 (1934); cf. preceding abstr. C. A. Silberrad

**Resonance in collisions of the second kind.** W. Hanle and K. Larché. *Z. Physik* 85, 548-54 (1933).—In collisions of the second kind, where excitation energy has to be transferred from one atom to another, the cross section depends very much upon the difference in excitation energies. If one considers the depolarization of Na fluorescence by collisions, one of the atoms is an excited Na, the other one must be excited to an oscillation in a different direction. By applying a suitable magnetic field one can vary the difference between the energies of the 2 excited states without getting any depolarization through the direct action of the field. The observed decrease of depolarization with increasing field strength (taken from old measurements by Hanle) det's., therefore, the resonance function, which is steeper than that given theoretically by Kallmann and London. R. Peierls

**Scattering of light by excited atoms.** V. Weisskopf. *Z. Physik* 85, 451-81 (1933).—The natural breadth of an absorption line starting from an excited (and not metastable) state of the atom has been investigated theoretically. As the initial state has a finite life time, there must be some external action (thermal excitation, electron impact, etc.) which always again excites new atoms. In general the results will depend on the special character of this action. One can find such conditions, however, that the absorption depends only upon the no. of excited atoms, and it is not necessary to take explicitly into account the way in which they have been excited. Formulas for the absorption and scattering coeffs., also for processes involving more than one light quantum, have been obtained. R. Peierls

**The absorption spectrum of thallium vapors in the short ultra-violet.** G. S. Kvater, N. V. Krencnevskii and A. N. Filippov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 110-11 (in German 111 12) (1934).—A band was observed at 2007 Å., another at 2376 Å. and lines were observed at 2205.5, 2169.5 and 2150.1 Å. The bands broaden, on heating, toward the low wave lengths. F. H. Rathmann

**The resonance series of lead vapor.** Marja Domaniew-

- ska-Kruger. *Acta Phys. Polonica* 1, 357-62(1932)(in German).—The fluorescence of Pb vapor shows 2 doublet series of bands, one excited by the Hg line 4358.3 Å., and another faint band excited by the Hg line 5461.0 Å. The presence of the series indicates a formation of stable Pb mols. in the vapor. The intensity of the series components decreases considerably with the distance from the exciting wave length. J. Wiertelak
- The intensities of some multiplets of Fe II and Ti II in stellar spectra. C. T. Elvey. *Astrophys. J.* 79, 263-70 (1934).—The intensities of selected absorption lines of Fe II and Ti II in the spectra of 8 stars exhibit a tendency to be directly proportional to the emission intensities as observed in the flash spectrum instead of to the square roots of the emission intensities. C. C. Kiess
- Spark spectra of bismuth, Bi III and Bi II. M. F. Crawford and A. B. McLay. *Proc. Roy. Soc. (London)* A143, 540-57(1934).—With the aid of new wave-length data extending from 1000 Å. in the extreme ultra-violet to 10,000 Å. in the infra-red the analyses of Bi III and Bi II previously given (*C. A.* 25, 457) are now revised and extended. The spectra were excited by an electrodeless discharge in Bi vapor, which gives lines narrow enough to permit measurement of hyperfine structures. Comprehensive tables present for these spectra the classified lines, hyperfine structures, and the terms, including the basic term  $6p^2P$  of Bi III. C. C. Kiess
- Notes on intensities in the spectrum O II. K. G. Emeleus. *Proc. Natl. Acad. Sci.* 20, 115-17(1934).—It is suggested that some cumulative effect, probably successive electron impacts, is the process by which certain multiplets of O II are excited. These multiplets do not appear with other O II groups in the neg. glow of a cold-cathode discharge of low c. d., but require for their excitation heavier currents such as prevail in hollow cathode and condensed discharges. C. C. Kiess
- Anomalous multiplet intensities in stellar spectra and sunspots. A. D. Thackeray. *Monthly Notices Roy. Astron. Soc.* 94, 99-115(1933).—The intensities of the 12 lines of the Fe I multiplet  $a^4F - s^2D^2$  were measured microphotometrically on spectrograms of stars of classes F, G, K and M. The observed and theoretical intensities are in good agreement for stars of classes F<sub>0</sub>, G<sub>0</sub> and K<sub>0</sub>; but for cooler stars of classes K<sub>0</sub> and M the weak members of the multiplet are strengthened relative to the stronger members. The same effect is observed on comparison of the disk and spot spectra of the sun. C. C. Kiess
- Possible variations in the intensity of the Fraunhofer lines. M. Minnaert, W. Bleeker and A. P. H. van der Meer. *Z. Astrophys.* 8, 59-61(1934).—Measurements of the profiles of the H and K lines of Ca have been made on spectrograms of the scattered light of the northern sky. At sun-spot max. the lines underwent fluctuations in intensity which showed a striking correlation with the solar const. of radiation, their profiles becoming deeper with increase in value of the solar const. At sun-spot min. the fluctuations were small and of the order of the error of observation. C. C. Kiess
- Calibration of Rowland's scale of intensities for solar lines in equivalent breadth. G. F. W. Mulders. *Z. Astrophys.* 8, 62-5(1934).—Rowland's intensity ests. of the absorption lines in the sun's spectrum have been expressed in terms of equiv. breadth, which is defined as the ratio of the total amt. of energy absorbed in the line to the energy contained in a strip of continuous spectrum 1 Å. in width close to the line. It was found that the equiv. breadth corresponding to a certain intensity is not const. for different wave lengths, but increases gradually in value from the ultra-violet to 5500 Å., then decreases strongly from 5500 to 5000 Å., from which point it again increases steadily to the red. C. C. Kiess
- Photography of the near infra-red region of stellar spectra. Paul W. Merrill. *Astrophys. J.* 79, 183-202 (1934).—The new types of photographic plates described by Mees (*G. A.* 26, 4546) have been used to study the near infra-red spectra of stars of various classes. Lines of H, N I, O I, Mg II and Ca II are conspicuous in the earlier type spectra, and those of Ca I, Ti I and Fe I in the spectra of types K and M. Heads of TiO bands are also prominent in spectra of type M. C. C. Kiess
- Flame and spark-in-flame spectra of rare earths. C. J. Rodden and O. S. Plantinga. *Phys. Rev.* 45, 280 (1934).—A spark passing through the flame directly above the inner cone considerably shortened the time of exposure; the same bands were shown as in the flame alone. The acetate, nitrate, chloride and sulfate all gave the same bands. Nineteen bands are reported for LaCl<sub>3</sub>, 7 for PrCl<sub>3</sub>, 26 for Nd, 41 for SmCl<sub>3</sub>, 16 for GdCl<sub>3</sub>, 14 for YbCl<sub>3</sub>, and 13 for YCl<sub>3</sub>. Gerald M. Petty
- Ultra-violet bands of beryllium chloride. W. R. Fredrickson and Martin E. Hogan, Jr. *Phys. Rev.* 45, 222-3(1934).—A band system lying in the near ultra violet region (3468-3700 Å.) due to a  $^2\Pi \rightarrow ^2\Sigma$  electronic transition is described. Louis Goldman
- The infra-red absorption spectrum of water, containing protium and deuterium. A. L. Casselman. *Phys. Rev.* 45, 221-2(1934).—The absorption curve of water containing 56% deuterium is shown. It has strong bands at 4.2  $\mu$  and 6.9  $\mu$  not shown by ordinary water. L. G.
- The band spectrum of ionized CdH. Erik Svensson and Folke Tyrén. *Z. Physik* 85, 257-63(1933).—More exact measurements permit interpretation of bands, which could not previously be analyzed. The disson. energy is approx.  $2.0 \pm 0.1$  v., in agreement with other values. R. Peierls
- A triplet band spectrum of aluminum hydride. W. Holst. *Z. Physik* 86, 338-47(1933); cf. *C. A.* 28, 1272<sup>4</sup>.—A triplet band system has been found. It shows pre-dissocn. The disson. energy of the lower state is less than 0.52 v. R. Peierls
- Structure of the second positive group of nitrogen. Arnold Guntch. *Z. Physik* 86, 262-73(1933).—Measurements in the band spectrum of N<sub>2</sub> are made. R. P.
- The so-called second positive group in the nitrogen spectrum. D. Coster, F. Brons and A. van der Ziel. *Z. Physik* 86, 411-12(1933); cf. *C. A.* 28, 411<sup>1</sup>.—Correction of some errors concerning the interpretation of the bands and the assumed values of disson. and excitation energies. R. Peierls
- The first negative group of ionized CO. Helmut Biskamp. *Z. Physik* 86, 33-41(1933).—A new method for obtaining intense band spectra of ionized CO has been developed and made it possible to photograph 22 new bands. One can obtain the potential curves for 3 electronic states and calc. their disson. energies. R. Peierls
- Rotational analysis of the  $^2\Sigma \rightarrow ^2\Sigma$  and  $^4\Pi \rightarrow ^2\Sigma$  bands of ionized CO. R. Schmid and L. Gerö. *Z. Physik* 86, 297-313(1933).—An analysis of exact measurements proves, as expected before, that the final states of these bands are identical. A complete analysis is given. R. Peierls
- Zeeman effect of the "comet tail" bands. R. Schmid and L. Gerö. *Z. Physik* 86, 314-20(1933).—Measurements of the Zeeman effect of these bands are given. R. Peierls
- Combination relations in the absorption spectrum of liquid oxygen. J. W. Ellis and H. O. Kneser. *Z. Physik* 86, 583-91(1933); cf. *C. A.* 27, 5641.—Measurements and suggested interpretation of some absorption bands of liquid O are given. R. Peierls
- Rotational analysis of the absorption bands of ICl. W. E. Curtis and J. Patkowski. *Phil. Trans. Roy. Soc. (London)* A232, 395-430(1934).—The absorption band of ICl, in the region from 6500 to 6800 Å., were observed under high dispersion to derive wave nos. of the lines sufficiently accurate for a rotational analysis. The bands are of the  $^2\Pi_1 \leftarrow ^2\Sigma$  type, consisting of P, Q and R branches. In all, 12 bands due to the more abundant isotope Cl<sup>35</sup> have been completely analyzed, accounting for practically all the stronger lines measured. The analysis yields accurate values for the band origins and the chief const. of the normal and excited states,  $^2\Sigma$  and  $^2\Pi_1$ , resp. C. C. K.
- The absorption spectrum of diatomic antimony (Sb<sub>2</sub>). S. M. Naudé. *Phys. Rev.* 45, 280(1934).—The spectrum of Sb<sub>2</sub> has been studied, and an equation is given for the heads of the bands observed. The observed intensities due to the mols. (Sb<sup>121</sup>)<sub>2</sub>, Sb<sup>121</sup>Sb<sup>123</sup> and (Sb<sup>123</sup>)<sub>2</sub> are in

agreement with the theoretical ratio of 5:8:3. The spectrum is very sensitive to changes in temp. and pressure.

Gerald M. Petty

**Magnetic extinction of tellurium ( $\text{Te}_2$ ).** J. Genard. *Compt. rend.* 198, 816-19(1934); cf. C. A. 28, 708<sup>8</sup>, 1273<sup>8</sup>.—By similar methods but with a more powerful magnetic field Smoluchowski's results (cf. C. A. 28, 394<sup>8</sup>) are confirmed, save that the percentage of quenching is slightly less.

C. A. Silberrad

**The resonance excitation of thallium spectrum in the vapors of its halide salts.** H. Neulmin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 212-13 (in English 213 14).—Ultra-violet emission lines, from spark discharges, of nearly the same wave length as the absorption lines of the Tl atom, were observed to excite high-energy Tl I lines in the vapors of some halide salts. This resonance phenomenon is not a photodissocn. of the Tl X mol., but is accounted for by the fact that the Tl X vapor contains enough free Tl atoms to absorb energy from the wings of the exciting lines, which are broadened sufficiently for resonance to occur.

C. C. Kiess

**Elementary notions of quantum mechanics.** Karl K. Darrow. *Rev. Modern Physics* 6, 23-68(1934). E. H.

**Dissociation of excited diatomic molecules by external perturbations.** C. Zeuer. *Proc. Roy. Soc. (London)* A140, 660-8(1933).—Math. Elec. fields of 20,000 v. cm.<sup>-1</sup> have a marked dissoc. effect on excited states which are crossed by appropriate repulsive states. All types of transitions are readily induced by collisions.

B. C. A.

**Influence of light on paramagnetic susceptibility.** D. M. Bose and P. K. Raha. *Nature* 133, 258-9(1934); cf. C. A. 27, 227.—The change,  $\Delta K$ , in the paramagnetic susceptibility of a soln., produced by the absorption of light, is given by  $\Delta K = 2\mu_0 n_2(p_2 - p_1)/3kT$ , where  $p_1$  and  $p_2$  are the magnetic moments of the ion in the ground and excited states, resp., and  $n_2$  is the no. of ions in the excited state.  $n_2$  is proportional to the light energy absorbed. Recent expts. on a  $\text{CrCl}_3$  soln., for which  $K = 13.42 \times 10^{-6}$ , give  $\Delta K = 7 \times 10^{-11}$  in a field of 40,000 gauss when 81% of the light from a Hg arc is absorbed. Sclwood's neg. results are explained by the smallness of the effect compared to the sensitivity of his app., but the justice of his remark on the difficulty of explaining the effects observed in didymium nitrate by a temporary breakdown of  $l$ -coupling is acknowledged.

W. W. S.

**Nuclear spins and magnetic moments.** W. E. Curtis. *Nature* 133, 256(1934).—Under favorable conditions the magnetic moment of the nucleus can be evaluated from hyperfine structure data, while under favorable conditions the spin quantum no.,  $I$ , can be obtained both from hyperfine data and from band spectrum observations. With  $\text{Li}^7$ ,  $\text{F}^{19}$  and  $\text{Na}^{23}$  the 2 methods give concordant results. Nuclei of even mass no. are of particular interest. With the possible exception of  $\text{N}^{14}$ , these show no hyperfine structure, and except for  $\text{H}^2$  and  $\text{N}^{14}$ , for which  $I = 1$ , band spectrum data give  $I = 0$ . Hence it has been assumed that except for these, and possibly  $\text{Li}^6$  and  $\text{B}^{10}$ , all nuclei of even mass no. have  $I = 0$ . Present exptl. knowledge does not justify this assumption and it is very desirable that spectroscopists be on the lookout for new band systems, especially in elements for which the mass no. is of the  $4n + 2$  type.

W. W. Stifler

**The atmospheric water vapor band 6324 Å. in the solar spectrum.** V. N. Kondrat'ev and D. I. Brodskii. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 170-2 (in German 172-5)(1934).—Sixty-nine new water lines and 3 O lines were identified. From these the valence angle  $\text{HOH}$  is  $\alpha = 104^\circ 18'$  and  $\text{KOH} = 1.016 \times 10^{-4}$  cm.

F. H. Rathmann

**Rotation spectra of  $\text{NH}_3$  and  $\text{NH}_4^+$ .** R. Bowling Barnes, W. S. Benedict and C. M. Lewis. *Phys. Rev.* 45, 347 (1934).—The formula  $\nu = 2BJ - 4DJ^2$ , which represents well the rotation spectrum of  $\text{NH}_3$ , does not represent that spectrum for  $\text{NH}_4^+$  unless  $4D$  is nearly zero or even neg. The spectrum was measured between 49 and 68  $\mu$ ,

and consists, in that region, of 6 lines, which were identified as nos. 20-15.

Gerald M. Petty

**The atmospheric ozone absorption in the visible spectrum.** Oliver R. Wulf, Alfred F. Moore and Eugene H. Melvin. *Astrophys. J.* 79, 270-2(1934).—Sunlight which has traversed long air paths because of multiple scattering, when observed in the eastern sky before sunrise, was found to exhibit pronounced absorption at the positions of the 2 main ozone bands in the yellow and orange.

C. C. Kiess

**Doublet and staggering in the simple emission bands of carbon dioxide.** R. Schmid. *Z. Physik* 85, 384-8(1933); cf. C. A. 28, 411<sup>7</sup>.—Some bands of  $\text{CO}_2$  which were repeatedly stated to be simple have been photographed in fifth order of a large grating, special care being taken to avoid overlapping of different orders and to increase the intensity. They were found to be doublets and to show "staggering" as well. It seems probable, therefore, that all bands of this spectrum show the same behavior.

R. Peierls

**Spectrum of infra-red absorption and the structure of polyatomic molecules.** Radu Titeica. *Bul. bilunar soc. fis. romania* No. 57, 31-8(1933).—In case of infra-red spectrum, the electronic energy does not vary and therefore  $h\nu = \Delta E_2 + \Delta E_3$ , where  $\Delta E_2$  is the energy of at. vibration in the mol. and  $\Delta E_3$  is the energy of rotation of the mol. It was found that the spectrum of acetone contains 27 strong bands. The mol. of acetone is of the type  $\text{Me-CO-Me}$  in the Y form. The form of the mol. is then  $\text{A}_1\text{BC}$  and there are 6 fundamentals. By adding 4 more fundamentals of Me there is for acetone a total of 10. In this series the following substances have been studied:  $\text{HClHO}$ ,  $\text{Me-CO-Me}$ ,  $\text{Me-CO-Et}$ ,  $\text{Et-CO-Et}$ , Me, Et, Bu, iso-Bu and iso-Am formates, Me, Et,  $\text{H}^2$  and Bu acetates, and Me and Et propionates. Absorption spectrum of MeOH contains 28 measured bands with 8 fundamentals of which 4 are single and 4 are double. EtOH contains 30 intense bands with a total of 13 fundamentals.

G. T. Motok

**Infra-red absorption spectra of stereoisomeric 1,2-dimethylcyclohexanes.** O. Miller and J. Lecomte. *Compt. rend.* 198, 812-13(1934); cf. C. A. 27, 5002, 5248.—The infra-red absorption spectra of the *cis* and *trans* isomerides differ markedly between themselves and from the Raman spectra.

C. A. Silberrad

**Infra-red absorption of benzene vapor.** Radu Titeica. *Bul. soc. romania fis.* 35, 89 92(1933).—With benzene vapor at a pressure of 55 mm., the following bands were observed: 678, 774, 840, 885, 945, 1036, 1169, 1265, 1370, 1501, 1767, 2000, 2222, 2541 and 3077  $\text{cm}^{-1}$ .

F. D. Rossini

**The ultra-violet absorption spectra of several aromatic substances.** I. Armin Hillmer and Paul Schorning. *Z. physik. Chem.* A167, 407-20(1934).—A study was made of the laws governing the changes in the ultra-violet absorption spectra of  $\text{C}_6\text{H}_6$ , propylbenzene, allylbenzene, and propenylbenzene when nuclear H atoms are replaced by 1 or 2 adjacent OH groups either free or etherified with MeOH or methylene glycol.

Roy H. Baechler

**Absorption and fluorescence of alcoholic solutions of phenanthrene.** Radu Titeica. *Bul. soc. romania fis.* 35, 149-55(1933).—The absorption bands of phenanthrene in alc. soln. were detd. By means of a Hilger E 1 spectrograph, the region 2800-3800 Å. comprising a structure of several continuous bands was photographed. For very feeble concns. 2 large bands occur with maxima about 2420 and 2515 Å. At higher concns. the 2 bands become one with the max. at about 2450 Å.; there also appears a series of bands somewhat diffuse and feeble at 2740, 2810 and 2930 Å. At concns. still higher are obtained a series of fine, sharp bands to about 3900 Å. In fluorescence, with increased concn. the spectrum of solns. of phenanthrene in EtOH narrows, leaving bands in only the visible and near ultra-violet. This is attributed to increased concn. causing absorption of the shorter waves by the first layers of the soln., the only light able to penetrate and excite fluorescence being that feebly absorbed and approaching the visible.

Calvin Brous

**Absorption and fluorescence spectra of naphthalene derivatives.** Bela Hurwicz. *Acta Phys. Polonica* 1, 339-44 (1932) (in German).—The absorption spectra of  $C_6H_6$  solns. of naphthalene, (I), acenaphthene (II), biacenaphthylidene (III) and fluorocyclene (IV) contain

common bands, specific to the naphthalene group.  $C_6H_6$  solns. of I and II show no fluorescence, those of III and IV a strong blue-purple fluorescence, except when they are irradiated by light of the wave length corresponding to the naphthalene bands. The max. of the absorption bands are: I, 3235, 3180, 3130, 3080, 3030, 2982, 2930 Å.; II, 3380, 3332, 3280, 3235, 3185, 3135, 3085, 3028, 2980 Å.; III, 4035, 3805, 3607, 3418, 3240, 3185 (very faint), 3132, 3075, 2982 Å.; IV, 4110, 3842, 3612, 3370, 3230, 3185, 3132 and 3078 (very faint) Å. The max. of the emission bands are: III, 4158, 4343, 4628 and 5034 Å.; IV, 4060, 4390, 4685 and 5030 Å. Since II contg. the groups  $CH_2CH_2$  shows no fluorescence, while III exhibits a pronounced fluorescence, it seems that the group  $C:C$  is responsible. J. Wiertelak

**Absorption and fluorescence spectra of decacycene and tribenzyldecacycene.** Bogna Klarner and Saturnina Woszczerowicz. *Acta Phys. Polonica* 2, 1-5 (1933) (in German).—The absorption spectrum of decacycene (I) in a  $C_6H_6$  soln. shows 8 bands with max. at 4480, 4230, 4040, 3830, 3620, 3415, 3230 and 3125 Å. The absorption spectrum of tribenzyldecacycene (II) in  $C_6H_6$  is similarly composed of 8 bands with max. at 4520, 4265, 4060, 3840, 3650, 3430, 3240 and 3125 Å. Both I and II show, in addn., an absorption field which is not dissected into bands, extending from 3125 Å. toward the absorption region of  $C_6H_6$ . (I) as well as (II) shows 4 emission bands each. The max. are as follows: (I) 5950, 5520, 5105 and 4765 Å.; (II) 6080, 5600, 5195, 4845 Å. J. W.

**Notes on the Raman diffusion of polarized light.** S. Pieńkowski. *Acta Phys. Polonica* 1, 309-16 (1932) (in French). J. Wiertelak

**Raman effect and dipole moment in relation to free rotation.** San-ichiro Mizushima and Yonezo Morino. *J. Chem. Soc. Japan* 55, 131-42 (1934).—Dipole moments of  $C_6H_5Cl$ ,  $C_6H_5Br$ , and  $C_6H_4(CH_2Br)_2$  were measured in various kinds of solns. over a wide range of temp. The results were computed theoretically (cf. C. A. 27, 2075) and the following conclusions were drawn. The 2  $CH_2X$  groups can rotate around a common axis, but not all the rotational states are equally probable. The probability for a rotational state decreases as the angle of rotation from the trans position increases. At higher temps. or in a medium with larger dielec. consts. the probability for the states of larger rotational angle increases. Benzene and toluene solns. are exceptional, where the deviation from the trans position is larger than one can expect from their dielec. consts. From the intensity measurements of Raman lines of  $C_6H_5Cl$  in the above solns. it is concluded that  $I_{\text{trans}}/I_{\text{rot}}$  (the ratio of the intensity of the 2 strong lines of  $\Delta\nu = 752$  and 653) decreases as the no. of mols. in trans position increases. Theoretical discussions are given with regard to the relation between the intensity and the symmetry property of the mol. in different rotational states. T. Katsurai

**The Raman spectra of ring compounds. II. Polysubstituted benzene compounds.** John W. Murray and Donald H. Andrews. *J. Chem. Physics* 2, 119-24 (1934); cf. C. A. 27, 3668.—Raman spectra are reported for PhF, 1,2,4- $C_6H_3Cl_3$ , 1,2,4,5- $C_6H_2Cl_4$ ,  $C_6H_5Cl$ ,  $C_6Cl_6$  and  $C_6Me_6$ . PhF had not been previously investigated; in each of the

other cases several lines were found which had not been previously reported. Gerald M. Petty

**Circular polarization of Raman lines of pinene illuminated by circularly polarized light and observed longitudinally.** P. Daure. *Compt. rend.* 198, 725-7 (1934)  $I_v, I_h$ , being the intensities of the light emitted from d pinene in the same direction as that of an incident beam of circularly polarized light that is polarized in the reverse and same direction, resp.,  $r = I_v/I_h$ , the ratio of inversion, was visually estd. for 43 lines ( $\Delta\nu = 1.39$  1659  $cm^{-1}$ ). It varies ( $< 0.25 - > 4$ ) for the different lines, but is independent of the direction of rotation of the incident beam (cf. C. A. 26, 3184). C. A. Silberrad

**The Raman effect. XXIX. The Raman spectra of halo acetic acid esters.** Hua-Chih Cheng. *Z. physik. Chem.* B24, 293-312 (1934); cf. C. A. 28, 44<sup>1</sup>.—Raman spectra were obtained for the Me, Et, Pr, iso-Pr, Bu, iso-Bu, secondary Bu, Am and iso-Am esters of  $AcOH$ , for bromoacetic acid and its Me, Et, Pr, iso-Pr and Bu esters; and for the Me, Et, Pr, iso-Pr, Bu and Am esters of chloroacetic acid, of dichloroacetic acid and of trichloroacetic acids. The characteristic frequencies of the various group have been discovered and discussed. G. M. Murphy

**Molecular diffusion of light in fluorescent liquids.** J. Canals and P. Peyrot. *Compt. rend.* 198, 746-9 (1934) cf. C. A. 28, 944<sup>1</sup>.—By means of dil.  $H_2SO_4$  solns. of quinine sulfate of  $p_H$  2 and varying concns. in quinine, c, in a glass vessel, at 18°, and a quartz-Hg lamp (cf. C. A. 21, 3158), the depolarization factor,  $\rho$ , is const., while the intensity of fluorescence is proportional to c, and the specific fluorescence is therefore const., and obeys Vavilov's law (cf. C. A. 19, 663). The proportionality is such that the method may be used for detn. of small amts. of quinine. C. A. Silberrad

**Diffusion of light and molecular polymorphism.** R. Lucas. *Compt. rend.* 198, 721-2 (1934).—It is suggested that as polymorphism affects rotatory power, magnetic birefringence, etc., of liquids (cf. C. A. 27, 5225) so it will affect diffusion of light, and in the case of Raman spectra, increase the no., and modify the relative intensities, of the lines. This explains the anomalies observed in these respects in the case of  $C_6H_6$  (cf. C. A. 27, 445<sup>1</sup>, 28, 2582<sup>2</sup>). C. A. Silberrad

**The spectrum of fluorine oxide,  $F_2O$ .** A. Glissmann and H. J. Schumacher. *Z. physik. Chem.* B24, 328-34 (1934)

—The absorption spectrum of  $F_2O$  was investigated between 8000 and 2100 Å. Absorption begins about 5400 Å and is continuous with max. at 4210, 3580, 2940 Å and at some other wave length lower than 2100 Å. The absorption coeffs. have been detd. for the region investigated. The first 3 max. correspond to a disson. into  $F_2 + O$  or  $F + FO$  but the max. below 2100 Å. is probably due to disson. into 3 atoms. The compd. decomposes photochemically with the formation of  $F_2$  and  $O_2$  and in glass or quartz spp.  $SiF_4$  and  $O_2$  are formed. G. M. M.

**Correlation of the photosyntheses of phosgene and hydrogen chloride.** G. K. Rollefson. *J. Am. Chem. Soc.* 56, 579-83 (1934).—The photochem. reactions occurring in an illuminated mixt. of  $CO$ ,  $H$  and  $Cl$  were studied. The reciprocal of the fraction of  $CO$  which reacts with  $H$  varies linearly with the ratio of  $(Cl)$  to  $(H_2)$ . The equal  $CO + Cl \rightleftharpoons COCl$  is not essential in the phosgene mechanism. The active form of  $Cl$  in both the phosgene and the  $HCl$  syntheses is identified as the  $Cl_2$  mol., which is stable enough to be present at equil. concn. This is consistent with the data on the temp. coeff. of  $HCl$  formation. The heat of disson. of  $Cl_2$  into  $Cl_2 + Cl$  is approx. 5 kg.-cal. E. J. Rosenbaum

**Photolysis of nitrogen oxides:  $N_2O_3$ ,  $N_2O$ , and  $NO_2$ .** Harrison H. Holmes and Farrington Daniels. *J. Am. Chem. Soc.* 56, 630-7 (1934).—Absorption coeffs. in the wave-length range 265-536  $m\mu$  were detd. for  $NO_2$ ,  $N_2O$ , and  $N_2O_3$ . From expts. on the mixed oxides quantum efficiencies were detd. The presence of  $N_2O_3$  does not affect the quantum efficiency of  $NO_2$  decompn. for which the values are 1.93 at 313, 1.88 at 366, 0.50 at 405 and 0.0 at 436  $m\mu$ . Absorbed light of wave lengths 380 and 265  $m\mu$  decomposes  $N_2O_3$  with a quantum efficiency of 0.6.  $N_2O$

is decompd. at 265  $m\mu$  with a quantum efficiency of 0.4. Though light of longer wave length is absorbed, no decompn. was observed. He, A, N, O, H, CO<sub>2</sub> and N<sub>2</sub>O when added as foreign gases lower the quantum efficiency slightly. The fluorescence is quenched by a small pressure of the foreign gas. The quantum efficiency for photodecompn. in CCl<sub>4</sub> soln. is near zero. The Norrish mechanism for the photodecompn. is confirmed. E. J. R.

Steady states produced by radiation with application to the distribution of atmospheric ozone. Oliver R. Wulf. *Phil. Mag.* 17, 251-63 (1934).—The steady state existing when a substance, formed by the action of radiation of a certain wave length, is decompd. by radiation of a different wave length is studied. For long paths there is a marked difference between the distribution of the absorbed radiation and the distribution of the material formed in the steady state. Weakly absorbed radiation which penetrates deeply is most important for the total amt. of the substance formed, since this is present at great diln. Use of the equations derived shows that the O<sub>3</sub> produced in the atm. by solar radiation will be distributed not as a layer but over a range of altitudes. The actual distribution depends on mech. disturbances. E. J. Rosenbaum

Effect of ultra-violet rays on the ultra-violet absorption spectrum of aqueous methylene blue solutions. Carl E. Nurnberger and L. Barle Arnow. *J. Phys. Chem.* 38, 717 (1934).—The method of using the Judd Lewis sector photometer with a quartz spectrograph and an underwater spark for obtaining absorption spectra is described. The ultra-violet absorption spectrum of methylene blue in distd. water is given and has 2 regions of absorption with maxima at 2920 and 2460 Å. Radiating the soln. with a Hg arc causes a decrease in the absorption in the visible and ultra-violet.  $\phi_H$  has no effect on the ultra-violet absorption spectrum but irradiation with ultra-violet causes greatest change in solns. of highest  $\phi_H$ . The wave lengths most active in decreasing the absorption are shorter than 2700 Å. For this reason the change in aq. solns. of methylene blue caused by ultra-violet radiation cannot be used for a measure of light intensity in the "physiologically active" region, 3100-2900 Å.

Howard A. Smith  
Fluorescence of synthetic pyocyanine. Charles Dhéré. *Compt. rend.* 198, 126-8 (1934).—In H<sub>2</sub>O, pyocyanine-HCl (I) dissociates in part into the free base (II), without manifesting fluorescence. In CHCl<sub>3</sub>, I shows a greenish yellow fluorescence, which was also shown when I in H<sub>2</sub>O was cautiously reduced with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> in the presence of AmOH, with Zn powder, with Mg and Hg, or with compressed yeast. Glucose added to II, in aq. NaOH gives a red reduction product with a greenish fluorescence. A similar result was obtained by the action of Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> on  $\alpha$ -hydroxyphenazine, of which II is the Me deriv.

Louis E. Wise  
Influence of intensity of light on photovoltaic phenomena. R. Audubert and Geneviève Lebrun. *Compt. rend.* 198, 729-31 (1934).—The relation  $E = (RT/nF) \log(1 + aI)$ , where  $a$  is a const. depending on the nature of the photosensitive substance, the liquid in contact therewith, and the therap.,  $I$  the intensity of the light, and  $R$ ,  $T$ ,  $n$  and  $F$  have their usual meanings, is valid for the electrodes Cu|CuO, Cu|Cu<sub>2</sub>O, Cu|brilliant green, Cu|malachite green and Ag|Ag<sub>2</sub>S, provided that  $n = 1$ .

C. A. Silberrad  
The catalytic influence of phosphorus on chemiluminescence. F. Schacherl. *Atti congresso nas. chim. pura applicata* 4, 599-608 (1933).—The literature is reviewed. The Semenov explanation (*C. A.* 22, 901, 2842; 23, 350, 2870; 24, 543) is favored. E. M. Symmes

Application of a hyperbolic function to the representation of the extinction of phosphides. V. L. Levshin and V. Antonov-Romanovskii. *Compt. rend. acad. sci.* 193, 100-102 (1933).—The extinction of the phosphorescence of Zn and Zn-Cd phosphides by infra-red rays is due to auto-excitation of the phosphide and is given by  $I = At^{-n}$ . F. H. R.

Coloration of fluorides of different elements by cathode rays. Hantaro Nagaoka, Yoshikatsu Sugiura and Tadao

Mishima. *Proc. Imp. Acad.* (Tokyo) 9, 486-9 (1933).—The coloration of fluoride disks by cathode rays (at 0-8000 v.) is described. CaF<sub>2</sub> gave violet coloration; LiF and NaF pink; MgF<sub>2</sub>, straw; AlF<sub>3</sub>, ash-gray; TiF<sub>4</sub>, dark straw; MnF<sub>2</sub>, straw; CrF<sub>3</sub>, black; ZnF<sub>2</sub>, gray; PbF<sub>2</sub>, black. Curves for LiF, TiF<sub>4</sub> and PbF<sub>2</sub> were plotted by taking  $V^{1/2}$  as abscissas, and ratio of intensity of coloration to reflected light as ordinates. The curve shows a bend at 680 v. (excitation potential of K radiation from F); a second bend corresponding to  $M$  radiation for Pb and  $K$  radiation for Ti. It is suggested that dissociation of F from the compd. causes the coloration, although no direct evidence is available. L. W.

Thermoluminescence spectra of fluorites. IV. Spectra of thermoluminescence restored by x-rays. Eiichi Iwase. *Sis. Papers Inst. Phys. Chem. Research* (Tokyo) 23, 212-23 (1934); cf. *C. A.* 28, 1928.—The thermoluminescence spectra of several fluorites of various origins were studied by methods previously described (*C. A.* 28, 973-4). Fluorites which lose their luminescence through heat treatment may be grouped according to the manner in which they recover it on exposure to x-rays: (1) those that regain their original emissive properties; (2) those in which the relative intensities of the emission bands are altered as compared with the original spectrum; (3) those that emit an entirely new set of bands as compared with the original spectrum. C. C. Kiess

Cathodoluminescence spectra of fluorites, calcites and certain synthesized phosphors containing samarium. Jun Yoshimura. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 23, 224-47 (1934).—Fluorites excited to luminescence by cathode rays contain the rare earths Sm, Eu, Dy, Tb and sometimes Er, Pr, Nd and Gd as activators. The narrow line-like bands emitted by these substances have been measured. Various calcites, on the other hand, emit a broad band, with max. near 6000 and 6310 Å., which is attributed to the presence of Mn. Synthesized fluorides and carbonates of the alk. earths, contg. Sm, exhibit the line-like bands characteristic of other phosphors contg. rare earths and entirely different from the luminescence of the oxides of the same elements. C. C. Kiess

The use of gas photoelectric cells in photometric measurements. Applications. Trajan D. Gheorghiu. *Ann. phys.* 20, 133-242 (1933); cf. *C. A.* 24, 1796.—Two photoelec. cells both having KH cathodes and W anodes and filled with A at reduced pressure are used in a spectrophotometer whose construction is described in detail with the method of procedure and corrections. The proportionality of the current to the illumination was verified in various ways for each cell. One of the cells controls the radiation so that relatively unstable sources may be used. The Hg lines from a Heraeus arc and small sections

(20-30 Å.) of the continuous spectrum of a Philips W ribbon lamp gave the most satisfactory results. The reliability of the results depends on the influence of the variable quantity of diffused light. The use of colored solns. or colored glass of various thicknesses as filters reduces the effects of diffused light and gives reproducible results. The precision is about 0.2%. The absorption curve of CuSO<sub>4</sub> (mol. extinction coeff.  $\epsilon$  plotted against  $\lambda$ ) in the region 4200-5600 Å. obtained by this method agrees with those obtained by other methods. Beer's law and Lambert's law are verified. The absorption curve of CuCl<sub>2</sub> does not follow Beer's law and differs considerably from that of CuSO<sub>4</sub>.  $\epsilon$  increases with concn. especially in the short wave lengths. On addn. of NaCl to a given concn. of CuCl<sub>2</sub>,  $\epsilon$  increases greatly for the short wave lengths and decreases slightly for the longer wave lengths. The spectra of solns. contg. 1, 2, 3 equivs. per l. of CuOH<sub>2</sub> and, resp., 3, 2, 1 equivs. of NaCl interlace. These variations appear to be due to the change in no. of anions contg. Cu and of hydrated cation. Solns. of  $d$ -,  $l$ - and  $d$ -Cu tartrate do not obey Beer's law. The alk. solns. of the active tartrates (2 g. per 100 cc. of 2% KOH soln.) give identical absorption curves with a min. at 4800 Å. The min. for the curve of the racemate is at the same  $\lambda$  for a 2% soln. although  $\epsilon$  is slightly greater throughout, but the min. for the curve of an equimol. mixt. of the  $d$ - and  $l$ -tar

itates (concn. 0.02) is at 4400 Å. The mixt. cannot be simply the racemate but probably contains complex anions contg. Cu.

Janet E. Austin

Precision and accuracy of a photoelectric method for comparison of the low light intensities involved in measurement of absorption and fluorescence spectra. F. P. Zschelle, Jr., T. R. Hogness and T. F. Young. *J. Phys. Chem.* 38, 1-11 (1934).—A photoelec. method has been developed for detg. specific absorption coeffs. and opacities with a precision better than 1.5 and 1.0%, resp. The app. consists of a monochromator, photocell, electrometer and high-resistance leak. Photoelec. sensitivities as great as  $2 \times 10^{-17}$  amp. per mm. permit the use of slits so narrow that spectral regions varying in width from 3 Å. at 4000 Å. to 13 Å. at 7000 Å. can be investigated with a source of a continuous spectrum. The method is also applicable for measuring spectral intensities of fluorescence.

Howard A. Smith

The effect of unipolar charged air, Röntgen rays and of ultra-violet light on the properties of Congo red and albumin solutions. B. S. Puchkovskii and V. N. Nekludov. *Kolloid-Z.* 66, 191-7 (1934).—Positively and negatively charged air had no effect on 0.005% Congo red and on

0.3 and 0.15% albumin solns., while x-rays had only a slight effect on the latter. Ultra-violet light gradually caused a fading of the Congo red; the effect was shown not to be due to  $O_2$ . Up to 3 hrs., the protective action of albumin slowly increases; on further exposure it sharply decreases. The changes are probably related to dielectricity changes.

COLIN G. FINK

A coreless induction furnace for alternating current of line frequency. Werner Hessenbruch and Wilhelm Rohn. *Stahl u. Eisen* 54, 77-82 (1934).—Sintered  $MgO$  is used as a refractory. The bath motion causes little erosion at the slag line. The reacting slag may be agitated to such an extent as to mix with the metal and form an emulsion resulting in a high refining velocity. The operations of the furnace for the production of 99.95% Fe and for the decarburization of 18-8 Cr-Ni steel to below 0.02% C are described. Costs of these operations are discussed.

C. B. Jenni

Utilizing carbon monoxide produced in the electric sublimation of phosphorus. I. B. N. Dolgov, B. A. Bolotov and A. N. Popova. *J. Applied Chem.* (U. S. S. R.) 6, 470-8 (1933).—A gas contg.  $CO$  75-85,  $CO_2$  2-5,  $H_2$  7-5,  $CH_4$  0-2,  $O$  0.2,  $N$  10-20,  $PH_3$  0.05-0.8 and  $H_2S$  0.04% is obtained in the sublimation of apatite or phosphorites for the production of yellow P. Of various methods a treatment with steam in the presence of siderite at 350° with at least 0.5 vol. of steam per vol. of gas produced best results.  $P_2O_5$  vapors and various suspensions are disposed of by passing the gas through a bubble app. and special filters. The life of the siderite may be prolonged by briquetting or by impregnation with  $Al_2O_3$  and its efficiency can be improved by the addn. of  $CuO$ . Through the use of siderite in the purification of steam the gas becomes enriched with  $H$  (by 5-10%). The purification may also be carried out with  $Cu$  shavings at 300-400° provided the gas is properly dried before.  $PH_3$  may be used as a catalyst for purification at 300-400° in the presence of steam, the conversion of  $CO$  being insignificant (2-3%).  $P$  and  $PH_3$  are converted into  $H_2PO_4$  by the presence of steam. The gas purified in the above manner can be used for heating and for the prepn. of  $H$  as well as of mixts. of  $CO$  and  $H$  to be used in the synthesis of  $MeOH$  and other org. syntheses under pressure.

A. A. B.

Conversion of gas obtained in the electric sublimation of phosphorus. II. B. N. Dolgov, B. A. Bolotov and N. P. Silina. *J. Applied Chem.* (U. S. S. R.) 6, 479-93 (1933); cf. preceding abstract.—The gas obtained in the elec. sublimation of P can, after a preliminary purification, be almost entirely converted with steam into the corresponding mixt. of  $CO$  and  $H$  to be used for org. syntheses and particularly for the synthesis of  $MeOH$ . The conversion is carried out best in the presence of heat-treated siderite and 10%  $Cr_2O_3$  or  $Al_2O_3$  and a catalyst composed of  $Al_2O_3$  60,  $Fe_2O_3$  30,  $Cr_2O_3$  8 and  $ThO_2$  2%. The first two catalysts when used in the conversion of the gas mixt. composed of  $CO$  and  $H$  in a ratio of 1:2 and 1:3 need a process temp. of

450-75° with 2 vols. steam. The mixed catalyst gives the required conversion at 375-400° for a gas-steam ratio 1:1. An increase in the amt. of steam up to 2-3.5 vols. at a temp. of 475-500° may give a 90-5% conversion with the mixed catalyst, this lowering the amt. of  $CO$  in the gas to 2-3%. Since the conversion gas contains some  $H_2S$ , it requires a preliminary purification with water under pressure for the removal of  $H_2S$  and  $CO_2$ .

A. A. B.

Electrolysis of molten silicates and preparation of silicon and silicides. L. Andrieux and M. Dodero. *Compt. rend.* 198, 753-5 (1934); cf. C. A. 23, 4893

With a C crucible as anode, an Fe rod as cathode, and a current of about 25 amp. at 10 v., a mixt. of  $2SiO_2 + Li_2O + 6LiF$  at 950° gave a product contg. Si 24.1-46.8%, Si combined with Li 30.7-55.5; Si with Fe 0.7-2.6, Li 17.0-17.8 and Fe 0.7-2.6%. With water-cooled cathode and  $SiO_2 + Li_2O + 2LiF$  with or without  $LiCl$  at 800-920°, the corresponding figures were 0-6.4, 48.0-61.8, 0.5-2.5, 26.3-36.4 and 0.5-2.5. In the latter case the product was spontaneously inflammable in air, as was also the gas evolved on contact with  $H_2O$ . The Li silicide is violet-colored, and approx.  $Si_2Li$ .

C. A. Silberrad

Theory of chromium plating. E. Liebreich. *Z. Elektrochem.* 40, 73-87 (1934).—Purified  $CrO_3$  alone and with foreign acids was electrolyzed with Au and Pt cathodes. The current-potential curves for  $CrO_3$  consisted of 2 branches; foreign acids produced 4 branches, each having about the same position, regardless of the nature of the acid. With Pt cathodes an addnl. branch appeared when  $H$  was evolved without deposition of  $Cr$ .  $HClO_4$  and  $H_3PO_4$  at high concn. caused reduction;  $H_2BO_3$  did not. The existence of a film on the Au cathode was proved and the film isolated. The dropping of the potential to neg. values was due to satn. of the cathode with  $H$ , directly in the case of Pt, and through the medium of the film in the case of Au.

Curtis L. Wilson

Nickel-plating aluminum sheet. Robert J. Snelling. *Metalwaren-Ind. u. Galvano-Tech.* 32, 289 (1934) Methods of removing the oxide layer and various suitable plating baths are described.

Curtis L. Wilson

Structure of electrolytic copper deposits obtained in the presence of certain colloids. P. Jacquet. *Compt. rend.* 198, 74-6 (1934); cf. C. A. 27, 909.—Cu was deposited from a soln. of 125 g./l.  $CuSO_4 \cdot 5H_2O$  and 25 g./l.  $H_2SO_4$  plus addn. agent (varying from 1 mg. to 5 g./l.), gelatin, serum albumin, gum arabic, gum tragacanth, dextrin or glycine. Each electrolysis lasted 5 hrs. at 18-20°; c. d. 2 amp./sq. dm. A section 1 cm. sq. was polished and etched. Three classes of colloids were discernible: (1)

very effective (gelatin, serum albumin); (2) av. effectiveness (gum arabic and tragacanth); and (3) relatively ineffective (dextrin and glycine). The most effective (finest grain size) are the most easily adsorbed.

**L. Waldbauer**  
**Direct determination of the number of active centers on a crystalline metallic cathode.** N. Thon. *Compt. rend.* 197, 1806-8 (1933).—Cu was deposited from a soln. contg 200 g./l.  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  and 30 g./l.  $\text{H}_2\text{SO}_4$ , at a c. d. of 0.4 amp./sq. dm. For a deposit 0.3 mm. thick an av. of  $3.0 \times 10^6$  crystals per sq. cm. was found; at higher c. d. the no. of crystals was greater.

**E. G. Vanden Bosche**  
**The electrolysis of cupric chloride in methanol solution.** J. Guillermet. *Compt. rend.* 197, 1608-10 (1933).—A 5% soln. of  $\text{CuCl}_2$  in  $\text{MeOH}$  was electrolyzed at a c. d. of 1.3 amp./sq. dm. At the Pt cathode deposits of  $\text{CuCl}$  contg 3% Cu were formed. A Cu anode was superficially converted into  $\text{CuCl}$ . With a Pt anode the  $\text{CuCl}$  cathodically formed remains in soln. The addn. of  $\text{HCl}$  and  $\text{CuCl}$  increases and decreases, resp., the Cu content of the deposits. Low yields are believed due to the recombination of  $\text{CuCl}$  and  $\text{Cl}$ , products of the primary reaction of electrolysis.

**E. G. Vanden Bosche**  
**Selenium rectifiers for electroplating plants.** Karl Maier. *Metallwaren-Ind. u. Galvano-Tech.* 32, 67-9 (1934).—Circuits for various sizes and kinds of electroplating plants are described.

**Curtis L. Wilson**  
**Health protection in plating plants.** R. J. Piersol. *Metal Cleaning and Finishing* 6, 25-9 (1934).—A detailed description of methods employed in plating plants to guard against health hazards.

**D. Thuesen**  
**Electrochemistry of the systems:  $\text{AgBr}-\text{AlBr}_3$  and  $\text{CuBr}-\text{AlBr}_3$  in ethylene dibromide.** V. A. Plotnikov and V. A. Kiketz. *J. Gen. Chem.* (U. S. S. R.) 3, 52-8 (1933).—The cond. of the system  $\text{AgBr}-\text{AlBr}_3-\text{C}_2\text{H}_4\text{Br}_2$  or  $\text{CuBr}-\text{AlBr}_3-\text{C}_2\text{H}_4\text{Br}_2$  is of the order of 0.001 mho. The sp. cond.,  $\kappa$ , rises with concn. of  $\text{AgBr}$  or  $\text{CuBr}$  when  $[\text{AlBr}_3]/[\text{C}_2\text{H}_4\text{Br}_2]$  is const.; the value of  $\kappa$  increases in the order  $\text{CuBr} < \text{KBr} < \text{AgBr}$ . Where  $[\text{MBr}]/[\text{AlBr}_3]$  is const.,  $\kappa$  diminishes with diln. Cryoscopic measurements indicate the formation of compds. of the type  $\text{Al}_2\text{Br}_6 \cdot n\text{MBr}$ . Cu or Ag is deposited on the cathode during electrolysis in accordance with Faraday's law; the decompn. potential is 0.76 v. for  $\text{AgBr}$  and 1.0 v. for  $\text{CuBr}$ .

**H. C. A.**  
**Anodic oxidation of aluminum.** C. L. Mautell. *Metal Cleaning and Finishing* 6, 11-16, 29 (1934).—The production of oxide films on Al for protective and decorative purposes by the use of the chromic acid and the  $\text{H}_2\text{SO}_4$  anodic oxidation processes is described in detail. The compn. of such films and their elec., chem. and mech. properties are discussed. Paint, varnish and other coating materials adhere much better to Al thus treated. The color of the oxide films may be varied, depending on the purity of the Al, the electrolyte and the operating conditions.

**D. Thuesen**  
**Certain properties of the oxide coating formed by the anodic polarization on the surface of oxidizable metals.** M. Marinescu. *Bul. ps. soc. române fis.* 35, 135-42 (1933).—M has investigated by means of an oscillograph the instantaneous current-voltage relationships for sinusoidal a. c. voltages existing at these surfaces at such low c. d. that O and H absorptions are reversible. Simple math. expressions for the current at different portions of the cycle are derived. The application of the shown neg. elec. resistance to the field of radio and telephonic transmission is suggested.

**Calvin Brous**  
**The electrolytic oxidation of glycolic acid in alkaline solution.** Eero Tommila. *Ann. Acad. Sci. Fennicae* A38, No. 6, 55 pp. (1933) (in German); cf. C. A. 28, 713<sup>h</sup>.—In the oxidation of glycolic acid with Pt anodes the oxidation is brought about by the catalytic action of Pt. The oxidation yields either  $\text{HCHO}$  (high v. and Pt anodes) or glyoxylic acid (low v. and Fe, Ni or Cu anodes) as primary products. Fe and Ni act as pure peroxide anodes. Above a certain potential H gas is formed at Pt anodes.

**A. E. Beitlich**  
**Electron paths in solutions during electrolysis with a**

**sparkling cathode.** P. Fisher and Katznelson. *J. Gen. Chem.* (U. S. S. R.) 3, 5-6 (1933).—The blue striae observed by Pissarshevski and Rozenberg (C. A. 18, 1424) in KI-starch solns. during electrolysis with the cathode not immersed in the soln., and ascribed by them to the action of electrons discharged from the cathode, are in reality due to  $\text{O}_2$ .

**B. C. A.**  
**Action of condensed spark on mixtures of carbon monoxide and hydrogen.** H. Lefebvre and M. van Overbeke. *Compt. rend.* 198, 736-8 (1934); cf. C. A. 27, 5052, and Montagne, C. A. 26, 3997. By the method used previously the condensed spark has very little action on mixts. of C() and H contg. 20-80% of either at low pressures (not more than 9 mm. Hg) unless the products of reaction are removed as formed, e. g., by connecting the reaction tube with one cooled in liquid O. Pressure then decreases and ultimately only CO or H remains, the 2 having interacted as far as possible to form  $\text{H}_2\text{O}$ ,  $\text{CO}_2$  and  $\text{C}_2\text{H}_2$ , the ratio  $\text{CO}_2:\text{C}_2\text{H}_2$  increasing with the initial percentage of CO.

**C. A. Silberrad**  
**The validity of Faraday's law in the case of electrode reactions during electric discharges in diluted gases.** V. Sihvonen. *Acta Chem. Fennica* B6, 71-4 (1933).—In general, Faraday's law seems to be valid for gas electrolyses when gas ions, formed at the electrodes, cause heterogeneous reactions in equiv. proportions. However, there must be no interfering side reactions. The law is applicable to (1) plain chem. and elec. reactions depending preferably only on heterogeneous formations and discharges of gas ions, (2) certain gases and materials for electrodes, (3) parallel and close electrodes, (4) highly dil. gases and (5) short duration of the expt. The mechanism of the reactions depends on the applied potential. The reactions with graphite and Pt electrodes in CO,  $\text{CO}_2$  and O under various conditions, pressures, a. c. and d. c. discharges are analyzed.

**A. E. Beitlich**  
**Water conditioning of flue gas for electrical precipitation process.** Ichiro Inomata. *Proc. Imp. Acad.* (Tokyo) 9, 506-9 (1933). The smelter fumes from the Ashio Copper Mine are humidified before entering the Cottrell treater. A formula for the proper amt. of  $\text{H}_2\text{O}$  to be used depends on the fume temp. (which varies from 40° to 110°) and the relative humidity of the fumes. Originally the purpose of the pptn. was to abate the nuisance; now the recovery of  $\text{As}_2\text{O}_3$  and the production of Pb-Sn alloy and refined Bi are of primary importance. The recovered  $\text{As}_2\text{O}_3$  and Bi amt. to 70-90% of the total Japanese productions.

**Primary cells.** Graphitwerk Kropfmühl A.-G. Ger. 563,410, Feb. 2, 1934 (Cl. 21b. 6.02). C obtained by thermal decompn. of graphitic acid is used as an ingredient of depolarizing compns. for primary cells.

**Dry cell.** Ralph R. Smith (to National Carbon Co.). U. S. 1,949,586, March 6.

**Storage batteries.** Soc. des accumulateurs électriques

(Anciens établissements Alfred Dinin). Fr. 757,315, Dec. 23, 1933. Dismountable assemblage of plates and diaphragms is described.

**Electrolytic cells.** N. V. Philips' Gloeilampenfabrieken. Brit. 402,967, Dec. 14, 1933. Cells, *s. g.*, electrolytic rectifiers or condensers, storage batteries, have a gas-escape aperture closed by a valve, the inner side of the vessel around the aperture being coated with wax, etc., not wetted by the electrolyte, to prevent creeping.

**Electrolytic condenser.** Harold I. Danziger (to Condenser Corp. of America). U. S. 1,948,289, Feb. 20. Structural features.

**Impregnated electrostatic condensers.** Richard E. Carlson (to Western Elec. Co.). U. S. 1,948,331, Feb. 20. Various details of heating to expel moisture and gases, impregnating, etc., are described.

**Electrolytic electrodes.** Maschinenfabrik Oerlikon. Ger. 592,130, Feb. 1, 1934 (Cl. 12a. 13). See Swiss 161,836 (C. A. 28, 422').

**Uniting ferrous metals with copper.** Bert L. Quarntrom (to Bundy Tubing Co.). U. S. 1,949,623, March 6. In a process involving electrodeposition, a body of ferrous metal and a body of Cu are united by a zone in which the Cu is in solid soln. with the ferrous metal, the total amount of Cu in this uniting zone not exceeding the possible soly. of Cu in  $\alpha$ -iron.

**Plating aluminum with other metals.** Johannes Fischer (to Siemens & Halske A.-G.). U. S. 1,947,981, Feb. 20. For producing firmly adherent coatings, articles of Al or its alloys are subjected to an elec. current in a bath contg. electrolytes of such nature as to produce an electrolytic coating of oxidized character; the articles, thus treated, are flash-coated electrolytically in an alk. bath with a metal such as Cu, brass, Cd, Ag or Au, and the flash-coated articles are then finish-coated electrolytically.

**Chromium plating.** Siemens & Halske A.-G. Ger. 591,642, Jan. 24, 1934 (Cl. 40c. 12). Elastic compact depositions of Cr are obtained by electrolysis of  $H_2CrO_4$ , the gas generated at the cathode being led away more or less horizontally, *s. g.*, by conduits.

**Chromium.** Siemens & Halske A.-G. Ger. 591,511, Jan. 23, 1934 (Cl. 48a. 604). In the electrolytic deposition of Cr from  $H_2CrO_4$  soln., an addn. of 1.6% of  $HClO_4$  is given to the  $H_2CrO_4$ . A small addn. of  $H_2SO_4$  may also be given.

**Electroplating nickel-chromium alloy on metals such as steel plates or sheets.** George L. Wallace (to Fiberloid Corp.). U. S. 1,948,145, Feb. 20. A cathode such as sheet steel and an anode of Cr-Ni alloy are immersed in a bath formed of Ni sulfate, Cr carbonate, boric acid and water (the Ni sulfate being in the proportion of 32-96 oz. and the Cr carbonate in the proportion of 16-32 oz. per gal.).

**Rhodium plating.** Thomas P. Shields. U. S. 1,949,131, Feb. 27. A bright lustrous deposit of Rh is obtained by use of an electrolyte comprising an aq. soln. of a sol. Rh salt such as the sulfate or chloride, a sol. Al salt such as K Al sulfate or  $AlCl_3$  and a free inorg. acid such as  $H_2SO_4$  or  $HCl$ .

**Electrolysis of fused salts.** Wintershall A.-G. Fr. 757,698, Dec. 30, 1933. The resistance of the cathodes is improved by directing a current of air or inert gas through the cell so as to pass over the place where the cathodes are immersed.

**Electrolytic iron and iron alloys.** Ernst Kelsen (to Kelsen Special Sheet Holding, S. A.). U. S. 1,948,235, Feb. 20. For producing iron of good magnetic qualities from raw materials contg. S, the S content of the electrolytically produced iron is reduced by adding to the electrolyte contg. the Fe salt a salt of an alk. earth metal such as  $BaCl_2$  having a cation forming an insol. ppt. with  $SO_4$  ion in an amount sufficient completely to effect such pptn.

**Refining copper.** James W. Scott (to Western Elec. Co.). U. S. 1,948,316, Feb. 20. The metal is inductively heated and melted and a reducing agent comprising H is introduced under the surface of the molten metal to combine with O; a vacuum of about 1 mm. to 4 mm. is then

applied to promote reactions between the reducing agent and the O to remove the latter from the Cu.

**Piperidine.** Deric W. Parkes. U. S. 1,947,732, Feb. 20. In an electrolytic process for producing piperidine by the electrolysis of pyridine and  $H_2SO_4$  in a diaphragm cell, pyridine is placed in the cathode chamber in such amt. that 10% of the catholyte is pyridine, and the content of  $H_2SO_4$  in the catholyte is adjusted to the ratio of 2.0-6.0 equivs. of the pyridine; the quantity of  $H_2SO_4$  in the anode chamber is such as to give the anolyte a d. of at least  $60^\circ Tw$ , and the electrolysis is conducted at specified temps. the creasing as the proportion of  $H_2SO_4$  increases.

**Cell for the electrolysis of alkali chlorides.** Paolo Pestalozza. Ger. 591,533, Jan. 23, 1934 (Cl. 12a. 9).

**Multiple-cell apparatus for carrying out electrolysis under pressure.** Ludwig Lacher. Ger. 582,725, Nov. 28, 1933 (Cl. 12a. 13).

**Apparatus for carrying out electrolytic decomposition at high pressure.** J. E. Noeggerath. Ger. 578,705, Jan. 12, 1934 (Cl. 12a. 13).

**Metal tubes.** Metallurgie du nickel. Fr. 757,539, Dec. 28, 1933. A metal wire, *s. g.*, of Fe, is coated with graphite and passed through an electrolytic bath, whereby a metal such as Ni is deposited to form a tube of any desired length.

**Tiltable electric furnace.** Akt.-Ges. Brown, Boveri & Cie. Ger. 592,014, Jan. 31, 1934 (Cl. 31a. 2.40).

**Electric furnace with a Carborundum tube and graphite resistor.** Fred E. O'Neil and Joseph F. Callahan (to Acheson Graphite Co.). U. S. 1,947,793, Feb. 20. A material more readily oxidizable than the resistor, such as lampblack, is placed between the resistor and the tube, for taking up O to lessen oxidation of the resistor at high temps.

**Electric resistance furnaces for metallurgical purposes.** Johann B. Felder. Swiss 162,845, Sept. 16, 1933, 165,979, Feb. 16, 1934 (Cl. 113).

**Electric resistance furnace suitable for heat-treating metal sheets.** Wm. E. Moore (to Pittsburgh Research Corp.). U. S. 1,947,612, Feb. 20. Structural features.

**Electric resistance ovens, having an internal fan of the centrifugal type for air circulation.** Lancelot W. Wild and Wild-Barfield Electric Furnaces Ltd. Brit. 401,491, Nov. 16, 1933. Addn. to 334,621 (C. A. 25, 884).

**Electric furnace for producing lead pigments.** "Subox" A.-G. Elektro-Chemische Fabrik. Swiss 163,392, (Cl. 16, 1933 (Cl. 113)).

**Electrical apparatus for testing conductivity of low resistance units.** Wm. E. Prince (to Western Elec. Co.) U. S. 1,948,238, Feb. 20.

**Constant-voltage device.** Fritz Michels (to Telefunken Ges. für drahtlose Telegraphie m. b. H.). U. S. 1,949,617, March 6. A tube suitable for use in circuits for smoothing out pulsating d. c. such as that derived from rectifying a. c. contains 2 electrodes and a filling of only substantially inert gases such as Ar, Kr, Xe, H and N.

**Annealing; tempering.** Herbert L. Clarke. Brit. 401,366, Nov. 13, 1933. Thin flexible safety-razor blades with medial slots have their medial end portions reduced in hardness by passing through them an elec. current, the blade being of such configuration that the current intensity is greater over the medial end portions than at or near the cutting edges. Oxidation may be avoided by surrounding the strip by an inert gas while in the tempering chamber and while being differentially heated.

**Heating metal objects.** Akt.-Ges. Brown, Boveri & Cie. Fr. 757,651, Dec. 30, 1933. Articles are heated in an evacuated pot in a chamber of an elec. furnace, the chamber being itself evacuated when the temp. reaches  $700^\circ$ , to prevent breakage of the walls of the pot.

**Use of gallium for electric contacts such as those of circuit breakers.** Richard Swinne (to Westinghouse Elec. & Mfg. Co.). U. S. 1,948,687, Feb. 27.

**Electrical precipitation apparatus.** Research Corp. of New York. Brit. 401,932, Nov. 23, 1933.

**High-tension conductor for electrofuses.** Metallgesellschaft. Ger. 592,291, Feb. 8, 1934 (Cl. 12a. 5).

**Electric resistance.** Robert Beyer (to Robert Beyer

Corp.). U. S. 1,947,692, Feb. 20. An elec. resistance suitable for use as a heating element at high temps. comprises a compacted mass contg. finely divided C particles penetrated with an oxide of a metal of relatively high m. p. such as oxide of Mn or of W. Various details of manuf. are given.

**Metallic vapor rectifiers.** Laurence F. Perrott (to The British Thomson-Houston Co. Ltd.). Brit. 401,815, Nov. 23, 1933.

**Preserving fats.** Otto Colm and Otto Karpeles. Austrian 136,241, Jan. 10, 1934 (Cl. 53b.). Fats are preserved by passage between electrodes of an earth metal, e. g., Al, connected to a source of d. c. at 4–40 v. and a c. d. of 3–12 milliamperes per sq. cm.

**Electric ozone generator.** Wm. R. Ridd (to Milprint Products Corp.). U. S. 1,948,240, Feb. 20. Various structural and operative details are described.

**Discharge lamps.** Willem F. Westendorp (to The

British Thomson-Houston Co. Ltd.). Brit. 401,793, Nov. 23, 1933. Two lamps, operating, resp., on the pos. and neg. half-waves of a single-phase a. c. supply to produce illumination without visible flicker, have glass or quartz envelopes filled with A, Ne, He, Kr, Xe, Hg or Na and have auxiliary electrodes connected to the anodes.

**Electric discharge lamps.** The General Electric Co. Ltd. and John W. Ryde. Brit. 401,846, A reflector or other sep. surface which is coated with an inorg. substance that phosphoresces with the emission of light of relatively long wave length, e. g., Zn-Cd sulfide, contg. a small admixt. of Cu, is used in combination with a high-pressure metal-vapor elev. discharge lamp running at considerably above atm. temp. to correct for the deficiency in such light in that emitted by the lamp.

**Apparatus and method for applying getter material to lamp filaments.** John Flaws, Jr. (to The British Thomson-Houston Co. Ltd.). Brit. 401,576, Nov. 10, 1933.

## 5—PHOTOGRAPHY

R. P. WIGHTMAN

**Photographic chemical data.** I. F. Hand. *Miniature Camera* 2, 61–3(1934).—Tables of formulas of several org. developers and chemicals used in photography are given. Relative solubilities and mol. wts. are included.

**Color photography.** G. Schweitzer. *Photo-Review* 43, 249(1931); 44, 105–6, 185–7, 201–3, 217–18, 232–4, 249–51, 265–6, 281–3, 297–9, 313–15, 332–3, 346, 361–3, 377–9 (1932).—A general review and discussion are given of photographic sensitive materials, filters, processes and app. for making photographs in color. H. D. Russell

**Temperature dependence of the photographic process.** H. Luft. *Phot. Korr.* 69, 161–5(1933).—This is an extension, with a review of the literature and a bibliography, of work already reported (Eggert and Luft, *C. A.* 26, 3738). Tests of sensitivity at temps. down to  $-190^{\circ}$  and tests on the influence of temp. on solarization are described. With temps. rising from  $-190^{\circ}$ , the sensitivity to light of various emulsions increases from practically at about  $-20^{\circ}$ , then falls to a min. at about  $-50^{\circ}$ , and finally rises again, this time irreversibly. The sensitivity to x-rays increases uniformly from  $-60^{\circ}$  to  $0^{\circ}$ ; below  $-60^{\circ}$  it is practically const., amounting to  $1/4$  or  $1/5$  of the sensitivity at room temp. (which result has been confirmed by H. Simon for a temp. of  $-250^{\circ}$ ). For the sensitivity to  $\alpha$ -rays the influence of temp. is of still less importance. As regards solarization with light, the max. d. is displaced toward higher exposures with increasing temp., with a simultaneous flattening of the descending (solarized) portion of the characteristic curve. For  $\gamma$ -rays this effect is similar but less pronounced.

**Physical development.** Allan F. Odell. *Camera* (Phila.) 48, 73–8(1934).—Phys. development, as described previously (*C. A.* 27, 4182), has been found satisfactory for high-speed panchromatic materials. There is claimed to be improvement over chem. development in regard to graininess of the negative and clearness of detail. No loss in emulsion speed was observed. A desensitizing bath may be used between the iodizing and developer baths. The sizes of the aggregates causing graininess are approx. 2–3  $\mu$  for chlorobromide emulsion (lantern slides), 20  $\mu$  for bromide emulsions by phys. development, 20–200  $\mu$  for the various "fine-grain" developers and 200  $\mu$  for chem. development.

**New formula for the representation of characteristic curves.** F. Chapuis. *Sci. ind. phot.* [2], 4, 249–50, 281–9, 313–20(1933); cf. *C. A.* 27, 5659.—The new formulas in their relationship to partial development are dealt with analytically—the effect of bromide, opaque emulsion, transparent emulsion and the effect of thickness. The "surface characteristics" of an emulsion are represented by a series of characteristic curves distributed

in a 3-dimensional envelope. The max. curves as well as the tracing of curves f. ters is demonstrated. Detns. of inertia, max. d. and transition point are made. Exptl. verification is given for the exactness of the general formula for a simple emulsion. Duplicating positive and process emulsions are said to give good agreement. Practical applications are discussed.

**Chemistry and purpose of materials used in compound-emulsion photographic fixative solutions.** C. Importance of ammonium chloride in the acid fixation bath. Fritz Hagelstein. *Pharm. Zentralhalle* 74, 754–6(1933); cf. *C. A.* 28, 265<sup>o</sup>.—The reasons underlying their use are emphasized and discussed.

**Highly disperse emulsions.** II. Lippo-Cramer. *Z. wiss. Phot.* 32, 182–4(1933); *C. A.* 26, 2385.—When a "grainless" AgBr emulsion is dyed with erythrosin or rhodamine immediately after mixing, its blue sensitivity is greatly diminished, while its yellow sensitivity (as tested with a tartrazine filter and the Eder-Hecht wedge) is either unaffected or slightly increased. After subsequent ripening, its sensitivity even to yellow is diminished in comparison with the ripened undyed emulsion, while addn. of the dye after preliminary ripening increases color sensitivity.

**Quinine hydrochloride in emulsion.** K. Kieser. *Phot. Ind.* 31, 997–8(1933).—The use of quinine-HCl and related compds. to produce blue-black tones with AgCl emulsions is discussed. Alteration of grain structure to coarser grain is apparently responsible for a change of green-black to blue-black tone.

**The action of supersonic waves on a photographic emulsion.** B. Claus. *Z. tech. Physik* 15, 74–8(1934).—Under the action of high-frequency mech. vibrations from a piezoelec. oscillator, the stability and homogeneity of an emulsion are improved, the Ag halide concn. can be increased and the general sensitivity is improved.

**Experiments on the latent image.** C. Wintner and E. H. Mynster. *Z. wiss. Phot.* 32, 157–81(1933).—Expts. of Kof and Haehn in 1907 (*C. A.* 1, 2981) have been repeated and extended. The fog produced by the vapor of a reacting mixt. of HCl and SnCl<sub>4</sub> in soln. is attributed to an indirect action of the Hg vapor given off; this reacts with traces of HCl and the O<sub>2</sub> in the air over the mixed soln. to form HgCl<sub>2</sub>, which later combines with the excess of Hg to form Hg<sub>2</sub>Cl<sub>2</sub>, the immediate fogging agent, in the emulsion film. Characteristic curve formulas are deduced for plates either when untreated or after exposure to HgCl<sub>2</sub> vapor. In the former case,  $S = K_1 a_1 e^{-a_1/n} + K_2 (1 - e^{-a_2/n})$ , where  $S$  is the d., and  $a_1$  and  $a_2$  are the sensitivity and fog nuclei, resp., per sq. cm. of the emulsion surface. A satisfactory agreement with the actual curves

has been found for the 2 very different plates, Ilford Process and Agfa Extra Rapid. E. R. Bullock

**Nucleus etching and grain isolation.** Lüpke-Cramer. *Phot. Korr.* 69, 177-9(1933).—After a discussion of the conceptions of nucleus etching and grain isolation, a series of comparative tests on the fogging of 32 brands of German plates by 3 different agents is described. Each plate was bathed for 2.5 min. in a soln. of either 2%  $(\text{NH}_4)_2\text{S}_2\text{O}_8$ , 1%  $\text{H}_2\text{O}_2$  or 0.002% methylene blue, washed briefly, and then developed, together with an untreated plate, for 4 min. in metol-hydroquinone. Large differences which are seen from 1 kind of plate to another, in the amt. of fog produced by the 1st 2 solns., are attributed in part to an action (when present in the emulsion) of sensitizing dye. Such displacement of adsorbed gelatin by a dye (grain isolation) may help explain the easy fogging, on storage, of infra-red sensitized plates. E. R. Bullock

**Grainless photographic silver.** Fritz Weigert. *Naturwissenschaften* 22, 71-2(1934).—Dichroism of Ag or Au contg. gelatin after drying under stress has been known (Anbrunn and Zsigmondy, *Ber. Sachs. Ges.* 57, 13(1899)) for some time; likewise the Ag of an exposed and developed photographic Ag halide emulsion after drying of the plate is dichroic. Hence part of this Ag is grainless, the particle size being of the order of a light wave. Three typical emulsions, Agfa extra rapid and contrast and Gevaert Vittachrom, developed with either metol-hydroquinone (rapid type developer), dil. Fe oxalate (chem.) or dil. *p*-phenylenediamine + sulfite (physical) were studied in a polarimeter with monochromator. Three types of dichroism were found: (I) The sign from red to blue is neg., the strength almost const. (grey dichroism), no double refraction, (II) neg. dichroism increasing toward blue, weakly neg. double refractive, (III) pos. dichroism for long waves, neg. for short waves, strongly neg. double refraction. Type III was found for the Gevaert plates with the wave length of sign reversal from 470 to 650  $\mu$  depending on developer and developing time, also for Agfa contrast (reversal 650-700  $\mu$ ) for the last 2 developers. Both Agfa plates were of type I in the first developer, Agfa extra rapid of type II in the last 2 developers. The dichroism is closely related to the colloid photographic theory of W. and Matulis (*C. A.* 28, 1909\*).

B. J. C. van der Hoeven

**Silver layer which forms positives directly.** Hans Arens and John Eggert. *Camera* (Luzern) 12, 225-7(1934).—A Ag halide direct pos. coating is described which may be coated on films, plates or paper. It is developed and fixed in a manner similar to other Ag halide materials. It is not too slow for practical work. Uses suggested are in the making of x-ray duplicate negatives, and the enlargement of single frames of motion-picture positives. The developed image is said to be very fine-grained.

O. E. Miller

**Intensification with mercuric iodide.** R. Namias.

*Il progresso fot.* 40, 261-4(1933).—See *C. A.* 28, 1941\*

Katharine Goepf

**Hardening of negatives in the tropics.** C. J. van Mansum. *Focus* 20, 761(1933).—Negatives can be processed in the tropics without the use of formalin or cooling, by the following procedure: The metol-hydroquinone-borax developer is used which suppresses softening. Development is followed by rinsing for 1 min. in running water or in a large tank (60 by 60 by 60 cm). Next, the film is immersed for 1 min. or longer in a hardening bath consisting of a 10% soln. of K alum. After a rinse of  $1/2$ -1 min., it is fixed in the usual acid-fixing bath. It is then rinsed in running water and washed for 10 and 30 min., resp., in 2 large tanks (as above). C. E. I.

**The new standardized procedure for the determination of the light sensitivity of photographic negative films for picture taking.** Martin Biltz. *Angew. Chem.* 47, 61-71(1934).—The standardizing method and the underlying principles are discussed. The statement of the sensitivity in standard degrees (Degree DIN) guarantees (1) the proper time of exposure, (2) absence of a disturbing developing fog and (3) constancy of the stated sensitivity during the specified time limit. Five references.

Karl Kammermeyer

**Panchromatic film.** Curt Emmermann. *Film für Alle* 7, 283-5(1933).—E. claims that the speeds given by film manufacturers are usually too high. Tests made with various high-speed panchromatic materials show much less speed than those advertised. A. K. W.

**The action of various elements and compounds on photographic plate.** S. Aoyama, T. Fukuroi and I. Takahashi. *Kinsoku no Kenkyu* 11, 21-37(1934).—The mechanism of the action was studied and the authors concluded from expts. on 59 kinds of material that the photoelec. action is due to activated air or other gas which are desorbed from the materials used, or reflected from the active centers on their surfaces. It has not been detd. whether the photoelec. action is affected by the direct chem. reaction between the activated gases and the halides or by some ultra-violet ray, emitted when dissociation or association takes place. M. Kuroda

**Photoelectric cell in [photographic] densitometry.** J. M. Blair, M. C. Hyman and G. T. Meredith. *Phot.* 7, 73, 409-11(1933). B. C. A.

**Further experiments on the Sterry effect with chloride development papers.** F. Formstecher. *Phot. Ind.* 31, 691-2(1933).—An exposed chloride development paper (Mimosa Sunotype extra hard) has been bathed in solns. of  $\text{K}_3\text{Fe}(\text{CN})_6$ ,  $\text{K}_2\text{C}_2\text{O}_7$  or  $\text{CuCl}_2$  of varying concn., in some cases with the solns. mixed and in others successively, and the changes in gamma and total gradation on a given development are recorded numerically. In connection with a difference in the action of  $\text{K}_3\text{Fe}(\text{CN})_6$  as compared with the other agents, it is recalled that Valenta showed (*C. A.* 10, 2852) that a ferricyanide soln. converts the  $\text{AgCl}$  of an emulsion to  $\text{Ag}_3\text{Fe}(\text{CN})_6$ . E. R. Bullock

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

**Progress of inorganic chemistry 1930-1933.** II. Systematic investigations (measurements). Wilhelm Klemm. *Angew. Chem.* 47, 79-84, 99-104(1934); cf. *C. A.* 28, 1613\*.—*Equilibria*.—A review of the following subjects: (1) heterogeneous systems, (2) homogeneous systems and (3) various subjects. *Properties of compounds*.—(1) Diffraction of x-rays and electron rays, (2) dipole measurements, (3) Raman effects and infra-red spectra, and (4) magnetochemistry. *General data*.—(1) Complex compds., (2) transition between bond types and (3) structure of at. nuclei. One hundred and sixteen references. Karl Kammermeyer

**Reactions of inorganic compounds with liquid hydrogen sulfide.** Harlan P. Guest. *Iowa State Coll. J. Sci.* 8, 197-8(1933).—Liquid  $\text{H}_2\text{S}$  reacts: with  $\text{CaO}$  forming a mixt. of  $\text{CaS}$  and  $\text{CaSHOH}$ ; with  $\text{CaC}_2$  forming  $\text{CaS}$

with some  $\text{Ca}(\text{SH})_2$ ; with  $\text{C}_2\text{H}_2$  to form a little  $\text{CH}_3\text{CHS}$ , with pure dry  $\text{SO}_2$  above  $68^\circ$  with increasing violence until explosions result; with  $\text{VOCl}_3$  to form a mixt. of  $\text{VSCl}_3$  and  $\text{VCl}_3\text{SHOH}$ .  $\text{H}_2\text{S}$  is oxidized slowly by  $\text{POCl}_3$  and not affected by  $\text{P}_2\text{O}_5$ . In liquid  $\text{H}_2\text{S}$  hydrated  $\text{Na}_2\text{S}$  reacts with  $\text{CS}_2$  to form  $\text{Na}_2\text{CS}_3$ . In an alc. soln. of  $\text{H}_2\text{S}$  and  $\text{CS}_2$ ,  $\text{NH}_3$  reacts to form  $(\text{NH}_4\text{S})(\text{NH}_4\text{S})\text{CS}$ . F. E. Brown

**Amphoteric oxide hydrates, their higher molecular compounds and solutions thereof.** XXII. Iso- and heteropolyvanadic acids, purpureo- and luteophosphovanadates—a contribution to the clarification of the question of the synthesis and constitution of heteropoly compounds. Gerhart Jander, Karl F. Jähr and Hans Witzmann. *Z. anorg. allgem. Chem.* 217, 65-79(1934). cf. *C. A.* 28, 2269\*.—By the diffusion method previously

described, a large no. of vanadate solns. contg.  $H_3PO_4$  were examd. to det. the nature of the V compds. existing in these solns. and to prove again the existence of an octavanadic acid already indicated in previous expts. (cf. C. A. 27, 4187). Tabulated results show that in vanadate solns. contg. acid phosphate, anions of an octavanadic acid exist. Crystn. expts. confirmed the presence of octavanadic acid in the dark red purpureophosphovanadates. These purpureovanadates can be arranged in 4 groups with the following molar proportions of  $H_3PO_4$  and octavanadic acid: 2:1, 1:1, 2:3, 1:3. The complicated changes and processes which rising  $[H^+]$  produces in these  $H_3PO_4$ -alkali vanadate solns. are indicated: (1) In alk. and weakly acid vanadate solns. the phosphate ions have no influence on the aggregation process; and (2) in all acid solns. the  $H_3PO_4$  has a threefold role: (a) it stabilizes the octavanadic acid ion, and therefore from  $H_3PO_4$ -vanadate solns. salts of octavanadic acid, isopolyvanadates, are obtained; (b)  $H_3PO_4$  forms with octavanadic acid double compds. of higher order, the so-called heteropoly acids, the salts of which are the purpureophosphovanadates; (c) in strongly acid solns. the  $H_3PO_4$  with the vanadate ions therein forms the vanadate phosphates or alkali vanadate phosphates, the so-called luteophosphovanadates. M. McMahon

The formation of alkali metal hydrides by atomic hydrogen. Edna Ferrell, Thomas G. Pearson and Percy L. Robinson. *J. Chem. Soc.* 1934, 7-8. Li, Na and K readily combine with at. H at ordinary temp. to form their resp. hydrides. B. A. Soule

Ammonium arsenates. C. Matignon and A. de Passillé. *Compt. rend.* 198, 777-9(1934).  $NH_4H_2AsO_4$ , prepd. from aq.  $NH_3$  and  $As_2O_3$  in correct proportions, forms nondeliquescent prisms,  $d_4^{20}$  2.340; 100 g.  $H_2O$  dissolves at 0°, 20°, 60° and 80° 33.74, 48.67, 83.05 and 122.4 g., resp.; it loses  $NH_3$  above 300° to form an almost insol. acid metaarsenate  $NH_4H(AsO_3)_2$ , which is unchanged at 435°. No trace of  $As_2O_3$  or As is formed. When boiled with  $H_2O$  the metaarsenate re-forms orthoarsenate.  $(NH_4)_2HASO_4$  is pptd. by EtOH from soln. of its constituents. The aq. soln. loses  $NH_3$  to form  $NH_4H_2AsO_4$ , as also does the dry salt on gentle heating, though it is stable in dry air in the cold. Its equil. formula is  $\log p = (-15,500/4.57T) + 1.75 \log T + 3.3$ .  $(NH_4)_2AsO_4 \cdot 3H_2O$  is pptd. on satg. a soln. of  $As_2O_3$  or of either acid salt with  $NH_3$ ; it rapidly loses  $NH_3$ . The anhyd. salt is formed when an acid salt absorbs  $NH_3$  at 8 atms. pressure; it also rapidly loses  $NH_3$ . Its equil. formula is  $\log p = (-13,070/4.57T) + 1.75 \log T + 3.3$ . C. A. Silberrad

Boron arsenate and mixed crystals of boron arsenate-phosphate. G. R. Levi and G. Ghiron. *Atti accad. Lincei* 18, 394-8(1933).  $BAsO_4$  has been prepd. by 2 methods: (1) Equimolar aunts. of a concd. soln. (80%) of  $H_2AsO_4$  and solid  $H_3BO_3$  are heated on a water bath, till the mass solidifies. The product is vacuum-dried, as pure  $BAsO_4$ , d. 3.583. It forms tetragonal crystals,  $c/a$  1.524,  $a$  4.46. These values were also detd. for  $BPO_4$ , and are 1.532, and 4.33, resp. They form mixed crystals in all proportions. (2) Solid  $(NH_4)_2HASO_4$  is heated with solid  $H_3BO_3$ , eventually under vacuum, to eliminate all  $NH_3$ . This method is also used to prep.  $BPO_4$ . A. W. Contieri

Reaction differentiating the hydrated calcium aluminates. A. Travers and P. Leduc. *Compt. rend.* 198, 828 31(1934); cf. C. A. 27, 5019. The cubic  $3CaO \cdot Al_2O_3 \cdot 6H_2O$  (cf. C. A. 23, 5125) scarcely reacts with boiling alc.  $NH_4Cl$ , whereas all other hydrated Ca aluminates do so more or less readily. As  $CaO$  is obviously more turnly combined in the hexahydrate, it is suggested that it is derived from the acid  $H_2AlO_3$ , while the other Ca aluminates are basic salts of  $HAlO_2$ , i. e.,  $CaO \cdot Al_2O_3 \cdot nCaO$ , convertible into the former type on heating. C. A. Silberrad

Action of chlorates on sulfur, selenium and tellurium. J. Amiel. *Compt. rend.* 198, 1033-5(1934).—The chlorates of Ba, Sr, Ca, Pb,  $Cu^{++}$ ,  $Cr^{+++}$ , Mg, Ni, Co, Zn and Cd (with increasing ease in this order) in presence of S

and a little  $H_2O$  evolve  $ClO_2$  below, and  $Cl_2 + O_2$  above, 50-60°; with S  $S_2Cl_2$  is formed, which is decompd. by  $H_2O$ , and sulfate is finally formed. If org. matter, e. g., paper or gum arabic, is present, inflammation may occur. Se reacts similarly but more vigorously, a slightly moist mixt. thereof with any chlorate except that of K becoming incandescent. Te is attacked only by concd. aq.  $HClO_3$  or aq.  $X(ClO_3)_3$  if  $X = Mg, Ni, Co, Zn$  or  $Cd$ . Ammoniacal chlorates, e. g.,  $Zn(ClO_3)_2 \cdot 4NH_3$  or  $Cd(ClO_3)_2 \cdot 6NH_3$ , do not react with S or Se. A dry mixt. of S +  $Sr(ClO_3)_2$  may be preserved indefinitely over  $P_2O_5$ ; and addn. of an alkali acetate prevents the action of any chlorate on S or Se. C. A. Silberrad

Investigations of iodates. I. The iodates of aluminum, chromium and iron. A. v. Endredy. *Z. anorg. allgem. Chem.* 217, 53 61(1934).—Compds. of the composition  $R^{+++}(IO_3)_3 \cdot xH_2O$  were prepd., where R represents Al, Cr and Fe. With Al,  $x = 6$ , for Cr,  $x = 2, 4\frac{1}{2}$ , and 5, and for Fe,  $x = 0$ . With increasing ionic radius and decreasing electroaffinity, the stability of the hydrates decrease, and the soly. falls. The structure of the Al compd. was that of a hexaquo complex cation. The structures of the Cr compds. were not established, and the Fe compd. was considered to be similar to ferric phosphate. C. E. P. Jeffreys

The sulfides, selenides and tellurides of the six platinum metals. Lothar Wohler, K. Ewald and H. G. Krall. *Ber.* 66B, 1638 52(1933); cf. C. A. 26, 340. —As a procedure, Se and the metal chloride were heated in  $CO_2$ , this giving  $2MCl + 2Se_{21/2} = 2MSe + xSe_2Cl_2$ . The melt was then heated in a tube *in vacuo* with Se. With Te the procedure was the same. S was introduced directly into the tube *in vacuo*. Excess S was extd. with  $CS_2$  and then boiled with 5%  $Na_2S$  soln., Se by 0.5 N KCN soln., Te with 2 N  $HNO_3$  followed by dil. KOH except for  $OsTe_2$  and  $PdTe_2$ , which were purified only with 10 N KOH. Each residue was washed with  $H_2O$ , dil. HCl, EtOH and  $H_2O$  and dried at 130° in  $CO_2$ . Many sulfides were also made by reaction of  $MeCl$  with dry  $H_2S$ . Ir and Se give no reaction at 300°.  $IrCl_3$  and Se at 600° give  $IrSe_2$ . Further heating with Se at 450° gives  $IrSe_3$ . At 400° in  $H_2$  this goes to  $IrSe_2$ .  $IrCl_3$  and Te at 750°, followed by reheating at 700°, give  $IrTe_2$ . If  $IrTe_2$  is heated in  $H_2$  at 600°  $IrTe_2$  is obtained.  $IrCl_3$  and S at 600° give  $IrS_2$ .  $IrCl_3$  and dry  $H_2S$  at 600° give  $IrS_2$ . In N. at 700°  $IrS_2$  or  $IrS_3$  gives  $IrS$ .  $RhCl_3$  and Se at 600° give  $Rh_2Se_3$ .  $RhTe_2$  was similarly obtained.  $RhCl_3$  and S at 600° form  $Rh_2S_3$ .  $RuSe_2$ ,  $RuTe_2$ ,  $RuS_2$  (by  $H_2S$ ),  $OsSe_2$ ,  $OsTe_2$ ,  $OsS_2$ ,  $PdSe_2$ ,  $PdTe_2$ ,  $PtSe_2$  and  $PtTe_2$  were obtained.  $PdCl_2$  and S at 450° gave  $PdS_2$ . Above 600°  $PdS$  is obtained.  $PtCl_2$  and  $H_2S$  followed by heating with S at 600° gave  $PtS_2$ . Above 630° this decomposes to  $PtS$ . The reactivity of the compds. varies with at. wt. of the neg. radical. Sulfides are extremely stable; selenides are more or less slowly attacked by *aqua regia*; tellurides are more or less easily attacked. Foster Dee Snell

Magnetic study of hydrated thoria. F. Bourion and D. Beau. *Compt. rend.* 198, 916-18(1934).—The magnetic susceptibility of hydrated thoria varies linearly with the content of  $H_2O$ ; it is therefore a mixt., and not a true hydroxide (cf. C. A. 17, 697; 23, 1330).

C. A. Silberrad

Magnesium sulfate. Hiroshi Hagisawa. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 12, 976-83(1933) (Abstracts (in English) published with *Sci. Papers Inst. Phys.-Chem. Research (Tokyo)* 23, Nos. 468-77).—From the detn. of soly. over the temp. range 0-95°, 2 hydrates,  $MgSO_4 \cdot 6H_2O$  and  $MgSO_4 \cdot 3H_2O$ , the transition point of which lies at 40°, have been found; the dehydration of  $MgSO_4 \cdot 6H_2O$  has been examd. by the thermobalance, and no other hydrates than these have been found. The soly. of  $MgSO_4 \cdot 6H_2O$  in  $SO_2$  soln. of various concns., and the partial pressures of  $SO_2$ , have been detd. at 25° by the statical method. K. Konda

The existence of mercuric permanganate. A. Oliverio. *Atti IV Congr. nas. chim. pura applicata* 1933, 552-6. —Addn. of aq.  $KMnO_4$  to concd.  $Hg(OAc)_2$  soln. ppts.

well-formed, flat, violet crystals contg. the OAc, Hg, and MnO<sub>2</sub> groups, exploding by shock or rapid heating. The reaction  $2\text{AgMnO}_4 + \text{HgCl}_2$  pptg. well-formed crystals, rather sol. in H<sub>2</sub>O, which decomp. at 130° with sublimation of HgCl and which contain the groups Cl, MnO<sub>2</sub> and Hg. The action of HMnO<sub>4</sub>, prepd. from BaMnO<sub>4</sub> and H<sub>2</sub>SO<sub>4</sub>, on HgO, gives a basic salt of Hg(MnO<sub>2</sub>)<sub>2</sub>.

E. M. Symmes

The solubility of sodium and potassium ferrocyanides in aqueous solutions of ammonia. A. Tettamanzi. *Atti accad. sci. Torino, Classe sci. fis., mat. nat.* 68, 506-12 (1933).—See C. A. 28, 1589°.

A. W. Contieri

The reaction of cyanide ions with tetrathionate and pentathionate ions. B. Foresti. *Z. anorg. allgem. Chem.* 217, 33-47 (1934).—The reactions between KCN and alkali tetra- and pentathionates were studied. In the presence of buffers in the pH range of 7-8 the formation of the CNS ion from the CN ion was quant., and it was not necessary to express the reactions in neutral and alkali soln. by different equations. In unbuffered solns.  $\frac{1}{2}$  the CN ion is transformed before the reaction is halted. With both S<sub>4</sub>O<sub>6</sub> and S<sub>5</sub>O<sub>6</sub> ions the reactions with the CN ion were second order. The velocity consts. at pH 7.31 were 5.44 and 25.05. At pH 7.54 the consts. changed to 10.25 and 51.2. The effect of pH was about the same on both reactions. The reaction of the S<sub>5</sub>O<sub>6</sub> ion with the CN ion takes place in 2 steps. The S<sub>5</sub>O<sub>6</sub> ion reacts with the CN ion forming CNS ion and tetrathionate, which in turn reacts with a second CN ion. It appears that the S<sub>5</sub>O<sub>6</sub> ion might be useful as an antidote for HCN poisoning.

Heteropoly compounds IV. Borotungstates and metatungstates. A. V. Rakovskii and A. V. Babaeva. *J. Gen. Chem. (U. S. S. R.)* 3, 59-66 (1933); cf. C. A. 27, 2395.—For the detn. of the character of H<sub>2</sub>O in boron- and metatungstates the salts were gradually dehydrated over H<sub>2</sub>SO<sub>4</sub> of definite concn. in a desiccator (van Bemmelen). The tabulated results show the existence of crystallhydrate regions. Thus in 5BaO B<sub>2</sub>O<sub>3</sub> 24WO<sub>3</sub> · xH<sub>2</sub>O 1 region corresponds to a content of H<sub>2</sub>O from 13.35 to 12.83%, and the other from 10.07 to 0.24%, while 5K<sub>2</sub>O B<sub>2</sub>O<sub>3</sub> 24WO<sub>3</sub> · xH<sub>2</sub>O showed 1 region with 9.57-9.22% H<sub>2</sub>O. BaO 4WO<sub>3</sub> · xH<sub>2</sub>O (I) showed 2 regions with 13.78 to 10.68% H<sub>2</sub>O. The results of hydration and dehydration of I indicate similar processes typical of adsorption compds., requiring further study to obtain exact data.

Chas. Blanc

The energy relationships of nitrous oxide and the structure of its acid. L. V. Pissarzhvskii. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, No. 7, 971-4.—The stability of a mol. cannot be measured by its heat of formation. The heat of formation of N<sub>2</sub>O is 17.7 and that of Cl<sub>2</sub>O is 16.2 Cal.; calcn. of the work of decompn. of these mols. shows that the stability of N<sub>2</sub>O is almost three times that of Cl<sub>2</sub>O. Since on decompn. into atoms there takes place combination of atoms of N, Cl and O into their mols., and since the release of the energy of N is 4 times that of Cl, the release of energy in the formation of mols. N<sub>2</sub> and O<sub>2</sub> from N<sub>2</sub>O is almost the same as that in formation of Cl<sub>2</sub> and O<sub>2</sub> from Cl<sub>2</sub>O.

V. D. K.

Binary system: thallium nitrate-thallium carbonate. A. S. Broun. *J. Gen. Chem. (U. S. S. R.)* 3, 998-1000 (1933).—From the fused mixts. of TlNO<sub>3</sub>, m. 206°, and Tl<sub>2</sub>CO<sub>3</sub>, m. 272-3°, the complex compds. 2TlNO<sub>3</sub> · Tl<sub>2</sub>CO<sub>3</sub>, m. 218°, and TlNO<sub>3</sub> · Tl<sub>2</sub>CO<sub>3</sub>, m. 214°, sepd.

Chas. Blanc

Potentiometric investigation of the formation of thio-sulfate from alkali sulfide and sulfurous acid. Erich Müller and K. Mehlhorn. *Angew. Chem.* 47, 134-9 (1934).—The following expts. were carried out: (1) action of aq. SO<sub>2</sub> soln. upon Na<sub>2</sub>S solns., (2) action of gaseous SO<sub>2</sub> upon Na<sub>2</sub>S solns., and (3) action of gaseous SO<sub>2</sub> upon concd. Na<sub>2</sub>S solns. with NaOH addns. The expts. with gaseous SO<sub>2</sub> were carried out with dil. (7%) and concd. gas (100%). The potentiometric investigation of the expts. showed that the reaction steps can be detected by sudden changes in the pH value. A no. of equations are discussed as tentative representations of the

reaction mechanisms. Several possible methods are given, for tech. applications, which aim to avoid the loss of S caused by the formation of Na<sub>2</sub>SO<sub>3</sub>.

K. K.

The peroxides and superacids of the halogens. L. V. Pissarzhvskii. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, No. 8, 1121-4.—Tetroxide of Cl can be obtained by the action of I on ether solns. of AgClO<sub>4</sub>. The ClO<sub>4</sub> ions give off one electron to iodine atoms and as anions react with each other to form tetroxide, (ClO<sub>4</sub>)<sub>2</sub>, having the same grouping of O atoms as O in H<sub>2</sub>O<sub>2</sub> (ClO<sub>4</sub>)<sub>2</sub> must be the anhydride of HClO<sub>4</sub> and HClO<sub>3</sub>, by reaction with H<sub>2</sub>O these acids are formed. HClO<sub>4</sub>, having the same grouping of O atoms as H<sub>2</sub>O<sub>2</sub>, is superchloric acid.

V. D. Karpenko

Nitrosylsulfuric acid. I. Ernst Weitz and Fritz Achterberg. *Ber.* 66B, 1718-27 (1933).—The alternative

structure of  $\left[ \begin{array}{c} \text{O} \quad \text{O} \\ \diagdown \quad \diagup \\ \text{O} \cdot \text{S} \cdot (\text{NO})_2 \end{array} \right] \text{H}$  with a coordination no. of

4 rather than 5 is presented.  $\text{K}_2\text{SO}_4 \cdot 2\text{NO} + \text{K}_2\text{SO}_4 + \text{H}_2\text{O} = \text{K}_2\text{S}_2\text{O}_8 + \text{N}_2\text{O} + 2\text{KOH}$ . This reaction is stopped by the building up of alkali on the right. Analogously, the reaction in alc. soln. to form  $\text{C}_2\text{H}_5\text{OSO}_3\text{K}$  is stopped by formation of KOH. These reactions do not agree with theories in which  $-\text{SO}_3\text{K}$  is one unit of the mol. but do agree with the structure suggested, that of a mixed anhydride of sulfuric and hyponitrous acid. This is in agreement with the incomplete decompn. in the lead chamber process.  $\text{K}_2\text{SO}_4 \cdot 2\text{NO}$  is quantitatively oxidized by KMnO<sub>4</sub> in 0.1 N KOH to K<sub>2</sub>SO<sub>4</sub> and KNO. On acidifying, the latter is converted to KNO<sub>2</sub>. *Ibid.* 1728-33.—Addn. of K<sub>2</sub>SO<sub>4</sub> · 2NO to FeSO<sub>4</sub> (NH<sub>4</sub>)<sub>2</sub> · SO<sub>4</sub> · 6H<sub>2</sub>O gives a red-yellow ppt. of K<sub>4</sub>Fe(SO<sub>4</sub> · 2NO)<sub>2</sub>, which decomposes when dried or on standing. Free NH<sub>4</sub> in the soln. does not alter the apparent result but the ppt. is more stable and the salt a basic one. Addn. of more NO to the soln. is without effect. Passing NO into a suspension of FeSO<sub>4</sub> in Na<sub>2</sub>SO<sub>4</sub> soln. gives oxidation of Fe<sup>++</sup> to Fe<sup>+++</sup> and reduction of NO to NH<sub>4</sub>OH. Addn. of NO to FeSO<sub>4</sub> in NH<sub>4</sub>OH soln. with (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> gives pptn. of Fe(OH)<sub>3</sub> but no NH<sub>4</sub>OH. FeS and K<sub>2</sub>SO<sub>4</sub> · 2NO react to give KFeS<sub>2</sub>(NO)<sub>2</sub> · H<sub>2</sub>O, which ppts. AgNO<sub>3</sub> as Ag<sub>3</sub>(NO)<sub>2</sub> showing ON:NO<sup>++</sup> to be present. K<sub>2</sub>SO<sub>4</sub> · 2NO and a Co salt give a mixt. of K<sub>4</sub>Co(SO<sub>4</sub> · 2NO)<sub>2</sub> and K<sub>2</sub>Co(SO<sub>4</sub> · 2NO)<sub>3</sub>, stable in air. In NH<sub>4</sub>OH soln. gas is evolved and a complex formed. K<sub>4</sub>Zn(SO<sub>4</sub> · 2NO)<sub>2</sub> and K<sub>4</sub>Mn(SO<sub>4</sub> · 2NO)<sub>2</sub> were prepd. The corresponding Na salts are not pptd. but more intense colorations indicate their presence in soln. Cu<sup>++</sup> salts give a red-violet with Na<sub>2</sub>SO<sub>4</sub> · 2NO followed by evolution of N<sub>2</sub>O, and decolorization. La gives colorless double salts. TlNO<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub> · 2NO give Tl<sub>2</sub>SO<sub>4</sub> · 2NO. K<sub>2</sub>SO<sub>4</sub> · 2NO gives the same in lower purity. BaCl<sub>2</sub> and Na<sub>2</sub>SO<sub>4</sub> · 2NO give BaSO<sub>4</sub> · 2NO · 2H<sub>2</sub>O. Luteo-cobalt chloride gives [Co(NH<sub>3</sub>)<sub>6</sub>]Cl(SO<sub>4</sub> · 2NO) · H<sub>2</sub>O. Luteo-chromium salts are similarly pptd.

Poster Dee Snell

The existence of double salt ammoniates. II. G. Spacu and P. Spacu. *Z. anorg. allgem. Chem.* 217, 80-4 (1934); cf. C. A. 28, 1619°.—Tensimetric investigations yielded evidence for the following structures for some complex ammoniates prepd. and previously investigated chemically. The decaammoniate is given the structure

where M'<sub>4</sub> is K<sup>+</sup> or NH<sub>4</sub><sup>+</sup>, and the diammoniate is given the structure:

C. E. P. Jeffreys

Structure of the thio-ether compounds of platinum and palladium chlorides. E. G. Cox, H. Saenger and W. Wardlaw. *J. Chem. Soc.* 1934, 182-6.—K<sub>2</sub>PtCl<sub>6</sub> and Me<sub>2</sub>S in H<sub>2</sub>O at 0° on standing overnight deposit a mixt. of [Pt(Me<sub>2</sub>S)<sub>4</sub>][PtCl<sub>6</sub>] (I), insol. in cold CHCl<sub>3</sub>, and α- (II) and β-Pt[Me<sub>2</sub>S]<sub>2</sub>Cl<sub>2</sub> (III). II, orange, monoclinic plates, m. 159°, readily sol. in Me<sub>2</sub>CO and CHCl<sub>3</sub>; III,

citron-yellow, monoclinic prisms,  $m. 159^\circ$ , sol. in  $H_2O$  (0.0986 g. in 100 cc. at  $15^\circ$ ),  $Me_2CO$  and  $CHCl_3$ , sepp. from the last with 1 mol. of  $CHCl_3$  of crystn., which is quickly lost; III is more sol. in  $Me_2CO$  than II. I is slightly sol. in  $CHCl_3$  and  $EtOH-CHCl_3$ , undergoing transformation into III; it breaks down to a mixt. of II and III on standing at room temp., warming at  $85^\circ$  or dissolving in excess aq. boiling  $Me_2S$ ; on warming in  $H_2O$  I changes into a mixt. of II and III, finally giving a yellow soln., from which solely III seps. Treating I with  $(NH_4)_2PtCl_6 \cdot H_2O$  gives the green salt of Magnus. II is completely converted into III on soln. in boiling  $H_2O$  and almost completely by treating with further aq.  $Me_2S$ . It is only partially transformed on recrystn. from  $CHCl_3$  or on melting, the solidified melt remelting at  $154-61^\circ$ . III is partially converted into II on recrystn. from  $CHCl_3$ . The conversion of either II or III into the other is very slight in  $Me_2CO$ , even on warming the soln. III reacts in a few min. with  $Ag_2O$  in  $H_2O$  with the production of  $AgCl$  and a markedly basic yellow-brown varnish-like substance; II reacts only very slowly, with evolution of  $Me_2S$ , formation of  $AgCl$  and pptn. of Pt as the oxide or hydroxide. III immediately pptn.  $AgCl$  on addn. of  $AgNO_3 \cdot HNO_3$ ; II does not give a ppt. II in  $CHCl_3$  gives an  $\alpha$ -tetrachloride, orange,  $m. 219-29^\circ$  (decompn.); III gives a tetrachloride, yellow prisms, very slightly sol. in  $CHCl_3$ , while the  $\alpha$ -form is very sol.  $\beta$ - $Pt[Me_2S]_2Cl_2$  dissolved in  $H_2O$  contg. a drop of  $C_2H_5(NH_2)_2$  and immediately treated with aq.  $K_2PtCl_6$  gives bisdimethylsulfinethylenediaminoplatinous chloride, rose, monoclinic prisms which are unstable on standing in  $H_2O$ ; the  $\alpha$ -isomer reacts much less readily;  $Me_2S$  is evolved and only  $[Pt(en)_2][PtCl_6]$  is obtained; in cold  $Me_2CO$  immediate reaction occurs, with evolution of  $Me_2S$  and pptn. of  $[Pt(en)_2]Cl_2$ . According to Barker's system, II has  $a:b:c = 1.089:1:1.4060$ ,  $\beta = 105^\circ 52'$ ; other crystallographic data are given. X-ray examn. gives  $a 10.16$ ,  $b 6.01$ ,  $c 8.48$  A.;  $\beta = 105^\circ 55'$ ;  $d$  is 2.58 g./cc. (by flotation, 2.56); the space group is either  $P2_1/m$  or  $P2_1/c(C_{2h}$  or  $C_{2h}')$ . Each mol. of II has very nearly full  $C_{2h}$  symmetry, i. e., a plane and a 2-fold axis, so that, at any rate to a close approx., the 4 valencies to the Pt atom must be coplanar, with the thio-ether groups in  $s$ -position. The  $\alpha$ -bromide is completely isomorphous with II. X-ray examn. of III gives  $a 9.3$ ,  $b 13.2$ ,  $c 8.7$  A.,  $\beta 105^\circ$  approx.,  $d$  2.50 g./cc. (by flotation).  $\alpha$ -Bisdimethylsulfinethylenediaminoplatinous chloride, monoclinic prisms,  $a:b:c = 1.588:1:1.013$ ,  $\beta = 93^\circ 56'$ ; x-ray measurement gives  $a 12.0$ ,  $b 7.9$ ,  $c 7.7$  A.,  $d$  2.08 g./cc. Bisdimethylsulfinethylenepalladous chloride, deep red,  $m. 128^\circ$ , monoclinic prisms,  $a:b:c = 1.719:1:1.419$ ,  $\beta = 105^\circ 42'$ ,  $d$  1.99 g./cc. The complete isomorphism of  $Pd(SMe_2)_2Cl_2$  with  $Pt(SMe_2)_2Cl_2$  leaves no doubt that the former also has a planar trans-configuration. C. J. West

**Interhalogen compounds:** dissociation of halide complexes, dissociation, hydrolysis, distribution ratios in acid solution. J. Horace Faull, Jr. *J. Am. Chem. Soc.* 56, 522-6(1934).—The distribution ratios of  $ICl$  and  $IBr$  between  $CCl_4$  and  $H_2O$  are  $(ICl)/(ICl)_{aq.} = 0.34$ ;  $(IBr)/(IBr)_{aq.} = 3.9$ . The dissociation constants for the several interhalogen complexes studied are:  $(IBr)(Br^-)/(IBr_2^-) = 0.0027$ ;  $(IBr)(Cl^-)/(IBrCl^-) = 0.023$ ;  $(ICl)(Cl^-)/(ICl_2^-) = 0.0060$ . The expl. method is described. The dissociation constants for  $ICl$  and  $IBr$  in aq. soln. are calcd. from prior measurements:  $(I_2)(Cl^-)/(ICl_2^-) = 1.6 \times 10^{-10}$ ;  $(I_2)(Br^-)/(IBr_2^-) = 1.2 \times 10^{-10}$ . Preliminary values are given for the equil. constants for 5 equilibria arising in the hydrolysis of  $ICl$  and  $IBr$ . Compared to the individual halogens these complexes are very stable, have larger hydrolysis constants, and are more completely extd. from  $H_2O$  by  $CCl_4$ . W. B. K., Jr.

**Configuration and optical rotation of inorganic complex compounds.** Werner Kuhn and Karl Bein. *Z. anorg. allgem. Chem.* 216, 321-48(1934).—There is a far-reaching correspondence in the optically active properties of materials of analogous configuration of the types  $[M(en)_2AB]X_n$  and  $[M(Ox)_2]K_n$ . ( $Ox$  = oxalate radical.) It is necessary that the optically active properties of a substance be defined

not by estn. of the mol. rotation, which is characteristic of the compds. at the same selected wave length, but by the sign of the rotation, which furnishes analogous absorption bands. The longest wave-length absorption bands of these compds. can be balanced by absorption bands of analogous origin. These absorption bands remain unchanged if in  $[Co(en)_2]Br$  an en is replaced with any other acid or basic residue or if Cr, Rh or Ir is substituted for Co. This is also true of substitution of Cr, Rh or Ir for Co in  $[Co(Ox)_2]K_3$ . A schematic model shows characteristic mutual features for these compds. which cause them to give corresponding maxima, left in yellow light, right in red light. Foster Dec Snell

**Compounds of triethanolamine with various metallic salts.** Felice Garvelli. *Atti accad. sci. Torino, Classe sci. fis., mat. nat.* 68, 398-401(1933).— $N(C_2H_4OH)_3$  forms compds. in aq. soln. with  $NiCl_2$ ,  $CuSO_4 + KSCN$ ,  $CoCl_2$ ,  $Co(SCN)_2$ , and  $CoI_2$ , the last 2 salts being prepd. by addn. of  $CoCl_2$  to  $KSCN$  and  $KI$ , resp.  $NiCl_2 \cdot 2[N(C_2H_4OH)_3]$  is a blue cryst. solid;  $CuSCN \cdot [N(C_2H_4OH)_3]$  is light green.  $CoCl_2$ ,  $CoSCN$  and  $CoI_2$  also form compds., in which the ratios Co:base:acid radical are 1:1:1, 1:1:1, and 2:2:1, resp. They are violet, deep violet and reddish violet in color. Their structures have not been detd. II. A. Tuttamanzi and B. Carli. *Ibid.* 68, 500-5(1933). See C. A. 28, 1295<sup>4</sup>. A. W. Conticri

**Complex salts with  $\alpha$ -dipyridyl.** Complex salts of bivalent nickel. P. M. Jaeger and J. A. van Dijk. *Proc. Acad. Sci. Amsterdam* 37, 10-15(1934).—The base  $\alpha$ - $\alpha'$ -dipyridyl (I)  $m. 71^\circ$  was prepd. by the action of anhyd.  $FeCl_3$  on pyridine in sealed tubes at  $300^\circ$  (C. A. 23, 143). I crystd. from  $AcOEt$  in big lustrous monoclinic crystals. Evapn. of the deep red soln. formed on mixing a soln. of 2.5 g. of  $NiSO_4 \cdot 7H_2O$  with 4.7 g. of I in alc. soln. gave red monoclinic-prismatic plates of  $[Ni]_2SO_4 \cdot 7H_2O$  (II) occasionally mixed with blue triclinic needles of  $[Ni](H_2O)_2SO_4 \cdot 4H_2O$  (III). This blue salt exists in a 2nd modification consisting of long, pale-blue, hair-like needles. II is a deriv. of a moderately strong complex cation, decompd. by heating with concd.  $HNO_3$  or aq. regia but giving no ppt. with boiling  $NH_4OH$  and only a slight ppt. with  $NaOH$  at room temp.  $NiS$  is only slowly formed by repeated heating of the soln. with excess of fresh yellow  $NH_4$  sulfide soln. Salts of the type  $[Ni]_2X_2$  could not be obtained in aq. soln. Treatment of aq. III with  $Ba(OH)_2$  gave a greenish colloidal ppt. of a mixt. of  $BaSO_4$  and  $Ni(OH)_2$  in a red soln. of  $[Ni]_2(OH)_2$ . Diagrams of the crystal forms of I, II and III are given, together with the data on the forms observed, the measured and calcd. angular values and the optical properties. C. R. Addinall

**Chemical evidence for the planar structure of platotetrammines.** H. D. K. Drew and F. S. H. Head. *J. Chem. Soc.* 1934, 221-6.— $\alpha$ -Aminoethylaminoplatinous chloride (I), Pt am ae  $Cl_2$ , bright yellow,  $m. 216-6^\circ$  (decompn.), results by heating  $\beta$ - $[Pt am_2 ac_2]Cl_2$  with concd.  $HCl$ ; it dissolves in hot aq. isobutylenediamine (II) to give a mixt. of  $\alpha$ - and  $\beta$ - $[Pt ib_2]Cl_2$ ,  $NH_3$  and  $EtNH_2$  being displaced.  $[Pt am Cl_2]K$  and aq.  $EtNH_2$  in  $H_2O$  give 58% of the  $\beta$ -isomer (III), pale yellow,  $m. 206^\circ$  and  $196^\circ$  when recrystd. from dil.  $HCl$  and  $H_2O$ , resp. Evapn. the mother liquor from III or oxidizing III with  $H_2O_2$  gives  $\alpha$ -aminoethylaminoplatinous chloride, Pt am ae  $Cl_2$ , bright yellow,  $m. 238^\circ$ ; with I it gives a red compd., probably  $[Pt am ae Cl_2]_2$ .  $\alpha$ -Pt am  $ae Cl_2$ ,  $EtNH_2$  and then  $K_2PtCl_6$  give  $\alpha$ -diamminobisethylenediaminoplatinous chloroplatinite, dichroic (blue-green) needles,  $m. 211^\circ$  (decompn.); the  $\beta$ -plato salt, dull green,  $m. 202^\circ$  (decompn.). III (4 g.) in  $H_2O$ , treated with 3.5 cc. of 40% II, gives a mixt. of  $\alpha$ -(IV) and  $\beta$ -aminoethylaminoisobutylenediaminoplatinous chloride (V), sepd. by crystn. from  $EtOH$ , the yields being 25-45% IV and 20-5% V. IV forms glassy crystals and gives a plato-salt,  $C_6H_5N_4Cl_4Pt_2$ , Ag-pink rhombic or hexagonal plates; V forms spear-shaped, rhombic crystals; the plato-salt seps. in woolly masses of chamolite-colored needles. Aq.  $C_2H_5(NH_2)_2$  and III give aminoethylaminobisethylenediaminoplatinous chloride,  $[Pt am ae en]Cl_2$ ,

prismatic needles, whose platino-salt forms bundles of small violet needles.  $\beta$ -Aminopyridinoplatinous chloride, from  $C_5H_5N$  and  $K[Pt am Cl_2]$  at room temp., is yellow; with  $C_5H_5(NH_2)_2$  it gives *aminopyridinoethylenediaminoplatinous chloride*, which seps. as a monohydrate; the platino-salt,  $C_7H_{11}ON_4Cl_2Pt_2$ , forms red plates.  $EtNH_2$  gives  $\alpha$ -aminopyridinoethylenediaminoplatinous chloride,  $[Pt am py ac_2]Cl_2$ , whose platino-salt forms a monohydrate, rose pink, and anhyd. salmon-pink crystals, which can be hydrated to the rose form. The action of aq. II upon  $\alpha$ -Pt  $am_2 Cl_2$ , Pt  $ib Cl_2$  or  $K_2PtCl_4$  gives a mixt. of  $\alpha$ - $(VI)$  and  $\beta$ -bis(isobutyl)enediaminoplatinous chloride (VII), sepd. by crystn. from EtOH, the yield being 31 and 38%, resp. VI seps. from 96% EtOH or  $H_2O$  as the dihydrate; the anhyd. VI is very hygroscopic and forms a monohydrate in 1 hr. and a dihydrate in 12 hrs.; the platino-salt,  $\alpha$ - $[Pt ib_2]PtCl_4$ , deep chamois-yellow plates. VII seps. from 96 or 85% EtOH as the monohydrate; from  $H_2O$  it forms a dihydrate, but the anhyd. salt rehydrates only to the monohydrate. A slight excess of II with  $K_2PtCl_4$  at room temp. gives *isobutylenediaminoplatinous chloride*, S-yellow. The  $\alpha$ -isomer represents the *trans*- and the  $\beta$ - the *cis*-pair of positions in the plane of the metallic atom. C. J. West

**Iridium hydroxopentammines.** Bertram E. Dixon. *J. Chem. Soc.* 1934, 34 6. —Concd.  $NH_4OH$  acts on Ir aquo-pentammines to form a hydroxo series,  $[Ir(NH_3)_5(OH)]X_4$ . The individual members (a) are stronger bases than the corresponding Co salts, much stronger than those of Cr; (b) liberate  $NH_3$  from a cold soln. of  $NH_4^+$ ; (c) approach the similar Pt compds. in stability; (d) resemble the pentammine rather than the hexammine type in behavior toward Palmier's specific reagents. Details of prepn. are given. B. A. Soule

**Metallo-ammino complex compounds of nitrosulfonic acids of naphthalene and benzene.** N. N. Vorozhtzov and V. V. Kozlov. *J. Gen. Chem.* (U. S. S. R.) 3, 917-20 (1933). —By the interaction of nitrosulfonic acids of  $C_{10}H_7$  and  $C_6H_5$  with aq.  $NH_3$  in solns. of Cu and Ni salts, or by mixing the sol. Cu and Ni salts of these acids with aq.  $NH_3$ , there were pptd. pure, cryst. metallo-ammino complex compds. insol. or nearly insol. in  $H_2O$  and common org. solvents (cf. Ephraim, C. A. 14, 2309; 15, 2373; 17, 912). The structures of these complexes are  $Cu(NH_3)_4R_2^+$  and  $Ni(NH_3)_4R_2^+$  (cf. Chugaev, Werner, *et al.*). The ability of  $NO_2^-$  and halogen-substituted sulfonic acids to give such complex compds. is ascribed to their increased electroneg. character. The ability of 1,2- $O_2NC_{10}H_6SO_3H$  (I) to give most easily these complexes shows the influence of the *o*-position of the  $NO_2$  and  $SO_3H$  groups in the ring (cf. C. A. 27, 2440). The influence of the electroneg. radicals is further dis-

played by the inability of the sulfonic acids of  $C_{10}H_7$  and  $C_6H_5$  to give such insol. complexes, while  $\alpha$ - and  $\beta$ -anthraquinonesulfonic acids produce them. The sparingly sol. Cu and Ni salts of disulfonic and nitrodisulfonic acids of  $C_{10}H_7$  gave sol.  $NH_3$  complexes. Some dinitro-naphthalenesulfonic acids, such as 1,8,5- $(O_2N)_2C_{10}H_7SO_3H$ , some  $\beta$ -nitrosulfonic acids (2,1- and 2,4,8-) and 1,3- and 1,8- $O_2NC_6H_4SO_3H$  produced no complex compds.  $p$ - $(O_2N)C_6H_4SO_3H$  (II) gave no complex  $NH_3$  compds. with Ni and Co salts, but produced the insol. Cu complex. The formation of some metallo-ammino complexes with the sulfonic acids of  $\alpha$ - $C_{10}H_7NO_2$  is so highly sensitive that the reaction can be used for detection and detn. of Cu and Ni and nitrosulfonic acids. All complex compds. prepd. lose some  $NH_3$  at room temp. and all the  $NH_3$  at  $110^\circ$ . By substituting aromatic and aliphatic amines for  $NH_3$  in the reaction, there were obtained ppts. of the salts of the corresponding  $\alpha$ - $O_2NC_{10}H_6SO_3H$  and amines free from Cu and Ni. By addn. of  $NH_4Cl$  or  $(NH_4)_2SO_4$  to a soln. of Cu salt of an  $\alpha$ - $O_2NC_{10}H_6SO_3H$  or  $O_2NC_{10}H_6SO_3H$  there were obtained cryst., sol. and ionized ppts. of the type  $(NH_4)_2SO_4 \cdot CuR_2$  (cf. Gmelin-Kraut, *Handbuch anorg. Chem.* 5, 876). The sensitiveness of the following reactions is given in parts of Cu, Ni or Co in parts of  $H_2O$ . (1,2- $O_2NC_{10}H_6SO_3$ ) $_2Cu(NH_3)_4 \cdot 2H_2O$ , m.  $241^\circ$  (decompn.), blue-violet plates; sensitiveness 1:58,000. Na salt of I gave with  $NH_3$  and  $CuSO_4$  a gray isomer, m.  $248^\circ$ , with the same empirical formula. (1,2- $O_2NC_{10}H_6SO_3$ ) $_2Ni(NH_3)_4$ , a white ppt. from dil. solns. and green needles from concd. solns. (the Ni- $NH_3$  complex compds. have no definite m. p.); the sensitiveness is 1:120,000. The Co- $NH_3$  complex of I formed microscopic prisms; the sensitiveness is 1:15,000. The Cu- $NH_3$  complex of 1,5- $O_2NC_{10}H_6SO_3H$  obtained from highly concd. solns. in long, colorless needles, was not analyzed (1,6- $O_2NC_{10}H_6SO_3$ ) $_2Cu(NH_3)_4 \cdot 4H_2O$ , light-blue crystals without a definite m. p., the anhydrous product is colorless; the sensitiveness is 1:18,000. (1,6- $O_2NC_{10}H_6SO_3$ ) $_2Ni(NH_3)_4$ , greenish prisms; the sensitiveness is 1:100,000. The Co- $NH_3$  complex of 1,6-acid is sensitive 1:25,000 (1,7- $O_2NC_{10}H_6SO_3$ ) $_2Cu(NH_3)_4 \cdot 2.5H_2O$ , m.  $242^\circ$  (decompn.), green needles; (1,7- $O_2NC_{10}H_6SO_3$ ) $_2Ni(NH_3)_4$  bluish gray needles, the sensitiveness is 1:700; the Co- $NH_3$  complex of the 1,7-acid formed irregular needles; the sensitiveness is 1:750. 1,8- $O_2NC_{10}H_6SO_3H$  formed dark-green solns. of Cu- $NH_3$  complex without pptn., gold plates of the Ni- $NH_3$  complex with a sensitiveness of 1:17,000, and small needles of Co- $NH_3$  complex from highly concd. solns. ( $p$ - $O_2NC_6H_4SO_3$ ) $_2Cu(NH_3)_4$ , m.  $270^\circ$  (decompn.), violet needles; the sensitiveness 1:400 ( $NH_4$ ) $_2SO_4 \cdot Cu(1,2-O_2NC_{10}H_6SO_3)_2$  was not further investigated. Chas. Blanc

## 7--ANALYTICAL CHEMISTRY

W. T. HALL

**Qualitative analysis without hydrogen sulfide.** L. A. Munro. *J. Chem. Education* 11, 242-5 (1934).—See C. A. 28, 1297<sup>4</sup>. G. G.

**Inclusion of rarer metals in elementary qualitative analysis.** I. Inclusion of tungsten and molybdenum in Groups I and II. Lyman K. Porter. *Ind. Eng. Chem., Anal. Ed.* 6, 138-9 (1934).—When 10 mg. of W or 20 mg. of Mo is present, students experience no difficulty in detecting them. Only slight modifications of the conventional procedure are necessary. These are described. W. T. H.

**Notes on quantitative microanalysis.** Friedrich Hecht. *Mikrochemie* 14, 283-5, 286-8 (1934); cf. C. A. 28, 64<sup>4</sup>.—A. A. Benedetti-Pichler. *Ibid.* 285-6, 288.—Polemical. W. T. H.

**Electroanalysis.** H. Hölemann. *Z. anal. Chem.* 96, 193-209 (1934).—A review of 44 papers published during the last 2 years. W. T. H.

**Microchemical notes.** X. L. Rosenthaler. *Mikrochemie* 14, 268-70 (1934); cf. C. A. 27, 3776; 28, 63<sup>4</sup>.—

Helpful hints are given with respect to the crystalline appearance of  $BaSO_4$ ,  $SrSO_4$ , and  $CaSO_4$  under the microscope. W. T. H.

**New method of preparative microchemistry.** Joachim Winkelmann. *Mikrochemie* 14, 171-80 (1934).—The technique required in prepg. suitable microscope slides with preps. on them is described in detail. W. T. H.

**An experiment in utilizing a new principle in ultimate analysis by the microchemical method.** Karl Schwarz. *Mikrochemie* 14, 271-9 (1934).—An app. is shown in which some gas volumetric studies were made of the gases from the combustion furnace. The gases contain  $O_2$ ,  $H_2O$  and  $CO_2$  for the most part. It would seem to be fairly easy to base the compn. of the substance burned upon the content of  $H_2O$ ,  $CO_2$ , and sometimes N (in the case of substances contg. N). The studies were not completed and cannot be continued at this time, but considerable preliminary work is described. W. T. H.

**Retention of dithionates by glassware after exposure to potassium dichromate cleaning solution.** Edwin P. Laug.

*Ind. Eng. Chem., Anal. Ed.* 6, 111-12(1934).—The safest and quickest way to remove all traces of cleaning soln. from glassware consists in boiling with several successive changes of water; at least 15 min. is allowed for each treatment. If such pains are not taken, enough chromic acid may remain to interfere with biol. work.

W. T. H.

The application of potential-forming systems of metal/metal ion for potentiometric titrations. Erich Müller and Kurt Mehlhorn. *Z. anal. Chem.* 96, 173-5(1934); cf. Brintinger and Jahn, *C. A.* 28, 71<sup>1</sup>.—A somewhat different explanation of the reactions is given.

W. T. H.

2,4-Dinitrophenylhydrazine as a quantitative reagent for benzaldehyde. R. E. Houghton. *Am. J. Pharm.* 106, 62-4(1934).—Dissolve 0.1 g. of aldehyde in 5 cc. EtOH. Dil. with 50 cc. water and add, while stirring, 50 cc. of a soln. of 0.25 g. 2,4-dinitrophenylhydrazine in 1.8 N H<sub>2</sub>SO<sub>4</sub>. When the ppt. has settled, filter, wash with 2 N H<sub>2</sub>SO<sub>4</sub>, dry at 110° and weigh.

W. G. Gaessler

Colorimetric determination of antimony in copper. A. A. Vasil'ev and M. E. Shub. *J. Applied Chem.* (U. S. S. R.) 6, 500-2(1933).—Clarke's method (*C. A.* 22, 3369) for detg. Sb on Cu metal is modified slightly. Instead of pptg. the Sb on Cu and stripping off the deposit with Na<sub>2</sub>O<sub>2</sub> and water, it is preferred to ppt. the Sb with MnO<sub>2</sub>·H<sub>2</sub>O or with Fe(OH)<sub>3</sub>. Moreover, instead of measuring the color produced in the aq. soln. by the reaction of Sb<sup>+++</sup>, pyridine and iodide, it is recommended to ext., the yellow org. compd. with AmOH and measure the color of this soln.

A. A. Boetlingk

Determination of traces of bismuth in presence of other metals. L. A. Haddock. *Analyst* 59, 163-8(1934).—If org. matter is present, destroy it by wet combustion, using H<sub>2</sub>SO<sub>4</sub> and 30% H<sub>2</sub>O<sub>2</sub>. Transfer the neutral or acid soln. to a sepg. funnel and add 2 g. of citric acid, or, if very much Fe is present, use as much as 10 g. Add concd. NH<sub>4</sub>OH until nearly neutral to litmus, keeping cold by running water. Add 10 ml. of 6 N NH<sub>4</sub>OH and to this alk. soln. add 2 g. of KCN, or more when large quantities of Cu, Ag, etc., are present. Shake vigorously with 4 sep., 15-ml. portions of 0.1% diphenylthiocarbazon in CHCl<sub>3</sub>. Wash each CHCl<sub>3</sub> ext. with 10 ml. of water in another sepg. funnel and transfer all the portions to a 100-ml. Kjeldahl Pyrex flask. Evap. the solvent, add 1 ml. of concd. H<sub>2</sub>SO<sub>4</sub> and heat carefully with 30% H<sub>2</sub>O<sub>2</sub> until all org. matter is oxidized. Transfer to a sepg. funnel with 20 ml. of water, well cooled. Add dil. 1, soln. dropwise to remove any SO<sub>2</sub> present. After this add 4 drops of approx. 5% SO<sub>2</sub> water, 2 ml. of 30% H<sub>3</sub>PO<sub>4</sub> and 5 ml. of fresh 10% KI soln. Shake with 3-ml. portions of a mixt. of 3 parts AmOH and 1 part EtOAc to dissolve the HBiI<sub>4</sub>. The final ext. should be nearly colorless. Collect all the exts. in a graduated cylinder and compare with standards prepd. from 0.001% Bi soln. and extd. similarly. The method is suitable for detg. 0.005-0.1 mg. of Bi. Not more than 0.5 mg. of Pb or Tl should be present.

W. T. H.

Analytical reactions of cesium and rubidium. Wm. J. O'Leary and Jacob Papish. *Ind. Eng. Chem., Anal. Ed.* 6, 107-11(1934).—After studying various reagents, it was found that a satisfactory sepn. of Cs and Rb from K can be made by treatment with luteophosphomolybdic acid which does not ppt. K when not more than 1 g. of KCl is present. To det. Cs and Rb in the ppt., the Mo is removed by pptn. with H<sub>2</sub>S under suitable conditions and the Ce + Rb are pptd. together with H<sub>2</sub>PtCl<sub>6</sub>. The ppt. is treated with water and hydrazine salt to reduce the Pt and the Cs is pptd. as silicotungstate. The Cs in the ppt. and the Rb in the filtrate are detd. as chloroplatinates after removing the silicotungstate by pptn. with HgNO<sub>3</sub>. The results obtained were within about 2% of the truth.

W. T. H.

New color test for cobalt. Eduardo F. Brau. *Rev. facultad cienc. quim.* (Univ. La Plata) 8, Pt. 2, 65 70(1933).—In Chiarottino's test for Co (*C. A.* 27, 2396) diimidine, tollidine, 2,7-diaminodibenzofuran, or 2,7-diaminofluorene may be used in place of benzidine.

L. E. Gilson

Copper beads. Hans Rakett. *Z. anal. Chem.* 96, 192-3(1934).—As little as 0.001 mg. of Cu can be detected by the bead test.

W. T. H.

Determination of small quantities of copper by measuring the catalytic effect. Friedrich L. Hahn. *Mikrochemie* 14, 240-2(1934).—Further information is given concerning the effect of traces of Cu in accelerating the reaction between Fe(CNS)<sub>3</sub> and Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (cf. Hahn and Leimbach (*C. A.* 17, 701) and Pavelka and Morth (*C. A.* 28, 66<sup>4</sup>)).

W. T. H.

Effect of nitric acid on the determination of iron with permanganate. D. Totoiescu. *Z. anal. Chem.* 96, 183-8(1934).—Further evidence is furnished to the effect that if a soln. contg. small quantities of HNO<sub>3</sub> is reduced by Zn and the reduced soln. titrated with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, the results in detg. Fe are too high. The HNO<sub>3</sub> is reduced for the most part to NH<sub>4</sub>OH.

W. T. H.

Notes on iodometry. I. Microdetermination of iron. F. Rappaport and R. Hohenberg. *Mikrochemie* 14, 119 28(1934).—Transfer the sample (0.2-2.0 mg. of Fe) and 2 cc. of 20% H<sub>2</sub>SO<sub>4</sub> to a specially designed flask with thick walls and glass connections to a flask contg. water for a steam distn., to a dropping funnel and to a receiver contg. 2 cc. of a cold mixt. of 20 cc. N NaOH + 15 cc. of 2% Na<sub>2</sub>SO<sub>3</sub> soln. Introduce steam into the flask until the exit tube is hot and all air is removed. Add through the dropping funnel 2 cc. of a soln. made by dissolving 0.01 mg. of pure KI in 20 cc. of 20% CdSO<sub>4</sub> soln. Distil with steam for 2 min. This causes the reduction of the Fe<sup>+++</sup> to Fe<sup>++</sup> with liberation of an equiv. quantity of I<sub>2</sub> which is carried over into the receiver by the steam. Lower the receiver and distil for another 2 min. to rinse out all the soln. from the tubing which was previously immersed in the sulfite soln. To the contents of the receiver add 5 drops of indicator soln. prepd. by dissolving 10 mg. of methyl red in 10 cc. of N NaOH and 100 cc. of water. Now, to oxidize all I<sup>-</sup> to IO<sub>3</sub><sup>-</sup>, add 20% H<sub>2</sub>SO<sub>4</sub> dropwise to acid reaction followed by 3 cc. of 15% NaOAc soln. and a soln. of 3 cc. Br<sub>2</sub> in 100 cc. of glacial AcOH until the soln. has a yellow color due to excess Br<sub>2</sub>. After 2 min. remove the excess Br<sub>2</sub> by adding concd. HCO<sub>2</sub>H until the color of Br<sub>2</sub> is lost: Br<sup>-</sup> and CO<sub>2</sub> are formed. Suck out any Br<sub>2</sub> fumes from the flask by means of the suction pump, and add 2 cc. more of 20% H<sub>2</sub>SO<sub>4</sub>. Add a little KI, to reduce IO<sub>3</sub><sup>-</sup> to I<sub>2</sub> and titrate with 0.005 N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> with starch as indicator. If the Fe is present in org. material, first treat with concd. H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>O<sub>2</sub>. To avoid trouble due to excess H<sub>2</sub>O<sub>2</sub> add a little Ti(SO<sub>4</sub>)<sub>2</sub> which acts as a catalyst for destroying org. material and forms with H<sub>2</sub>O<sub>2</sub> a peroxide which is decompd. more easily than H<sub>2</sub>O<sub>2</sub> itself.

W. T. H.

Determination of small amounts of lead. Karl Seelkopf and Harald Toeger. *Z. ges. expl. Med.* 91, 539-48(1933).—The electrolytic micro method for Pb of Schmidt (*C. A.* 27, 2741) was tested and found less accurate than the method of Bohnenkamp and Linnewech (*C. A.* 27, 5680).

Milton Levy

Titrimetric determination of magnesium with o-hydroxyquinoline in the brine from salt lakes. N. V. Komar and R. E. Kirillova. *J. Applied Chem.* (U. S. S. R.) 6, 358-61(1933).—In detg. Mg with 8-hydroxyquinoline the pptn. must be repeated. The soln. must contain NH<sub>4</sub><sup>+</sup> salts and be hot. The procedure is described.

A. A. B.

Potentiometric determination of nickel in steel by potassium cyanide. W. Hiltner and W. Grundmann. *Arch. Eisenhüttenw.* 7, 461-4(1934).—The possibility of cyanometric detn. of Ni by means of the AgI-Ag<sub>2</sub>S electrode is discussed and expts. described which show that the latter is useful as indicator electrode for cyanogenic ions even in the presence of oxidizing agents.

M. H.

New spot test for potassium. N. S. Poluektov. *Mikrochemie* 14, 265-6(1934).—The Na or NH<sub>4</sub> salt of [C<sub>2</sub>H<sub>5</sub>(NO<sub>2</sub>)<sub>2</sub>]<sub>2</sub>NH is sold as a dye under the name "aurantia." The amine itself is sol. in dil. NaOH or NH<sub>4</sub>OH, forming a strongly colored orange-yellow soln. On adding acid, yellow flakes of the amine are pptd. If to the slightly alk. soln. a little K<sup>+</sup> is added an orange-red cryst. ppt. is formed. The reaction can be carried out

conveniently as a spot test on filter paper. As reagent, dissolve 0.3 g. of the dye in 2 cc. of  $N Na_2CO_3$  and 20 cc. of water heated to boiling. Add a drop of the soln. to be tested to filter paper and promptly follow with a drop of the reagent. 0.003 mg. of K can be detected. Also in *Kali* (U. S. S. R.) 1933, No. 10, 44. W. T. H.

**Determination of potassium by the cobalt nitrite method.** O. M. Kosman. *J. Applied Chem.* (U. S. S. R.) 6, 362-6 (1933).—The use of the cobaltinitrite method is advocated, and detailed directions are given for obtaining a ppt.  $K_2Na[Co(NO_2)_6] \cdot 6H_2O$  of definite compn. A. A. B.

**Detection of sodium with uranyl acetate.** L. Rosenthaler. *Mikrochemie* 14, 267 (1934).—The difficulties encountered in the testing for Na in the presence of  $KNO_3$  (cf. C. A. 27, 2902) were due to the fact that the  $NaNO_3$  assumed to be present was really  $KNO_3$ .

W. T. H.

**Detection and microdetermination of silver, mercury and iodides.** I. M. Korenman. *Mikrochemie* 14, 181-8 (1934).—When starch reacts with free  $I_2$  in the presence of iodide, a blue color is produced. The addn. of  $Hg^{++}$  or  $Ag^+$  causes the blue color to disappear and yellow  $HgI_2$  or  $AgI$  is formed of which the color is much less intense. It is shown that this behavior can be made the basis for the detection and detn. of small quantities of  $Hg^{++}$ ,  $Ag^+$  or  $I^-$ .

W. T. H.

**Determination of fluorine.** M. Frommes. *Z. anal. Chem.* 96, 211-23 (1934).—A review of about 40 recent papers.

W. T. H.

**The colorimetric determination of traces of fluorine.** L. Szegő and B. Cassoni. *Giorn. chim. ind. applicata* 15, 599-602 (1933).—In detg. F by the colorimetric method according to Steiger (C. A. 2, 1104) volatilization of  $SiF_4$  is incomplete in the presence of large amts. of colloidal  $SiO_2$ , whereas, with  $Na_2SiF_6$ , it is complete. A. W. C.

**Detection and estimation of small amounts of fluorine.** Application of the zirconium purpurin test. I. M. Kolthoff and Maurice E. Stansby. *Ind. Eng. Chem., Anal. Ed.* 6, 118-21 (1934).—The qual. test for F described uses a modification of the de Boer-Bussart reagent and is sensitive to 0.003 mg. of fluoride. Various anions have an interfering effect. A simple distn. method is described by which 0.005 mg. of F can be detected in the presence of any cation or anion. A procedure for the titration of 0.5 to 15 mg. of F, in which  $ZrOCl_2$  is used as reagent and purpurin as indicator, is accurate to 2%. A colorimetric method for quantities of F between 0.01 and 0.05 mg. is also described which is accurate to 0.002 mg. of F. In the presence of interfering substances the F is sepd. by a distn.

A. L. Henne

**Determination of iodine.** P. Kuhn and A. Loeser. *Arch. expl. Path. Pharmacol.* 170, 609 (1933).—A reply to criticism (Barkan and King, *ibid.*, C. A. 27, 2168).

B. C. A.

**Determination of mercury in air and in urine.** A. M. Fraser. *J. Ind. Hyg.* 16, 67-77 (1934).—Air is passed through a tube in solid  $CO_2$  and ether and the Hg condensed and weighed. The Hg is converted to  $HgCl_2$  by use of aq.  $Cl_2$ , then pptd. as  $HgS$ , redissolved, deposited electrolytically and weighed on a microbalance. To det. Hg in the ash of urine, the acid ext. is treated with  $H_2S$ , the ppt. dissolved in aqua regia and the Hg pptd. on Fe wire from a soln. contg.  $CuSO_4$  and  $KCl$ . The Hg is volatilized in a capillary tube and the diam. of the condensed droplet measured. If over 0.20 mg. of Hg is present the electrolytic method is preferred. A. L. E.

**Rapid method for the determination of phosphorus in copper and copper-zinc alloys.** A. A. Vasil'ev and Z. V. Churilina. *J. Applied Chem.* (U. S. S. R.) 6, 563-6 (1933).—Slight modifications of known methods are suggested whereby satisfactory results can be obtained with weighing of the yellow phosphomolybdate ppt.

A. A. Boettingk

**Determination of sulfur in steel by Herwig's method.** B. Sosnovskii and P. Telnikh. *Steel* (U. S. S. R.) 1933, No. 3, 128-9.

H. W. Rathmann

**Synthetic cryolite analysis.** F. J. Frere. *Ind. Eng. Chem., Anal. Ed.* 6, 124-5 (1934); cf. C. A. 27, 928.

**Synthetic cryolite differs from the native product in not contg. the various constituents in definite proportions.** In the hope of eventually establishing a satisfactory procedure for the complete analysis, expts. were performed to det. the soly. of natural cryolite in aq.  $Na$  solns. It was found that no cryolite dissolves if the soln. contains 0.1 g.  $NaF$  in 100 cc. If, therefore, a synthetic cryolite contains  $NaF$  in excess of that required to form  $Na_3AlF_6$ , the excess  $NaF$  will dissolve in the dil.  $Na$  soln. and can be detd. by the method already described. The procedure fails if sol.  $Al$  salt is present. Expts. are also described in which known methods for detg.  $Na$  and  $H_2O$  were tested. W. T. H.

**Volumetric determination of chromic oxide in its compounds.** I. Yumánov. *J. Chem. Ind. (Moscow)* 1933, No. 9, 61.—The sample is heated in  $NaOCl$  soln. and the  $CrO_4^{--}$  formed is titrated with  $KI$  and  $Na_2S_2O_3$ .

H. M. Leicester

**New potentiometric method for analyzing mercurous salts.** G. Spacu and P. Spacu. *Z. anal. Chem.* 96, 188-92 (1934).—The method depends upon the pptn. of  $Hg_2(IO_3)_2$  in a vol. of about 80 cc. of 30%  $EtOH$ . A. indicator electrode a Pt wire coated with  $Hg$  is used against a normal calomel cell. If the soln. is more dil., e. g., 0.01 M, the results are inaccurate because the indicator electrode becomes passive.

W. T. H.

**Action of sodium amide on silicates and refractories.** P. Victor Peterson and F. W. Bergstrom. *Ind. Eng. Chem., Anal. Ed.* 6, 186-8 (1934).—If silicates, glasses, and certain refractories are ground to pass through a 200-mesh sieve, they can be decompd. by fusion with  $NaNH_2$  at 300-375°. A 100-cc. Ni crucible is recommended and an elec. muffle through which  $NH_3$  gas is passed. After the fusion, the  $SiO_2$  can be detd. in the usual way.

W. T. H.

**Gas-volumetric determination of lead dioxide.** M. L. Blanc and E. Eberius. *Z. anal. Chem.* 93, 447 (1933), cf. C. A. 26, 4768; 28, 1301<sup>9</sup>.—Polemical. B. C. A.

**Hypochlorite determinations.** F. K. Revva and V. V. Illarionov. *J. Applied Chem.* (U. S. S. R.) 6, 568-70 (1933).—A comparative study was made of the bromate and permanganate methods. Both are capable of giving good results, but  $HCl$  is better than  $H_2SO_4$  for making the soln. acid.

A. A. Boettingk

**Detection of carbon monoxide.** Fritz Bayer. *Berg- und Hüttenmännisches Jahrb.* 81, 135-9 (1933).—The newer methods are reviewed and described with particular reference to the reaction with  $I_2O_5$  and to the reduction to  $CH_4$ .

M. Hartenheum

**Oxidation of nitric oxide in small concentrations and its determination.** V. P'yankov. *J. Gen. Chem.* (U. S. S. R.) 3, 652-9 (1933).—Studies of the air in factories and mines by the Griess method for detg.  $N_2O_3$  in  $NaOH$  soln. through which the air was passed, disclosed the fact that  $NO$  in small concns. is oxidized rapidly to  $N_2O_3$  and more slowly to  $NO_2$ . When 0.6 mg.  $NO$  per l. of air is present, 95% is converted to  $NO_2$  in 2.5 hrs. Chas. Blanc

**A rapid method of dust sampling and approximate quantitation for routine plant operation.** Theodore Hatch and E. Ward Thompson. *J. Ind. Hyg.* 16, 92-9 (1934). A method based on the use of the Owens' counter is described.

A. L. Eldor

**The interferometer in air protection (use of the interferometer in measuring low concentrations of toxic gases).** Hans Görlacher. *Gasschutz u. Luftschutz* 4, 19 (1934). On the basis of some preliminary expts. and theoretical considerations the use of the Zeiss interferometer is suggested as a convenient method of detg. low concns. of foreign gases in the atmosphere.

A. L. Kibler

**The colorimetric determination of sodium in vegetation.** J. G. Louw. *Onderstepoort J. Vet. Sci.* 1, 425-34 (1933).—The procedure of Malan and van der Lingen (C. A. 27, 5358) was tested and found satisfactory for detg. 0.04-0.1 mg.  $Na$  in the presence of 0.1 mg.  $P$ . Not more than 0.8 mg. of  $K$  should be present.

K. D. Jacob

**Quantitative spectrophotoelectric analytical method applied to solutions of chlorophylls a and b.** F. Paul Zscheile, Jr. *J. Phys. Chem.* 38, 95-102 (1934).—By the

recently developed method (C. A. 28, 2623<sup>1</sup>) quant. light-absorption data were obtained for pure chlorophylls *a* and *b* and their mixts. The accuracy of the detn. of the compn. of mixt. is better than 1.0%. Exptl. details are discussed which are essential for a high degree of accuracy.

Howard Agnew Smith  
Use of Benedict's solution for the micro detection of sugar in urine and other solutions. Henry Tauber. *Mikrochemie* 14, 169-70 (1934).—Use 0.05 cc. of the clear or filtered urine in a tiny test tube and 0.5 cc. of Benedict's soln. As little as 0.1% glucose can be detected in a sample of 0.05 cc.

W. T. H.  
Methods of organic chemical analysis by hydrogenation and some oxidation methods of analysis. H. ter Meulen. *Rec. trav. chim.* 53, 118-25 (1934).—Recent changes in the app. and catalysts used in hydrogenation methods are described. The changes affect the detn. of O, N, S, Hg, As and Cd. Improvements have also been made in the technic of detg. C and H by combustion with  $MnO_2$  or  $PbO_2$  to absorb  $SO_2$  and for detg. S in gasoline. The experience of the lab. at Delft with methods published elsewhere is described.

W. T. H.  
Calorimetric analysis. II. Testing the purity of organic substances. R. N. M. A. Malotaux and J. Straub. *Rec. trav. chim.* 53, 128-40 (1934).—In the previous paper (C. A. 27, 2007) app. and technic were described for detg. melting and solidification lines which show the quantities of heat liberated or evolved during a run. In the present paper it is shown that a practical application of the method is the detn. of the purity of org. substances. The theoretical form of the melting curve is shown and the effect of impurities upon it. The purity of various chemicals was tested and concordant results were obtained and in cases where a definite quantity of impurity had been added, the results were found to be accurate. The substances studied were nitrotoluene, guaiacol, indole,  $\alpha$ -naphthylamine, azobenzene, benzophenone, stearic acid, triglycerides from tallow and lard and dihenzyl.

W. T. H.  
Determination of iodine in organic compounds. Joseph I. Goldberg. *Mikrochemie* 14, 161-6 (1934).—The conversion of the I to inorg.  $I^-$  can be accomplished satisfactorily by the method given in Pregl's book but without the addn. of bisulfite. Wash the carbonate soln. into an Erlenmeyer flask, neutralize to methyl orange with  $N H_2SO_4$  and add 0.1 cc. in excess. The total vol. at this point should not exceed 75 cc. Add 1 cc. of satd.  $Br_2$  water, shake and allow to stand 2 min. Then remove excess  $Br_2$  by adding 1 cc. of 5% phenol which contains no quinone. Shake again and after 2-3 min. add 1 g. of KI and titrate with thiosulfate. Excellent results were obtained with 5-7 mg. portions of materials contg. 10-70% I.

W. T. H.  
Detection and determination of small quantities of cholesterol and of  $\alpha$ - or  $\beta$ -stearins. Alfred Wasitzky. *Mikrochemie* 14, 289-310 (1934).—A review.

W. T. H.  
New micro method for detecting monoses in the pres-

ence of reducing biose. Henry Tauber. *Mikrochemie* 14, 167-9 (1934).—To 1 drop of neutral monose-biose soln. suitably diluted so that not more than 1.25 mg. per cc. is present (2.5 mg. of sucrose can be present) add 1 drop of a new reagent which is prepd. by dissolving 24 g.  $Cu(OAc)_2$  in 450 cc. of boiling water, adding 25 cc. of 8.5% lactic acid after filtering, shaking, filtering again and dilg. to 500 cc. Add the same reagents to 0.05 cc. of water in another small test tube. Heat the 2 tubes for 8 min. in boiling water and allow to cool for 2 min. Then add to each 1 drop of  $MoO_3$  soln. (150 g.  $MoO_3$  + 75 g.  $Na_2CO_3$  in 500 cc. Filter, add 800 cc. of 85%  $H_3PO_4$  and, when cool, dil. to 1 l). Shake and after 2 min. add 10 drops of distd. water. A blue color shows the presence of a monose. In the case of a biose, both solns. will be green.

W. T. H.  
Influence of hydrogen peroxide on the determination of glucose by the Bertrand method. A. Malkov. *J. Applied Chem.* (U. S. S. R.) 6, 567 (1933).—If  $H_2O_2$  is present, the glucose results are high.

A. A. Boetlingk  
Quantitative estimation of furfural at 0° with bromine. Elizabeth E. Hughes and S. F. Acree. *Ind. Eng. Chem., Anal. Ed.* 6, 123-4 (1934).—Treat furfural at 0° for 5 min. with an excess of 0.1 N  $KBrO_3$  in the presence of KBr and 3% HCl. The furfural combines with 1 mol. of  $Br_2$ . Det. the excess oxidant by treating with KI and titrating with  $Na_2S_2O_3$  soln.

W. T. H.  
Determination of amino acids by titration with formalin. N. I. Bulgakov. *J. Applied Chem.* (U. S. S. R.) 6, 375-9 (1933).—As buffer soln. borax is better than  $Na_2HPO_4$  for titrating amino acids with  $HCHO$ . The soln. should have  $pH = 9.00$  at the end point.  $CO_2$  must be absent. The procedure is described.

A. A. Boetlingk  
Detection of tri(hydroxyethyl)amine and a new reaction of cobaltous salts. F. Garelli and A. Tettamanzi. *Industria chimica* 8, 577-8 (1933).—Solns. of  $CoCl_2$  or  $CoSO_4$  give with  $N(C_2H_4.OH)_3$  an intense violet-pink color. This can be used to detect the base at concns. as low as 1:2000. The base can also be used to detect 1 part of  $Co^{II}$  in 15,000 parts of soln.

B. C. A.  
Mol. diffusion of light in fluorescent liquids [detn. of small amts. of quinine] (Canals, Peyrot) 3.

Lunge, Geo.: Technical Gas Analysis. Rewritten by H. R. Ambler. London: Gurney & Jackson. 410 pp. 21s.

Starck, H. P.: Volumetric Analysis. London: Baillière, Tindall & Cox. 228 pp. 7s. 6d.

Separating manganese from calcium, magnesium, iron and aluminum in the analysis of manganese ores. I. A. Ivanov. *Russ.* 31, 427, Oct. 31, 1933. After the usual treatment with acids the sepn. of  $SiO_2$  and the pptn. of Fe and Al and heating of the soln. with alkali acetate, Mn is pptd. with  $K_2Cr_2O_7$  in a weakly acidic soln., and this is followed by neutralization with  $NH_4OH$ .

## • 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIERER

The pyrite-marcasite relation. M. J. Buerger. *Am. Mineral.* 19, 37-61 (1934).—A critical study of available analyses indicates that pyrite corresponds closely to ideal  $FeS_2$ , while marcasite is definitely S-low. Comparison of unit cell ds. with detd. ds. shows that the excess Fe is present as proxy solid soln. The relation of the 2 minerals is primarily a chem. one. In the formation of marcasite in acid soln. the function of the  $H^+$  seems to be to remove some of the S from the normal  $FeS_2$  groups, forming  $H_2S$  and S-deficient  $FeS_2$ .

A. M. Brant  
A recent find of bixbyite and associated minerals in the Thomas Range, Utah. Arthur Montgomery. *Am. Mineral.* 19, 82-7 (1934).—Small black cubes of bixbyite occur in rhyolite, assocd. with topaz, garnet, beryl, etc.

A. M. Brant

Crystallographic study of Hungarian calcites. Maria Vendl. *Math. naturw. Anz. ungar. Akad. Wiss.* 49, 167-78 (1932).

S. S. de Finály  
Zoisite and other minerals included in mica from Spruce Pine, North Carolina. George M. Hall. *Am. Mineral.* 19, 76-80 (1934).—Zoisite occurs as long flat needle crystals parallel to the cleavages or as fibrous spherical masses penetrating the mica. Biotite, magnetite and garnet are also found as inclusions.

A. M. Brant  
Allanite from Wyoming. R. C. Wells. *Am. Mineral.* 19, 81-2 (1934).—Analysis shows the presence of Th 1.12%, U 0.01% and Pb 0.102%.

A. M. Brant  
Sorption of gas by mineral. IV. Zeolites and bentonite. Jitsusaburo Sameshima and Hachiro Hemmi. *Bull. Chem. Soc. Japan* 9, 27-41 (1934); cf. C. A. 26,

8978.—Data are given for the sorption of  $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{SO}_2$ ,  $\text{C}_2\text{H}_6$ , O and H at  $0^\circ$  and  $25^\circ$  and 1 atm. by dehydrated laumontite, stilbite, mordenite (a), natrolite, apophyllite, analcite (b), inesite and bentonite (c). Apart from b, all samples sorb much  $\text{NH}_3$ , the sorption being of the chem. type except with a and c; a is a sorbent of the chabazite class, c of the silica gel class.

**The genesis of titanite crystals.** K. Obenauer and H. Behmenburg. *Centr. Mineral. Geol.* A1934, 47-55.—The frequencies of occurrence of zones and faces are statistically evaluated. The 29 genetic types listed by Bauer (*Mineralog. petrog. Mitt.* 43, 319-31 (1933)) are reduced to 5. The simplest types are found to be mineralogenetically oldest.

**A natural mineral gel from Vashegy.** László Zombory. *Földtani Közlöny* 63, 219-20 (1933).—A natural mineral gel, a transparent, brownish thick liquid, contained insol. 0.08,  $\text{SiO}_2$  2.07,  $\text{Fe}_2\text{O}_3$  11.32,  $\text{Al}_2\text{O}_3$  19.58, CaO 1.68, MnO 1.60,  $\text{SO}_3$  37.89,  $\text{P}_2\text{O}_5$  6.25, Cl 1.26,  $\text{H}_2\text{O}$  18.36, sum 100.11%. This compn. corresponds to  $(\text{Fe}, \text{Al})_2\text{O}_3 \cdot 2\text{SO}_3 \cdot x\text{H}_2\text{O}$  or  $(\text{Fe}, \text{Al})_2\text{O}_3 \cdot 3\text{SO}_3 \cdot y\text{H}_2\text{O} + n(\text{Fe}, \text{Al})(\text{OH})_3$ . It may have been formed by the oxidation and hydrolysis of decompg. sulfidic ores. The gel probably was chiefly a mixt. of Fe and Al sulfates. Also in *Centr. Mineral. Geol.* 1934A, 90-1.

**A hydrothermal deposit in Wayne County, Missouri.** W. A. Tarr and Joseph J. Bryan. *Econ. Geol.* 29, 84-92 (1934).—Intense hydrothermal alteration has almost completely altered granite to sericite, epidote and chlorite for short distances from the joints. Sphalerite and a little pyrite and galena were introduced during the closing stages.

**New observations on the ores of the basin of the Niari.** A. E. F. V. Lebedeff and G. Choubert. *Compt. rend.* 198, 484-6 (1934).—The ores contain Zn, Pb and Cu. The principal minerals are calamine, willemite, galena, chalcocite, diopside, etc. Less common are descloizite, vanadinite, phosgenite and wulfenite.

**The molybdenum mine at Azegour, Morocco.** Arnold Heim. *Econ. Geol.* 29, 76-83 (1934).—Pneumatolytic molybdenite assoc. with garnet occurs in a metamorphosed limestone near a granite batholith. It forms disseminated grains and rosetts and is rarely found in pockets. The ore averages 1.2%  $\text{MoS}_2$ .

**Survey of the character of the petroleum deposits of Roumania.** L. Mrazec. *Intern. Bohrtech., Erdolbergbau u. Geol.* 41, 229-34, 239-45 (1933).—The historical geology and stratigraphy are treated with a view to aiding in search for oil. About 50% of the petroleum now produced in the world comes from Tertiary formations. The oil facies is characterized by the presence of liquid and gaseous hydrocarbons together with "old" or fossil salt water. The water is high in Br and I, the I indicating the org. origin of the oil. The gaseous hydrocarbons probably far exceed the liquid in total wt. The older deposits appear to be highest in said. hydrocarbons, which represent the most stable equil. between C and H. E. E. C.

**The origin and migration of petroleum.** Karl Kröjci-Graf. *Intern. Z. Bohrtech., Erdolbergbau u. Geol.* 41, 101-5, 203-10 (1933); cf. C. A. 28, 9961. A summary of hypotheses.

**The origin of iodine and bromine in oil-bearing waters.** A. P. Vinogradov. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1, 214-15 (in English 216) (1934).—The oil-bearing waters of the Caucasus and the marine muds of the Black, Barents and Kara Seas contain 0.003-0.02% I and 0.0025-0.007% Br. The origin of the I is in the fossil mud of marine bottoms.

**The mode of intrusion of deep-seated alkaline bodies.** Helge G. Backlund. *Bull. Geol. Inst. Univ. Upsala* 24, 1-24 (1933).—Evidence favors the theory of gravity differentiation of a single magma (cf. Bowen, *The Evolution of Igneous Rocks*). The conical shape often assumed by these intrusive bodies is explained by the assumption of convection currents (cf. Holmes, C. A. 25, 4496).

**Chemical analyses of Swedish rocks.** Walter Larsson. *Bull. Geol. Inst. Univ. Upsala* 24, 47-196 (1933).—A com-

pilation and classification of 1004 analyses of Swedish silicate rocks. A statistical comparison of granitic and leptitic rocks is made.

**Ophitic texture and the order of crystallization of basaltic magmas.** Torsten Krokström. *Bull. Geol. Inst. Univ. Upsala* 24, 197-216 (1933).—Examn. of olivine dolerites from Sweden and Greenland showed that the plagioclase crystd. before the pyroxene. The rock could not have been formed by simple fractional crystn. of a single magma as postulated by Bowen. The possibility of liquid immiscibility as a contributing factor is defended.

**Pyroxene andesites of Mount Cserhát.** Aladár Vendl. *Math. naturw. Ans. ungar. Akad. Wiss.* 49, 504-61 (1932).—Detailed chem. and petrographic description, with 75 rock analyses and 12 photomicrographs.

**Rocks of Kenya.** E. Jérémie. *Compt. rend.* 198, 838-40 (1934).—Analyses of the following are given: oceanite; banded spherulitic phonolite contg. poikilitic egirite and enigmatite; phonolite contg. large crystals of nephelite and sphene, with egiritic augite, hedenbergite and enigmatite; and similar phonolite with kataforite and Na amphibole in place of hedenbergite.

**Minerals from the limestone at Gökum (Sweden).** Christer Enberg. *Bull. Geol. Inst. Univ. Upsala* 24, 257-72 (1933).—Examn. of garnet, pyroxene and vesuvianite indicate that the rock has been subjected to several distinct metamorphic processes.

**Emery (rock) of Samos.** J. de Lapparent. *Compt. rend.* 198, 760-1 (1934); cf. C. A. 27, 4756.—The vein of emery rock, 6 m. thick, is in cryst. limestone; the lower 4.5 m. is homogeneous and consists of diaspore contg. white mica and Fe oxides, but no corundum; the upper 1.5 m. consists of pisolitic ferruginous nodules in an Fe-free matrix, and mainly diaspore, but contg. mica, chloritoid and a little kaolin. The emery contains about 3.5%  $\text{TiO}_2$  and 24%  $\text{Fe}_2\text{O}_3$ , and is a metamorphosed ferruginous siliceous bauxite. The Naxos emery is similar, but metamorphism has proceeded further with formation of corundum.

**The geochemistry of boron.** I. V. M. Goldschmidt and Cl. Peters. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1932, 402-7.—With a Cu arc, it was found possible to det. as little as 0.0005%  $\text{B}_2\text{O}_3$  in rocks, meteorites, ashes, etc. German granites and gabbros contd. 0.001%  $\text{B}_2\text{O}_3$ , meteorites somewhat less. Argillaceous sedimentary rocks averaged about 0.1%  $\text{B}_2\text{O}_3$ . This higher B content must come from the hydrosphere, especially from sea water. The B content of sea water may be due either to the primordial atm. having contained  $\text{B}_2\text{O}_3$ , or to its being thrown into the air by the many volcanic eruptions during the course of geological time. In the region of metamorphic descendants of the above-mentioned sedimentary rocks (phyllite and mica schist), considerable amts. of freshly formed tourmaline occur. A marked concn. of B is found in coal ash. II. *Ibid.* 528-45. Numerous detns. of the B content in rocks, minerals, waters, soils, plants, etc., have been made. Magmatic rocks contain about 0.0005-0.001%  $\text{B}_2\text{O}_3$ . The content for sea salts and sediments is high. The siliceous skeletons of sea organisms and coral contain B. The B content of plants runs as high as 0.5% in peas and 1% in a tropical nectar. The origin of B and Cl in the sea is discussed.

**The geochemistry of germanium.** V. M. Goldschmidt and Cl. Peters. *Nachr. Ges. Wiss. Göttingen Math.-physik. Klasse* 1933, 141-66.—Analyses of a large no. of substances contg. Ge were carried out by means of arc- and x-ray spectral methods. A method for the detn. of 0.0001% of Ge is described. Ge was found in almost all magmatic rocks and minerals, except dunite. Its distribution in these and in sedimentary rocks is discussed. In meteorites, the Ge accumulates in the Fe-Ni and not in the troilite. Bituminous coals contained 0.001-1.6%  $\text{GeO}_2$ , brown coals generally less than 0.01%. The enrichment of Ge in the coals is discussed. The av. Ge content of silicate rocks is about 0.0005%.

**Formation of the earth.** René Perrin. *Compt. rend.* 198, 105-7(1934).—The formation of the earth has followed the laws governing the equil. of a 3-phase system: solid-magma-gas, the resistance to diffusion being taken into account. The partition of elements among the phases has been thus conditioned. The formation of a solid crust, leading to a state of false equil., permits the existence of an atm. At a true equil., all the  $O_2$  of the atm. would be bound by a thickness of less than 1 m. of the metallic nucleus. P. discusses the hypothesis that the first stage of condensation is the formation of liquid slags, composed of the silicates of Ca and Mg. It is possible that bodies

<sup>1</sup> composed mainly of light elements have always been "dead stars," all their  $O_2$  having been combined in their rocks from the beginning. L. Waldbauer

Ocher and earth color deposits in the Upper Palatinate (Kruse) 26. Iron mine region of Bilbao (Wohlbiel, et al.) 9.

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, OSCAR E. HARDER AND RICHARD RIMBACH

**Soap flotation.** John M. Patek. *Eng. Mining J.* 135, 125(1934).—A study of the action of depressing gels. Results of flotation tests on the recovery of cassiterite from silicate gang minerals are tabulated. Control of  $pH$  is important in making the silicate gels. It should be slightly on the alk. side (7.2). W. H. Boynton

**A study trip through the iron mine region of Bilbao.** H. Wohlbiel, Otto Muller and B. Kochanowsky. *Kohle u. Erz* 30, 248-50(1933); *Chimie & Industrie* 31, 78.—A description of the geological formation and of the working of the mines. A. Papineau-Couture

**The silver problem in milling silver-lead-zinc ores.** Hartley Sargent. *Can. Mining J.* 55, 112-13(1934).—Tables of assays and recoveries in the sepn. of Ag minerals from Zn minerals by milling methods are shown. W. H. Boynton

**Treatment of waste from silver manufacture.** Ernest A. Smith. *Metal Ind.* (London) 43, 827-9(1933); 44, 6-8(1934).—In Ag mfg. processes the net Ag losses may total 1 5% of the Ag used. Clean Ag scrap is melted without other treatment. Common scrap is sent directly to the smelters for melting, assaying and refining. Filings and turnings are freed from Fe, Ni or nickel silver before melting. Floor sweepings may contain 15 100 oz. Ag per 100 lb. These are burned to remove the bulk of the material, then ground to about  $1/32$  in. previous to sampling. The coarse metallics which remain on the screen may be melted without further treatment and the finer material usually goes to the smelter. Buffing sand, lime and pumice materials frequently contain 175-200 oz. per 100 lb. This material goes to the refiners for cupellation treatment.  $H_2SO_4$  stripping solns., contg.  $HNO_3$  or  $KNO_3$ , are freed from Ag by HCl or NaCl. The Ag may be pptd. by Cu or Fe and sold directly to the refiners. Spent plating solns. contain 2-3 oz. Ag per gal. and from these the Ag may be sepd. electrolytically or as  $AgCl$ , or with Zn, or the soln. may be evapd. and the dry salts recovered. H. E. Messmore

**The refinement of metal by the method of A. S. Tochinskii.** E. Kostyuchenko. *Stal* 3, No. 7, 18 (1933).—The method described by Perrin (*C. A.* 27, 422) was first worked out by Tochinskii in 1928. H. W. Rathmann

**A modern copper refinery in Canada.** M. Altmeyer. *Cuivre et laiton* 7, 7 12(1934).—The works of the Canadian Copper Refiners Ltd. in Montreal-East are described, especially the electrolytic plant. M. Hartenheim

**Deoxidizers and fluxes.** G. I. Bailey. *Metal Ind.* (London) 43, 561-4, 583-8, 592(1933).—Deoxidizers must be capable of reducing existing oxides in molten metals and the resulting oxide must be readily removable from the metal bath. Free energy of oxidation is a more reliable guide to the selection of deoxidizers than the heat of formation of the oxide. The oxides resulting from deoxidation should be capable of coagulation into comparatively large particles to facilitate removal. A compd., Cu phosphide, contg. 10-15% P is an excellent deoxidizer for molten Cu. This deoxidizer probably by reduction of  $Cu_2O$  prevents the reaction  $Cu_2O + H_2$  (dissolved) =  $2Cu + H_2O$  (steam). B. suggests the formation of a

metaphosphate slag of the approx. compn.  $Cu_3PO_4$ . Pellets contg. 10-20% P, the remainder Zn, added to oxidized brass or bronze quickly removes the surface oxide. In the casting of Ni and its alloys Mn is an excellent deoxidizer and desulfurizer. Si and boric acid form fluid slags with certain metallic oxides. Al is a powerful deoxidizer but the  $Al_2O_3$  is not slag forming. Ca, Ba, Sr, Li, Zn and Be have been used as deoxidizers for Cu with some success. Sound Cu castings can be made with H, as the deoxidizer provided air is excluded from the molten metal. Co may also be used. H. E. Messmore

**Pyrites processing in the Dwight-Lloyd plant.** H. E. Wosin. *Metallog. Periodic Rev.* No. 8, 25-8(1934).—Roasting of pyrites is an exothermic process expending energy in heat, while agglomeration is an endothermic process requiring addn. of heat. It was successfully tried to combine the 2 methods to obtain a more economical heat utilization. It was found in expts. that roasted pyrites to which crude pyrites had been added to bring the S content up to about 12% could be re-roasted without difficulty to a S content below 0.2%, yielding at the same time a good solid and porous agglomerate. Coke dust could be saved and the cost of agglomerate reduced considerably. The operation of a plant is described. M. Hartenheim

<sup>6</sup> **Sulfur enrichment in washed pyrite.** Arthur J. Cad-dick. *Mining Mag.* 50, 154-5(1934); cf. *C. A.* 23, 4655.—Where heap leaching of cuprous pyritic minerals is conducted the classification of the crude mineral is of prime importance, for it should ensure the max. quantity of washed ore of a quality that will yield cinders, after the roasting of the washed pyrites for  $H_2SO_4$  manuf., of sufficient purity for economic use as Fe ore. In this respect the classification of the crude mineral is largely governed by the  $SiO_2$  content. In the present paper the causes are outlined whereby the S content of the washed pyrites resultant from heap leaching is higher than that of the original cuprous pyrites. The presence in partially oxidized or sulfated mineral of  $CuSO_4 \cdot 5H_2O$  would naturally lower the S content of the mineral, as the amt. of S in this constituent is only 12.8%; however, since it is sol. and in the course of heap leaching is extd. from the mineral, it follows that the elimination of 12.8% S material increases the S content of the residual ore. Again, but in lesser degree, the presence of  $Cu_2S$  of only 20.14% S lowers the S content of the original ore. Other S combinations are considered. In general it can be taken that the enrichment shown in S content in relation to that of the original ore is due to the removal, in whole or part, of constituents contg. less S than that of the true Fe pyrite,  $FeS_2$ . A. W. Furhank

- Refractory materials for the iron and steel industries. Alfred B. Searle. *Iron & Steel Ind.* 7, 115-18(1934). E. H.
- Bessemer steel. Revival of its manufacture in Great Britain. L. P. Sidney. *Iron & Steel Ind.* 7, 121-4, 133(1934). E. H.
- Manufacture of rimmed steel ingots. J. H. Nead and T. S. Washburn. *Metals & Alloys* 5, 43-7(1934).—A presentation of the factors which affect the quality and production of ingots for deep-drawing sheets and strips. Downs Schaaf
- Refining reactions in steel making. Marcel Guedras. *Aciers spéciaux* 8, 371-2(1933); cf. C. A. 27, 4197.—Deoxidation and desulfurization in the elec. furnace process are described. Desulfurization is the resultant of the deoxidation, that is, there is an important relation between the S content and that of oxide. S is partly eliminated as CaS and partly as SO<sub>2</sub>. G. T. Motok
- Mounting of small metallographic specimens and metal powders in bakelite. H. M. Schleicher and J. L. Everhart. *Metals & Alloys* 5, 59-60(1934).—Bakelite resinoid is used as a mounting medium, the hardening taking place by heat alone (temp. ranging from 85° to 130°). D. S.
- Relation between plastic deformation in deep drawing and tensile properties of various metals. M. H. Sommer. *Am. Inst. Mining Met. Engrs., Tech. Pub.* No. 541, 19 pp.(1934). Alden H. Emery
- Application of the pendulum for measuring hardness, rigidity of structures and modulus of elasticity. P. Le Rolland. *Usine* 43, No. 8, 29(1934).—The principle and the method of measurement are described. Accuracy is 1/500. M. Hartenheim
- Deoxidation of technical silver melts. K. W. Frochlich. *Mitt. Forschungsinst. Probieramt Edelmetalle* 7, 132-5(1934).—Of all deoxidizing agents P is the cheapest and also the most economical. The use of phosphor-copper is advantageous because of its easy castability; H disease will not occur during bright annealing; elongation and deep drawability are considerably improved while tensile strength and hardness are lowered very little; intermediary annealing between rolling, drawing, etc., can be of the shorter duration the more P remains in the alloy; and P-contg. Ag-Cu alloys are not easily attacked by acidic foodstuffs. Care must be taken not to heat over 646° in intermediary annealing, as red-brittleness follows. M. Hartenheim
- Properties of German silver. J. Cournot and F. Hiltbold. *Compt. rend.* 198, 749-51(1934).—The effect of cold working and annealing on German silvers contg. 55-60% Cu and 8-22% Ni has been studied. Cold working produces a Brinell hardness, *H*, < 200, increasing with increased content of Ni. *H* of a cold-worked alloy contg. 60% Cu + 9Ni when heated at 250-300° increased from 200 to 230, but after 10 min. at 300° or 1 hr. at 650° fell to 67; corresponding figures for an alloy contg. 60% Cu + 15Ni are 220-240 and 80-90. With const. Ni *H* decreases linearly with increase of Cu; with const. Cu it increases with increased Ni. Homogenization by long-continued annealing at a high temp. is necessary to remove the dendritic structure of the cast metal. C. A. Silberrad
- Influence of impurities on the technical properties of zinc. Wilhelm Herrmann. *Chem.-Ztg.* 57, 958-9(1933).—Cd increases the hardness, brittleness and red-shortness of Zn and also influences the malleability and ductility; 0.20-0.25% Cd is the max. for rolling, 0.30% Cd gives crack formation at the edge of the sheet, while 0.50% Cd makes rolling of Zn impossible. Brasses of high m. p. or high casting temp. contain little Cd. Brasses of low m. p. or low casting temp. retain most of the Cd; if the content is high, crack formation may occur. Cd has a slightly favorable influence on the corrosion resistance of the Zn Pb is the least harmful of the impurities of Zn. Pb up to 1.0% has a favorable effect on the rolling properties of Zn. Small amts. of PbS, however, make the Zn very brittle. Pb up to 0.3-0.5% increases the softness of the Zn and neutralizes the embrittling action of other impurities such as Cd, Fe, As and Sb. Flaking and scaling of galvanizing on bending results if the Pb content of the Zn is above 1.25%. In alloys up to 2%, Pb is used to increase machinability. In Zn-rich brasses the corrosion resistance against alk. reagents is increased by a Pb content up to 2.5%, especially if a few tenths percent Fe is present. Fe makes Zn hard and brittle; 0.015% Fe has a decided harmful effect on the rolling properties of Zn. Fe also acts unfavorably on galvanizing Zn. Hardness and brittleness of Zn are raised extraordinarily by Sn, a Sn content of 0.02% makes rolling impossible. For normal galvanizing work Sn has beneficial properties, 0.50-0.60% Sn may be present in the Zn. Sn reduces the bending stability of galvanized shapes and must be kept to a low max. for the galvanizing of plate, wire and other articles requiring great bending properties. Cu up to 0.05% has no influence on the forging and rolling of Zn, at 0.07% small edge cracks form; at 0.08% the influence of hardness becomes noticeable. Zn contg. 0.18-0.19% Cu can no longer be rolled. Cu influences the color of galvanizing and Zn casting and is limited below 0.2%. Arsenic and Sb diminish the usefulness of Zn for practical purposes, influencing the rolling properties, galvanizing properties and corrosion resistance of the Zn. Al is never present in the virgin Zn, yet is often added up to 0.01% in galvanizing and Zn casting to remove the color caused by Cu and Sb and to keep the Zn fluid, lustrous and uniform. Larger amts. of Al increase hardness. Ten refrences. C. B. Jenni
- Protective coatings for metal work. E. A. Hurst. *Ind. Finishing* 10, No. 4, 16-22(1934).—The results of investigations of the rust-inhibitive power of red lead, Fe<sub>2</sub>O<sub>3</sub>, chromates and metallic Zn in porous and non-porous vehicles are described. Red lead is inferior to Fe<sub>2</sub>O<sub>3</sub> as well as to Zn, the latter giving very satisfactory results when non-porous vehicles are used. D. T.
- Galvanizing malleable castings. G. M. Thrasher. *Foundry* 62, No. 2, 19-20, 60(1934).—Galvanizing malleable fittings by the basket method is described in detail. The importance of a low dross production is stressed. Downs Schaaf
- New process for making zinc-coated farm fencing more durable. J. L. Schueler. *Agr. Eng.* 14, 339-40(1933).—The thoroughly cleaned wire is passed through a molten Pb bath; held at a temp. (not specified) which develops certain desired phys. properties (not specified) in the steel wire, and then through the molten Zn bath. The wire is then subjected to the action of a flame which evens the distribution of the coating and seals up pin holes or other voids. Wire produced by this process shows greater resistance to corrosion than that produced by the ordinary galvanizing processes. K. D. Jacob
- Antirust agents for polished machine parts. Beugl

Kjerrnäs and John Bergstedt. *Tek. Tid. Upp. C, Kemi* 64, 4-8(1934).—The efficiencies of 28 different anti-rust agents, comprising clear and pigmented varnishes, petroleum, heavy cylinder oils, wool-fat solns., etc., were investigated for use on machines and mech. parts. The tests showed that petroleum (drop point 44-8°) gave the best protection. Among the drying materials a red varnish with an odor of wool fat, also gave satisfactory results.

D. Thuesen  
The mechanics of adherence in metal plating. K. Altmanberger. *Oberflächentech.* 11, 15-16(1934).—The problem of good adherence of layer to the surface of a metal is discussed for varnishing, enameling and plating. Electrolytic plating is considered, like galvanizing, to be an alloying process between base metal and cover, the latter diffusing into the former and forming with it solid solns. or intermetallic compds.; the crystal lattices grow together. H retards the formation of an alloy. One reason for unsatisfactory adhesion is that all electrodeposited metals tend to contract during deposition, in particular Ni, Co, Fe, Cr, etc., which absorb H easily; this causes internal stresses. The best adhesion is obtained when the formation of solid solns. between base and cover is as complete as possible, that is if the crystals of the base metal continue, during electrodeposition, to grow in the same crystal lattice. For this reason the metal must be as clean as possible. The adhesive force is detd. by measuring that force which is required to lift a deposit off the base metal. Some other tests by twisting, Brinell test and the Erichsen test are mentioned.

M. H.  
The formation of basic copper chloride and its identity with atacamite. H. P. Rooksby and R. C. Chirnside. *J. Soc. Chem. Ind.* 53, 33 5T(1934).—Basic Cu chloride corresponding to the mineral atacamite is formed by the corrosion of Cu in chloride solns. as shown by its x-ray pattern. The corrosion product of Eureka metal by chlorides has substantially the same pattern, but contains a small amt. of Ni.

L. W. T. Cummings  
Causes of porosity in nonferrous castings. J. H. Cheetham. *Iron Age* 133, No. 5, 22-4(1934).—Several causes of faulty brass; bronze and other nonferrous castings are detailed.

Downs Schaaf  
Testing cast iron. E. Siebel and M. Pfender. *Giesserei* 21, 21-7(1934).—A discussion of the exptl. results of expansion, tensile and elongation tests.

C. L. W.  
The dependence of gray cast iron upon the nature of the mold. A. Vath. *Giesserei* 21, 1-3(1934).—Bending strength, hardness and graphite nucleus no. increase with the water content of the mold. The phosphide eutectic is likewise more strongly developed; this results in increased brittleness.

Curtis L. Wilson  
The influence of copper on the graphitization behavior of white cast iron. Louis Lykken. *Iowa State Coll. J. Sci.* 8, 207-10(1933).—The Acm point of white cast iron suitable for malleabilizing is lowered 45°F. by the addn. of 3% Cu. The presence of 2% of Cu shortens the time in both stages of graphitization of white cast iron. Copper tends to refine the grains, and the castings etch faster.

F. E. Brown  
The system: Liquid iron-carbon oxides. H. C. Vacher. *Bur. Standards J. Research* 11, 541-51(1933).—A known mixt. of C oxides, at 1 atm. pressure was passed over liquid Fe maintained at a temp. of 1580° for approx. 90 min.; the Fe was then allowed to solidify, and the resulting ingot was analyzed for C and O. The C-O product obtained for molten Fe under mixts. of C oxides contg. approx. 11% CO<sub>2</sub> was found to be 0.0028. Addnl. expts. on the system liquid Fe-H<sub>2</sub>O vapor showed that the data of both systems were in good agreement with data for the water-gas reaction.

Downs Schaaf  
Survey of the magnetic changes in some irons and steels as a function of the temperature. J. Seigle. *J. phys. radium* [7], 5, 37-48(1934).—After a general chapter outlining the various reversible and irreversible magnetic transformations and their assocd. anomalies in expansion produced by heat treatments, detailed results for a no. of irons and steels are discussed. A large no. of complicated diagrams are presented, correlating these anomalies with

1 magnetic behavior and with the Curie point. The results of x-ray studies are summarized. W. W. Stiffer

The microoptical investigation of iron and steel by polarized light. N. Ahmad and M. F. Schwarz. *Metalurgia* 9, 33-7, 77-80(1933-34).—The app. used is briefly described. Pearlite in certain orientations appears very bright with crossed nicols. Slip bands can be brought out sharply with crossed nicols, and internal stresses can be detected. Several forms of Fe oxide can be differentiated with polarized light, other inclusions can be identified, and the structure of graphite in cast iron can be brought out. Flow lines found in such materials as cold-headed bolts can be followed. Constituents in Fe-W, Fe-Mo and other Fe alloys can be identified. Micrographs obtained with parallel nicols and with crossed nicols are shown.

J. L. Gregg  
Passage of hydrogen through steel. T. N. Morris. *Nature* 133, 217-18(1934).—H<sub>2</sub>, formed by the reaction between dil. citric acid and mild steel at 25°, is almost as likely to penetrate the steel sheet as to pass into the acid solution.

Gerald M. Petty  
Alloy steels—their properties and uses. W. H. Hatfield. *Iron & Steel Ind.* 7, 129-33(1934).

E. H.  
The difficult problem of selecting alloy steels. H. W. McQuaid. *Heat Treating and Forging* 20, 15-18, 21(1934).—The properties of many alloy steels are considered in their proper application to many industrial uses.

Downs Schaaf  
Structure of an alloy steel. Owen W. Ellis. *Iron Age* 133, No. 3, 20-3(1934); cf. *C. A.* 27, 5288; 28, 1842<sup>a</sup>.—A new constitutional diagram for quenched steels is drawn up and discussed. Mechanism of the formation of pearlite, troostite and nodular troostite is presented.

C. B. J.  
Crystal structure and forming as exemplified in Elektron metal. Walther Schmidt. *Z. Metallkunde* 23, 229-36(1933).—A discussion of the forming of the alloy Elektron based upon previous observations on the crystallography of the deformation process and upon new observations, in which it is shown that crystallographic reasoning, at least in this case, is of practical importance.

R. F. M.  
Nonoxidizing steels. Moreau. *Usine* 43, No. 2, 31(1933).—From the standpoint of the metal and the condition of its surface 3 principal points influence corrosion: the law of homogeneity, law of concn. limit of solid solns. and law of self-protection. An alloy forming a solid soln. is homogeneous, and therefore does not oxidize and can be readily worked. Addns. of other metals made to increase chem. resistance should enter into solid solns; below a certain concn. chem. resistance is not obtained. Self-protection is given by adding a nobler metal than the solid soln. so that an oxide film is formed on the surface of sufficient thickness and continuity to prevent corrosion. Martensitic, ferritic and austenitic steels on a Cr-Ni basis satisfy these claims very well, also steels with addns. of Cu, Mn, Al, etc. Compas., properties and fields of application are described.

M. Hartenheim  
The hardness testing and heat treatment of high-speed tools steels. J. Garland. *Machinery* (London) 43, 194-5(1933).—A discussion is given on the differences found in the hardness of high-speed steel tools supplied to a standard analysis and specification by the same and different makers. Recommended practice in hardening is a temp. range of 1228° to 1320°, followed by reheating at 570° to 620°.

A. W. Furbank  
Rate of age-hardening of duralumin as determined by upsetting tests. J. O. Lyst. *Metals & Alloys* 5, 57-8(1934).—An upsetting test is described for studying the workability of various alloys of Al in such operations as riveting. It was found that duralumin aged at room temp. after quenching begins to age-harden appreciably in 1 1/4 hrs. after quenching; the same alloy stored at 0° immediately after quenching began to age-harden 36 hrs. after quenching and when stored at -45° did not age-harden appreciably over a period of 14 days.

Downs Schaaf  
Recent progress in case-hardening of steels. Léon Guillet. *Génie civil* 104, 7-12, 29-36, 58-62, 82-4(1934).—Case-hardening agents, pastes, liquids and gases, are dis-

cussed. The factors in case-hardening are: the metal, temp., time, agent used, its conductivity, humidity, relation of its vol. to that of the pieces and the grain size of the metal. Ni steels require a lower temp. than ordinary steels, because Ni retards the migration of C. The Cowan process is discussed, and the Cowan, Ripoché, Hurni and Aube furnaces are compared. Micrographs are given of normal and abnormal structures, along with fractures and cooling curves. Cooling practices, hardness after annealing and some of the irregularities that appear are discussed. A long table of hardnesses obtained by different means is added. The treatment and properties of special steels is reviewed. A. N. H.

The influence of cathodic hydrogen on the strength of steel. D. Alekseev, P. Afanas'ev and V. Ostroumov. *Z. Elektrochem.* 40, 92-8(1934); cf. C. A. 20, 2779.—The cathodic brittleness of steel in  $H_2SO_4$  to which  $H_2S$ ,  $SO_2$  and  $As_2O_3$  were added was studied, with variation of c. g., stress, concn., time and temp. Metallographic and x-ray analyses gave no evidence of structure changes, so it was assumed that the H penetrates the intercryst. spaces. Part is loosely bound and easily removed by bending or heating; part remains as a solid soln.

Temper brittleness of common structural steels. Paul Borul. *Rev. mét.* 31, 14-31(1934).—A group of killed steels was compared with a representative number of open and rimming steels. Any heat treatment which permits pptn. of  $O_2$  renders open and rimmed steels more brittle than killed. In killed steels all treatments used produce practically the same impact strength; this varies greatly in rimmed steels.  $O_2$  acts as a catalyzer of germination extending greatly the range in which the physical structure of steel undercooled below  $A_1$  is unstable.

Red brittleness of copper steels; means of prevention. F. Nehl. *Usine* 43, No. 4, 31(1934); *Stahl u. Eisen* 53, 773-8(1933).—Red brittleness of Cu steels in tube making can be avoided when the following points are observed: steel with not more than 2% Cu worked between 800° and 1100° does not show cracks; above 1100°, steels with more than 0.5% Cu produce cracks when bending; with less than 0.5% cracks are not formed at any temp. The addn. of Ni in an amt. higher than half that of Cu prevents cracking at all rolling temps. M. Hartenheim

Some micrographic aspects of an annealed hard ordinary carbon steel. J. Seigle. *Chimie et industrie* 30, 1282-9(1933).—A detailed micrographic examn. of a steel having the following compn.: C 0.58, Mn 0.68, Si 0.15, S 0.020, P 0.021%, led to the following conclusions: (1) On heating pearlite subsists practically unchanged to the end of the dilatometric anomaly, except in the case of very prolonged heating or of very strong cold-working after the 1st heating; the 2nd heating then gives a coalesced structure. (2) On cooling, pearlite forms at the very beginning of the dilatometric anomaly. (3) The pearlite of a given hard steel can have a C content considerably lower than the generally admitted 0.85-0.90%, while the steel retains all the characteristics of an annealed steel.

The effect of nitrogen content on high-chromium steels. S. M. Norwood. *Can. Chem. Met.* 18, 86(1934).—Large columnar grains of the straight-Cr alloys contg. over 18% Cr have been improved by the addn. of appropriate amounts of N as high-N ferrochrome. The N should be present in an amount equal to about 1% of the Cr content, thereby improving the strength and toughness of the casting without materially affecting the hardness or the machinability. One detrimental effect of N on the properties of wrought Cr-Ni steels is decreased stability at elevated temps. These steels are, like usual types, subject to intergranular attack. N improves Cr-Ni steels in machinability and provides nonmagnetic castings of relatively high strength. W. H. Boynton

Resistance of nitrified austenitic manganese steel against sea water. Shun-ichi Satō. *Proc. Imp. Acad. (Tokyo)* 9, 402-3(1933).—The potentials of Fe, of a special steel contg. C 0.42, Si 0.21, Mn 0.55, P 0.024, S 0.012, Ni 0.25, Cr 1.47, Al 1.38, Mo 0.25% and of a

steel contg. C 1.21, Si 0.03, Mn 11.72, P 0.04, S 0.007%, both before and after nitriding, were measured in sea water. The attack of the specimens was in relation to their potential. The nitrified austenitic Mn steel showed the highest potential and was entirely unattacked.

Chromium alloy steel castings. J. H. Critchett. *Foundry* 62, 16-18, 43(1934).—Certain phys. and chem. properties are listed for plain Cr-steel castings contg. (1) 1-3% Cr, (2) 4-7% Cr, (3) 12-14% Cr, (4) 18% Cr and (5) 25% Cr. N addns. to over 20% Cr steels is advocated in order to reduce the tendency toward large columnar grains and grain growth on holding for long time periods at high temp.

Deterioration of chromium-tungsten steels in ammonia gas. P. R. Kisting. *Metals & Alloys* 5, 54-6(1934).—Results are given for 1-year exposure tests of a series of Cr-W steels (Cr up to 2.7%, W up to 11.7%) to a 3:1 mixt. of H and N with 10%  $NH_3$  at a temp. of 300° and at a pressure of 600 atm.

Heat-treating steel wheels. Anon. *Heat Treating and Forging* 19, 12-13, 17, 40-1(1933).—A compact unit is described in which movement and heating are precisely controlled.

"Union Bau-Stahl" as the material for bridge construction. S. Ohta and S. Kawaguchi. *Tetsu to Hagane (J. Iron Steel Inst., Japan)* 20, 29-34(1934).—Mechanical and corrosion tests were carried out and results are given. Plates, T-bars and rivets of this steel showed, resp., yield point, 38-41, 37-38, 36-40; tensile strength, 57-61, 58-60, 52-53; elongation 20-24, 19-23, 27-30; hardness (Brin.) 183-192, 183-187, 153-156; (Izod) 6-4, 6, 15. Corrosion tests were made in air, water, sea water and solns. of  $H_2SO_4$ , HCl,  $HNO_3$  and NaCl. This U. B. steel is generally superior to ordinary C steel except in the case of  $H_2SO_4$ .

Research on metals and alloys. F. C. Frary. *Ind. Eng. Chem.* 26, 281-4(1934).—A review of some of the important considerations involved in the production of a new com. alloy, with emphasis on the effect of impurities in metals; workability in relation to crystal structure and annealing; the problem of melting metals; and the "customers' problems" such as the utilization of the finished product, casting processes and corrosion resistance.

Beryllium and its alloys. H. A. Sloman. *Metal Ind. (London)* 44, 160-2, 183-6, 210-11(1934).—A survey of the present position of Be; its occurrence, extrn., technic of production by electrolysis, properties and uses. The production, usefulness, application and properties of Be-Al alloys, Be bronzes, Be-Ni alloys and Be plating also are discussed.

Hall effect and some other physical constants of alloys II. The tin-bismuth series of alloys. W. Rheinalt Thomas and R. J. Evans. *Phil. Mag.* 47, 65-83(1934); cf. C. A. 26, 3419.—The Hall coeffs., resistivity, temp. coeff. of resistance, thermoelectric power and d. were detd. for Sn-Bi alloys over the entire compn. range. The samples were carefully annealed. The most rapid variations in properties occur in the region of low Sn content. The Hall coeff. changes sign as the magnetic field is increased. The max. value occurs at a compn. of 94% Bi for a magnetic field of 3096 gauss. For more intense magnetic fields, the max. is shifted toward higher concns. of Bi. The results indicate a solid soln. of Sn in Bi at the Bi end of the compn. range. E. J. Rosenbaum

Magnetostrictive alloys with low temperature coefficients of frequency. John McD. Ide. *Proc. Inst. Radio Engrs.* 22, 177-90(1934).—A study of 34 magnetic alloys of Fe, Ni, Cr and Co was made with rods of these alloys used as secondary frequency standards to stabilize the frequency of magnetostrictive oscillators. The temp. coeff. of frequency is a function of compn., heat treatment, temp. and magnetization. Seven alloys gave temp. coeffs. of the order of 1 cycle in a million per degre, when properly heat-treated and magnetized. Five alloys showed large magnetostriction and gave good frequency stabilization when used with C magnetostriction oscil-

lators. All alloys contained Ni and Fe, with Cr or Co or both included. The best results were obtained with the following contents: Cr 8-10%, Ni 38-38% and the balance Fe together with 1% Mn to facilitate forging.

W. H. Roynton

**Metallic alloys stable toward phosphoric acid.** O. I. Ver and M. M. Romanov. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1933, 111 14 (in German 114-17).—All steels with high Cr content are stable toward  $H_3PO_4$  at room temp. Steels contg. up to 18% Cr are unsuitable, for although an increase in Si content (4 to 10%) decreases the loss in wt. of the alloys in boiling 80%  $H_3PO_4$ , the alloys are hard and brittle. Steels contg. about 20% Cr are more stable toward  $H_3PO_4$ , but increase of the C content (up to 1%) decreases their stability. Steels contg. 30% and more Cr show the greatest stability toward boiling 60%  $H_3PO_4$ . Toward 80%  $H_3PO_4$  at 135° almost all the Cr-contg. steels tested were not stable; an exception was the steel contg. 0.148% C, 2.74% Si and 38% Cr, which when exposed to boiling 80%  $H_3PO_4$  for 48 hrs. lost only 1.26 g. per sq. m. per hr. Increasing the C content to 0.8%, but no higher, did not affect the stability unfavorably. A series of Cr-Mn steels contg. not more than 0.23% C, 8-11% Mn and an av. of 18% Cr, also several steels contg. Cr, Mn and Ni and a Cr-Ni steel of type V2A (18% Cr, 8% Ni, 0.20% C) were forged, rolled to sheets 2 mm. thick, quenched in water at 1100°, and tested in boiling 60%  $H_3PO_4$ . Steels in which the ratio of Cr to Mn corresponded to that for Cr and Ni in a Cr-Ni steel of type V2A showed the greatest stability; their loss in wt. was 0.41 g. per sq. m. per hr. A Cr-Ni steel of type V2A was more stable; its wt. loss was 0.14 g. per sq. m. per hr. Cr-Mn steels which had been quenched at different temps. showed smaller wt. losses after testing in 80%  $H_3PO_4$  than did annealed steels. A cast iron with 2.60% C, 1.39% Si, 0.63% Mn and 34.66% Cr possessed max. stability toward boiling 73%  $H_3PO_4$ ; its loss in wt. was 1.97 g. per sq. m. per hr. Cast irons with other proportions of C, Si and Cr are slightly stable toward acid of this concn. A simple Al bronze, 9 Al bronzes contg. from 0.02-0.67% Cr, and one contg. 3% Fe were tested in boiling 60%  $H_3PO_4$  at 135° and in the com. acid at 15°. The alloys were quenched in water at 900° and tempered at 700°. All the Al bronzes were stable toward both pure and com.  $H_3PO_4$  at room temp. In 80%  $H_3PO_4$  at 135-40° an Al bronze contg. 0.5% Cr was most stable (loss 0.25 g. per sq. m. per hr.). To simplify the alloying of the Al bronzes with Cr, melts were made in which the Cr was introduced in the form of ferrochromium. One of these alloys contg. 9.46% Al, 0.37% Cr, 0.26% Fe and 89.91% Cu was stable toward boiling 87%  $H_3PO_4$ ; its wt. loss was 0.076 g. per sq. m. per hr. in a 240-hr. test. Al bronzes alloyed with Cr and Fe are therefore very stable toward boiling  $H_3PO_4$  of high concns., but the casting of these alloys is difficult, because of the separation of large quantities of gases. The authors recommend the use of degasifiers in the fusion, such as  $CaC_2$  mixed with borax in equal quantities and used in an amt. equal to about 1% of the wt. of the charge. The mech. properties of the Al bronzes alloyed with Cr are satisfactory.

Louise Kelley

**Special alloys for working barrels and balls and seats.** Walter F. Rogers. *Proc. Am. Petroleum Inst. 14th Ann. Meeting, Sect. IV*, 51-7 (1933).—See C. A. 28, 842.

E. H.

**An apparatus for the production of high-melting alloys.** F. Beck. *Z. tech. Physik* 14, 554-6 (1933).—An app. is described which utilizes the elec. resistance of a pressed metal powder for melting it without the use of a crucible.

J. B. Austin

**Cupro-nickel containing beryllium.** M. Bailly. *Compt. rend.* 198, 578-80 (1934); cf. C. A. 27, 693.—The alloy, Ni 67.52, Cu 29.94, Be 1.14, Fe 0.02, Mn 0.25, Mg 0.07%, was quenched in  $H_2O$  from 1075° and cold-rolled, then (a) heated 15 min. at 1025° and quenched in  $H_2O$ ; (b) as (a) but cold-worked by 20% elongation; (c) as (a) but cold-rolled. The samples were then heated for varying times at varying temp. 100-750°. The Brinell

hardness of (a), initially at least 154, increases more rapidly when heated at 200-400° than those of (b) or (c), which change little (250-289) and are approx. similar until heated at 400° and upward; at this point there is a rapid increase to about 420, after which all decrease to 217 after heating at 750°. Cold working probably retards pptn. of some compd. Changes in hardness are accompanied by little change in corrosion by  $NHCl$  or  $NHNO_3$ , with little indication of intergranular corrosion.

C. A. Silberrad

**The resistances of some copper-palladium alloys.** D. Stockdale. *Trans. Faraday Soc.* 30, 310-14 (1934).—At room temp. the sp. resistance of Cu-Pd alloy wire contg. 58.02 at. % Pd (5 other Cu-Pd alloys were studied) is of the same order ( $46.6 \times 10^{-6}$  ohm-cm.) as those of the more complex alloy wires, and is usually considerably greater than those of the pure binary alloys. On the other hand, while the temp. coeff. ( $1.1 \times 10^{-4}$ ) is considerably smaller than those of most of the binary alloys, it is too large to permit of the use of this material in the construction of standard resistance coils. Reuben Roseman

**Mechanical properties of gold-copper alloys.** W. Broniewski and K. Wesolowski. *Compt. rend.* 198, 569-71 (1934).—Curves showing for rapidly and slowly cooled alloys resistance to tensile stress, elastic limit, Brinell hardness, reduction, elongation and resilience indicate a slight formation of AuCu in the quickly cooled alloy and marked formation of both AuCu and AuCu<sub>2</sub> in the slowly cooled, the first three properties increasing, the last three decreasing with slow cooling. The mechanical properties of alloys contg. not less than 850 fine and 583 fine are satisfactory, but those of the 750-fine alloy are distinctly the worst of the alloys examd. (920-583 fine).

C. A. Silberrad

**Some defects in the working of gold alloys.** E. Raub. *Mitt. Forschungs-inst. Probieramt Edelmetalle* 7, 104-8 (1933), 127-32 (1934).—Defects which become noticeable in gold alloys during or after working or in manufacturing processes can be traced to: (1) foreign metallic impurities, (2) oxidation of base metals in the alloys, (3) slag-like impurities, (4) particular properties of the alloys. Of foreign metallic impurities, Bi, Pb and Te are very harmful at as low as 0.05%; the Au alloy becomes brittle and cracks when rolled. P causes hot-brittleness. Base metals, e. g., Cu, Cd, Zn and Ni, form compds. with O at elevated temps. which segregate when the melt solidifies and cause defects in rolling, drawing, etc., and also when the finished article is polished. Inclusions of small particles of corundum, emery or other impurities originating sometimes in the scrap used for melting also cause defects particularly in polishing. The defects under (4) can be traced to rapid growth of crystal grains, which occurs particularly if Au alloys of 18 and more carats are annealed before they have been greatly deformed (rolling, etc.); unless the alloys are annealed only after they have undergone a strong deformation, cracks occur during or after working. Internal stresses can exist which lead to tearing; sometimes these can be caused by the corroding action of perspiration, especially in alloy contg. 33% or less Au. Heating to 250-300° generally suffices to equalize internal stresses.

M. Hartenheim

**Recrystallization of iron alloys with closed  $\gamma$ -field at the A<sub>1</sub> and A<sub>2</sub> points.** Albert Heinzel. *Arch. Eisenhüttenw.* 7, 470 82 (1934).—Recrystn. as a result of polymorphous transformations was studied on alloys of Fe with Al, Si, V and W. It was found that the nuclei no. of the alloys is, at the A<sub>1</sub> transformation, essentially independent of concn. of the added components, that a refinement of the grain does not take place in the entire concn. range of the  $\gamma$ -field but stops at the concn. corresponding to 4/5 of the satn. limit of the  $\gamma$ -solid soln.; further, that with increasing addns. the crystallites formed at A<sub>1</sub> assume more and more crystallographic direction until they are unidirectional. The gradual disappearance of grain refinement takes place with the lowering of the A<sub>1</sub> temp. which makes the recrystn. of Fe at the A<sub>1</sub> point similar to the recrystn. of cold-worked metals.

M. Hartenheim

Shifting of the eutectic temperature in iron-carbon alloys. Bugen Piwowarsky. *Stahl u. Eisen* 54, 83-4 (1934).—Time-temp. curves on alloys prepd. from electrolytic Fe and sugar charcoal were carefully studied. Eutectic temp. falls with rising superheat of the melt; rises with increased C content. Cast Fe, cooled immediately after the addn. of Si or Mn, lowered the eutectic point. If more time is given the melt after the addn. this undercooling vanishes. On addn. of Ni the temp. of the eutectic drops with the time of standing. Mo stands between Ni and Si in its action. C. B. Jenni

Diffusions that take place in iron-silicon alloys during heat treatment. N. A. Ziegler. *Am. Inst. Mining Met. Engrs., Tech. Pub. No. 538*, 6 pp. (1934).—No appreciable diffusion resulting in a change of chem. compn. takes place in Si-Fe during heat treatment. When unalloyed Fe is heat-treated, Fe oxide scale is formed on the surface, but there is nothing to prevent O from diffusing into the metal and satg. it, if heated to a sufficiently high temp. In Si alloys (at least 2% Si) a film of Fe silicate on the surface acts as a barrier to O diffusion, but does not interfere with diffusion of C to the surface and escape as CO. Alden H. Emery

The intermediate phases of the iron-tungsten system. W. P. Sykes and Kent R. Van Horn. *Trans. Am. Inst. Mining Met. Engrs.* 105, 198-214 (1933).—The constitutional diagram of the Fe-W system was constructed. The temp. of the peritectoid reactions ( $\alpha + \beta \rightleftharpoons \epsilon$ ) was about 1040°. The homogeneity ranges of the intermediate phases were not detd. exactly because of difficulty in forming the compounds and attaining equil. However, alloys contg. 68-69% W after protracted sintering at 1800° appear to consist solely of  $\beta$  Fe<sub>3</sub>W<sub>2</sub>, while the liquid formed at the eutectic temp. can be detected in concns. between 67.5 and 68% W. Probably the compn. range of  $\beta$  at 1800° does not exceed 1%. The  $\epsilon$  phase appears to be represented by the formula Fe<sub>3</sub>W. A. H. E.

Hardness measurements on binary alloys of lead-antimony, antimony-tin and lead-tin. N. Aoki. *Kinsoh no Kenkyuh* 11, 1-20 (1934).—Brinell hardness of these binary alloys was detd. and the relationship to the microstructure and the equil. diagram was studied. The hardness is not const. for different loads; Brinell hardness of alloys, rich in  $\gamma$  and  $\delta$  phase increases with load to a max. and then decreases gradually; that of alloys rich in  $\alpha$  or  $\beta$  phase increases till the samples break. Time of loading, aging at room temp. and annealing affect the hardness. The effects depend on the structure of phase. M. Kuroda

The ternary alloys: magnesium-zinc-calcium. René Paris. *Compt. rend.* 197, 1634-6 (1933).—The temp.-compn. diagram for the system is given. The compds. in the system include Ca<sub>2</sub>Mg<sub>3</sub>, Ca<sub>2</sub>Zn<sub>3</sub> and Ca<sub>2</sub>Mg<sub>2</sub>Zn<sub>3</sub>; the last exists as large polygonal crystals, insol. in HNO<sub>3</sub>, m. without decompn. at 495°. Alloys contg. 30% or more Ca oxidize readily; alloys rich in Zn oxidize slightly, are hard, break easily and are difficult to work; alloys rich in Mg are light, oxidize but slightly and are easily worked. E. G. Vanden Bosche

The system: Fe-Fe<sub>3</sub>C-ZrC Fe<sub>3</sub>Zr<sub>2</sub>. Rudolf Vogel and Karl Loehberg. *Arch. Eisenhüttenw.* 7, 473-8 (1934).—The constitutional diagram for Fe with up to 6% C and 30% Zr was detd. by thermal and structural examn. A pseudobinary section Fe-ZrC in which a  $\gamma$ -solid soln. with 0.8% C and 6.08% Zr forms a eutectic with the ZrC with 1.8% C and 9.88% Zr, divides the examd. concn. quadrangle Fe-Fe<sub>3</sub>C-ZrC-Fe<sub>3</sub>Zr<sub>2</sub> into 2 areas with similar equil. conditions. In the area Fe-Fe<sub>3</sub>C-ZrC, a eutectic plane exists at 1145°, where a binary Fe-C melt is in equil. with a binary solid soln. of  $\gamma$ -iron with C, cementite and zirconium carbide. In the area Fe-ZrC-Fe<sub>3</sub>Zr<sub>2</sub>, an Fe-Zr melt at 1330° is in equil. with a binary solid soln. of  $\gamma$ -iron with Zr, ZrC and Fe<sub>3</sub>Zr<sub>2</sub>. The eutectoid disintegration of the  $\gamma$ -solid solns. shifts from the Fe-Zr side to Fe-C side to lower temps.; in the disintegration range two 4-phase planes were found. One, at 780°, is a transition phase where a  $\gamma$ -solid soln. with 0.1% C and 0.8% Zr disintegrates into almost pure  $\alpha$ -iron and ZrC in presence of Fe<sub>3</sub>-

Zr<sub>2</sub>. The other 4-phase plane is a eutectoid plane at the temp. of pearlite; all ZrC is segregated at higher temps. which transforms finally the remainder of the  $\gamma$ -solid soln. into pure pearlite. The occurrence of Fe-Zr compds. reduces the hardness; increasing ZrC increases hardness. The structure of quenched Zr steels consists of martensite which is less brittle than pure Fe-C martensite. M. H.

Behavior of some light alloys towards sea-water corrosion. J. Cournot, M. Chaussain and H. Fournier. *Compt. rend.* 198, 85-7 (1934).—Immersion and alternate immersion tests were made with two groups of Cu-free Al alloys, one contg. approx. 9% Mg and minor amts. of Mn and Si, and the other contg. Mg 2-3, Mn 1-3, Sb 0.2-0.5, Si 0.3-0.5%. The loss of wt. of the alloys high in Mg compares favorably with that of ordinary duralumin and is slightly better than that of a duralumin contg. Ni and Cr. The loss of wt. of an alloy contg. Mg 9.18, Si 0.66, Mn 0.34% was less than half of that of an alloy of similar compn., but contg. only 0.03% Mn. These alloys show promise for marine service. Leopold Pessel

A new method for prevention of corrosion of aluminum and its alloys. M. Tasaki. *Tetsu to Hagane (J. Iron Steel Inst. Japan)* 20, 42-6 (1934).—To prevent corrosion, Al is anodically oxidized at the same time that it is being annealed, in a bath which is kept at 500° for duralumin or at 230° for pure Al, and which contains equal parts of KNO<sub>3</sub> and NaNO<sub>3</sub>. A.c. is used at 65 v. and 0.04 amp./sq. cm for duralumin, or at 100 v. for Al. After 30 min. for duralumin or 1 hr. for Al, the metal is quenched in water and washed. Changes in the bath, effects of impurity, loss of the salt, recovery of the salt and analytical methods for impurities were studied. Corrosion resistance produced by this method is equal or superior to that by other methods, and the mechanical properties of the metal are not injured. M. Kuroda

Corrosion and protection of magnesium and its light alloys. Guy D. Bengough and L. Whitby. *Trans. Inst. Chem. Engrs.* (London) Advance Copy, Dec. 8, 1933, 13 pp.; *Metal Ind.* (London) 44, 3-5, 83-5 (1934), cf. C. A. 27, 5704.—Data are given on the compn. of the corrosion products of Mg exposed to an indoor and to an outdoor atm. Curves of wt. increment vs. time show that no permanently protective film is formed on Mg exposed outdoors. Losses of wt. are given for a no. of Mg alloys, exposed outdoors and under various indoor conditions. The value of lanolin as a protective coating is indicated. A slight loss of wt. may be accompanied by a considerable loss in elongation. Data on sea water immersion and salt spray tests are given, illustrating the effectiveness of various protective chem. films, especially that produced by the "selenium treatment," with and without the addn. use of org. protective coatings. Leopold Pessel

The theories of corrosion. V. O. A. Knight. *Mineral Industries, Penna. State Coll.* 3, No. 5, 2, 4 (1934), cf. C. A. 28, 1647.—Soil corrosion is considered. Alden H. Emery

Practical problems of corrosion. VIII. Inhibitive action of certain pigments on rusting. K. G. Lewis and U. R. Evans. *J. Soc. Chem. Ind.* 53, 25-33T (1934), cf. C. A. 24, 2619.—Steel and Fe specimens of different analysis, in contact with a no. of paint pigments and inert materials suspended in 7 different kinds of water and dil salt solns., with and without the addn. of O<sub>2</sub>, were examd. for loss of wt. Red lead, litharge, PbO<sub>2</sub>, Pb<sub>3</sub>O<sub>4</sub>, Pb oxalate, Pb<sub>2</sub>CrO<sub>4</sub>, white lead, Pb sulfate, Fe<sub>2</sub>O<sub>3</sub>, ZnO, MnO<sub>2</sub>, silica, magnesite, Ca carbonate, Ba sulfate, glass beads, Carborundum, sand, emery flour, "Blom Pigment S," "Blom Pigment N" and silica gel were investigated. Magnesite, litharge, "Blom Pigment S" and "Blom Pigment N" prevented attack almost completely in most liquids, while some of the other solids indicated inhibitive action in some liquids. Some pigments, especially MnO<sub>2</sub> and PbO<sub>2</sub>, accelerated the attack. In the presence of added O<sub>2</sub>, As<sub>2</sub>O<sub>3</sub> and Mg carbonate showed inhibitive action, 7 different types of Fe<sub>2</sub>O<sub>3</sub> behaved irregularly. ZnO acted as inhibitor. In sea water, red lead indicated inhibitive possibilities. Another set of expts. comprised scratch tests made on paint films contg. the pigments, and visual

observation of corrosion attack. Litharge, red lead, ZnO, "Blom Pigment S," Zn dust and Zn dust mixed with ZnO were corrosion inhibiting. PbO<sub>2</sub>, MgO, Mg carbonate and MnO<sub>2</sub> were doubtful. Lack of inhibitive action at the scratch was shown by Fe<sub>2</sub>O<sub>3</sub>, As<sub>2</sub>O<sub>3</sub>, Sb<sub>2</sub>O<sub>3</sub>, SnO<sub>2</sub>, Ti oxide, emery flour, Carborundum, Pb oxalate, Pb sulfate, white lead, Pb chromate, Ba sulfate, graphite, lamp black, Al pigment, Al coarse powder. Expts. made with mixts. of graphite with red lead or ZnO showed red lead to be more effective in giving inhibitive properties to graphite paints. The inhibitive phenomena are explained by the influence exerted by the pigments upon the phys. characteristics of the primary corrosion films and are similar to the phenomena caused by NaOH or K<sub>2</sub>CrO<sub>4</sub>.

<sup>1</sup> Leopold Pessel  
The usefulness of corrosion tests to the chemical engineer. A. S. White. *Ind. Chemist* 10, 98-101(1934).

<sup>2</sup> E. H.  
Fatigue and corrosion. K. Laute. *Oberflächenforsch.* 10, 281(1933).—Present views on corrosion fatigue are discussed; it is due not only to electrolytic effects, but the presence of O is necessary. Decrease of endurance strength under simultaneous corrosion is twice as great as in air; simple spraying with water may cause this effect which may even reach 80% in highly refined steels. Cu is, however, perfectly resistant. Protective coatings of metallic nature (spherulizing, galvanizing, etc.) and of red lead increase the length of life but do not prevent corrosion. Nitriding reduces fatigue 4-20% and promises well for future application; cold-pressing promotes more favorable distribution of stresses and gives an improvement up to 30%. Frequency of alternating stresses seems to have an influence on corrosion fatigue only above 1000 cycles per sec. Corrosion fatigue can be explained, according to present theories, that a film of different thickness is formed which tears under mech. stress; low frequencies of stress permit the film to form again, so that only high frequencies have the harmful effect of baring the surface for corrosion.

M. Hartenheimer  
Corrosion fatigue and sucker-rod failures. Blaine B. Wescott and C. Norman Bowers. *Proc. Am. Petroleum Inst. 14th Ann. Meeting Sect. IV*, 29-42(1933).—See C. A. 28, 449.

<sup>3</sup> E. H.  
Report on Bureau of Standards soil-corrosion and pipe-coating investigation. Leonard P. Wood. *J. Am. Water Works Assoc.* 26, 176-88(1934).—The materials tested included all forms of Fe, Cu, brass and their alloys that have or might have underground use. The data cover varying periods up to 8 or 10 years. Soil character rather than nature of material controls the type and severity of corrosion. Aside from high-Si cast iron, which under a wide number of conditions showed little corrosion, no ferrous pipe material showed marked superiority. Galvanizing showed substantial protection. Alloys of 75% or higher Cu content showed excellent corrosion resistance. Thin paint films and coatings affected by soil stresses are not satisfactory. Tentative recommendations are made.

D. K. French  
Soil-corrosion, studies 1932. Rate of loss of weight and pitting of ferrous and nonferrous specimens and metallic protective coatings. K. H. Logan and R. H. Taylor. *Bur. Standards J. Research* 12, 119-45(1934)(Research Paper No. 638).—Data obtained from specimens removed in 1932 are given. In most soils the rate of corrosion decreases apparently with time, because of more stable trench conditions or because of the formation of corrosion products, tending ultimately toward a fixed rate of corrosion. Prediction of the rate of corrosion, based upon the soil types established by the U. S. Department of Agriculture, seems possible. The type of soil rather than the variety of ferrous material is usually the controlling factor with respect to corrosion, but in certain soils proper choice of the material assumes great importance. Cu and alloys high in Cu corrode less rapidly than most ferrous materials in the soils investigated. A Zn coating weighing 1 ounce per sq. ft. should extend the life of the coated material at least 6 years in very corrosive soils and much longer under more favorable conditions.

<sup>4</sup> A practical method of electrical protection for pipe lines against soil corrosion. Starr Thayer. *Natural Gas* 14, No. 11, 6-12(1933); *Proc. Am. Petroleum Inst. 14th Ann. Meeting Sect. IV*, 148-52.—Expts. in lab. and field showed that a hot application of coal-tar enamel and the maintenance of a p. d. of 0.3 v. is sufficient to stop corrosion. Expts. with grease-coated lines showed that the cost of protecting them electrically is at least 9 times as much as that for the enameled lines, which are completely protected. Any high elec.-resistance coating is adaptable to this type of permanent protection. A. W. Furbank

<sup>5</sup> Corrosion troubles with cast-iron pipes laid in Groninger soil; causes and methods of combatting. C. M. Wichers. *Wasser* 7, 117-32(1933).—From the results of studies of conditions of the mains and chem. tests on samples of earth taken from around the pipes W. concludes that corrosion is independent of the type of Fe and is favored by these factors: (1) loosely packed soil immediately around the pipes through which air and water pass readily, (2) high concn. of H ions, (3) presence of H<sub>2</sub>S, (4) absence of CaCO<sub>3</sub>, and (5) presence of sulfate. The reduction of sulfate (by bacterial action) is not in itself regarded as a cause of corrosion but the entrance of O makes this condition dangerous. In the case of a soil contg. FeS where entrance of O is possible, the p<sub>H</sub> is no measure of the danger of corrosion, as FeSO<sub>4</sub> formed would have an acid reaction but basic ferric salts an alk. reaction. Corrosion may be prevented by keeping the mains dry, as by the use of a protective coating. A cheap means of decreasing corrosion is packing the pipes when laid with a well packed layer of clay or loam 10 cm. thick. Lime should be added if the clay or loam is in itself corrosive. In the appended discussion the use of protective coatings, particularly bituminous ones, is considered.

M. G. Moore  
Behavior of steel pipe under strongly corrosive conditions. F. Eisenstecken and E. Gerold. *Gas u. Wasserfach* 76, 93-1(1934); cf. C. A. 27, 5042.—Electrolytic corrosion is independent of the pipe material and can be minimized by the use of insulating coatings, insulating couplings and elec. drainage systems. The p. d. across insulating couplings should not exceed 0.1 v. Periodic tests should be made on both insulating couplings and drainage systems.

<sup>6</sup> R. W. Ryan  
Protection of metallic pipes buried in soil against electrolytic corrosion, especially from stray earth currents. F. Besig. *Gas u. Wasserfach* 77, 37-42(1934); cf. C. A. 27, 2411.—Potential or current measurements are required to det. definitely whether a given case of corrosion is electrolytic or chemical. Pipe coatings are perhaps the most important protective measure. The various coating types are mentioned. While it is desirable to remedy stray currents at their source, in some cases insulating couplings may be used where the drop across the coupling does not exceed 0.1 v., but this must be frequently checked. Five types of insulating couplings are illustrated and described. Such couplings should not be used in low-resistance soil. Elec. drainage methods sometimes give good results but care must be taken in their installation and they must be continually supervised while in use.

<sup>7</sup> R. W. Ryan  
Electrolytic corrosion in a hospital. Wilhelm Franckenstein. *Gas u. Wasserfach* 76, 934-6(1933).—Electrolytic corrosion of water and steam lines, etc., was found to be due to defective grounds on the 3-wire d. c. system within the hospital, and was remedied by the use of a suitable independent ground.

<sup>8</sup> R. W. Ryan  
Effect of the hydrogen-ion concentration on the corrosion of iron. J. M. Bryan. *Trans. Faraday Soc.* 29, 1198-1209(1933); cf. C. A. 27, 5625.—Expts. were carried out, by the previously described method, on a mild steel as used in tin-plate manuf. Ferric Fe causes a slight inhibition of corrosion at higher and an acceleration at lower acidities. With ferric Fe present initially, O causes acceleration over the whole range of p<sub>H</sub> studied. In the presence of ferric Fe most of the R is removed through polarization, irrespective of the p<sub>H</sub> or the presence or absence of O. With ferric Fe present initially, free O has a max. effect on corrosion at about p<sub>H</sub> 4, because of

the polarization of H. Part of this depolarization is apparently due to the action of the dissolved Fe as O carrier.

Leopold Pessel

The effect of water on iron pipes. John R. Baylis. *Proc. Am. Soc. Munic. Engrs.* 39, 177-83 (1933).—A brief review is made of the theory of corrosion, the formation and building up of tubercles, and their destruction.

W. H. Boynton

Corrosion in gearing. J. R. Kammel. *Commonwealth Engr.* 21, 75-6 (1933).—By continuous impact elec. potentials are set up which, if the lubricant contains traces of electrolytes, may cause considerable electrolytic corrosion. Addn. of approx. 50% of ZnO to the lubricant was found to overcome this difficulty. Metallic Zn is deposited on the running surfaces by electrochem. action and exerts anodic protection.

Leopold Pessel

The corrosion of telegraph wire. N. Taitz and V. Yuza. *Steel* (U. S. S. R.) 1933, No. 3, 74-85.—Corrosion in acid soln., in salt soln., and in artificial and natural atms. is increased by drawing, by non-metallic inclusions on the surface and by even a small amt. (0.50%) of Mn. Annealing decreases corrosion. A Cu content of 0.25-0.30% is recommended. Loss in wt. of annealed specimens is 4 times as great in the first 24 hrs. as in the following 72 hrs.; on other specimens the loss is proportional to the time.

H. W. Rathmann

Corrosion prevention by protective coatings with particular consideration of the industries of viscose rayon and viscose films. Fritz Ohl. *Metallbörse* 23, 1390-1, 1422-3 (1933).—Red lead and Fe oxide paints, also the slightly better bituminous coatings, are decidedly inferior to certain modern proprietary coatings, as was shown by extensive tests of 3 such paints, "Nust," "Harvel," "Daprenol," under a great variety of corrosive conditions occurring in these industries.

Leopold Pessel

Arc-welding of aluminum and a few properties of weld metal. L. Anastasiadis. *Z. Metallkunde* 25, 97 8, 141, 285-6 (1933).—Brief discussion of the possibilities of arc-welding Al, with some test data. Halogen salts were used as fluxes. Details in welding technic are given, and several welds illustrated and described. Photomicrographs and data on phys. properties and corrosion expts. are given.

R. F. Mehl

Welding copper for the chemical and allied industries. Werner Froelich. *Can. Chem. Met.* 18, 13-15 (1934).—Welding of Cu should not commence at one end and proceed to the farther end of the weld. Starting at a point 5-10 inches (12.7-25.4 cm.) away from one end, proceeding to the other end and then returning to the starting point to complete the weld to the other end avoids the mech. stresses always imposed upon rolled or forged Cu section by straight-through welding. Fluxes should not be applied until the surface is red-hot. Where hammering is impracticable, careful annealing and chilling of the weld will go far toward balancing mech. and chem. properties within the section affected.

Concentrating ores. Richard Fromm. *Brit.* 401,819, Nov. 16, 1933. Phosphatide made from soy beans or the mud or slime by-product of the manuf. of soy-bean oil is added to ore pulp in froth flotation concn. as a "froth accumulator."

Concentrating ores. Stanley Tucker and Minerals Separation Ltd. *Brit.* 401,720, Nov. 20, 1933. Ore, particularly that in which the values are intergrown with the gang, is coarsely ground and concd. by flotation, the unfloated part is then subjected to a 2nd flotation operation to give a 2nd concentrate and this, after the whole of the coarser particles thereof have been reground, is again concd. by flotation to recover the remainder of the values. Application of the process to the concn. of chalcopyrite, mixed with pyrite, and the differential sepn. of galena and zinc blende is described.

Apparatus for slush concentration of materials such as ores. Wm. C. Rickel. *U. S.* 1,947,877, Feb. 20 Mech. features.

Rotary disintegrating mill adapted for ore or coal treatment. Arthur J. Weinig. *U. S.* 1,948,606, Feb. 27 Structural and mech. features.

Electromagnetic ore separator. Robert Becker. *Ger* 591,881, Jan. 29, 1934 (Cl. 1b. 4.01).

Recovering metal values from silica precipitates. The Rhodesia Broken Hill Development Co., Ltd. *Ger* 592,354, Feb. 7, 1934 (Cl. 40a. 13.01). See *Brit.* 274,297 (C. A. 22, 1947).

Extracting metals from complex copper-gold ores, etc. Alva D. Lee. *U. S.* 1,947,850, Feb. 20. Finely divided ore is introduced into an air-tight furnace and continuously fed in a comparatively thin layer or stream and is subjected to the action of a highly reducing flame for a sufficient length of time substantially to reduce at least part of the metallic elements; metallic vapors are collected and condensed, and the hot residue is gradually and continuously removed and quenched without prior subjection to oxidizing conditions. App. is described.

Apparatus for dezincing molten lead by injection of a gaseous reagent such as chlorine. Karl A. Lindner (to American Smelting and Refining Co.). *U. S.* 1,949,391 2, Feb. 27. Various details of app. and operation are described.

Treating molten metals as in the refining of bearing metals. Wm. H. Kelly (to Mary E. Kelly). *U. S.* 1,949,051, Feb. 27. A perforated cage contg. water-retaining material such as asbestos satd. with water is introduced beneath a surface of molten metal so that steam is generated and dissoed. into H and O which are released into the metal through the perforations of the cage.

Pump for molten metals such as lead and its alloys. Joseph E. Rhoads and George H. White (to Chester A. Macomic). *U. S.* 1,947,876, Feb. 20. Structural and mech. details.

Flux. Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. *Ger.* 591,906, Jan. 29, 1934 (Cl. 40a. 15.10). A flux or purifying agent for smelting metals or alloys consists of a mixt. of ferrocyanides and phosphates, especially pyro- or meta-phosphates, with or without SiO<sub>2</sub>, silicate, alkalies or other slag-forming substances. Compds. of B such as H<sub>3</sub>BO<sub>3</sub> or borates may be present. Examples are given.

Treatment of metallurgical slags. Treibacher chem Werke A.-G. *Austrian* 136,400, Jan. 25, 1934 (Cl. 80d). In the manuf. of products resembling pumice by treating a fused slag with water, the slag is preheated to a temp. above that at which it is produced. The slag may also be treated with substances which raise its m. p., e. g., CaO, Al<sub>2</sub>O<sub>3</sub> or coke.

Dwight-Lloyd apparatus. Blei- und Silberhütte Bru-

bach G. m. b. H. and Paul Wefelscheid. Ger. 580,105, Dec. 8, 1933 (Cl. 40a. 3.60). Addn. to 578,968 (C. A. 28, 732<sup>2</sup>).

Siemens-Martin furnace plant. "Terni" Società per l'industria e l'elettricità. Ger. 591,807, Jan. 29, 1934 (Cl. 24c. 5.01).

Siemens-Martin furnace of refractory materials. Friedrich Siemens A.-G. Ger. 590,242, Dec. 29, 1933 (Cl. 18b. 14.01). Addn. to 516,887 (C. A. 25, 2804).

Rotary-hearth furnace for roasting ores. Felix Baron von Schlippenbach. Ger. 592,235, Feb. 3, 1934 (Cl. 40a. 18.01).

Multiple-hearth furnace for roasting ores. John Harris and Robert John Harris. Ger. 592,234, Feb. 3, 1934 (Cl. 40a. 4.30).

Apparatus for collecting gases from metallurgical converters. Soc. générale métallurgique de Hoboken. Ger. 592,246, Feb. 3, 1934 (Cl. 40a. 29). The gases evolved at different periods of the process are passed to sep. holders.

Apparatus for washing exhaust gases from metallurgical furnaces, etc. Charles M. Gerhold. U. S. 1,948,348, Feb. 20. Structural and operative details.

Vertical shaft furnace suitable for melting steel scrap or reducing iron ore. Hermann A. Brassert, Fredrik Wille and Paul Zimmermann (to H. A. Brassert & Co.). U. S. 1,948,696, Feb. 27.

Furnace suitable for heat-treating metals. George J. Hagan. U. S. 1,948,173, Feb. 20.

Hot-surface members for steel recuperators. Rekuperator G. m. b. H. Ger. 591,630, Jan. 24, 1934 (Cl. 24c. 5.02).

Composite metals. The Mond Nickel Co., Ltd. Fr. 757,254, Dec. 22, 1933. A solid metal such as Fe or steel is covered with Ni or an alloy of Ni by forming between the 2 metals an alloy having a hardness, a chem. compn., a resistance to corrosion, a microstructure and an at. structure revealed by the diffraction of x-rays, different from those of the 2 original metals. Thus, if steel is used as base metal an intermediate Fe-Ni alloy contg. 2-7% Fe of 0.0012-0.5 mm. thickness is formed for a final thickness of 0.65-1.5 mm. of Ni. Fr. 757,255. Ni or an Ni alloy is heated in contact with a base metal in a reducing atm. to 1175-1300°, and worked at 1300-975° with successive reductions in section of 10-25%. An intermediate ductile alloy is thus produced between the 2 metals.

Hard metal articles. Wolfram & Molybdaen A.-G. Fr. 757,375, Dec. 26, 1933. Hard metal powder is introduced into a supply tube of rubber, etc., and hydraulic pressure acting in all directions is applied. The compressed tube of metal is worked to the desired shape and concreted at a high temp.

Refining metals. Theodor Laible. Swiss 163,948, Nov. 16, 1933 (Cl. 76). Molten industrial metal, Cu is refined by adding fluorspar, CuO, SiO<sub>2</sub>, CaCO<sub>3</sub> and Na<sub>2</sub>S<sub>2</sub>O<sub>7</sub>. The method is useful for refining "new-silver," Cu bronze and brass.

Heat treatments such as hardening or tempering. John W. Harsch (to Leeds & Northrup Co.). U. S. 1,949,716, March 6. Various details of furnace construction and operation are described, involving heat regulation by forcibly circulating gas in different heating zones.

Heat-treating cobalt-molybdenum alloys. Werner Köster (to Vereinigte Stahlwerke A.-G.). U. S. 1,949,313, Feb. 27. For obtaining alloys of high hardness, an alloy of Mo together with Co 10-35% is heated to above 1000° but below the m. p. and then rapidly cooled and subsequently annealed at temps. of 500-900°.

Plant for annealing bars and tubes in commercial lengths. Allmänna Svenska Elektriska Aktiebolaget and Lennart Högel. Brit. 401,559, Nov. 16, 1933.

Apparatus for cleaning and annealing small metal articles, etc. George Webb (to Colt's Patent Fire Arms Mfg. Co.). U. S. 1,949,438, March 6. Mech. features.

Cementation. Cecil F. Simmonds and Sheepbridge Stokes Centrifugal Castings Co. Ltd. Brit. 401,421, Nov. 16, 1933. The grooves and bore of a peripherally grooved cylinder, from which piston rings are made, are rendered impervious to hardening, prior to surface harden-

ing of the exposed parts, by tinning or by painting with a compn. of Na silicate and powd. Al or Cr<sub>2</sub>O<sub>3</sub>.

Nitriding ferrous materials. John J. Egan (to Electro Metallurgical Co.). U. S. 1,949,082, March 6. For producing a nitride case, the material is heated at nitriding temps. below the eutectoid at about 600° in the presence of NH<sub>3</sub> and an accelerating agent such as pyridine or quino-line.

Increasing the resistance of springs to fatigue. Paul O. F. Vorwerk (to Edelstahlwerk Rochling A.-G.). U. S. 1,947,927, Feb. 20. The surface layers of springs such as leaf springs are compacted by blasting with hard small bodies free from sharp edges and points, such as surrounded steel particles.

Aluminum. Joseph A. Nock, Jr. (to Aluminium Ltd.). Can. 339,340, Feb. 13, 1934. Al or an Al-base alloy and a preliminary alloy contg. Ti in sufficient quantity to produce in the final melt a Ti content of 0.01-0.5% are separately melted, the melted Al-base alloy is combined with the melted preliminary alloy and the resulting melt is immediately cast.

Gold and silver. Bernard Gautier. Swiss 164,595, Dec. 16, 1933 (Cl. 76). A process for extg. Au and Ag from mineral sulfides, poor in Pb, by cyanization and flotation is described.

Iron. Eugen Piowowsky. Ger. 590,058, Dec. 21, 1933 (Cl. 18a. 1.20). Addn. to 564,681 (C. A. 27, 944). Cast Fe which does not deteriorate or corrode contains 0.1-3% As, as in 564,681, and also, Ni up to 3, Cr 1.5, Al 0.5, Mo 0.5 and Ti 0.2%, singly or severally.

Iron. Ernst J. Kohlmeier. Ger. 591,759, Jan. 26, 1934 (Cl. 18a. 18.05). A process is described for smelting Fe by heating a mixt. of Fe compd., S-free and S-contg. materials, or a mixt. of Fe compd. and S-contg. material, to above 1400° to give Fe-S, allowing this to congeal, and removing the S by chilling, granulating and sintering.

Iron. Vereinigte Stahlwerke A.-G. Ger. 591,875, Jan. 29, 1934 (Cl. 18a. 18.01). Fe is obtained by treating Fe ores with HCl under high pressure.

Iron sponge. Klockner-Werke A.-G. Abteilung Georgs-Marien-Werke and Friedrich v. Holt. Ger. 583,124, Jan. 31, 1934 (Cl. 18a. 18.01). A mixt. of Fe ore with 6-10% of fuel is treated with a reducing gas under such conditions that the product does not sinter.

Means for siphoning iron from cupola furnaces. Friedrich Schinke. Ger. 592,426, Feb. 7, 1934 (Cl. 31a. 1.20).

Producing metals such as iron and steel from ore. Hermann A. Brassert (to H. A. Brassert & Co.). U. S. 1,948,697, Feb. 27. The lower portion of a column of descending ore is surrounded with a reducing flame adjacent to but spaced from the column to melt the reduced ore in the lower portion of the column; the column is supported out of contact with the melted metal and gases from the flame are passed upwardly through the upper portion of the column to effect ore reduction. App. is described.

Manufacture of iron and steel articles such as tubes, wire or sheets. Nikolaus Bregger. U. S. 1,949,599, March 6. For producing products by successive elongation treatments or passes, without preliminary or intermediate annealing and without pickling or fresh coating of the material between the passes, scale is first removed from the material by a pickling treatment and the cleaned surface is converted into a rough and spongy condition by corroding it with an etching substance such as HCl and H<sub>2</sub>SO<sub>4</sub> soln. and the surface is then coated with a thin film-like layer of anti-friction material such as a Pb-Sn alloy penetrating into and filling all the cavities of the spongy surface, and the treated material is then subjected to the required number of elongation passes.

Steel. Hermann A. Brassert (to H. A. Brassert & Co.). U. S. 1,948,695, Feb. 27. Steel scrap is melted in a vertical shaft furnace solely by means of fuel such as gas or liquid fuel injected into the furnace and burned out of contact with the scrap so that the latter is maintained free of contact with carbonaceous-fuels; the molten steel is transferred to a second furnace and there refined. App. is described. Cf. C. A. 28, 1322<sup>2</sup>.

Steel. Compagnie des forges de Chatillon-Commentry

et Neuves-Maisons. Ger. 592,290, Feb. 5, 1934 (Cl. 18d. 1.30). The mech. properties of austenitic steel are improved by including 0.1-0.75% of As in the steel. Specific steels are described.

Device for heating and agitating melted ferrous materials for making steel. Vassily V. Soldatoff. U. S. 1,949,731, March 6.

Burnishing steel, etc. Berardo Guccini. Swiss 164,555, Dec. 16, 1933 (Cl. 44d.). Fe and its alloys are burnished chemically by defatting, and immersing in an alk. bath contg. alkali nitrate, an org. nitro compd. and PbO<sub>2</sub>. The objects are then immersed in vegetable oil. Cf. C. A. 27, 262.

Refining steel. Vere B. Browne (to Allegheny Steel Co.). U. S. 1,949,529, March 6. For refining steel contg. dissolved basic oxides and having on it a surface slag, material such as sand is added to supply an excess of SiO<sub>2</sub> over that theoretically necessary to convert all the dissolved oxides to silicates and such a change in the relative soln. pressures is effected as to set up a migratory tendency of the dissolved oxides from the steel to the slag with conversion of the oxides in the slag to the corresponding silicates (the excess SiO<sub>2</sub> in the slag maintaining the latter free from uncombined oxides other than SiO<sub>2</sub> and preventing premature equil. or reversal of the migration).

Non-corrodible surfaces on "sucker rods". Vere B. Browne (to Allegheny Steel Co.). U. S. 1,947,969, Feb. 20. Various details are given for the manuf. of rods with a steel core covered with a tube of non-corrodible Cr-Ni alloy steel.

Armor plate. Fried. Krupp A.-G. Brit. 401,491, Nov. 16, 1933. Addn. to 401,364 (C. A. 28, 2317<sup>a</sup>). Armor plate, hardened on 1 side, is made from those steel alloys of 401,364 which, as regards the relation between the C content and the sum of the Cr and Ni contents, fall under a curve shown in a diagram, preferably within an area similarly shown thereon.

Colored and hardened strip steel. Albert R. Stargardter (to Gillette Safety Razor Co.). U. S. 1,948,192, Feb. 20. The strip is heated to a temp. above its crit. point and then immersed in a gaseous medium having a reducing constituent such as CO but of oxidizing effect, and the oxidized strip is then chilled to harden it. App. is described.

Steel and its alloys from ores. Wm. J. Popham (to Minnesota Metallurgical Co.). U. S. 1,947,735, Feb. 20. Fe oxide ore or a mixt. of such an ore is melted while commingled with a flux such as lime and fluorspar and with a salt of a polycarboxylic acid such as Na mucate in the proportion of 15-35 g. per 15 lb. of ore, which serves as a catalyst.

Alloy steel rails. Christer P. Sandberg, Oscar F. A. Sandberg and Nils P. P. Sandberg. Brit. 401,666, Nov. 16, 1933. The rails are rolled from an alloy steel contg. C 0.35-0.6, Mn about 1 and Cr 0.30-1 or Ni 1.0-3.0%, and, after leaving the rolls, are subjected to an accelerated cooling through the crit. range. The temp. thereof is then equalized at above 500° and the rail is then caused to cool slowly to about 350°. The steel may also contain 0.25-1.0% Cu.

Alloys. Joseph Decock. Brit. 401,431, Nov. 16, 1933. See Fr. 733,673 (C. A. 27, 945).

Alloys. Heraeus-Vacuumschmelze A.-G. and Wilhelm Rohn. Brit. 402,254, Nov. 30, 1933. Addn. to 395,060 (C. A. 28, 90<sup>a</sup>). See Fr. 42,643 (C. A. 28, 734<sup>a</sup>).

Alloys. Emil Reuter. Ger. 582,937-8, Dec. 30, 1933 (Cl. 40b. 16). An alloy for tool consists of Cr 2.5-9, Mo 6-20, W 3-10, Co 10-36, V 2-5, Ta 0.5-5, C 0.73-2.33% and the rest Ni. The sum of the Mo, W and V contents is 15 times the C content and the ratios of the content of Cr to Co and Mo to W are 1:4 and 2:1, resp., (582,937). The Ni may be replaced by Fe (582,938).

Alloys resisting sulfur. Heraeus-Vacuumschmelze A.-G. Ger. 591,641, Jan. 25, 1934 (Cl. 40b. 14). An alloy resisting S and S-compds., particularly H<sub>2</sub>S, consists of Ni 44-79, Cr 9-31, Al at least 9, Si at least 2, and 0-14% of one or more of the following, Fe, Mo, Cu, Mn and C.

Hard alloys. Wolfram & Molybdaen A.-G. Swiss

1 163,608, Nov. 1, 1933 (Cl. 76). Fr. 757,410, Dec. 26, 1933. A hard alloy contains carbide of a metal of the 4th to 6th group of the periodic table and up to 25% of an alloy of B with a metal of the Fe group. Thus, the alloy may contain 25% of Fe-B or Fe-Ni and 75% of WC, TaC, TiC, NbC, VC, ZrC, HfC or Mo<sub>2</sub>C. The mixt. may be pressed and sintered. Cf. C. A. 28, 458<sup>a</sup>.

Magnetic alloys. Wm. Jessop & Sons Ltd., and John E. Gould. Brit. 401,476, Nov. 16, 1933. A permanent magnet has at least 1 of the members forming the pole pieces, of steel having a coercive force of not less than 100 c. g. s. units, contg., e. g., 6-35% Co, and another part of steel of coercive force of 30-80 units, contg., e. g., 6% W or Cr.

Alloy for turbine blades. Wilhelm Rohn. U. S. 1,948,448, Feb. 20. Blades of steam turbines are made of an alloy contg. Fe 46-98.5, Ni 39-0.5 and metals, such as Mo and W, of the 6th group of the periodic system m. above 2000° 15-1% and C less than 0.04%. Such alloys are highly resistant to corrosion and to erosion.

Aluminum alloy. Louis W. Kempf (to Aluminium Ltd.). Can. 339,339, Feb. 13, 1934. An Al alloy contg. Si 5-25 and Mg 0.02-3.0% is hard and resistant to corrosion.

Aluminum alloys. Akt.-Ges. vorm. Skodawerke. Austrian 136,265, Jan. 25, 1934 (Cl. 40b). Al alloys for making motor pistons and cylinders contain Si 5-25 and Te, Sr and (or) La up to 5% each, with or without Mg, Cu, Fe, Mn, Ni, Co, Cr and (or) Li up to 2% each. Specific alloys are described.

Aluminum alloys. Jean Hanco. Ger. 592,323, Feb. 6, 1934 (Cl. 40b. 18). See Fr. 638,159 (C. A. 23, 88).

Aluminum alloys. J. Stone & Co., Ltd. Fr. 757,025, Dec. 29, 1933. Alloys of Al with Cu, Ni, Mg, Fe and Si also contain up to 1% of Ce to make the alloy more easily cast. The alloys may contain Cu 0.5-5, Ni 0.5-3, Mg 0.1-2.5, Fe 0.2-2, Si 0.2-2.5, Ce up to 1% and Al the rest.

Riveted plated products of aluminum alloy sheets. Gustav Schreiber (to I. G. Farbenind. A.-G.). U. S. 1,949,112, Feb. 27. Articles are formed of a high-strength Al alloy in the form of sheets which are riveted together with rivets of a high-grade Al alloy contg. Mg about 4-7% and having an electrolytic potential approx. equal to that of "technically pure" Al. The sheets may be coated with "technically pure" Al and the rivets may also contain Mn 0.3-1.0%.

Alloys of beryllium with heavy metals. Ernst Pokorný (to I. G. Farbenind. A.-G.). U. S. 1,949,082, Feb. 27. See Fr. 736,847 (C. A. 27, 1319).

Cadmium alloys. American Smelting & Refining Co. Fr. 757,392, Dec. 26, 1933. An alloy for bearings contains Ni 0.25-7% and Cd the rest. Al, Sb, Cu, Mg and Zn not above 3% may be added.

Copper alloys. George H. Whiteman and Imperial Chemical Industries, Ltd. Brit. 402,118, Nov. 27, 1933. Tubes for use in heat exchangers are made from Cu alloys contg. Al 2-8 and Ni 1-3%, the Ni being always less than the Al.

Copper-zinc alloys. Oesterreichische Dynamit Nobel A.-G. Fr. 757,232, Dec. 22, 1933. Alloys which are resistant to corrosion and easily worked are made by adding a small amt. of Ni or (and) Co to  $\gamma$ -brasses (alloys of Cu and Zn contg. 31-40% of Cu). One example contains Cu 38-33, Co 1-6 and Ni 4% and Zn the rest. Fr. 757,233. Alloys having the above properties are made by adding a small amt. of Ni or (and) Co to Cu-Zn alloys in the  $\beta + \gamma$  zone, i. e., alloys contg. Cu 40-50%. One example contains Cu 45, Ni 2, Co 2.5% and Zn the rest.

Iron alloys. Soc. anon. des hauts-fourneaux, forges et aciéries de Pompey. Fr. 757,518, Dec. 28, 1933. An Fe alloy resistant to corrosion contains C < 0.05, Mn 0.2-0.6, Si 0.2-0.6, P < 0.02, S 0.015, Cu 0.3-0.6 and W 0.01-0.15%. Cr (0.01-0.04%) may be added to improve the mech. characteristics. Cf. C. A. 27, 4210.

High-carbon chilled iron alloy roll. Wm. H. Seaman. U. S. 1,948,243, Feb. 20. Chilled rolls are formed contg. high-carbon iron asfeed. with Mn 0.15-0.27, Si 0.15-0.65, Cr 0.20-0.50 and Ni 2.5-5.0%. U. S. 1,948,244

relates to chilled rolls of Fe alloy contg. Si 0.25–0.35, Cr 0.25–0.35, Mn 0.18–0.22, and Ni about 3.2 and C 3.5–4.0%. U. S. 1,948,245 relates to rolls which may be formed of chilled Fe alloy contg. Si 0.15–0.25, Cr 0.25–0.35, Mn 0.15–0.20, C about 3.3 and Ni 4.75–5.0%. U. S. 1,948,246 relates to rolls of Fe alloy contg. C 2.60–3.35, Mn 0.10–0.40, Cr 0.15–0.65, Mo in about the same proportion as the Cr, and Ni 1.25–5.0%. Cf. C. A. 28, 91<sup>1</sup>.

**Ledeburitic, preliminary iron alloy free from graphite.** Josef Novak and Roman Kesselring. U. S. 1,947,650, Feb. 20. A "pre-alloy" of this type suitable for use in the manuf. of steels contains Fe with some impurities together with Cr 20–30, W 2–6, Ni 6–15, Cu 10–15 and C 2.5–3.0%.

**Ferromagnetic alloys.** Vereinigte Stahlwerke A.-G. Brit. 401,443, Nov. 16, 1933. Addn. to 346,013 (C. A. 26, 416). See Fr. 42,094 (C. A. 27, 4707).

**Alloy for magnetically recorded sound records.** Theodore Cohen (to Scientific Research Trust). U. S. 1,949,409, March 6. An alloy is used such as music-wire contg. Ni 5% and Co 5%.

**Lead alloys.** Henry Harris. Ger. 592,461, Feb. 7, 1934 (Cl. 40b. 10). See U. S. 1,860,095 (C. A. 26, 3772).

**Refining magnesium and its alloys prior to casting.** Frederick Badger and British Maxium Ltd. Brit. 401,072, Nov. 13, 1933. Cf. Brit. 375,743 (C. A. 27, 3185). The  $MgCl_2$  contains 2–10%  $H_2O$ .

**Silver alloys.** Tadashi Tanabe. Brit. 401,527, Nov. 16, 1933. See Japan. 99,246 (C. A. 28, 2317<sup>4</sup>).

**Tin alloys.** Max Speichert. Ger. 592,237, Feb. 3, 1934 (Cl. 40c. 44.00). Waste Sn alloy contg. Sb, Cu and Pb, with or without Ni and As, is fused and treated with  $PbS$  and (or)  $Sb_2S_3$ , with or without S. The upper of the 2 layers into which the mixt. seps. contains most of the Sn and Cu as sulfides, together with Pb and possibly Sb. This layer is withdrawn, roasted to oxides, freed from Cu by lixiviation, and reduced to yield a solder. The lower layer comprises a modified alloy of higher Pb or Sb content. An example is given in which an alloy contg. Sn 30, Pb 52, Sb 15 and Cu 3% yields a solder contg. Sn 46, Pb 52, and Sb 1.6% and a hard alloy contg. Pb 87, Sb 11.4 and Sn 1.6%.

**Bimetallic thermostatic elements.** Howard D. Matthews (to W. M. Chace Valve Co.). U. S. 1,948,121, Feb. 20. Elements used together such as a Si-Cu alloy and a Ni-steel alloy are heat treated at temps. above those of contemplated use in order to relieve internal stress in the metals.

**Apparatus and process for treating ribbons of safety razor blades.** Heinrich Bassat. Brit. 402,002, Nov. 23, 1933. A strip of contiguous razor blades, after the grinding, polishing, etching and cleansing or rinsing operations have been completed, is fed forward and sprayed on both sides with oily liquid to remove rinsing water, wiped and finally dried by hot air.

**Protected metal sheets.** John E. Burns and H. H. Robertson Co. Brit. 401,783, Nov. 23, 1933. In forming protected sheets covered on both sides with fibrous material, e. g., asbestos, impregnated with asphalt, etc., which is protected by a layer of asphalt, the unprotected side edges are provided with covering means surrounded by the final coating of asphalt, etc., so that the sheet may be bent near said edges without rupturing the protective coating.

**Zinc sheets for use in galvanic cells.** Paul Mittmann (to American Lurgi Corp.). U. S. 1,947,948, Feb. 20. Relatively thin Zn plates are cast at a temp. of about 420–

40°, rolled into sheets in the usual manner, and the sheets are then cold rolled.

**Multiple wire-drawing apparatus.** Walther Nacken Brit. 401,991, Nov. 23, 1933.

**Process for obtaining coherent masses from powdered hard metal, e. g., a mixture of a hard carbide and a metal of lower melting point.** Wolfram & Molybdaen A.-G. Brit. 401,521, Nov. 16, 1933.

**Forming compound metal bodies such as copper-clad iron, etc.** Ernst Schubarth. U. S. 1,948,242, Feb. 20. Various details of app. and operation are described for nesting, heating and extrusion of assocd. metals in coaxial layers.

**Optical system, etc., for discovering and recording defects in metal plates such as those of steam boilers.** Jared P. Morrison (to Hartford Steam Boiler Inspection and Insurance Co.). U. S. 1,947,729, Feb. 20. A photographic app. may be used.

**Tools with working portions of tantalum carbide.** Clarence W. Balke (to Ramet Corp. of America). U. S. 1,948,489, Feb. 27. A working portion of Ta carbide is Ni-plated, baked and attached with Ag solder to a steel body. Cf. C. A. 28, 1013<sup>4</sup>.

**Coating metals.** Alessandro Salvi and Francesco Gianni. Ger. 591,781, Jan. 26, 1934 (Cl. 48b. 8). See Brit. 381,956 (C. A. 27, 4521).

**Coating metals such as iron, zinc, magnesium and their alloys.** Robert R. Tanner and Herman J. Lodegren (to Metal Finishing Research Corp.). U. S. 1,949,090, Feb. 27. A bath is formed contg. phosphate of Zn, Mn or Fe, a sol. compd. of a metal less basic than the metal to be coated, such as Cu nitrate, and an oxidizing agent such as  $HNO_3$ ; the article to be coated, which is formed of Fe, Zn, Mg or their alloys, is immersed in the bath while it is at room temp. The total acidity of the bath as measured with phenolphthalein as indicator is at least 15 times the free acidity as measured with methyl orange as indicator.

**Coating iron or steel with zinc.** John L. Bray. U. S. 1,948,505, Feb. 27. The article to be coated is dipped in molten Zn, removed and cooled to below the solidifying point of the Zn, then dipped in a bath of molten Pb contg. Zn materially below the satn. point at the operating temp. of the bath. A portion of this Pb-Zn bath is removed from time to time and Pb is added to maintain the bath with a desired proportion of Zn below the satn. point.

**Polishing metals.** Udylyte Process Co. Fr. 757,702, Dec. 30, 1933. Zn, Cd and Mg are given a brilliancy by dipping them in an oxidizing bath, not nitrogenated and contg. an acid or a base, e. g., an aq. bath contg. chromic acid and  $H_2SO_4$  or  $NaMnO_4$  and  $NaOH$ .

**Reacting on zinc with tin salts, etc., to form alloys for soldering or other purposes.** Ernest Hey. U. S. 1,947,938, Feb. 20. Zn which may be in the form of sheets is treated with a soln. such as may be formed by dissolving Sn in  $HCl$  until there results from the reaction a gas-distended, coherent sponge-like material around the Zn and the reaction is regulated (as by adjustment of the strength of the acid metal soln.) to avoid detachment of the reaction product from the Zn. Alloys also contg. Cu, Pb, Ag and Au may also be formed from similarly assocd. materials.

**Coated welding electrode.** John B. Austin (to Una Welding, Inc.). U. S. 1,949,398, Feb. 27. A nitrocellulose lacquer is used for securing coating materials such as fluxes, etc., to a metal rod and the coating is substantially free from inorg. binding agents.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROULLER AND CLARENCE J. WEST

**Nature of valencies in organic chemistry.** G. Urbain. *Bull. soc. chim.* 53, 637–52 (1933).—A lecture. B. C. A. H.

**Neopentyl deuteride.** Frank C. Whitmore, Geo. H. Fleming, D. H. Rank, E. R. Bordner and K. D. Larson.

*J. Am. Chem. Soc.* 56, 749 (1934).—Neopentylmagnesium chloride reacts with  $H_2O$  (d. 1.0735) to give a mixt. of neopentane and neopentyl deuteride, m. —22° to —21° (neopentane, —21° to —20°),  $n_D^{20}$  1.35360 (neopentane,

1.35375); the deuteride boils about 0.2° below pure neopentane.

C. J. West

Preparation of butyl and hexyl alcohols from by-products obtained in the synthesis of divinyl from ethyl alcohol. III. B. A. Kazanskii, A. A. Balandin, I. M. Tzerkovnikov, K. A. Ivanova and E. N. Staroverova. *J. Applied Chem.* (U. S. S. R.) 6, 260-73 (1933).—The Bu fraction sepd. from the above by-products b. 115-20°,  $d_4^{20}$  0.8352,  $n_D^{20}$  1.4085, Br no. 49.3; it constituted about 22.18% of the unsatd. alcs. of the formula  $C_4H_8O$  in the fraction. This fraction was hydrogenated by the Sabatier method in the presence of various catalysts, such as Ni pptd. on pumice stone with a glass and a Cu tube, Cu on asbestos, Fe, and Ni (hydrogenation is the liquid phase). The process was carried out at 340-50°, 320-30°, 120°, 350°, 200° 5', 400-80° and 100°. The catalysts had the following consts.: b<sub>744</sub> 115.5-17° (mainly 116°),  $n_D^{20}$  1.4008,  $d_4^{20}$  0.8105, which are fairly close to those given in the literature for BuOH. The hexyl fraction was also redistd. and hydrogenated under similar conditions. It yielded a product b. 150-5°,  $n_D^{20}$  1.4187,  $d_4^{20}$  0.8205. This is not a uniform product. The yield of BuOH amounted to 19.2% of the total of the alc. by-products. The best hydrogenation temp. for the Bu fraction lies at 120°, although hydrogenation takes place at 50°; Ni pptd. on asbestos is the best catalyst at 150°.

A. A. B.

Dynamics and mechanism of aliphatic substitution. R. A. Moelwyn-Hughes. *Nature* 133, 294 (1934).—Slator's data (*J. Chem. Soc.* 85, 1286 (1904)) on the reaction velocities of  $Na_2S_2O_8$  with alkyl halides, sym. ethylenedihalides,  $C_2H_4I_2$  and  $C_2H_4Br_2$  are in agreement with the theory of Hughes and Ingold (*C. A.* 28, 1983<sup>a</sup>, 2324<sup>a</sup>).

Gerald M. Petty

Peroxide effect in the addition of reagents to unsaturated compounds. IV. The addition of halogen acids to vinyl chloride. M. S. Kharasch and C. W. Hannum. *J. Am. Chem. Soc.* 56, 712-14 (1934); cf. *C. A.* 27, 3444.—The addn. of HX to  $CH_2=CHCl$  can occur to give  $MeCHClX$  or  $CH_3XCH_2Cl$ . Under normal "non-peroxide catalyzed" conditions the formation of  $MeCHXCl$  was found to occur exclusively as predicted. Without solvent or a good antioxidant the addn. of HBr leads to a rapid, nearly quant., formation of  $CH_3BrCH_2Cl$ ; in the presence of metal catalysts the peroxide effect is destroyed and nearly quant. yields of  $MeCHClBr$  are obtained. Under the influence of sun or artificial light, at room temp. or near 0°, the effect of *p*-thiocresol and other antioxidants is almost completely destroyed; strong illumination, particularly sunlight, increases tremendously the velocity of the "abnormal" reaction. The addn. of HBr at elevated temps. in the dark proceeds at an increased velocity but decreases the yield of "normal" product,  $MeCHBrCl$ , showing the "peroxide" effect to be increased under these conditions. In the presence of air, the solvent effect is of minor importance since the "peroxide catalyzed reaction" proceeds so fast that it obliterates quite effectively any antioxidant effect of the solvent; some 1,1-isomer was formed, without the use of antioxidants, by the addn. *in vacuo* in  $PhNO_2$  and particularly in mesitylene. The addn. of HCl in the absence of metal salt catalysts does not proceed at a sufficiently rapid rate to be studied conveniently. The addn. of HI under any condition forms only  $MeCHICl$ ; the strongly reducing HI destroys all peroxides, even at -40°.

C. J. West

$\beta$ -Chloroethyl methyl sulfide. W. R. Kinier and Wallace Windus. *Org. Syntheses* XIV, 18-19 (1934).— $MeSCH_2CH_2OH$  and  $SOCl_2$  give 75-85% of  $MeSCH_2CH_2Cl$ .

C. J. West

$\beta$ -Hydroxyethyl methyl sulfide. Wallace Windus and P. R. Schildneck. *Org. Syntheses* XIV, 54-6 (1934).—[HN:C(SMe)NH<sub>2</sub>]<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub> and NaOH give MeSH, the Na salt of which reacts with  $HOCH_2CH_2Cl$  to give 74-82% of  $MeSCH_2CH_2OH$ .

C. J. West

The *aci*-form of trinitromethane. Leslie W. Andrew and Dalziel J. L. Hammick. *J. Chem. Soc.* 1934, 244.—The K salt of nitroform, stirred into concd. H<sub>2</sub>SO<sub>4</sub> at room temp., gives a product m. 50°; the liquid melt solidifies below 0° and then m. 14°; the higher-melting solid could

not be purified; it is almost certainly the *aci*-form.

C. J. West

Quantitative study of the reaction between some primary aliphatic alcohols and sulfuric acid. C. M. Suter and Elmer Oberg. *J. Am. Chem. Soc.* 56, 677-9 (1934).—The extent of ester formation at equil. in the reaction between a no. of alcs. and H<sub>2</sub>SO<sub>4</sub> has been detd. at 25°. The equil. const. (K) in general increases with a decrease in the concn. of H<sub>2</sub>O in the reaction mixt. Values for K with 96.7% H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>SO<sub>4</sub> with 5.20, 22.6 and 31.98% SO<sub>3</sub> were found as follows: MeOH 3.30, 3.42, 3.62, 3.67; EtOH 1.76, 2.02, 2.08, 1.98;  $ClCH_2CH_2OH$  2, 2, 2.44, 2.55; PrOH 2.30, 2.38, 2.59, 2.76; BuOH 2.60, 2.83, 2.82, 3.04; (1st 2 acids only) iso-BuOH 3.14, 3.32, AmOH 2.78, 2.98;  $C_6H_5OH$  2.57, 2.70. In the prepn. of alkyl H sulfates the use of H<sub>2</sub>SO<sub>4</sub> contg. 30% SO<sub>3</sub> increases the yields 10-15% over those obtainable from the concd acid when the mol. ratio of the reactants is unity.

C. J. West

Quaternary ammonium salts from bromopropylidialkylamines. IV. Formation of four-membered rings. C. F. Gibbs and C. S. Marvel. *J. Am. Chem. Soc.* 56, 725-7 (1934); cf. *C. A.* 27, 2936.— $\gamma$ -Phenoxycyclopropylidethylamine, b<sub>1</sub> 118-20°; chloroplatinate, m. 134-5°; di-Pr analog, b<sub>1</sub> 137-9°,  $d_4^{20}$  0.938,  $n_D^{20}$  1.4983; di-Bu analog, b<sub>1</sub> 148-50°, d. 0.931,  $n_D^{20}$  1.4939; chloroplatinate, m. 150-3°,  $\gamma$ -bromopropylidipropylamine, b<sub>1</sub> 77-8°; chloroplatinate, m. 194-6°; di-Bu analog, b<sub>1</sub> 96-8°, d. 1.073,  $n_D^{20}$  1.4082; bromoaurate, m. 130°. These Br derivs. undergo spontaneous intramol. condensation to give the corresponding cyclic dialkyltrimethylammonium bromides,  $(CH_2)_3NR-Br$ ; R = Et, m. 175-8°; Pr, m. 52-9°; Bu, m. 120-1°; Diethylallylamine-HBr, m. 189-90°. The above reaction is of theoretical interest since the corresponding bromopropylidethylamines condense to produce only linear polymers.

C. J. West

Thermal decomposition of organic compounds from the standpoint of free radicals. VII. The ethylidene radical. F. O. Rice and A. L. Glasbrook. *J. Am. Chem. Soc.* 56, 741-3 (1934); cf. *C. A.* 27, 5714; 28, 1655<sup>a</sup>.—The expts. seem to indicate that, if the  $MeCH$  radical is formed in the decompn. of  $MeCH:N$ , it is a radical of exceedingly short life, since in contrast with the behavior of  $CH_3N_2$ , the Paneth effect with metallic mirrors is not shown. Furthermore, no  $MeCH:CO$  can be detected when the decompn. is carried out in an atm. of CO<sub>2</sub>. Since  $C_2H_4$  is the only condensable gas formed during this decompn., in particular since neither  $C_2H_2$  nor 2-butene is formed, it seems likely that the  $MeCH$  radical rearranges very easily according to the equation  $MeCH \rightarrow CH_2:CH$ . The decompn. of  $MeCH:NN:CHMe$  was studied, 60% appearing to decompose to  $C_2H_4$  and N<sub>2</sub>; the remaining 40% gave a non-volatile oil, some HCN and probably  $CH_4$ .

C. J. West

Electrolysis of ether solutions of the Grignard compound. Isolation, identification and determination of anodic products. W. V. Evans and F. H. Lee. *J. Am. Chem. Soc.* 56, 654-7 (1934).—The anodic products of the electrolysis of EtMgCl, EtMgBr or EtMgI are  $C_2H_4$ ,  $C_2H_6$  and traces of H<sub>2</sub>; PrMgX gives  $C_2H_4$ ,  $C_2H_6$  and traces of H<sub>2</sub>; mixts. of EtMgX and PrMgX give chiefly  $C_2H_4$ ,  $C_2H_6$ ,  $C_3H_8$  and  $C_4H_{10}$ ; mixts. of EtMgX and PhMgX give  $C_2H_4$  and  $C_2H_6$ . The electrolytic products of  $MeMgX$  vary with the concn.; at high concn.  $C_2H_4$  is the chief product; at low concn. more  $CH_4$  and unsatd. hydrocarbons as  $C_3H_4$  and iso- $C_4H_8$  are produced. The mechanism of these reactions is suggested.

C. J. West

Ease of ring formation in the case of cyclic imines. G. Salomon. *Helv. Chim. Acta* 16, 1361-73 (1933); cf. *C. A.* 27, 3448.—In the prepn. of cyclic imines from halogenated alkylamines the formation of 3- and 4-membered rings requires a higher heat of activation than that of the 5- and 6-membered rings. The reaction can occur only when an activated mol. is in the "ring position." The statistical equil. ring position  $\approx$  chain position is expressed by the reaction const. On thermodynamic grounds it seems probable that this equil. depends on the solvent. The ring position of the dissolved mol. will

predominate if the mol. is physically very different from the solvent. In agreement with this theory, the reaction const. of this ring-closure reaction is 5–6% smaller in org. solvents than in  $H_2O$ . Since the org. solvent also lowers the heat of activation by 5 kg. cal., the reaction-checking influence of the org. solvent is less obvious in a comparison of the reaction velocities. Stoll's theory in regard to the space-filling of many-membered rings was applied to this idea of "ring position." By means of this theory the appearance of a large heat of activation in the formation of hexamethylenimine was traced to an unfavorable spatial arrangement of the ring-forming mol. Louise Kelley

**The formation of acids from aldehydes and water vapor.** Stefan Goldschmidt, Paul Askenasy and Hermann Grimm. *Ber.* 67B, 202-13(1934).—CuO contg. a little  $Cr_2O_3$  is a good catalyst for the reaction of aldehydes and steam to form acids and H. At  $350^\circ$  53% conversion of AcH to AcOH was obtained. The equil. in this reaction is discussed. Alcs. also react; aldehydes and acids are formed.

G. B. Taylor

**Wood alcohol oils.** S. I. Ruibin and S. S. Medvedev. *J. Applied Chem.* (U. S. S. R.) 6, 311-19(1933).—In the investigation of wood alc. oils the following substances were detected: in the water-insol. part:  $EtCOCHMe_2$ ,  $EtCOPr$  and  $MeCOBu$ ; in the water sol. part: acetone,  $EtCOCHMe_2$ , cyclopentanone, allyl and crotonyl alcs., and  $(CH_3O)_2$ . The main constituent of the oil is a ketone, this making it a valuable solvent. A. A. B.

**The action of metallic sodium on aliphatic ketones.** A. B. Favorskii and I. N. Nazarov. *Bull. acad. sci. U. R. S. S., Classe sci. math. nat.* 1933, 1309-51; cf. *C. A.* 27, 3445.—Na reacts with  $(Me_2C)_2CO$  (I) in  $Et_2O$  to give a dark red ketyl (II) decomp. in the presence of air, with disappearance of the color. The colorless soln. with  $H_2O$  gives  $H_2O_2$  as in the case of aromatic ketones. Na with I in  $Et_2O$  in a sealed tube gives II, which after several days passes to a ppt. of  $[(Me_2C)_2(NaO)C]_2$  (III) unlike the corresponding aromatic compds. Also  $[(Me_2C)_2(HO)C]_2$  (IV) does not give II with  $EtONa$ . Na also reacts with I without solvent to give orange II and III. In a typical expt., addn. of 9 g. Na ribbon to 30 g. I at ordinary temp. gave II with rise of temp. to  $60-80^\circ$ . After a day the mass thickened owing to sepn. of III and reaction ceased. Completion of the reaction by heating at  $100-20^\circ$  for 5-6 hrs. with shaking, cooling and shaking with abs.  $Et_2O$  for several days until all color had permanently disappeared, resulted in the removal of one Na for each mol. of I. No H was evolved. II with  $H_2O$  gave I, IV and  $(Me_2C)_2CHOH$  (V), in equal quantities. I and V arose from IV. IV at  $220-50^\circ$  gave  $(Me_2C)_2CCOCMe_2$  (VI), and with Na in  $Et_2O$  gives III. IV,  $b_p$   $156^\circ$ , m.  $85-6^\circ$  from abs.  $EtOH$ . Gradual addn. of 5.5 g. IV with const. shaking to 35 g. concd.  $H_2SO_4$  at  $-10^\circ$ , pouring the mixt. onto ice, extn. with  $Et_2O$ , removal of the  $Et_2O$  and distn. with steam gave 82% of VI, colorless liquid (even at  $20^\circ$ ) with camphor odor,  $b_p$   $119-21^\circ$ . VI (3 g.) in 17 cc. abs.  $EtOH$  with 3 g. Na gave 2.5 g.  $(Me_2C)_2CC(H)(OH)CMe_2$  (VII),  $b_p$   $122-4^\circ$ . VII without solvent did not react with Na. VI with Na gave a violet product which changed to yellow in 20 days. A suspension of 0.5 g. VI in 10 cc.  $H_2O$  cooled with ice with 15 cc. of 2% Br in  $H_2O$ , added gradually with const. shaking, gave a yellow ppt. which was filtered and dried by pressing between filter paper and then placed *in vacuo* in the dark for 2 days. The product, 0.56 g. of  $(Me_2C)_2CCBr(OH)CMe_2$  (VIII), m.  $74-5^\circ$  (decampn.). VIII was also obtained from VII and Br. VIII decomposes on standing, is stable to dil.  $H_2SO_4$ , and is easily decompd. by alkali, giving VI, HBr and HBrO. VII gave neither a urethan nor a Bz deriv. To 30 cc. abs.  $Et_2O$  and 5 g. Na in a flask, through which well-dried  $CO_2$  ( $CaCl_2$ ,  $H_2SO_4$ , and  $P_2O_5$ ) was passed, was added 10 g. I in 10 cc.  $Et_2O$ , over a period of 3 days with frequent shaking. The  $Et_2O$  lost by evapn. was replenished. The white cryst. ppt. formed was sepd. from the Na with  $Et_2O$  and decompd. with  $H_2O$ . Acidification of the aq. soln. and extn. with  $Et_2O$  gave 2 g. of a hydroxy acid. Seven g. of unchanged I was recovered.  $Me_2CCOCHMe_2$  reacted with Na in

the same manner as I, but the proportion of pinacol in the mixt. of products obtained by decomp. the Na ketyl with  $H_2O$  was smaller and it was not isolated in the pure state.  $Me_2C(IX)$  reacted with Na in the absence of a solvent to a slight extent as an enol, but the principal product was the pinacolate,  $[(Me_2C)(ONa)CMe]_2$  (X). No colored ketyl was observed, although this is probably formed momentarily since  $H_2O_2$  was detected. IX (90 g.) and 22 g. Na gave H for 1-1.5 hrs. After cessation of the evolution of gas, the mixt. was heated in a sealed tube at  $110^\circ$  for 16-20 hrs. with frequent shaking. Careful opening of the tube (H under pressure present), and sepn. of the colorless product from the excess Na with  $Et_2O$  and Fe wire gave X. X with  $H_2O$  gave IX,  $Me_2CCH(OH)Me$ , and 80% of a mixt.  $b_p$   $90-107^\circ$ , which was sepd. into a lower (90-99°) (XI) and a higher (99-107°) (XII) fraction. XI was  $(Me_2C)Me_2CCOCMe_2$  and XII was the unsatd. alc.,  $CH_2=C(CMe_2)CMe(OH)(CMe_2)$ . No pinacol corresponding to X was isolated. Distn. of XII at ordinary pressure caused further dehydration to give  $[CH_2=C(CMe_2)]_2$  (XIII), b.  $168-70^\circ$ , best prepd. by heating XII with anhyd.  $(CO_2H)_2$ . XII with  $KMnO_4$  gave IX,  $Me_2CCOCH_2$  and  $Me_2CCO_2H$ . XIII added 1 mol. Br and reacted with maleic anhydride in  $C_6H_6$  to give 5,6-di-tert-butyl-1,2,3,4-tetrahydrophtalic anhydride, m.  $128-9^\circ$ , which was converted to the corresponding alc. m.  $183-4^\circ$ , with NaOH and  $H_2SO_4$ . XI  $b_p$   $200-2^\circ$ ,  $d_4^{20}$  0.8434, M. R. 58.377. Reduction of XI with Na and abs.  $EtOH$  gave  $(Me_2C)Me_2CCH(OH)CMe_2$ ,  $b_p$   $99^\circ$ ,  $d_4^{20}$  0.8481; Bz deriv. m.  $48-9^\circ$ . XI was accompanied by a small amt. of  $(Me_2C)_2MeC(OMe)_2$ . Lewis W. Rutz

**The highly activated carbonyl group: mesityl glyoxal.** Arzy R. Gray and Reynold C. Fuson. *J. Am. Chem. Soc.* 56, 739-41(1934).— $\beta$ -Isoduryloyl chloride and Mg in  $Et_2O$  give 30% of dimesityl diketone (I), yellow, m.  $120-1^\circ$ , which does not react with alkali,  $MeMgI$  or  $H_2NNHCO-NH_2$ ; a 2nd product m.  $231-2^\circ$ . Reduction of acetomesitylene with  $SnO$  in  $H_2O$ -dioxane gives 82.5% of mesityl glyoxal (II),  $b_p$   $105-6^\circ$ ,  $b_p$   $118-9^\circ$ ,  $n_D^{20}$  1.5520; the hydrate m.  $100-100.5^\circ$ ; the oxime m.  $138.5-9^\circ$ ; the phenylhydrazone, yellow, m.  $145.5-6.0^\circ$ ; the semicarbazone, pale yellow, m.  $207-8^\circ$ ; the menthone deriv.,  $C_{10}H_{18}O_3$ , m.  $194.5-5^\circ$ . In contact with alkalies II rearranges to mesityl glycolic acid. II with  $PhMgBr$  gives *Ph mesityl diketone*, pale greenish yellow, m.  $136-7^\circ$ ; the monosemicarbazone m.  $203-4^\circ$ . II and mesitylmagnesium bromide give I and 1,2-bis( $\beta$ -isoduryloyl)ethylene glycol, m.  $160.5-61.5^\circ$ ; this was also prepd. in 39% yield by the use of Mg and  $I_2$  in  $Et_2O-C_6H_6$ ; its diacetate m.  $185-5.5^\circ$ .

C. J. West

**Absorption in the ultra-violet and chemical reactivity of certain classes of organic compounds.** Maximilien Grunfeld. *Ann. chim.* 20, 304-70(1933); cf. *C. A.* 26, 2967, 4301.—The absorption spectra in the region 2600-2100 Å. of the following synthetically prepd. compds. have been measured by the rotating sector method: formic, acetic, butyric, caproic, caprylic, lauric, myristic, palmitic and stearic acids; aceto-, propio-, valero- and octano-nitriles; amyl- (I), octyl- (II), dodecyl- (III), cyclohexyl- (IV), *o*-methylcyclohexyl-amine (V), and 4-aminoheptane (VI) and their HCl salts; pimelic acid (VII), azelaic acid (VIII), Et azelate (IX), Me tetradecanedioate (X), dibenzyl tetradecanedioate (XI), benzyl alc.; pivalic amide (XII), *N*-diethyltrimethylacetamide (XIII), dimethylheptylacetic acid (2,2-dimethylnonanoic acid) (XIV) and amide (XV), triethylacetamide (XVI), *N,N'*-diethylmalonamide (XVII), *N,N'*-di-*o*-methylcyclohexylmalonamide (XVIII), dimethylheptylacetophenone (XIX) and semicarbazone, *N*-dodecylbenzamide (XX), *N*-dodecylphenylacetamide (XXI), *N*-dodecylphenylpropionamide (XXII), *N*-dodecylphenylbutyramide (XXIII), *N*-dodecylphenylvaleramide (XXIV). 95% alc. was used as solvent and also, in some cases, water and hexane. Methods of synthesis are described. Curves are given for some of the compds. and numerical data for others. For the monobasic acids the absorption is continuous in this region. The curve for  $HCO_2H$  is nearest the visible. The higher homologs beginning with the 3rd term have practically identical coeffs. of absorp-

tion, i. e., the groups  $\text{CH}_2$  and Me cannot be considered as chromophores in this region of the spectrum. The spectra of the nitriles and amines confirm this conclusion. The amine HCl salts in water are more transparent than the free bases. The primary amines in alc. differ from the secondary especially for the long wave lengths. The absorption spectra of dibasic acids already given (C. A. 24, 2951) were reexamined, using synthetic products. For nearly all the results are the same, but the curves of VII, VIII, IX and X are given since they are more transparent than the former samples. The former conclusions are substantiated. The curves of XII, XIII, XIV, XV and XVI are of the same form as those of compds. having the same chromophoric group without  $\alpha$ -substitution but are shifted to the red. This absorption is probably due to the mutual influence of the alkyl radicals and the functional group since the hydrocarbon groups do not absorb in this region. The speeds of reaction of Et malonate in abs. alc. with I, II and III are the same and greater than those with IV, V and VI. The speeds of reaction of II and V in petroleum ether are greater than in alc. These results parallel the absorption spectra and agree with the theory (C. A. 26, 8775). The speeds of reaction of esters with III in abs. alc. were measured in sealed tubes at  $100^\circ$ .  $\text{BzOEt}$  does not react under these conditions.  $\text{PhCH}_2\text{CO}_2\text{Et}$  reacts with the greatest speed; Et phenylpropionate and Et phenylbutyrate have practically the same reactivity. These variations are in accord with the variations of their absorption spectra (C. A. 26, 5081). New compds. described are: XIX,  $b_m$  188-90°, prep'd. by treating iso-PrCOPh with  $\text{NaNH}_2$  and heptyl bromide in PhMe and boiling 5 hrs. (71% yield), oxime, m.  $130^\circ$ ; semicarbazone, m.  $59^\circ$ ; XV, m.  $97-8^\circ$ , from XIX on heating 7 hrs. with  $\text{NaNH}_2$  in PhMe; XIV,  $b_m$   $163^\circ$ , from XV by treatment at  $0^\circ$  with  $\text{H}_2\text{SO}_4$  and  $\text{NaNO}_2$ ; XI,  $b_m$   $295-307^\circ$ , m.  $54^\circ$ , by heating the corresponding Na salt with excess  $\text{PhCH}_2\text{Cl}$  in the presence of KI for 7 hrs., adding  $\text{H}_2\text{O}$ , extg. with ether and distg. XX, m.  $68^\circ$ , XXI, m.  $78^\circ$ , XXII, m.  $61^\circ$ , XXIII, m.  $58^\circ$ , and XXIV, m.  $54^\circ$ , were prep'd. by heating equimol. quantities of the corresponding Et esters and dodecylamine in a sealed tube at  $280^\circ$  for 8 hrs. Janet E. Austin

Preparation of sodium formate from sodium hydroxide and carbon monoxide (as a laboratory experiment). H. Rheinboldt. Z. physik. chem. Unterrichts. 46, 1(1933). Purified CO from a gasometer is passed through a wash bottle contg. 50% KOH and through one contg. slightly colored (indigo) water, into the reaction chamber (a large test tube) which is electrically heated; the excess CO is burned. The mass with which the reaction chamber is filled is prep'd. by dissolving 40 g. NaOH in  $\text{H}_2\text{O}$ , adding 30 g. of soda lime, and heating and stirring the mass until it begins to solidify; it is then rapidly dried at  $105-10^\circ$  and ground in a mortar. Glass wool is used to provide the necessary surface. The reaction chamber is carefully heated and swept out with CO until the CO burns at the end of the train. The flow is then decreased to 60-100 bubbles per min. When the no. of bubbles in the end wash bottle is less than those in the bottle before the reaction chamber, the temp. is kept const. ( $160-210^\circ$ ); with proper control, there should be complete absorption of the CO. On extn. of the reaction mass, the test is obtained. No yield is given. Louis Waldbauer

Analysis of the dispersion curves of substituted propionic acids. P. A. Levene and Alexander Rothen. J. Am. Chem. Soc. 56, 746(1934).—A preliminary paper on the dispersion curves and partial rotation of derivs. of Et- $\text{CO}_2\text{H}$ . C. J. West

Catalytic decompositions of several complex alcohols. Urion. Ann. chim. [11], 1, 5-87(1934).—The catalytic decompn. of several  $\alpha$ -ethylenic  $\alpha$ -glycols by passage over heated pumice, alumina or reduced Cu gave very complex mixts. of liquids which were extremely difficult to fractionate. These mixts. contained straight-chain  $\alpha$ -diketones, isocyclic 5-membered C compds. consisting of ethylenic hydrocarbons formed by dehydration, and  $\alpha$ -diketones from dehydrogenation which were studied in both keto and enol modifications, unsat'd. erythronic

compds. and aldehydes from the breakdown of certain secondary products. Many compds. occurring as aldehydes or ketones in complex mixts. were characterized through their oximes, phenylhydrazones and semicarbazones without previous isolation. Reliance on the simplification theory stated by Prévost and Kirrmann (C. A. 25, 3809) permitted the prediction of certain results and gave justification for the most complicated isomerisations and transformations. Inversely, the present work has given a new series of verifications of the theory. Erythrol (I),  $\text{CH}_2\text{:CHCH(OH)CH}_2\text{OH}$ ,  $b_m$   $94-5^\circ$ , prep'd. in 35% yields by the controlled heating of inactive erythritol with  $\text{HCO}_2\text{H}$  and sapon. of the formate with BaO, was only partially decomp'd. with formation of crotonaldehyde (II) and  $\text{H}_2\text{O}$  on passage over heated pumice at  $320^\circ$ . Catalytic decompn. of I over  $\text{Al}_2\text{O}_3$  at  $310-20^\circ$  gave some Et-CHO but produced mainly II, b.  $102-4^\circ$ , and a dimer of II,  $b_m$   $78-80^\circ$ ,  $d_4^{25}$  1.008,  $n_D^{25}$  1.4780 (semicarbazone, m.  $191-2^\circ$ ), formed by polymerization. The dehydration operates at the expense of the more mobile secondary OH group of I and yields the enolic form of vinylacetaldehyde, which reverts to II, the more stable form. Decompn. of 75 g. of I, by streaming at the rate of 20 g. per hr. over Cu heated to  $280^\circ$  in a Pyrex tube, produced 2 g. of EtCHO, 15 g. of a mixt. of  $\text{H}_2\text{O}$ , MeCH:CHCHO and (EtCO) $_2$  (oxime, m.  $180-3^\circ$ ; semicarbazone, m.  $160-1^\circ$ ), 30 g. of unaltered I and 12 g. of ethylketol in the enolic form MeCH:C(OH)CH $_2$ OH,  $b_m$   $51.5^\circ$ ,  $d_4^{25}$  1.020,  $n_D^{25}$  1.4250. The gaseous products of decompn. contain, in addn. to CO,  $\text{CO}_2$ , H and traces of sat'd. hydrocarbons, some erythrene, converted on bromination into the tetrabromide, m.  $118^\circ$ . [ $\text{CH}_2\text{:CHCH(OH)}_2$ ] (III), prep'd. by the reduction of acrolein with a Zn-Cu couple in AcOH, gave, on thermal decompn. of 45 g. of the glycol at the rate of 25 g. per hr. over pumice at  $300^\circ$ , 3 g. of a mixt. of acrolein and EtCHO; 3 g. of  $\text{H}_2\text{O}$  contg. traces of org. products; 6 g. of cyclopentylformaldehyde (IV), and 25 g. of unaltered III contaminated with small quantities of adipic aldehyde (V) (dioxime, m.  $184-6^\circ$ ). The results obtained by decompn. of III over  $\text{Al}_2\text{O}_3$  are qualitatively the same although the isomerization into V and its dehydration are more complete. This thermal decompn. provides an excellent procedure for the prep'n. in 28% yields from acrolein of notable quantities of IV, b.  $146^\circ$ ,  $b_m$   $48^\circ$ ,  $d_4^{25}$  0.970,  $n_D^{25}$  1.4828, M. R. 28.27 (calcd. 27.24); p-nitrophenylhydrazone, m.  $198^\circ$ . IV was catalytically reduced in the presence of PdO, on active charcoal to cyclopentylformaldehyde (VI),  $b_m$   $34^\circ$ ,  $b_m$   $136^\circ$ ,  $d_4^{25}$  0.930,  $n_D^{25}$  1.4390, M. R. 27.72 (calcd. 27.72) (C. A. 9, 2067), semicarbazone, m.  $124^\circ$ . Oxidation of IV with  $\text{Ag}_2\text{O}$  produced cyclopentenylcarboxylic acid (VII), m.  $121^\circ$ , brominated to the 1,2-dibromocyclopentyl acid, m.  $133^\circ$ , and oxidized by  $\text{KMnO}_4$  to glutaric acid, m.  $97^\circ$ , thus establishing the position of the double linkage in IV and VII. By the action of  $\text{RMgBr}$  (R = Me, Et or Pr) on IV were formed the corresponding cyclopentyl-1-alkylcarbinols,  $\text{C}_7\text{H}_{12}\text{O}$ ,  $b_m$   $165-8^\circ$ ,  $b_m$   $67-8^\circ$ ,  $d_4^{25}$  0.939,  $n_D^{25}$  1.4710, M. R. 33.34 (calcd. 33.38);  $\text{C}_8\text{H}_{14}\text{O}$ ,  $b_m$   $179-80^\circ$ ,  $b_m$   $78-9^\circ$ ,  $d_4^{25}$  0.982,  $n_D^{25}$  1.4750, M. R. 38.05 (calcd. 38.00), and  $\text{C}_9\text{H}_{16}\text{O}$ ,  $b_m$   $197-8^\circ$ ,  $b_m$   $92-4^\circ$ ,  $d_4^{25}$  0.920,  $n_D^{25}$  1.4710, M. R. 42.55 (calcd. 42.62). Dehydration of these alcs. by passage over  $\text{Al}_2\text{O}_3$  supported on pumice and heated to  $320^\circ$  gave the erythronic hydrocarbons,

$\text{CH}_2\text{:(CH)}_2\text{CH:CCH:CHR}$  (R = H, Me or Et): 1-vinylcyclopentene,  $b_m$   $114-15^\circ$ ,  $d_4^{25}$  0.824,  $n_D^{25}$  1.4870, M. R. 32.78 (calcd. 31.99) M. E. 1.39; 1-propenylcyclopentene,  $b_m$   $142-4^\circ$ ,  $d_4^{25}$  0.885,  $n_D^{25}$  1.4865, M. R. 37.18 (calcd. 36.01) M. E. 1.17, and (1-cyclopentenylethyl)-ethylene,  $b_m$   $59-62^\circ$ ,  $d_4^{25}$  0.833,  $n_D^{25}$  1.4850, M. R. 41.67 (calcd. 40.62) M. E. 1.35. Examn. of the vinylcyclopentene by a study of its Raman spectra showed that it contained not more than 1% of impurities consisting of ethylcyclopentene and ethylidenecyclopentene. The products isolated from the decompn. of III over Cu result from the superposition of the effects of the temp. and the catalytic action of the metal. In addn. to the formation of acrolein and EtCHO, IV and  $\text{H}_2\text{O}$ , together with un-

altered III mixed with a little of V, the catalyst provokes the formation of bipropionyl (VIII),  $\alpha$ -methylcyclopentane-1,2-dione (IX), and  $\text{EtCH}(\text{OH})\text{COEt}$  (X),  $b_p$  57–8°,  $d_4^{25}$  0.956,  $n_D^{25}$  1.4340, M. R. 31.59 (calcd. 31.44) (osazone, m. 161°). The passage of III over Cu at 300–20° gave 28% of VIII,  $b_p$  130°,  $b_m$  32°,  $d_4^{25}$  0.941,  $n_D^{25}$  1.4180, M. R. 30.19 (calcd. 30.10) (semicarbazone, m. 270°). Agitation of VIII with aq.  $\alpha$ -( $\text{H}_2\text{N}$ ) $_2\text{C}_2\text{H}_4\cdot 2\text{HCl}$  and  $\text{Na}_2\text{CO}_3$  yielded the *diethylquinazoline*, m. 50.5°. Oxidation in the cold with  $\text{H}_2\text{O}_2$  converted VIII into  $\text{EtCO}_2\text{H}$ . The dehydrogenation of III over Cu at 280° yielded 20% of IX, m. 104.5° (crystg. from  $\text{H}_2\text{O}$  as  $\text{C}_8\text{H}_{10}\text{O}_2\cdot 2\text{H}_2\text{O}$ , m. 78–9°); *dioxime*, m. 148–9° (decompn.); *dihydrazone*, m. 143°, *semicarbazone*, m. about 280° (Maquenne block); *quinazoline deriv.*, m. 73–3.5°; *monophenylurethan*, m. 137–8°, *disbromide*, m. 163–4°. [ $\text{MeCH:CHCH}(\text{OH})$ ] $_2$  (XI), prep'd. in 60% yields by the Zn-Cu reduction in AcOH of crotonaldehyde (Charon, *Ann.* 17, 217 (1899)), was decomp'd. by the passage of 50 g. over  $\text{Al}_2\text{O}_3$  at 320° and yielded 6 g. of a mixt. of crotonaldehyde and  $\text{H}_2\text{O}$ ; 18 g. of the *cis* and *trans* isomers of 2,3-dimethyl-1-cyclopentenylaldehydes (XII); 5 g. of the dimer of crotonaldehyde and 8 g. of XI. The mixt. XII,  $b_p$  64–72° (semicarbazone, m. 185–7° (C. A. 18, 1988)), on oxidation with  $\text{AgNO}_3$  in NaOH (C. A. 3, 2677) gave a mixt. of the corresponding acids,  $\text{C}_8\text{H}_{10}\text{O}_4$ ,  $b_p$  105–7°, from which the *trans* form, m. 42° (dibromide, m. 160–1°), crystd. Decompn. of 110 g. of XI over Cu at 280° gave 10 g. of a mixt. of crotonaldehyde and  $\text{H}_2\text{O}$ , 25 g. of dimethylhexatrienes, b. 135–48°, 10 g. of bibutylryl, 8 g. of XII, 16 g. of  $\alpha$ -ethyl- $\beta$ -methylcyclopentanediene, b. 106–8°, and 12 g. of XI. The mixt. b. 135–48° was fractionated into 2 portions, b. 137–43° and 144–8°. The latter gave a solid hydrocarbon, 1,6-dimethyl-1,3,5-hexatriene, m. 52.5°,  $b_p$  43°,  $b_m$  147–8°,  $d_4^{25}$  0.7961,  $n_D^{25}$  1.5131, M. R. 40.50 (calcd. 37.74) M. E. 2.76; *hexabromide*, m. 122°. On account of its higher b. p. and m. p. the structure *trans-trans* has been allotted to this modification. The liquid hydrocarbon,  $b_p$  137–43°,  $d_4^{25}$  0.794,  $n_D^{25}$  1.4708, absorbing 6 atoms of Br, is contaminated with its isomer. It may have the *trans-cis-trans* configuration. The essential portion of the fraction  $b_p$  57–60° was bibutylryl,  $b_p$  57–8°,  $d_4^{25}$  0.929, recognized by its greenish yellow vapor and identified through the oxime, m. 186–7°. On agitation with 10% KOH and redistn., the portion  $b_p$  106–8° gave the dienolic modification of  $\alpha$ -ethyl- $\beta$ -methylcyclopentane-*o*-dione, m. 24°,  $b_p$  107–8°,  $d_4^{25}$  1.036,  $n_D^{25}$  1.5042, M. R. 40.01 (calcd. 39.06). The properties of the dione are parallel in every respect to those of the lower homolog (IX) isolated in the decompn. of III. The keto form yields a *dioxime*, m. 150–2°, and a *diphenylhydrazone*, m. 132°. The enolic modification is indicated by the violet color with  $\text{FeCl}_3$ . It gives a *disbromide*, m. 142°, which on heating with powd. Zn in alc. reverts to the diketone, m. 24°; osazone, m. 135°. Thermal decompn. of 60 g. X,  $b_p$  61–2°, prep'd. by the method of Bouveault and Locquin (*Bull. soc. chim.* 35, 637 (1906)), over  $\text{Al}_2\text{O}_3$  at 320° yielded 3 g. of  $\text{EtCHO}$ , 20 g. of a mixt. of  $\text{H}_2\text{O}$  and  $(\text{EtCO})_2$ , and 25 g. of unchanged material. The sapon. with 2% MeOH.HCl of  $\text{AcCH}_2\text{OAc}$ , prep'd. from  $\text{ClCH}_2\text{Ac}$  by heating with AcOH,  $\text{Ac}_2\text{O}$  and AcONa, gave  $\text{AcCH}_2\text{OH}$ , b. 47–9°. The decompn. of 50 g. of the  $\alpha$ -ketol over  $\text{Al}_2\text{O}_3$  at 325° yielded 1 g. of AcH and 5 g. of Ac. Decompn. over Cu gave similar results except that the Ac was contaminated with AcCHO, resulting from the direct dehydrogenation of the acetal, provoked by the catalytic action of the Cu. Glycidol (XIV) (C. A. 24, 2428) gives 2 fundamental reactions when decomp'd. over  $\text{Al}_2\text{O}_3$ ; a dehydration producing  $\text{CH}_2\text{:CHCHO}$  and an isomerization into acetal which, in turn, is cleaved into AcH, Ac, CO and  $\text{CO}_2$ . Treatment of 80 g. of XIV with  $\text{Al}_2\text{O}_3$  at 320° yielded 1 g. of AcH, 8 g. of  $\text{CH}_2\text{:CHCHO}$ , 5 g. of Ac, 8 g. of acetal, 25 g. of unaltered XIV and 5 g. of glycerol. Identical results were obtained by decompn. over Cu at 280°. The thermal decompn. of 80 g. of  $\text{AcCO}_2\text{H}$  gave 6 g. of AcH and 5 g. of a mixt. of Ac and aq. AcCHO formed by the interaction of the intermediary ions Ac and H. The AcCHO formed a mixt. of mono- and dimethyl-

glyoxime, m. 130–60° (C. A. 9, 1328), and evidently resulted from the reduction of  $\text{AcCO}_2\text{H}$  favored by the presence of Cu. The residue in the distn. flask solidified on cooling to a faintly colored mass of methylsuccinic acid (XV), m. 112.5°, formed by an addolization of 2 mols. of  $\text{AcCO}_2\text{H}$  to the diacid,  $\text{MeC}(\text{OH})(\text{CO}_2\text{H})\text{CH}_2\text{COCO}_2\text{H}$ , which is transformed to XV by the loss of 1 mol. of  $\text{CO}_2$  and rearrangement. C. R. Addinall

Decamethylene glycol. R. H. F. Manske. *Org. Syntheses* XIV, 20 2 (1934).—Reduction of  $(\text{CH}_2)_{10}(\text{CO}_2\text{Et})_2$  with EtOH and Na gives 73–6% of  $(\text{CH}_2)_{10}(\text{OH})_2$ ; various other glycols have been prep'd. by the same method in yields of 57–88%. C. J. West

$\beta$ -Diethylaminosthyl alcohol. W. H. Hartman. *Org. Syntheses* XIV, 28–9 (1934).— $\text{Et}_2\text{NH}$  and  $\text{ClCH}_2\text{CH}_2\text{OH}$  with NaOH give 68–70% of  $\text{Et}_2\text{NCH}_2\text{CH}_2\text{OH}$ . C. J. West

Syntheses in the homoneurine series. III. Homoneurines of the quinine alkaloids as qualitative reagents for the iodide ion. Eugen Macovski, Alexandru Silberg, Eugen Ramontianu and Elieue Crăciunescu. *J. prakt. Chem.* 139, 254–60 (1934); cf. C. A. 27, 956.—Quinine and allyl bromide in EtOH, heated at 100° for 30–45 min., give *quinine dibromoallylate* (*quinine dihomoneurine bromide*) (I), crystals with 3 mols.  $\text{H}_2\text{O}$ , m. 145–7° (decompn.); the *iodide* crystallizes with 3 mols.  $\text{H}_2\text{O}$  and m. 140° (decompn.). I in a 5–7% aq. soln. gives a qual. test for I ion in a diln. of N/20; no ppt. is obtained with concd. aq. KCl, KBr and KCN;  $\text{K}_2\text{Fe}(\text{CN})_6$  gives a red soln. but no ppt.;  $\text{K}_2\text{Fe}(\text{CN})_6$  gives a yellow ppt. which at once dissolves; KCNS gives a difficultly sol. ppt. *Cinchonine-dihomoneurine bromide*, m. 232° (decompn.); this will detect I ion in a concn. of N/40, giving the yellow iodide, m. 247–50°. Benzoylcinchonine monomethyl bromide will detect the I ion in a diln. of N/400. C. J. West

Glycerol  $\alpha,\gamma$ -dibromohydrin. Geza Braun. *Org. Syntheses* XIV, 42–4 (1934).—Details are given of the prep'n. of  $\text{CH}(\text{OH})(\text{CH}_2\text{Br})_2$  from  $\text{C}_3\text{H}_7(\text{OH})_3$ , Br and red P, the yield being 52–4%. C. J. West

Glycine ethyl ester hydrochloride. C. S. Marvel. *Org. Syntheses* XIV, 46–7 (1934).— $\text{CH}_3\text{NCH}_2\text{CN}$  and  $\text{EtOH}$  with HCl give 89–91% of  $\text{EtO}_2\text{CCH}_2\text{NH}_2\cdot\text{HCl}$ . C. J. W.

*di*-Methionine. G. Barger and T. E. Weichselbaum. *Org. Syntheses* XIV, 58–60 (1934).—Details are given of the prep'n. of Et Na phthalimidomalonate, Et 1-methylthiol-3-phthalimidopropane-3,3-dicarboxylate, the free acid and methionine, the yields being 82–5, 70–81, 95.5–8 and 84–5%, resp. The overall yield, based on the  $\text{MeSC}_2\text{H}_5\text{Cl}$  used, is 54–60%. C. J. West

Canavanine, an amino acid. IV. The constitution of cananine, a product of enzymic hydrolysis of canavanine. Matsuno-uke Kitagawa and Shinichi Mononobe. *J. Agr. Chem. Soc. Japan* 9, 845–58 (1933); cf. C. A. 28, 1021°.—Canaline (I) on reduction with  $\text{H}_2$  and Pt black in AcOH or MeOH absorbed 2 atoms of H and set free 1 mol. of  $\text{NH}_3$ .  $\gamma$ -Hydroxy- $\alpha$ -aminobutyric acid, m. 201–2° (decompn.), was isolated from the product. Canavanine and dibenzoylcanaline (II) were not catalytically reduced. Acetylation of II in acid or neutral soln. gave dibenzoylcanaline anhydride, m. 163–4°. No OH group could be found in I. I warmed with mineral acid did not give a lactone. The OH group may be introduced in the  $\gamma$ -position by catalytic reduction. The formula  $\text{CH}_3(\text{ONH}_2)\text{CH}_2\text{CH}(\text{NH}_2)\text{CO}_2\text{H}$  is assigned to I. Canavanine is not toxic to mice. Y. Kihara

Ethyl acetosuccinate. Homer Adkins, Neville Ishell and Bruno Wojcik. *Org. Syntheses* XIV, 38–9 (1934).—The Na comp'd. of  $\text{AcCH}_2\text{CO}_2\text{Et}$  and  $\text{ClCH}_2\text{CO}_2\text{Et}$  gives 56–62% of Et acetosuccinate; similarly Et  $\alpha$ -acetoglutarate results in 52% yield. C. J. West

Polarimetric study of complex ferri-tartrates. Pariselle and Delaol. *Compt. rend.* 198, 83–5 (1934).—Polarimetric rotation curves for solns. of varying concns. of tartaric acid and  $\text{Fe}(\text{NO}_3)_3$  showed a max corresponding to the formation of  $[\text{C}_4\text{H}_4\text{O}_6\text{Fe}]_2$ . On neutralization, a yellow ppt. insol. in  $\text{H}_2\text{O}$ , but sol. in acids and hydroxides, was obtained. With equimol. solns. of tartaric acid and  $\text{Fe}(\text{NO}_3)_3$  and with varying concns. of NaOH, the

same type of curve was obtained, the min. corresponding to the Na ferritartarate and the max. to the free acid. With 1 mole of Fe for 1, 2, 3— $n$  moles of tartaric acid and with varying concns. of NaOH, the 1st max. corresponds to the ferritartaric acid as before, the min. to the complex  $[\text{C}_4\text{H}_2\text{O}_6\text{Na}]_n\text{Fe}$  (I); this is formed when for  $n$  moles of acid per mole of nitrate,  $(n+3)$  moles of NaOH are used; a 2nd max. is obtained for  $(2n+3)$  moles of NaOH corresponding to  $[\text{C}_4\text{H}_2\text{O}_6\text{Na}]_n\text{Fe}$  (II). For Na tartrate and  $\text{Fe}(\text{NO}_3)_3$  solns. there is mutarotation. The curve has a max. at 1 mole Na tartrate, 1 Fe, preceded by a clear break at 3 moles of tartrate, 2 Fe; a min. for 3 tartrate and 1 Fe, and a 2nd max. at 9 tartrate, 1 Fe. Mutarotation is explained by an equil. between I and II for 3–9 moles, and an equil. between I and the ferritartaric acid for values between 1.5–3 moles of tartrate. Below 1.5 mutarotation no longer occurs, because only the ferritartaric acid is formed.

Louis Waldbauer

**Some tartaromanganic salts.** G. Lejeune. *Compt. rend.* 197, 1650–2 (1933).—On soln. of 7 g. of Job's mangano-tartrate,  $[(\text{C}_4\text{H}_2\text{O}_6)_2\text{MnNa}]\text{Na} \cdot 17\text{H}_2\text{O}$  (cf. C. A. 1, 1930), in tartaric acid soln. (10 g. in 20 cc. water) and filtration of the bitartrate ppt. 2 g. of red crystals is obtained from the filtrate, corresponding to  $[\text{C}_4\text{H}_2\text{O}_6\text{Mn}(\text{OH})]\text{H}_2\text{H}_2\text{O}$ . The same compd. can be prepd. by soln. of  $\text{MnO}_2$  in concd. tartaric acid. On soln. of  $\text{MnO}_2$  in Na bitartrate soln.  $[\text{C}_4\text{H}_2\text{O}_6\text{Mn}(\text{OH})]\text{NaH}_4\text{H}_2\text{O}$  is obtained.

I. J. Patton

**Pyrophosphate ester of citric acid.** Eugen Wertyporoch and Hermann Kiekenberg. *Biochem. Z.* 268, 8–10 (1934).—Mol. quantities of the Ba salt of diethylpyrophosphoric acid and citric acid are heated 3–4 hrs. A yellow-brown, thick oil is obtained:  $(\text{HO}_2\text{CCH}_2)_2\text{C}(\text{CO}_2\text{H})\text{OP}(\text{O})(\text{OH})\text{OP}(\text{O})(\text{OEt})_2$ . The oil is freed from the excess of reagents by shaking out first with  $\text{CHCl}_3$ , then with  $\text{Et}_2\text{O}$ . The citric acid pyrophosphate ester is crystd. as the brucine salt which m. 142–3°.

S. Morgulis

**Reaction of aliphatic imino ethers with hydrazine.** Wilfrid Oberhummer. *Monatsh.* 63, 285–300 (1933).— $\text{MeC}(\text{NH})\text{OEt} \cdot \text{HCl}$  (I) (30 g.), added in several portions during 5 min. to 8 g.  $\text{N}_2\text{H}_4$  in 150–200 cc.  $\text{EtOH}$  at  $-10^\circ$  to  $-12^\circ$  and stirred for 1 hr., gives 12–14 g. (50%) of *acetamidrasone-HCl* (II),  $\text{MeC}(\text{NH})\text{NHNH}_2 \cdot \text{HCl}$ , rose, m. 131–2°; the free base is stable in cold  $\text{H}_2\text{O}$  or abs.  $\text{EtOH}$  but warming with dil. alkali gives  $\text{AcOH}$ ,  $\text{N}_2\text{H}_4$ , and  $\text{NH}_3$ . I (1 mol.) and 2 mols.  $\text{N}_2\text{H}_4$  in abs.  $\text{EtOH}$  at  $-3^\circ$  to  $1^\circ$  give *acetylhydrazidine-HCl* (III),  $\text{MeC}(\text{NH})\text{NHNH}_2 \cdot \text{NHNH}_2 \cdot \text{HCl}$ , rose, decomp. 140–50°; *picrate*, decomp. 126–8°; *chloroplatinate*, 2III.PtCl<sub>4</sub>; *sulfate*, m. 192–3°; hydrolysis of III gives  $\text{AcOH}$  and  $\text{N}_2\text{H}_4$ . The free base gives ppts. with several metallic salts. Dry distn. of III gives 3,5-dimethyl-1-amino-1,2,4-triazole (IV) and  $\text{N}_2\text{H}_4 \cdot \text{HCl}$ . When 60 g. I in 400 cc.  $\text{EtOH}$  is treated with 15 g.  $\text{N}_2\text{H}_4$  in 50 cc.  $\text{EtOH}$  during 2.5 hrs., there results a good yield of IV and a small amt. of *Et acetate asine*,  $(\text{N}:\text{CMeOEt})_2$ , m. 28°. II and  $\text{EtNO}_2$  in abs.  $\text{EtOH}$  give 5-methyltetrazole, m. 145–6°. II and  $\text{HNO}_3$  in acid soln. give  $\text{N}_2\text{H}_4$ ,  $\text{NH}_4\text{Cl}$  and  $\text{AcOH}$ ; III gives  $\text{N}_2\text{H}_4$ ,  $\text{N}_2\text{H}_4 \cdot \text{HCl}$ , etc.

C. J. West

**Action of ammonia and amines on the esters of unsaturated acids.** III. Action of ammonia, methylamine and diethylamine on methyl acrylate. Karl Morsch. *Monatsh.* 63, 220–35 (1933); cf. C. A. 27, 713.— $\text{CH}_2=\text{CHCO}_2\text{Me}$  (I) and 10%  $\text{MeOH-NH}_3$ , allowed to stand 1 day at room temp., give 23% of *di-Me  $\beta,\beta'$ -iminodipropionate* (II),  $\text{HN}(\text{CH}_2\text{CH}_2\text{CO}_2\text{Me})_2$ , b<sub>10</sub>, 132.5° (*HCl salt*, m. 136.5–7.5°), and 48% of *tri-Me  $\beta,\beta',\beta''$ -tripropionatamine* (III),  $\text{N}(\text{CH}_2\text{CH}_2\text{CO}_2\text{Me})_3$ , b<sub>9</sub>, 171–4° (*HCl salt*, m. 93°; *chloroplatinate*, m. 172.5° (decompn.)). I and 20%  $\text{MeOH-NH}_3$ , allowed to stand 3 days, give 2% II, 5% III, 26% of the *diamide* (IV) of II, m. 144.5–5.8° (*chloroplatinate*, m. 200.5° (decompn.)), 4% of the *triamide* (V) of III, m. 185.5–6° (*chloroplatinate*, m. 196.5° (decompn.)), and 3% of the *monoamide* from III, whose *chloroplatinate* m. 178.8.5° (decompn.). I and satd.  $\text{MeOH-NH}_3$  (at room temp.), allowed to stand 14 days at room temp., give 39.5% IV and 36.5% V; after standing

5 months the yield of IV was 35% and of V 44%. I in 10%  $\text{MeOH-NH}_3$ , heated 8 hrs. at  $100^\circ$ , gives 3%  $\text{H}_2\text{NCH}_2\text{CH}_2\text{CO}_2\text{Me}$  (VI) and 6.5% of II; in  $\text{EtOH}$  the yields are 8% VI, 54% II and 5% III. With about an equal vol. of liquid  $\text{NH}_3$  at room temp., the following yields are obtained: 100 hrs., 2.5% VI, 42% II, 15.5% III; 14 days, 35% IV and 13% V; 5 months, 33% IV and 56% V. I and 10%  $\text{MeOH-MeNH}_2$  (0.55 mol.) for 2 days at room temp. give 22% *Me  $\beta$ -methylaminopropionate* (VII), b<sub>11</sub>, 50° (*HCl salt*, liquefies in the air), and 70% of *di-Me  $\beta,\beta'$ -methyliminodipropionate* (VIII), b<sub>9</sub>, 123–4° (*HCl salt*, m. 120.5–1.5°); 1.1 mols.  $\text{MeNH}_2$  for 2 days, give 24% VII, 35% VIII and 5.5%  *$\beta$ -methylaminopropionic methylamide* (IX), b<sub>9</sub>, 131–2° (*HCl salt*, m. 134.5°); 4 mols.  $\text{MeNH}_2$  for 4 days give 64% IX. With 1.1 mols.  $\text{MeNH}_2$  in abs.  $\text{EtOH}$  (2 days) there results 39.5% VII, 32% VIII and 4% IX. With liquid  $\text{MeNH}_2$  the following results were obtained on heating 8 hrs. at  $60-5^\circ$ : 0.55 mol., 5% VII, 89.5% VIII; 1.1 mols., 31% VII, 36.5% VIII and 9% IX; 4 mols., 71.5% IX. I and  $\text{Et}_3\text{NH}$ , allowed to stand several days at room temp. or refluxed 1 hr., give  $\text{Et}_3\text{NCH}_2\text{CH}_2\text{CO}_2\text{Me}$ , b<sub>9</sub>, 66.5°; heating I with 3 mols.  $\text{Et}_3\text{NH}$  24 hrs. at  $190-200^\circ$  gives  *$\beta$ -diethylaminopropionic diethylamide*, b<sub>10</sub>, 123.5–4.5°. C. J. West

**$\delta$ -Ethoxybutylurea.** E. Wertheim. *J. Am. Chem. Soc.* 56, 735–6 (1934).—Details are given of the prepn of  $\text{EtOC}_4\text{H}_8\text{CN}$  and of  $\text{EtOC}_4\text{H}_8\text{NH}_2$ , which reacts with  $\text{KCNO}$  to give  *$\delta$ -ethoxybutylurea*, m. 68–9°. This compd. is faintly bitter, showing that the sweet taste of dulcin depends upon the presence of the  $\text{C}_6\text{H}_5$  ring;  $\text{HOC}_6\text{H}_4\text{NHCONH}_2$  is also not sweet, while *o*- $\text{HOC}_6\text{H}_4\text{NHCONH}_2$  is very sweet.

C. J. West

**Synthesis of ethyl N-3-methyl-5-benzalhydantoin-N-1-acetate and certain of its derivatives.** Anne Litzinger. *J. Am. Chem. Soc.* 56, 673–7 (1934).—The Na compd. of methylbenzalhydantoin and  $\text{ClCH}_2\text{CO}_2\text{Et}$  in  $\text{EtOH}$ , heated until the soln. is neutral, give *Et N-3-methyl-5-benzalhydantoin-N-1-acetate* (I), m. 50.5–1.5°; this rearranges to the *isomer*, m. 121–2° (II), by treating the hot  $\text{EtOH}$  soln. with dry  $\text{HCl}$ ; 1 g. II is sol. in 5 cc. hot and 60 cc. cold  $\text{EtOH}$  or 4 cc. hot  $\text{CCl}_4$ . The *Me ester* m. 115.5–6°; 1 g. dissolves in 2 cc. hot and 11 cc. cold abs.  $\text{MeOH}$  and in 8 cc. hot and 33 cc. cold 90%  $\text{MeOH}$ . Hydrolysis of I gives a *Na salt*, decomp. 294–5° (1 g. is sol. in 25 cc. hot  $\text{EtOH}$ ), of *N-3-methyl-5-benzalhydantoin N-1-acetic acid* (III), m. 160–1°; 1 g. dissolves in 110 cc. hot and 1000 cc. cold  $\text{H}_2\text{O}$ . II gives a *Na salt*, decomp. 299–300°; a *K salt*, decomp. 235–7°, crystals with 1 mol.  $\text{EtOH}$ ; and a *Pb salt*, m. 241–2° (decompn.). (1 g. is sol. in 210 cc. hot and 400 cc. cold  $\text{H}_2\text{O}$ ) of the *isomer* of III, m. 222–3°, 1 g. of which dissolves in 1100 cc. hot and 2200 cc. cold  $\text{H}_2\text{O}$ . Reduction of either acid gives the *benzyl deriv.*, m. 150–1° (1 g. dissolves in 8 cc. cold  $\text{EtOH}$  and in 13 cc. hot and 100 cc. cold  $\text{H}_2\text{O}$ ); *Et ester*, m. 49.5–51°; *Na salt*, crystals with 2 mols.  $\text{EtOH}$ , decomp. 275–6° (1 g. is sol. in 2.5 cc. cold  $\text{H}_2\text{O}$  and 24 cc. cold abs.  $\text{EtOH}$ ). Both I and II add  $\text{Br}$  and give the same *product*,  $\text{C}_{15}\text{H}_{15}\text{O}_4\text{N}_2\text{Br} \cdot \text{EtOH}$ , m. 113–3.5°.

C. J. West

**Optically active allantoin.** R. Fosse, P.-E. Thomas and P. de Graeve. *Compt. rend.* 198, 689–93 (1934)

Allantoinase of soy bean acts on allantoin to give a pure *cryst. l-rotatory form*,  $[\alpha]_D^{20} -3.24^\circ$ . Rachel Brown

**Mutarotation of  $\beta$ -D-ribose and  $\beta$ -l-ribose.** Francis P. Phelps, Horace S. Isbel and Ward Pigman. *J. Am. Chem. Soc.* 56, 747–8 (1934).—At  $1^\circ$  2.0236 g. of *D*-ribose in 45.223 g.  $\text{H}_2\text{O}$  gave 1.5 min. after soln.  $[\alpha]_D^{20} -23.1^\circ$ , 5 min.  $-21.3^\circ$ , 10 min.  $-19.5^\circ$ , 20 min.  $-18.8^\circ$ , 30 min.  $-19.1^\circ$ , 60 min.  $-21.2^\circ$ , 120 min.  $-23.1^\circ$ , 300 min.  $-23.7^\circ$ ; 1.9941 g. of *l*-ribose in 45.223 g.  $\text{H}_2\text{O}$ : 2 min.  $23.2^\circ$ , 5 min.  $21.5^\circ$ , 10 min.  $19.9^\circ$ , 20 min.  $18.7^\circ$ , 30 min.  $19.4^\circ$ , 60 min.  $21.5^\circ$ , 120 min.  $23.2^\circ$ , 300 min.  $24.3^\circ$ , 24 hrs.  $24^\circ$ . Cryst. *D*- and *l*-ribose in  $\text{H}_2\text{O}$  establish equil. with at least 3 isomers, 1 of the isomers being less *l-rotatory* and the other more *l-rotatory* than the *cryst. D* sugar. The *cryst. sugar* is tentatively designated as  *$\beta$ -D-ribose* and its mirror image as  *$\beta$ -l-ribose*.

C. J. West

**Reactions of carbohydrates in liquid ammonia.** Preliminary paper. Irving E. Muskat. *J. Am. Chem. Soc.*

56, 693-5(1934).—All the ordinary sugars, their methylated, acetylated and acetone derivs. are quite sol. in liquid  $\text{NH}_3$ ; the polysaccharides are also quite sol. With the exception of the free sugars, liquid  $\text{NH}_3$  is without effect on these carbohydrates and their derivs. The free sugars react in liquid  $\text{NH}_3$  to give the corresponding amines; thus glucose gives quant. 1-aminoglucose. The alkali metal salts of carbohydrates may be prep'd. by treating the soln. in liquid  $\text{NH}_3$  with K or K in  $\text{NH}_3$  with the sugar in  $\text{NH}_3$ ;  $\text{KNH}_2$  may also be used. These salts react with alkyl halides;  $\alpha$ -Me mannoside gives 92% of the tetra-Me deriv.; monoacetoneglucose gives 95% of the tri-Me deriv.; the diacetone deriv. gives 96% of the 3-Me deriv.; sucrose yields the octa-Me deriv. Certain of the aryl halides react with these K salts but no details are given here. The dry salt (free from  $\text{NH}_3$ ) in a suitable solvent reacts with acyl halides; thus,  $\alpha$ -Me mannoside gives almost quant. the tetra-Ac deriv. These K salts also react with  $\text{POCl}_3$ ,  $\text{SOCl}_2$ , and  $\text{SCl}_2$  to give the corresponding esters. C. J. West

**Mutarotation of  $\alpha$ -D-glucose in deuterium water.** Eugene Pasquy. *J. Am. Chem. Soc.* 56, 745 6(1934); *C. A.* 28, 744<sup>9</sup>.—The velocity of mutarotation of  $\alpha$ -D-glucose in pure  $\text{H}_2\text{O}$  at  $20^\circ$  is identical with that in  $\text{H}_2\text{O}$  at  $10^\circ$ ; the effect of the  $\text{H}_2\text{O}$  is equiv. to a drop of  $10^\circ$  in the temp. In  $\text{H}_2\text{O}$   $[\alpha]_D^{20}$  is 52.14<sup>9</sup> for the equil. mixt. as compared with 52.06<sup>9</sup> in  $\text{H}_2\text{O}$ . Evidently, the replacement of the displaceable H atom of glucose by  $\text{H}^2$  does not change the value of the sp rotation for the wave length of Na light. C. J. West

**Action of pyridine-acetic anhydride on aldose oximes.** Production of hexaacetylaldomannose oxime. Venancio Dulofeu, Pedro Cattaneo and German Mendivilzina. *Chem. Soc.* 1934, 147-8. Two reagents were used, I contg. 6.3 cc.  $\text{C}_5\text{H}_5\text{N}$  and 4.2 cc.  $\text{Ac}_2\text{O}$  and II contg. 2 cc.  $\text{C}_5\text{H}_5\text{N}$  and 5 cc.  $\text{Ac}_2\text{O}$ . With both reagents, even at  $0^\circ$ , the only product obtained from arabinose, xylose and thiamine oximes was the acetylated nitrile; evidently the oximes react in the open-chain form. Glucose oxime and I give the hexa-Ac deriv. (III), m. 113-5<sup>9</sup>, in decreasing yields as the temp. is increased from  $0^\circ$  to  $90^\circ$ ; at  $100^\circ$  and above the product is pentaacetylglucononitrile (IV); with II at  $0^\circ$  and  $30^\circ$  III is formed; at  $60^\circ$  both III and IV result and above  $70^\circ$  only IV was obtained. Mannose oxime (V) gives a mixt. of acetylated oxime and nitrile with both I and II; above  $30^\circ$  only nitrile was formed. V (5 g.) in 31.5 cc.  $\text{C}_5\text{H}_5\text{N}$  and 21 cc.  $\text{Ac}_2\text{O}$  at  $0^\circ$  for 8 days gives 6.7 g. hexaacetylaldomannose oxime, m. 94<sup>9</sup>,  $[\alpha]_D^{20}$  8.3<sup>9</sup>; heating 10 min. at  $130^\circ$  gives the nitrile, m. 93<sup>9</sup>. C. J. West

**Crystallization of the osazones and hydrazones as a means of identification of various sugars.** M. Wagenaar. *Chem. Weekblad* 71, 229 42(1934).—A qual. study of the formation of hydrazones and osazones from a no. of pentoses and hexoses with  $\text{PhN}_2\text{H}_2$ ,  $\text{PhNMeNH}_2$ ,  $\text{Ph}_2\text{N-NH}$ ,  $\text{O}_2\text{NC}_6\text{H}_4\text{N}_2\text{H}_2$  and  $p\text{-BrC}_6\text{H}_4\text{N}_2\text{H}_2$ . The reagent recommended is a soln. of the hydrazine (0.15-0.5 g.) in 2 cc. of glycerol and 1 cc. of glacial  $\text{AcOH}$ . In some expts. a small quantity of  $\text{Na}_2\text{SO}_3$  was added, or another acid (lactic, citric, oleic) used in place of  $\text{AcOH}$ . A. W. Dox

**Conversion of 2-p-toluenesulfonyl- $\beta$ -methylglucoside into methylepiglucoamine.** E. W. Bodycote, W. N. Haworth and E. L. Hirst. *J. Chem. Soc.* 1934, 151-4.—This work was undertaken with the intention of effecting a synthesis of glucosamine by direct substitution of an  $\text{NH}_2$  group into a suitable glucose deriv. 3,4,6-Triacetyl- $\beta$ -methylglucoside and  $p\text{-MeC}_6\text{H}_4\text{SO}_2\text{Cl}$  give the 2-p-toluenesulfonyl deriv. (I), m. 157<sup>9</sup>,  $[\alpha]_D^{20}$  1.5<sup>9</sup> ( $\text{CHCl}_3$ ,  $c$  2); hydrolysis gives 2-p-toluenesulfonyl- $\beta$ -methylglucoside (II). Either I or II in  $\text{MeOH}$ , satd. with  $\text{NH}_3$  at  $0^\circ$  and heated in a sealed tube at  $110^\circ$  for 18 hrs., gives methylepiglucoamine-HCl (III), m. 210 12<sup>9</sup>,  $[\alpha]_D^{20}$  -145<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  0.9); the yield from I is 40%. I and  $\text{MeOH-NH}_3$  at  $15^\circ$  give after 72 hrs. 75% of II. Hydrolysis of III with boiling  $\text{HCl}$  of any concn. greater than 1% gives 80% of methylepiglucoamine-HCl, m. 228<sup>9</sup> (decompn.),  $[\alpha]_D^{20}$  184<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  0.7); boiling 8 hrs. with 0.5%  $\text{HCl}$  gives epiglucoamine, whose phenyllosazone m. 225 7<sup>9</sup>

(decompn.). Deamination of III with  $\text{AgNO}_3$  in  $\text{H}_2\text{O}$  gives a sirup which does not reduce Fehling soln. until after hydrolysis; the hydrolysis product had  $[\alpha]_D^{20}$  -100<sup>9</sup> (approx.) in  $\text{H}_2\text{O}$ . The deamination product (mainly Me hexoside) gives 40% of a tetra-Ac deriv.,  $[\alpha]_D^{20}$  -23<sup>9</sup> ( $\text{CHCl}_3$ ); the tetra-Me deriv. b.p. 105<sup>9</sup>,  $n_D^{20}$  1.4588,  $[\alpha]_D^{20}$  -47<sup>9</sup> ( $\text{CHCl}_3$ ,  $c$  1.8), -32<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  1.7). The deamination product may be  $\beta$ -Me altroside. C. J. W.

**Isolation of a crystalline dimethylanhydromethylhexoside. Characterization of 3,4,6-trimethylglucose.** W. N. Haworth, E. L. Hirst and L. Punizzon. *J. Chem. Soc.* 1934, 154-7.—2-p-Toluenesulfonyl- $\beta$ -methylglucoside with  $\text{MeI}$  and  $\text{Ag}_2\text{O}$  in  $\text{MeOH}$  gives 70-5% of 2-p-toluenesulfonyl-3,4,6-trimethyl- $\beta$ -methylglucoside, m. 67<sup>9</sup>,  $[\alpha]_D^{20}$  -10<sup>9</sup> ( $\text{CHCl}_3$ ,  $c$  1.4); this is unchanged by heating with 18%  $\text{MeOH-NH}_3$  at  $120^\circ$  for 76 hrs.; boiling with 4%  $\text{MeONa-MeOH}$  for 8 hrs. gives 3,4,6-trimethyl- $\beta$ -methylglucoside, b.p. 95<sup>9</sup>, m. 51<sup>9</sup>,  $[\alpha]_D^{20}$  -20<sup>9</sup> ( $\text{CHCl}_3$ ,  $c$  1.1); hydrolysis with 5%  $\text{HCl}$  gives 3,4,6-trimethylglucose,  $[\alpha]_D^{20}$  71<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  2). Oxidation with  $\text{Br}$  gives 3,4,6-trimethylgluconolactone, b.p. 140<sup>9</sup>,  $n_D^{20}$  1.4688,  $[\alpha]_D^{20}$  87<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  1); phenylhydrazide, m. 126<sup>9</sup>; the rate of hydrolysis in  $\text{H}_2\text{O}$  was closely similar to that of other  $\delta$ -lactones of the glucose series. At equil. the lactone and acid are present in the proportion of 9 and 91%, resp. The amide with  $\text{NaOCl}$  gives 2,3,5-trimethyl- $d$ -arabofuranose, b.p. 95<sup>9</sup>,  $n_D^{20}$  1.450,  $[\alpha]_D^{20}$  45<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  1). 2-Toluenesulfonyl-3,4,6-triacetyl- $\beta$ -methylglucoside in  $\text{CHCl}_3$  with  $\text{MeONa}$  at  $0^\circ$  gives anhydro- $\beta$ -methylhexoside (I),  $[\alpha]_D^{20}$  -25<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  1), -40<sup>9</sup> ( $\text{AcOEt}$ ,  $c$  2); heating with 5%  $\text{HCl}$  gives a hygroscopic sirup, the rotation changing from -25<sup>9</sup> to -77<sup>9</sup>;  $\text{MeI}$  and  $\text{Ag}_2\text{O}$  give a di-Me deriv. of I, m. 69<sup>9</sup>,  $[\alpha]_D^{20}$  40<sup>9</sup> ( $\text{AcOEt}$ ,  $c$  1), 24<sup>9</sup> ( $\text{H}_2\text{O}$ ,  $c$  1); during hydrolysis with 5%  $\text{HCl}$  the rotation changes from 21<sup>9</sup> to 67<sup>9</sup>. The high neg. rotation of the hydrolysis product of I suggests that the substance has passed into the altrose series. C. J. West

**Analysis of  $\gamma$ -methyl fructoside mixtures by means of invertase.** I. C. B. Purves and C. S. Hudson. *J. Am. Chem. Soc.* 56, 702 7(1934).—By using the polarimeter and a Cu reduction method to follow the partial hydrolysis with invertase of  $\gamma$ -Me fructoside, the sp. rotation of the constituent unstable to the enzyme was found to be  $[\alpha]_D^{20}$  -52  $\pm$  2<sup>9</sup> in  $\text{H}_2\text{O}$ ; it was tentatively assumed to be a true Me fructoside of mol. wt. 194. The optical changes suggested that the enzyme hydrolyzed a  $\gamma$ -fructose deriv. possessing the  $\beta$ -configuration. Under comparable conditions invertase hydrolyzed sucrose 13.5 times as rapidly as the  $\gamma$ -fructose deriv. and the types of the 2 hydrolysis-time curves, while not logarithmic, were similar. A fermentation with yeast removed the constituent unstable to invertase from  $\gamma$ -Me fructoside but left the remainder unchanged in amt. and in sp. rotation. When the condensation of fructose with acid  $\text{MeOH}$  was arrested at the point of max.  $d$ -rotation, approx. 45% of the total non-reducing product was hydrolyzed by invertase and the sp. rotation of the remaining 55% was approx.  $[\alpha]_D^{20}$  50<sup>9</sup> in  $\text{H}_2\text{O}$ , calcd. as Me fructoside. These figures, in contrast to the amt. of fructose left uncondensed, did not change with wide variation in the conditions of the condensation. When the condensation was prolonged past the pt. of max.  $d$ -rotation, only 10-20% of the non-reducing product was hydrolyzed by invertase and the sp. rotation of the remainder became strongly  $l$ -rotatory, due to the production of Me fructoside of the normal less-easily hydrolyzable type. II. Isolation of a new crystalline methyl fructoside. *Ibid.* 708 11.—After a soln. contg. pure fructose in dry  $\text{Me}_2\text{CO}$ -free  $\text{MeOH}$  and  $\text{HCl}$  had reached its max. rotation ( $[\alpha]_D^{20}$  0.5<sup>9</sup> in  $\text{MeOH}$ ), it was neutralized with  $\text{Ag}_2\text{O}$ , the  $\text{MeOH}$  removed and the product fermented with baker's yeast; the non-reducing sirup, contg. 70-80% solids, was extd. with  $\text{AcOEt}$  and  $\text{AmOH}$ ; the  $\text{AcOEt}$  and 1st  $\text{AmOH}$  exts. gave 10% of  $\gamma$ -Me fructoside, m. 60<sup>9</sup>,  $[\alpha]_D^{20}$  93<sup>9</sup> ( $\text{H}_2\text{O}$ , 0.4911 g. in 25 ml.), 91.6<sup>9</sup> ( $\text{MeOH}$ , 0.1852 g. in 25 ml.); its reducing power is at least 250 times less than that of fructose under the same conditions; it is practically unchanged after heating 1 hr. at  $60^\circ$  and 0.1 mm. Approx. 41% of the condensation product remained as an

unfermentable sirup of variable sp. rotation and derived from  $\gamma$ -fructose; this mixt. contained at least 3-non-reducing derivs.; a liquid  $\gamma$ -Me deriv.,  $[\alpha]_D^{25} = -52 = 2^\circ$ , fermentable by yeast, a liquid deriv.,  $[\alpha]_D^{25} 51^\circ$ , not fermentable, in the more sol. portion, and a deriv. with  $25.2^\circ$  in the less sol. portion. Raybin's diazouracil test for sucrose was given by none of the 3  $\gamma$ -fructose derivs., although 1 of them was hydrolyzed by invertase. This test is therefore more sp. for the sucrose linking than the action of invertase.

The sulfonation of cane sugar. Tokuro Soda. *Bull. Chem. Soc. Japan* 9, 1-8(1934); cf. C. A. 17, 2872.—Treatment of sucrose in pyridine with  $\text{ClSO}_3\text{H}$  gives a complex mixt. of esters contg. 1-4  $\text{SO}_3\text{H}$  groups, of which only 1 is in the glucose group, as shown by hydrolysis and fermentation. The mixed esters form cryst. K, Ba and brucine salts whose optical character is shown by photographs and detn. of  $[\alpha]$ . Recrystn. of these does not effect a sepn. of the individual compds. H. A. B.

The structure of high-molecular organic compounds. H. Staudinger. *Naturwissenschaften* 22, 65-71, 84-9 (1934); cf. C. A. 27, 948.—A lecture reviewing recent work on large org. mols. (cf. S., *Die hochmolekulare org. Verbindungen*, Kautschuk u. Cellulose, C. A. 26, 3513). Many references are given. B. J. C. van der Hoeven

The chemistry of lignin. Max Phillips. *Chem. Rev.* 14, 103-70(1934).—A review, with many references.

Louise Kelley  
The formation of cyclic compounds. I. The relative ease of formation and the relative stability of simple carbon rings. Shin-ichi Sako. *Bull. Chem. Soc. Japan* 9, 41-54 (1934).—A discussion. The relative stability and ease of formation of C rings are not necessarily the same, since the latter depends not only on the probability of the terminal atoms coming close together, but also on the effect of free rotation about the C-C bonds on the position of these atoms. H. A. Beatty

Decarboxylation of 1-phenylcycloparaffin-1-carboxylic acids. Francis H. Case. *J. Am. Chem. Soc.* 56, 715-17 (1934).—1-Phenylcycloparaffin-1-carboxylic acids were prepd. by adding 1 mol. of the requisite alkylene dibromide to the Na deriv. of  $\text{PhCH}_2\text{CN}$  (2 mols.  $\text{NaNH}_2$  to 1 mol. nitrile), refluxing for 10 hrs. and hydrolyzing with alc. KOH. 1-Phenylcyclopentane-1-carboxylic acid, m.  $158-0^\circ$  (45.8% yield); amide, m.  $157-8^\circ$ ; the cyclohexane deriv. m.  $121^\circ$  (22.2% yield); amide, m.  $95-6^\circ$ ;  $\text{Br}(\text{CH}_2)_6\text{Br}$  gave no acid;  $o\text{-C}_6\text{H}_4(\text{CH}_2\text{Br})_2$  gave 8.3% of 2-phenylhydropentene-2-carboxylic acid, m.  $194-5^\circ$ . The Ba salt of the acid (1 mol.) and 3 mols. dry  $\text{MeONa}$ , distd. at  $40\text{ mm.}$ , yielded the corresponding phenylcycloparaffin; phenylcyclobutane,  $b_{10} 101-2^\circ$ ,  $b_{15} 190-1^\circ$ ,  $d_4^{20} 0.9378$ ,  $n_D^{20} 1.5277$ , 28.1% yield; the cyclopropane, cyclopentane and cyclohexane derivs. were prepd. in 5.5, 57.1 and 64% yields, resp. C. J. West

Bicyclo[3.3.0]octane-2,6-dione. L. Ruzicka, A. Borges de Almeida and A. Brack. *Helv. Chim. Acta* 17, 183-200(1934).—A degradation product of desoxycholic acid described by Wieland and Dane (C. A. 27, 2689) is the only previously recorded deriv. of bicyclo[3.3.0]octane (I). Reduction of bicyclo[3.3.0]octane-2,6-dione (II) would yield the unknown fundamental hydrocarbon I, and II would be a suitable starting point for the prepn. of bicyclo[3.3.0]octatetrene (III) and compds. of the bicyclofulvene type such as the tetra-Me deriv. (IV) (C. A. 26, 976). The synthesis of II has been accomplished by the cyclization of di-Et cyclopentane-1-one-3-carboxylate-2- $\beta$ -propionate (V) to Et bicyclooctane-2,6-dione-3-carboxylate (VI) and the double cyclization of tetra-Et hexane-1,3,4,6-tetracarboxylate (VII) to di-Et bicyclooctane-2,6-dione-3,7-dicarboxylate (VIII). The keto esters (VI and VIII) were sapon. to the diketone II. Condensation of 640 g. of  $\text{CH}_3(\text{CO}_2\text{Et})_2$  and 275 g. of  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{Et}$  in the presence of 40 g. Na in 700 cc. abs. alc. gave 80% of tri-Et propane-1,1,3-tricarboxylate,  $b_{12} 157-8^\circ$ , which was condensed with  $\text{BrCH}_2\text{CO}_2\text{Et}$  to form tetra-Et butane-1,2,2,4-tetracarboxylate (XVI),  $b_{12} 166-8^\circ$ , in 70 83% yields. Cyclization of XVI with powd. Na in benzene gave a mixt. of both possible tri-Et cyclopentane-1-one tricar-

boxylates,  $b_{12} 145-50^\circ$ . By boiling 346 g. of XVI for 8 hrs. with 400 cc. 20% HCl, evap. to dryness and heating the residue with a 4-fold amt. of 25% alc.  $\text{H}_2\text{SO}_4$ , extg. and reesterifying 95% of tri-Et butane-1,2,4-tricarboxylate (IX),  $b_{12} 110-2^\circ$ , was obtained which gave on sapon. with 20% HCl for 8 hrs., the free acid, m.  $122-3^\circ$ . Cyclization of 137 g. of IX with 13.8 g. Na (1.2 atoms) in 350 cc. benzene produced a mixt. of di-Et cyclopentane-1-one-2,3- (X) and 2,4-dicarboxylate (XII), both  $b_{12} 115^\circ$ . X is more acidic than XII and was extd. from the mixt. by a mixt. of  $\text{Na}_2\text{CO}_3$  and  $\text{NaHCO}_3$ . Condensation of X with  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{Et}$  gave a mixt. of the expected tri-Et cyclopentane-1-one-2,3-dicarboxylate-2- $\beta$ -propionate (XI) and VII resulting from ester cleavage. The sepn. of this mixt. by fractional distn. was difficult. Sapon. with 20% HCl for 8 hrs. gave trans-hexane-1,3,4,6-tetracarboxylic acid (trans-XIV), m.  $202-3^\circ$ . The residue from the evapd. mother liquor was esterified with alc.  $\text{H}_2\text{SO}_4$  and the careful fractionation of the distd. ester gave V,  $b_{12-16} 113-6^\circ$  (sapon. to the free acid, m.  $119-20^\circ$ ), and VII,  $b_{12} 162-6^\circ$ , which on sapon. yielded in addn. to a small amt. of trans-XIV, an appreciable quantity of a mixt. of cis-hexane-1,3,4,6-tetracarboxylic acid (cis-XIV) and its anhydride, m. and mixed m. 161. The mixt. of esters resulting from the similar condensation of XII with  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{H}$  gave, after analogous treatment, in addn. to a limited amt. of trans-XIV, 2 new compds., hexane-1,2,4,5-tetracarboxylic acid (XX), m.  $149-50^\circ$  (sinters about  $140^\circ$ ), and cyclopentane-1-one-4-carboxylic-2- $\beta$ -propionic acid (XIX), m.  $109-10^\circ$ . The above-mentioned hexanetetracarboxylic acids were synthesized. The addn. of 113 g. (1 mol.)  $\text{NCCH}_2\text{CO}_2\text{Et}$  and 68.5 g.  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{Et}$  (0.5 mol.) to 14.5 g. Na (0.5 mol.) in 170 cc. cold abs. alc. gave on working up the reaction mixt. and distg. at 11 mm., 58 g.  $\text{NCCH}_2\text{CO}_2\text{Et}$ , 31 g. di-Et  $\alpha$ -cyanoglutarate (XXII),  $b_{12-16} 140^\circ$ , and further 49 g. tri-Et 3-cyanopentane-1,3,5-tricarboxylate,  $b_{12} 108^\circ$ . The condensation of XXII with  $\alpha$ -bromoglutaric ester (C. A. 15, 3078) produced tetra-Et 3-cyanohexane-1,3,4,6-tetracarboxylate (XXIII),  $b_{12-16} 152^\circ$ , which can be obtained in better yields by first condensing XXI with  $\text{NCCH}_2\text{CO}_2\text{Et}$  to tri-Et 1-cyanobutane-1,2,4-tricarboxylate (XXIV),  $b_{12-16} 142^\circ$ , and condensing this compd. with  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{Et}$ . The sapon. of XXIII with 20% HCl gave trans-XIV, m.  $202-3^\circ$  (Silberrad, *J. Chem. Soc.* 85, 614(1904), found  $215^\circ$ ). From the mother liquor was obtained cis-XIV mixed with its anhydride, m.  $162^\circ$ . By heating in 20 cc. of 20% HCl for 20 hrs. at  $185^\circ$ , 0.5 g. cis-XIV was converted into the trans-modification. Condensation of  $\text{CH}_3\text{CH}(\text{CO}_2\text{Et})_2$  (C. A. 6, 1749) with  $\text{ClCH}_2\text{CH}_2\text{CO}_2\text{H}$  gave XXV,  $\text{C}_{12}\text{H}_{22}\text{O}_{10}$ ,  $b_{12} 158-60^\circ$ , which was condensed with  $\text{BrCH}_2\text{CO}_2\text{Et}$  by the aid of Na in alc. to hexa-Et hexane-1,2,2,4,4,6-hexacarboxylate (XXVI),  $b_{12-16} 173^\circ$ . On heating with 20% HCl XXVI was sapon. to the desired tetracarboxylic acid, XX (C. A. 20, 3446). Extn. of the reaction mixt. from the cyclization of trans-VII with Na in benzene, by  $\text{Na}_2\text{CO}_3$  and then NaOH gave di-Et bicyclo[3.3.0]octane-2,6-dione-3,7-dicarboxylate (VIII),  $\text{C}_{14}\text{H}_{18}\text{O}_6$ , m.  $57.5^\circ$  (from pentane), and tri-Et cyclopentane-1-one-3,5-dicarboxylate-2- $\beta$ -propionate (XXVII),  $\text{C}_{16}\text{H}_{20}\text{O}_7$ . The use of 2.4 atoms of Na gave VIII as the main product. With 1.2 atoms Na, XXVII predominated. Cyclization of the cis-ester with 2.4 atoms of Na gave only VIII. Since the same bicyclo product VIII is formed from both cis- and trans-modifications of the tetracarboxylate it cannot be decided whether VIII is derived from cis- or trans-bicyclo[3.3.0]octane. By shaking with 100 cc. of 20% HCl for 5 days, 5 g. of VIII was sapon. with 85% yields of II,  $b_{12-16} 83^\circ$ , m.  $45^\circ$ ,  $d_4^{20} 1.1290$ ,  $1.1013$ ,  $1.0753$ ,  $1.0481$  at  $60^\circ$ ,  $94^\circ$ ,  $125^\circ$ ,  $156^\circ$ ;  $n_D^{20} 1.4877$ ,  $1.4730$ ,  $1.4604$ ,  $1.4486$  at  $54^\circ$ ,  $93^\circ$ ,  $127^\circ$ ,  $159^\circ$ ;  $M_D 35.04$ ,  $35.13$ ,  $35.22$ ,  $35.37$  (calcd.  $34.76$ ) at  $60^\circ$ ,  $94^\circ$ ,  $125^\circ$ ,  $156^\circ$ , dioxime, m.  $201^\circ$ . Condensation of II with  $\text{BzH}$  in the presence of dry HCl gave a dibenzylidene compd., m.  $239-40^\circ$ . Treatment of II with isomyl formate and EtONa gave an unstable dihydroxymethylene deriv. on ozonization yielded the expected butane-1,2,3,4-tetracarboxylic acid, m.  $195^\circ$  (Auwers and Jacob, *Ber.* 27, 1114(1894)), converted on heating with  $\text{Ac}_2\text{O}$  into

the dianhydride, m. 234-6°. The reactivity of 2 of the methylene groups of II eliminates the possibility of the alternative bicyclo[3.2.1]octanedione formulation.

C. R. Addinall

**Anionotropic and prototropic changes in cyclic systems.**  
**II. The hydroxy-3,4-diphenyl-5-benzylidenecyclopentenones.** Harold Burton and Charles W. Shoppee. *J. Chem. Soc.* 1934, 197-201; cf. *C. A.* 27, 4219.—Anhydroacetonebenzil and BzH with NaOH (cf. Gray, *C. A.* 4, 1032) give 4-hydroxy-3,4-diphenyl-5-benzylidene- $\Delta^2$ -cyclopentenone (I), the bulk of which m. 232°, only a trace of the isomer (II)\*, m. 213.5°, being formed. I, MeI, AgO and NaOH, refluxed 10.5 days, give the 4-MeO deriv. of I, pale yellow, m. 158°; 4-EtO deriv., pale yellow, m. 159°; II gives a 4-MeO deriv., m. 122°. I could not be acetylated by any of the usual methods. The isomeric 2-HO deriv. (III), m. 216°, yields a 2-MeO deriv., yellow, m. 212°; III and EtOH-HCl give the 2-EtO deriv., yellow, m. 122-3°, but MeOH-HCl gives the isomeric III, m. 223°, whose MeO deriv., pale yellow, m. 124°. I and SOCl<sub>2</sub>, refluxed for 0.5 hr., give the 2-Cl deriv. (IV), bright yellow, m. 175°, and some 2,4-di-Cl deriv. (?) (V), pale yellow needles or prisms from Pr<sub>2</sub>O, m. 173°; the needles are converted into the prisms on standing in the solvent at 15°. IV with AcOAg in MeOH gives a 2-MeO deriv., yellow, m. 143°; with AcOAg in AcOH there results the 2-Ac deriv., m. 174-5°, identical with the acetylation product of I. V with AcOAg in MeOH gives the 2-chloro-4-methoxy deriv., pale yellow, m. 155°, which appears to contain 0.5 mol. MeOH of crystn.; with AcOAg in AcOH there is formed the 2-chloro-4-acetoxy deriv., yellow, m. 160°, and 3,4-diphenyl-5-benzylidene- $\Delta^2$ -cyclopentene-1,2-dione, bright red, m. 198-9° (2,4-antitrophenylosasone, m. 279-80° (decompn.)). 3,4-Diphenyl- $\Delta^2$ -cyclopentenone and BzH with EtONa give the 2,5-dibenzylidene deriv., orange, m. 202°.  $\alpha$ -Methyl-anhydroacetonebenzil and BzH give 4-hydroxy-3,4-diphenyl-5-benzylidene-2-methyl- $\Delta^2$ -cyclopentenone, m. 227°; with Ac<sub>2</sub>O and a trace of H<sub>2</sub>SO<sub>4</sub> this gives 3,4-diphenyl-5-benzylidene-2-methylene- $\Delta^2$ -cyclopentenone (VI), orange-red, m. 253°; O<sub>2</sub> gives HCHO, BzOH and unidentified substances. A 2nd product of the action of AcO is the compd. C<sub>20</sub>H<sub>18</sub>O<sub>2</sub>, yellow, m. 225°, which appears to be a dimer of VI. The reactions undergone by I are explicable on the basis of triad anionotropic and prototropic changes. **III. The isomeric chloro-3,4-diphenylcyclopentenones.** *Ibid.* 201-5.—Anhydroacetonebenzil and AcCl give 4-chloro-3,4-diphenyl- $\Delta^2$ -cyclopentenone (II), m. 116-17° (cf. Allen and Spanagel, *C. A.* 27, 80); SOCl<sub>2</sub> gives only a poor yield of II; refluxing with AcOH and AcOAg gives the dimer, C<sub>40</sub>H<sub>34</sub>O<sub>4</sub>. II with MeOH and AcOAg forms the 4-MeO deriv. (III), m. 123.5°; this also results from I, Ag<sub>2</sub>O, NaOH and MeI by refluxing 1 week. With excess of Br in CHCl<sub>3</sub> at 15° for 48 hrs. there results a compd. C<sub>18</sub>H<sub>16</sub>OBr<sub>2</sub>, buff, m. 145°. III and BzH give the 5-benzylidene deriv., m. 158° (cf. preceding abstr.), and some of the isomer, m. 122°. I and cold satd. EtOH-HCl after 24 hrs. give 2-chloro-3,4-diphenyl- $\Delta^2$ -cyclopentenone (IV), m. 124.9° which is unchanged by boiling EtOH-AgNO<sub>3</sub>, MeOH-AcOAg or C<sub>6</sub>H<sub>5</sub>N; quinoline splits off HCl but the EtO-sol. products could not be crystd.; piperidine also splits off HCl and gives the dimer, C<sub>40</sub>H<sub>34</sub>O<sub>4</sub>; the chloride is very slowly attacked by Zn in AcOH, a compd. C<sub>24</sub>H<sub>22</sub>OCl, orange-pink, m. 210° (decompn.), being isolated. Oxidation of the chloride with O<sub>2</sub> gives traces of an aldehyde and BzOH; KMnO<sub>4</sub> gives 88% of desylacetic acid. With dil. EtOH-KOH the chloride gives only yellow resins but not the dimer; MeOH-MeONa gives amorphous high-melting brown solids. 3,4-Diphenyl- $\Delta^2$ -cyclopentenone and Cl at 115° give the 2-Cl deriv., m. 50°, and a mono-Cl dimer, C<sub>40</sub>H<sub>34</sub>O<sub>2</sub>Cl, m. 216° (decompn.); this is also formed with SO<sub>2</sub>Cl<sub>2</sub> at 20°; oxidation with NaOBr gives diphenylmaleic anhydride. It is inferred that the initial stage in the production of the dimer C<sub>40</sub>H<sub>34</sub>O<sub>4</sub> from Japp's chloride (IV) is a prototropic change. **IV. Hydroxy-3,4-diphenyl-5-isopropylidenecyclopentenones.** *Ibid.* 205-7. (Japp and Knox, *J. Chem. Soc.* 87, 673 (1905).—The

transformations undergone by the compds. of the isopropylidene series are fundamentally identical with those displayed by the 5,5-di-Me and 5-benzylidene compds. 4-Hydroxy-3,4-diphenyl-5-isopropylidene- $\Delta^2$ -cyclopentenone with Ac<sub>2</sub>O and a trace of H<sub>2</sub>SO<sub>4</sub> yields the 2-Ac deriv. (I), buff, m. 140-1°; reduction with HI gives 3,4-diphenyl-5-isopropylidene- $\Delta^2$ -cyclopentenone, whose benzylidene deriv., orange, m. 234°. Alkalies cause a deep-seated decompn. of I. Hydrolysis with HCl in Me<sub>2</sub>CO gives a mixt. of 2-chloro-3,4-diphenyl-5-isopropylidene- $\Delta^2$ -cyclopentenone (?), m. 188°, and a small quantity of 2-hydroxy-3,4-diphenyl-5-isopropylidene- $\Delta^2$ -cyclopentenone (II), m. 207°; the chloride and EtOH-KOH give the isomeric  $\Delta^2$ -compd. (III), m. 253°. II was not converted into III by brief treatment with hot EtOH-EtONa. The chloride was unchanged by refluxing with AcOAg in MeOH for 0.5 hr. On oxidation it gives a small quantity of diphenylmaleic anhydride. Its structure has not been definitely established.

C. J. West

**Active cis- and trans-1-methyl-3-cyclohexanol.** Marcel Godchot and Germaine Cauquil. *Compt. rend.* 198, 663-5 (1934).—The cis- and trans-forms of 3-MeC<sub>6</sub>H<sub>11</sub>OH can be fractionally crystd. from MeOH as the p-nitrobenzoates. Sapon. gave the free cis- and trans-forms which have the following properties, resp.: b<sub>D</sub> 167-8°, 70-7°; d<sub>4</sub> 0.9274, 0.9201;  $\eta_{25}^0$  1.4590, 1.4589;  $\eta_{40}^0$  0.2652, 0.3774;  $[\alpha]_{D20}^{20}$  -7.29°, -4.06°;  $[\alpha]_{D25}^{25}$  -7.83°, -4.26°;  $[\alpha]_{D30}^{30}$  -8.76°, -4.68°;  $[\alpha]_{D35}^{35}$  -14.2°, -7.03°. Phenylurethans, 90°, 117-17.5°;  $[\alpha]_D^{20}$  -12.43°, -23.55°. p-Nitrobenzoates, m. 78-9°, 45-45.5°;  $[\alpha]_D^{20}$  -27.15°, -2.44°; acid phthalate, non-cryst., m. 92.3°;  $[\alpha]_D^{20}$  not obtained, -13.7°. Oxidation of both forms, resp., with CrOSO<sub>4</sub> gave 3-MeC<sub>6</sub>H<sub>4</sub>O (semicarbazone, m. 186°).

Julius White

**Nitrosites and nitrosates.** III. Lydia Monti and F. Bucci. *Gazz. chim. ital.* 63, 708 12 (1933); cf. M. and Dimelli, *C. A.* 26, 4803.—The decompn. of other nitrogenated compds. was studied. Heated in an inert gas in the same way as in the previous expts., methylcyclohexene nitrosate (I) decompn. similarly to amylenenitrosate, with about the same proportions of N, NO, CO<sub>2</sub> and H<sub>2</sub>O. It is probable therefore that this mode of decompn. is a general property of nitrosates. In an inert gas, stilbene pseudonitrosite (II) decompn. as do  $\alpha$ -nitrosites, i. e., it evolves a higher proportion of gas and of total N (58% compared with 40%) than do other nitrosites, and only a trace of CO<sub>2</sub>. As a result of the intramol. oxidation, the II mol. tends to rupture at the diatomic chain between the 2 C<sub>6</sub>H<sub>5</sub> nuclei, with formation of BzH and BzOH, which are found in all cases as decompn. products. The following data give the decompn. temp., the percentage of N, percentage of NO, percentage total N and percentage of the total N in the original I or II evolved, resp.: I, 5, 2.87, 0.34, 42.72; II, 1.64, 10.17, 66.37, 58.2. As would be foreseen from its constitution, PhCH(NO<sub>2</sub>)CH(NO<sub>2</sub>)Ph is more resistant to heat than are I and II. Heated in an inert gas for 3-4 hrs. at 100-150°, it does not evolve any gas, but sublimates unaltered. However, when heated rapidly to 240° it partially sublimates, but also in part decompn., with evolution of a gas composed chiefly of NO.

C. C. Davis

**Chloro derivatives of p-xylene.** Henri Wahl. *Compt. rend.* 198, 100-2 (1934); cf. *C. A.* 28, 1670°.—On nitration, 2,4-ClMeC<sub>6</sub>H<sub>3</sub>Me yielded a mixt. of 2,4,5-ClMe(O<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>Me (I), m. 77°, b<sub>D</sub> 139-40°; 2-chloro-6-nitro-p-xylene (II), yellow needles, m. 36°, b<sub>D</sub> 133-4° and 2,4,3-ClMe(O<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>Me (III), m. 56°, b<sub>D</sub> 135-6°. 4,2,6-Me(H<sub>2</sub>N)(O<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>Me prepd. by Soum's method (*C. A.* 10, 1537) was converted into II by the Sandmeyer reaction. The corresponding amine, from II, needles, m. 40°, b<sub>D</sub> 133°; Ac deriv. m. 171°, Bz deriv., m. 177°; picrate, m. 171°. The amine derived from I m. 92°, b<sub>D</sub> 136°; Ac deriv., m. 181°; Bz deriv., m. 163°; picrate, m. 195°. The amine derived from III m. 41°, b<sub>D</sub> 127°; Ac deriv., m. 179°; Bz deriv., m. 144°; picrate, m. 120°.

Louis R. Wise

**Side-chain chlorination of toluene.** Harold S. King and W. H. Reazley. *Proc. Nova Scotian Inst. Sci.* 18, 204-12

(1931).—The progress of the side-chain chlorination of PhMe can be conveniently detd. by reference to the b.-p. curve of mixts. of PhMe, PhCH<sub>2</sub>Cl and PhCHCl<sub>2</sub>. The compn. of these mixts. was detd. by refractometer, the relation between  $\pi$  and compn. being linear. The following values were found: PhMe  $n_D^{20}$  1.4971, PhCH<sub>2</sub>Cl  $n_D^{20}$  1.5391, PhCHCl<sub>2</sub>  $n_D^{20}$  1.5502. C. M. Pert

**Syntheses of chloromethyl derivatives of phenyl ethers.** Raymond Quelet. *Compt. rend.* 198, 102-5 (1934); cf. C. A. 27, 3921 and Blanc, C. A. 17, 2103.—4-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>Cl, b<sub>15</sub> 117°, d<sub>4</sub><sup>20</sup> 1.159,  $n_D^{20}$  1.553, was prepd. in 50% yield, by passing a rapid stream of HCl for 1 hr. into a well-stirred mixt. of 200 g. PhOMe, 100 g. 40% HCHO, 100 cc. petr. ether and 40 g. ZnCl<sub>2</sub> at 0-5°. (4-MeOC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>CH<sub>2</sub> is formed as a by-product. A similar reaction with PhOEt gave low yields of the unstable 4-EtOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>Cl, b<sub>15</sub> 123°,  $n_D^{20}$  1.536. Analogously, *o*-, *m*- and *p*-MeC<sub>6</sub>H<sub>4</sub>OMe, and 3,4-MeO(iso-Pr)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Me gave risc, resp., to 3-methyl-4-methoxy- $\alpha$ -chlorotoluene (I), fairly stable, b<sub>15</sub> 119°, d<sub>4</sub><sup>20</sup> 1.13,  $n_D^{20}$  1.549; 2-methyl-4-methoxy- $\alpha$ -chlorotoluene (II), very unstable fuming liquid, b<sub>15</sub> 123°, 5-methyl-2-methoxy- $\alpha$ -chlorotoluene, stable, b<sub>15</sub> 121°, d<sub>4</sub><sup>20</sup> 1.128,  $n_D^{20}$  1.545, obtained in 75% yield; and 2-methyl-5-methoxy-3-isopropyl- $\alpha$ -chlorotoluene, fairly stable, b<sub>15</sub> 148°, d<sub>4</sub><sup>20</sup> 1.067 and  $n_D^{20}$  1.539. By-products of these reactions were: 3,3'-dimethyl-4,4'-dimethoxydiphenylmethane (from I), b<sub>10</sub> 207-9°, needles, m. 24°, the corresponding benzophenone, m. 115°, by oxidation in AcOH with Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (cf. Gomberg and Anderson, C. A. 19, 2486); 2,2'-dimethyl-4,4'-dimethoxydiphenylmethane (from II), b<sub>15</sub> 215-6°, m. 60°, the corresponding benzophenone, m. 71°; 5,5'-dimethyl-2,2'-dimethoxydiphenylmethane (from III), b<sub>10</sub> 197-9°, m. 55°, the corresponding benzophenone, m. 82°. Louis E. Wise

**Nitromesitylene.** Garfield Powell and F. R. Johnson. *Org. Syntheses* 14, 68-70 (1934).—Nitration of 1,3,5-C<sub>6</sub>H<sub>3</sub>Me<sub>3</sub> in AcOH-Ac<sub>2</sub>O gives 74.6-6.5% of the 2-NO<sub>2</sub> deriv. C. J. West

**Synthesis of  $\beta$ -hydroxy- $\beta$ -phenylethylamine.** I. R. Rafter. *Industria chimica* 8, 575-7 (1933). H<sub>2</sub>NCH<sub>2</sub>COCI is condensed (AlCl<sub>3</sub>) with C<sub>6</sub>H<sub>6</sub>, and the H<sub>2</sub>NCH<sub>2</sub>COPH hydrogenated catalytically to a 71% yield of pure HOC-HPHCH<sub>2</sub>NH<sub>2</sub>. B. C. A.

**Amphoteric nature of organic oxygen compounds.** N. A. Pushin and R. Živadinović. *Bull. soc. chim. roy. Yougoslav.* 4, 23-30 (1933).—The fusion diagrams of the systems NH<sub>2</sub>Ph-piperonal and  $\beta$ -C<sub>10</sub>H<sub>11</sub>NH<sub>2</sub> camphor do not give evidence of compd. formation; *p*-MeC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> forms a compd. with 1 mol. of *o*-C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O, m. 195°, and with 2 mols. of coumarin, m. 42°. B. C. A.

**Internal molecular compounds.** L. Dede and A. Rosenberg. *Ber.* 67B, 147-53 (1934). The color of solns. of isomeric nitroanilines is explained as due to formation of internal complexes and is substantiated by color changes occurring on addn. of HClO<sub>4</sub>, showing variation in the stability of the complex as related to color intensity. This is further substantiated by similar behavior of nitrophenols and similarity in the forms of absorption curves of various mononitro and of various monoamino compds. Foster Dee Snell

**Color reactions of organic compounds. I. Color reactions of arylthioureas.** George M. Dyson. *J. Chem. Soc.* 1934, 174 7. —(Certain NO<sub>2</sub>-substituted arylthioureas dissolved in warm concd. H<sub>2</sub>SO<sub>4</sub> with the formation of a violet color (C. A. 18, 3363). These colors are due, first, to the formation of the corresponding amine and, secondly, to the oxidation of this amine by a trace of HNO<sub>3</sub> produced from the NO<sub>2</sub> group. In compds. of the type ANHCS-NiIB, in which A comprises a NO<sub>2</sub> group attached to an aryl residue, no color is produced unless B is an aromatic residue, and the inclusion of a NO<sub>2</sub> group in B, even if attached to an aromatic residue, precludes color formation; further, the nature of the color produced is dependent on the aromatic group B, but is independent of the orientation of the NO<sub>2</sub> group in A. *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> (25 g. in 500 ml. 20% HCl), agitated with 15 g. CSeCl<sub>2</sub> for 70 hrs., gives 20 g. *o*-nitrophenylthiocarbamide, yellow, m. 74°; 3-nitro-*o*-tolyl analog, brown, m. 84°; 4-NO<sub>2</sub> isomer, pale

cream, m. 74°; 5-NO<sub>2</sub> isomer, lemon-yellow, m. 92°; 2-nitro-*p*-tolyl analog, pale yellow, m. 68°; 3-NO<sub>2</sub> isomer, yellow, m. 67°; 6-NO<sub>2</sub> isomer, pale yellow, m. 77°; 5-nitro-2-methoxyphenyl analog, m. 83°. Thioureas: *N*-*o*-nitrophenyl-*N'*-propyl, cream, m. 168°; *o*-nitro-*s*-diphenyl, golden yellow, m. 188°; 2-nitro-2'-methyl-*s*-diphenyl, bright yellow, m. 192°; 3'-Me isomer, deep golden yellow, m. 150°; 4'-Me isomer, lemon, m. 207°; 4'-bromo-2-nitro-*s*-diphenyl, golden yellow, m. 210°; *N*-*o*-nitrophenyl-*N'*- $\alpha$ -naphthyl, olive-green, m. 145°;  $\beta$ -naphthyl isomer, ochre, m. 170°; *s*-di-*o*-nitrophenyl, orange, m. 160°; 2,3'-dinistro-*s*-diphenyl, orange, m. 116°; 2,4'-di-NO<sub>2</sub> isomer, pale yellow, m. 153°; *N*-*m*-nitrophenyl-*N'*-propyl, m. 110°; 3-nitro-*s*-diphenyl, yellow, m. 156°; 3-nitro-2'-methyl-*s*-diphenyl, lemon-yellow, m. 154°; 3'-Me isomer, yellow, m. 158°; 4'-Me isomer, m. 157°; 3,3'-dinistro-*s*-diphenyl, ochre, m. 168°; 4'-bromo-3-nitro-*s*-diphenyl, pale yellow, m. 173°; 2,4'-dichloro-3-nitro-*s*-diphenyl, m. 151°; 3,2'-dinistro-6-methyl-*s*-diphenyl, deep orange, m. 160°; *N*-*m*-nitrophenyl-*N'*- $\alpha$ -naphthyl, yellow, m. 156°;  $\beta$ -naphthyl isomer, yellow, m. 164°; 3,3'-dinistro-6'-methyl-*s*-diphenyl, deep lemon, m. 136°; 3,4'-di-NO<sub>2</sub> isomer, orange, m. 158°; 3,4'-dinistro-*s*-diphenyl, m. 172°; 3,3'-dinistro-1'-methyl-*s*-diphenyl, deep orange-red, m. 115°; 3,3'-di-NO<sub>2</sub> isomer, m. 188°; *N*-*p*-nitrophenyl-*N'*-propyl, cream, m. 170°; 4-nitro-*s*-diphenyl, pale yellow, m. 175°; 4-nitro-2'-methyl-*s*-diphenyl, lemon-yellow, m. 132°; 3'-Me isomer, pale orange, m. 135°; 4'-Me isomer, lemon yellow, m. 165°; 4,4'-dinistro-*s*-diphenyl, orange-red, m. 175°; 4'-bromo-1-nitro-*s*-diphenyl, cream-yellow, m. 161°; 4'-Cl deriv., yellow, m. 179°; 4'-MeCl deriv., yellow, m. 155°; *N*-*p*-nitrophenyl-*N'*- $\alpha$ -naphthyl, yellow,  $\beta$ -naphthyl isomer, yellow, m. 157°; 4,3'-dinistro-6'-methyl-*s*-diphenyl, bright orange, m. 175°; 4'-Me isomer, pale yellow, m. 176°; 4,4'-di-nitro-6'-methyl deriv., pale yellow, m. 181°; 4,2'-dinistro-4'-methyl deriv., yellow, m. 176°; 4-nitro-*o*-tolyl, yellow, m. 140°; *N*-4-nitro-*o*-tolyl-*N'*-propyl, cream, m. 173°; 5-nitro-2-methyl-*s*-diphenyl, m. 171°; 4'-Br deriv., m. 183°; 5-nitro-2,2'-dimethyl-*s*-diphenyl, yellow, m. 149°; 2,3'-di-Me isomer, pale yellow, m. 156°; 2,4'-di-Me isomer, pale yellow, m. 161°; *N*-4-nitro-*o*-tolyl-*N'*- $\alpha$ -naphthyl, yellow, m. 191°;  $\beta$ -naphthyl isomer, m. 154°; 3,3'-dinistro-6,6'-dimethyl-*s*-diphenyl, very pale yellow, m. 162°; *N*-5-nitro-*o*-tolyl-*N'*-propyl, pale yellow, m. 157°; 1-nitro-2,2'-dimethyl-*s*-diphenyl, lemon-yellow, m. 14°; 2,3'-di-Me isomer, pale yellow, m. 153°; 2,4'-di-Me isomer, light yellow, m. 150°; *N*-5-nitro-*o*-tolyl-*N'*- $\alpha$ -naphthyl, yellow, m. 166°;  $\beta$ -naphthyl isomer, pale yellow, m. 165°; 2-nitro-*p*-tolyl, orange, m. 122°; *N*-2-nitro-*p*-tolyl-*N'*-propyl, m. 147°; 3-nitro-1-methyl-*s*-diphenyl, cream, m. 152°; 4'-Br deriv., lemon yellow, m. 173°; 3-nitro-2',4'-dimethyl-*s*-diphenyl, m. 111°; 3',4'-di-Me isomer, pale yellow, m. 152°; 4,4'-di-Me isomer, yellow, m. 176°; *N*-2-nitro-*p*-tolyl-*N'*- $\alpha$ -naphthyl, m. 165°;  $\beta$ -naphthyl isomer, yellow, m. 212°; 3-nitro-*p*-tolyl, yellow, m. 138°; *N*-3-nitro-*p*-tolyl-*N'*-propyl, m. 144°; 2-nitro-4-methyl-*s*-diphenyl, orange, m. 125°; 4'-Br deriv., yellow, m. 156°; 2-nitro-2',1-dimethyl-*s*-diphenyl, pale yellow, m. 164°; 3',4'-di-Me isomer, yellow, m. 156°; 4,4'-di-Me isomer, pale yellow, m. 162°; *N*-3-nitro-*p*-tolyl-*N'*- $\alpha$ -naphthyl, citron-yellow, m. 168°;  $\beta$ -naphthyl isomer, ochre, m. 159°; 5-nitro-2-methoxyphenyl, orange; *N*-5-nitro-2-methoxyphenyl-*N'*-propyl, pale yellow, m. 171°; 5-nitro-2-methoxy-*s*-diphenyl, pale brown, m. 173°; 4'-Br deriv., m. 180°; 2'-Me deriv., pale brown, m. 162°; 3'-Me deriv., pale brown, m. 168°; 4'-Me deriv., yellow, m. 162°; 3',5'-dinistro-2-methoxy-*s*-diphenyl, orange, m. 164°; 4',5'-di-NO<sub>2</sub> isomer, orange, m. 162°; *N*-5-nitro-2-methoxyphenyl-*N'*- $\alpha$ -naphthyl, ochre, m. 178°;  $\beta$ -naphthyl isomer, yellow, m. 175°; 5,5'-dinistro-2,2'-dimethoxy-*s*-diphenyl, brown, m. 175°; 3-nitro-*o*-tolyl, pale yellow, m. 171°; 4'-bromo-2-nitro-6-methyl-*s*-diphenyl, pale yellow, m. 164°; *N*-3-nitro-*o*-tolyl-*N'*- $\alpha$ -naphthyl, pale yellow, m. 171°; 2-nitro-4',6'-dimethyl-*s*-diphenyl, pale yellow, m. 160°; 4-nitro-3-methyl-*s*-diphenyl, m. 158°; 4'-F deriv., m. 154°; 4'-Br deriv., yellow, m. 147°; *N*-6-nitro-*m*-tolyl-*N'*- $\alpha$ -naphthyl, cream,

m. 142°; *β*-naphthyl deriv., m. 172°; 4-nitro-3,4'-dimethyl-*s*-diphenyl, pale yellow, m. 110°. C. J. West

**Inhibitory effect of substituents in chemical reactions.**  
**III. The reactivity of the isothiocyanato group in substituted arylthiocarbimides.** Donald W. Browne and G. Malcolm Dyson. *J. Chem. Soc.* 1934, 178-9; cf. C. A. 26, 1586.—The rate of disappearance of various thiocarbimides from a *N*/13.5 soln. in EtOH was measured at the b. p. of the soln., 78.5°, over periods from 10-90 min. The general trend of addn. of EtOH to arylthiocarbimides is that of a side-chain reaction favored by "electron-recession"; in nearly all the cases examd., the *m*-substituted compd. is more reactive than the corresponding *o*- and *p*-substituted compds.; the reaction is favored by unsat. in the substituents. The percentages of thiocarbimide disappearing in 60 min. were: 1-naphthyl 11.5; 2-naphthyl 28.5; 4-acenaphthyl 5; 3-carboxyphenyl (m. 163° (decompn.)) 55; 4-isomer (decompn. 220°) 72.5; 2-carbomethoxyphenyl 33; 3-isomer 65; 4-isomer 70; 2-carbethoxyphenyl 28.5; 3-isomer 65; 4-isomer 75; 4-carbopropoxyphenyl (m. 32°) 77.5; 4-carbomethoxyphenyl (yellow oil, b<sub>p</sub> 180°) 75.5; 4-carbomethoxyphenyl (yellow, b<sub>p</sub> 205°) 79; *Et* phenylacetate-4- (m. 58°) 23.5; *Et* *β*-phenylpropionate-4- (yellow, b<sub>p</sub> 296°) 11; *Et* cinnamate-4- (golden, m. 62°) 55; 4-acetamidophenyl 20.5; 3,4-dichlorophenyl 80; 3,4,5-trimethoxyphenyl (m. 65°) 33; 4-diethylaminophenyl, no reaction. The following derivs. of thiourethan (*Et* thionocarbamate) were prepd. during this work: 1-naphthyl, m. 106°; 4-isomer, m. 92°; 3-acenaphthyl, brown, m. 140°; 3-carboxyphenyl, m. 210°; 4-isomer, m. 212°; 2-carbomethoxyphenyl, m. 70°; 3-isomer, m. 104°; 4-isomer, m. 121°; 2-carbethoxyphenyl, m. 48°; 3-isomer, m. 76°; 1-isomer, m. 118°; 4-carbopropoxyphenyl, m. 97°; butoxy homolog, m. 83°; amoxy homolog, m. 67°; *Et* phenylacetate-1-, m. 69°; *Et* cinnamate-4-, m. 128°; 4-acetamidophenyl, m. 173°; 3,4-dichlorophenyl, m. 125°; 3,4,5-trimethoxyphenyl, m. 132°. C. J. West

**Halogenation of phenolic ethers and anilides.** IV. Chlorination of some *p*-substituted anilides. Brynmor Jones. *J. Chem. Soc.* 1934, 210-13; cf. C. A. 26, 1263.

The measurement of the velocity coeffs. for the chlorination of substances of the type *p*-AcNH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>X in 99% AcOH at 20°, where X is *p*-Cl, *p*-Br and *p*-CO<sub>2</sub>H, gives the following series of diminishing directive powers: EtCONH > MeCONH > PhCONH > C<sub>6</sub>H<sub>5</sub>SO<sub>2</sub>NH > PhSO<sub>2</sub>NH >> Cl<sub>2</sub>CCONH; in both the *p*-Cl and the *p*-NO<sub>2</sub> series the theoretical sequence •MeCONH > PhCONH is found and in the *p*-Cl and *p*-Br series the order C<sub>6</sub>H<sub>5</sub>SO<sub>2</sub>NH > MeCONH observed in the unsubstituted anilides is reversed. A comparison of the relative directive influences of Br, Cl and CO<sub>2</sub>H in *p*-substituted phenolic ethers and anilides shows that with the anilides all 3 groups display similar effects, while in the ethers the deactivation due to the CO<sub>2</sub>H group becomes much more pronounced. C. J. West

**Thiocarbamide formation under different conditions.** I. Chas. Raiford and G. Mervin McNulty. *J. Am. Chem. Soc.* 56, 680-1 (1934).—Four methods for the prepn. of thiocarbamide were studied: (1) heating 10 g. amine, 2 mols. CS<sub>2</sub>, 25 cc. EtOH and 0.5 g. S as long as H<sub>2</sub>S was evolved; (2) heating 10 g. amine, 1.5 mols. CS<sub>2</sub>, 30 cc. EtOH and 0.2 g. powd. NaOH for 4 hrs.; (3) Fry's method (C. A. 7, 3980), the mixt. being stirred; (4) Snedker's method (C. A. 20, 174), the mixt. being shaken instead of stirred. 3-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, 3,5-Cl<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> and 3,4- and 3,5-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub> gave no product by method (1), while with method (3) the yields were 87, 71, 47 and 85%, resp.; on the other hand, with method (4) the yields of thiocarbamide from 2,4-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, 2,5-MeO(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, 2-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>Ph and 2-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>-C<sub>6</sub>H<sub>4</sub>-Cl-4 were 84, 10, 84 and 63%. 2-Methoxy-4-bromo-*n*-methylphenylamine, m. 96°; *Ac* deriv., m. 122-3; *n*-methyl-4-acetylaminovaniline, m. 120-30° (74% yield); *n*-bromo-4-acetylaminovaniline, m. 120-30° (71%); 3-Br isomer, m. 210-11° (41%); 3,5-di-Br deriv., m. 244-5° (78%); 2-(4-chlorophenyl)aniline, m. 52 (61%). New sym diarylthioureas, (RNH<sub>2</sub>)<sub>2</sub>CS, were prepd. with R as

follows: 3,5-dibromophenyl, m. 134-5° (85% yield); 3,4-di-Br isomer, cream, m. 100-3° (47%); 2,5-di-Cl analog, m. 175-6° (68%); 2,4-di-Cl isomer, brown, m. 184-5° (79%); 3,5-di-Cl isomer, m. 156-7° (71%); 2-bromo-4-chloro analog, m. 206-7° (64%); 2-chloro-4-bromo isomer, pale brown, m. 159-60° (65%); 2-methoxy-5-methyl analog, m. 143-4° (72%); 2-methoxy-4-bromo-5-methyl analog, m. 175-6° (62%); *p*-phenylphenyl, m. 230 (90%); *p*-(*p*-chlorophenyl)phenyl, m. 219-20° (88%); *o*-phenylphenyl, m. 154-5 (90%); *o*-(*p*-chlorophenyl)-phenyl, m. 193-4° (70%). These yields are by method (4).

C. J. West

**Thiocyanogenation of aromatic compounds with the aid of chloroamides.** II. Thiocyanogenation of toluidines. M. V. Likhoshershtov and A. A. Petrov. *J. Gen. Chem.* (U. S. S. R.) 3, 759-64 (1933); cf. C. A. 28, 1677.

Thiocyanogenation of the isomeric toluidines with the aid of CO(NHCl)<sub>2</sub>, AcNHCl and dichloropentamethylenetetramine (I) (Delépine, C. A. 6, 622) proceed rapidly with the liberation of heat. AcNHCl is more stable than CO(NHCl)<sub>2</sub> and I produced best results. The addn. of a few drops of H<sub>2</sub>SO<sub>4</sub> to the reaction mixt. checks the oxidation process and gives purer products. Practically all the thiocyanate derivs. can be halogenated with the aid of the chloroamines; the yields of Br, Cl and I derivs. obtained decrease in the order given. The CNS group easily takes up the *p*-position to the available NH<sub>2</sub> group in the ring, especially when 1 or both *m*-positions are vacant; if the *p*-position is engaged the CNS group difficultly enters 1 of the vacant *o*-positions, whereby with an excessive heat liberation the product becomes yellow with a considerable formation of a thiazole: 5,2,3-RC<sub>6</sub>H<sub>3</sub>(NH<sub>2</sub>)SCN + H<sub>2</sub>O → RC<sub>6</sub>H<sub>3</sub>(NH<sub>2</sub>)SCONH<sub>2</sub> -

H<sub>2</sub>O → RC<sub>6</sub>H<sub>3</sub>N:C(NH<sub>2</sub>)<sub>2</sub>S. Such a thiazole regrouping of *o*-aminothiocyanates does not always proceed spontaneously and must be aided by heating with acids. When 2 substituents are present in the *o*- and *p*-positions, the thiocyanogenation either does not take place or with a considerable resubstitution of the reaction product. The thiocyanogenated toluidines and their halogen derivs. are becoming important as the intermediates in the production of thiondigo (French pat. 650,955; U. S. pat. 1,703,140), for medicinal preps. (Kaufmann, C. A. 23, 2244-5; Taubmann, C. A. 24, 4840) and for insecticides (U. S. pat. 1,794,046). 2,5-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>(NH<sub>2</sub>)SCN (II), m. 69-70°, was obtained in 80-85% yield by adding 0.1 mol. dry AcNHCl to a mixt. of 0.1 mol. each of *o*-toluidine and NH<sub>4</sub>SCN in 200 cc. 80% AcOH, allowing the mixt. to cool, then dilg., filtering and crystg. from alc. Similar results were obtained with the aid of CO(NHCl)<sub>2</sub> and I; the acetyl deriv. of II m. 140.5°. To a mixt. of 0.1 mol. each of II and KBr in 200 cc. 60% AcOH was added with shaking 0.5 mol. CO(NHCl)<sub>2</sub>, the mixt. was heated and filtered cold, giving 2,3,5-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Br)SCN, m. 98-9.5°; the *Ac* deriv. m. 150°. With the exception of 3,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>(NH<sub>2</sub>)SCN (III) (see Ger. 495,879, C. A. 24, 3518), the following thiocyanate derivs. of *m*-toluidine are new compds. obtained by the methods described above. *m*-Toluidine, in distinction from the *o*- and *p*-isomers, easily produced dithiocyanates and large yields of various halogen derivs. III heated with 1 mol. AcNHCl and a little HCl in AcOH gave 3,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Cl)SCN, m. 95-7°; this, heated with equimol. amts. of CO(NHCl)<sub>2</sub> or AcNHCl and KBr, produced 95% 3,2,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Br)(Cl)SCN, m. 105°; III with 2 mols. AcNHCl gave 3,2,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Cl)<sub>2</sub>SCN, m. 105-6°. III produced 3,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Br)SCN, m. 78°, and 3,2,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Br)<sub>2</sub>SCN, m. 103.5°. This monobromide with AcNHCl gave 3,2,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(Cl)(Br)SCN, m. 98°. III with AcNHCl and KI gave a small yield of 3,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(I)SCN, m. 80-7°. *m*-Toluidine with 2 mols. of CO(NHCl)<sub>2</sub> or AcNHCl and NH<sub>4</sub>SCN produced 3,4,6-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>(SCN)<sub>2</sub> (IV), m. 142-3°. IV heated with dil. HCl gave 5-methyl-6-thiocyano-2-aminobenzothiazole, Me(NCS)-

C<sub>6</sub>H<sub>3</sub>N:C(NH<sub>2</sub>)<sub>2</sub>S, m. 210°, which, diazotized and coupled

with  $\alpha$ -C<sub>10</sub>H<sub>7</sub>OH, gave a violet dye, while IV is difficultly diazotized and gives with  $\alpha$ -C<sub>10</sub>H<sub>7</sub>OH a red dye. IV with CO(NHCl)<sub>2</sub> and KBr in AcOH gave 2,3,4,6-MeC<sub>6</sub>HBr-(NH<sub>2</sub>)<sub>2</sub>(SCN)<sub>2</sub> (V), disintegrating at 162° and m. 241°. Evidently at about 160° V is isomerized to 4-bromo-5-methyl-6-thiocyano-2-aminobenzothiazole (Hunter, C. A. 20, 195). *p*-Toluidine with 1 mol. of NH<sub>2</sub>SCN and AcNHCl produced a thiocyanate, m. 56°, which is decomd. in the air. The product recrystd., m. 142° (Kaufmann, C. A. 23, 2244-5). *p*-Toluidine with 2 mols. each of NH<sub>2</sub>SCN and a chloramine gave a resinsified mixt. of a dithiocyano-*p*-toluidine, m. 123°, and 4-thiocyano-6-methyl-2-aminobenzothiazole, m. 225° (Kaufmann, loc. cit.). Chas. Blanc

Action of sodium ethoxide upon phenyl thiocyanate. John Ross. *J. Am. Chem. Soc.* 56, 727-9 (1934); cf. C. A. 27, 5065.—EtONa in EtOH reacts with PhSCN to give PhSNa, PhSEt and Ph<sub>2</sub>S<sub>2</sub>. The mechanism of the formation of the last 2 compds. is discussed. PhSOEt is reduced by PhSH to give PhSEt and Ph<sub>2</sub>S<sub>2</sub>. *Et benzene-sulfonate*, b. 100°, and PhSH give Ph<sub>2</sub>S<sub>2</sub>. PhSH and PhCNO give 15% of Ph<sub>2</sub>S<sub>2</sub>. EtOH-free EtONa and PhSCN give only Ph<sub>2</sub>S<sub>2</sub>. C. J. West

*p*-Nitrophenyl isocyanate. R. L. Shriner, W. H. Horne and R. F. B. Cox. *Org. Syntheses* 14, 72-4 (1934).—AcOEt is satd. with COCl<sub>2</sub> and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub> in AcOEt introduced during 3-4 hrs., the stream of COCl<sub>2</sub> being continued; the *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NHCOCl is converted to *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>NCO during crystn. from CCl<sub>4</sub>; yield 85-95%. C. J. West

Derivatives of *m*-phenylenediamine. F. Bell and R. Cohen. *J. Chem. Soc.* 1934, 243.—*m*-C<sub>6</sub>H<sub>4</sub>(NHSO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>Me-*p*) (I) and Br in C<sub>6</sub>H<sub>5</sub>N give 4,6-dibromo-1,3-bis-(*p*-toluenesulfonamido)benzene, m. 209°; excess Br in C<sub>6</sub>H<sub>5</sub>N gives the 2,4,6-tri-Br deriv., m. 223°. *m*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> and *m*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Cl in C<sub>6</sub>H<sub>5</sub>N give 1,3-bis-(*m*-nitrobenzenesulfonamido)benzene, m. 195°; fuming HNO<sub>3</sub> in AcOH gives the 4,6-di-NO<sub>2</sub> deriv., m. 235°; further nitration gives the 2,4,6-tri-NO<sub>2</sub> deriv., m. 218°. Nitration of I gives 4,6-dinitro-1,3-bis-(*p*-toluenesulfonamido)benzene, pale yellow, m. 208-10°; further nitration gives the 2,4,6-tri-NO<sub>2</sub> deriv., m. 223°. C. J. West

*m*-Phenylenediamine sulfate. M. S. Rozhdestvenskii and T. N. Karskaya. *J. Gen. Chem.* (U. S. S. R.) 3, 558 (1933).—*m*-Phenylenediamine sulfate forms a stable hydrate, 3[C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub>]·4H<sub>2</sub>O. Lewis W. Butz

Extension of Michael's reaction. III. Tejendra Nath Ghosh and Praphulla Chandra Guha. *J. Indian Inst. Sci.* 16A, 103-12 (1933); cf. C. A. 24, 4787.—The action of the Na derivs. of AcCH<sub>2</sub>CO<sub>2</sub>Et, NCCH<sub>2</sub>CO<sub>2</sub>Et, Ac<sub>2</sub>CH<sub>2</sub> and H<sub>2</sub>NCO<sub>2</sub>Et on systems contg. the unsatd. linkages N:N and C:N has been studied. PhN:NCO<sub>2</sub>Et (*Ber.* 28, 1927 (1895)) reacts with AcCH<sub>2</sub>NaCO<sub>2</sub>Et (I), NCCH<sub>2</sub>NaCO<sub>2</sub>Et (II) and Ac<sub>2</sub>CHNa (III) to yield *Et β*-N-carbethoxyacetylmethyl-β-phenylcarbasinate (IV), C<sub>12</sub>H<sub>15</sub>N<sub>2</sub>O<sub>4</sub>, m. 103-4°, and the corresponding carbethoxycyanomethyl and diacetylmethyl compds., m. 69-70° and 130-1°, resp. The yields are generally very poor and the compds. are unstable in the presence of cold dil. alkali and hot acids. Hydrolysis of IV into PhNC confirms the direct attachment of the acetoacetic ester grouping to the β-N atom. PhN:NCO<sub>2</sub>Et reacts with NaHNCO<sub>2</sub>Et (V) to form an unstable intermediate which is readily hydrolyzed to H<sub>2</sub>NCO<sub>2</sub>Et and *Et β*-N-hydroxy-β-phenylcarbasinate (VI), m. 178-9°. Treatment of VI with aq.

KOH gives PhN:N:C(OK).O (VII), m. 135-6°, converted on acidification into PhN:N:C(OH).O (VIII), m. 214-6°.

Ring structures are ascribed to VII and VIII since VIII could not be esterified; treatment of VII with MeI or EtI gives C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>O<sub>3</sub>, m. 128 9°, or C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>O<sub>3</sub>, m. 130-1°; the corresponding tolyl-substituted compd. (IX) does not contain any H<sub>2</sub>O of crystn. and hence cannot possess an open-chain structure, and finally, though K salts and esters of carbazinic acids and substituted carbazinic acids are known to exist, no such free acid is known. Et *p*-tolylazocarboxylate reacted similarly with

V to yield MeC<sub>6</sub>H<sub>4</sub>N:N:C(OH).O (IX), m. 168-70°. The condensation of I with (:NCO<sub>2</sub>Et)<sub>2</sub> gave similarly di-*Et β*-N-carbethoxyacetylmethylhydrazocarboxylate, m. 74-5°. From the inactivity of azobenzene in such reactions the conclusion is drawn that for a Michael condensation with N:N systems there should be at least 1 strongly neg. group attached to one of the N atoms, (cf. C. A. 19, 1424). The compds. PhN:CHPh and PhN:CHCO<sub>2</sub>Et contg. the unsatd. grouping N:C do not lend themselves to Michael's condensation. PhNH:N:C(CO<sub>2</sub>Et)<sub>2</sub> reacts with I, II and NaCH(CO<sub>2</sub>Et)<sub>2</sub> (X) to yield addn. compds. easily hydrolyzed to PhNHNH:CH(CO<sub>2</sub>Et)CO<sub>2</sub>H, m. 110-1°, oxidized by FeCl<sub>3</sub> to PhN:NCH(CO<sub>2</sub>Et)CO<sub>2</sub>H, m. 174-8°, and hydrolyzed by alc. KOH to PhNHNHCH<sub>2</sub>CO<sub>2</sub>H, m. 152-3°. Attempts were made to utilize the condensation with mustard oils and isocyanates for the synthesis of pyridine derivs. Carbethoxythiocarbimide was condensed with I, III and X to form the monobasic acids EtO<sub>2</sub>CCHAcSCNHCOC<sub>2</sub>H<sub>5</sub> (XI), (EtO<sub>2</sub>C)<sub>2</sub>CHSCNHCOC<sub>2</sub>H<sub>5</sub> (XII), m. 70-2°, and Ac<sub>2</sub>CHSCNHCOC<sub>2</sub>H<sub>5</sub> (XIII), m. 121-2°. By analogy with the compd. XIII in which the CO<sub>2</sub>H group must have been derived from the CO<sub>2</sub>Et group attached to the N atom, the free CO<sub>2</sub>H groups in XI and XII are shown as attached to the end N atoms. After esterification XI was treated with a mol. proportion of EtONa but no pyridine compds. formed by cleavage of 1 mol. of EtOH were obtained. Treatment of carbethoxythiocarbimide with II gave *Et thiocarbethoxycyanoacetylcabamate*, m. 152-3°, hydrolyzed by cold 0.1 N KOH to the free acid (XIV), m. 158-60°. On heating, the compds. XI, XII, XIII and XIV were not converted into the corresponding thioamides by loss of CO<sub>2</sub> but were decomd. C. R. A

Diazoaminobenzene. W. W. Hartman and J. B. Dickey. *Org. Syntheses* 14, 24-6 (1934).—Detailed directions are given for the prepn., in 82-5% yield, of PhN<sub>2</sub>NHPh from PhNH<sub>2</sub>. C. J. West

The preparation of certain organomagnesium (compounds) by "entrainment" (cleansing action). Grignard. *Compt. rend.* 198, 625-8 (1934).—G. has found that difficultly sol. halides which reacted only slightly with Mg could be made to react if EtMgBr (I) was added to the reaction. G. believes that I acts as a cleansing agent for the Mg and the halides. C<sub>6</sub>Me<sub>2</sub>Br in the presence of equimol. amts. of I reacted with Mg to give C<sub>6</sub>(MgBr)Me<sub>2</sub> (II). II treated with CO<sub>2</sub> followed by hydrolysis gave C<sub>6</sub>Me<sub>2</sub>CO<sub>2</sub>H (85% yield). Similarly II treated with BzH gave C<sub>6</sub>Me<sub>2</sub>CH(OH)Ph, m. 107.5° (80% yield) 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>MgBr treated with CO<sub>2</sub> gave 3,4-(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H, m. 178.5° (25% yield). With 2 mols. of I, *p*-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub> gave *p*-(BrMg)<sub>2</sub>C<sub>6</sub>H<sub>3</sub> (40%) and *p*-BrC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>Br gave *p*-BrC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>MgBr (60%). The latter on further treatment with (2 mols.) gave (BrMgC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>. Julius White

The organomagnesium (compound) of pentamethylbenzene. Henri Clement. *Compt. rend.* 198, 665-7 (1934); cf. preceding abstr.—Equimol. amts. of C<sub>5</sub>Me<sub>5</sub>Br and EtBr were treated with 25% excess Mg in anhyd. Et<sub>2</sub>O. The addn. of CO<sub>2</sub> to this mixt. gave PrOII and C<sub>5</sub>Me<sub>5</sub>CO<sub>2</sub>H (82% yield). Likewise BzH gave C<sub>5</sub>Me<sub>5</sub>CH(OH)Ph, m. 107.5° (80% yield); EtOAc gave C<sub>5</sub>Me<sub>5</sub>COMe (I), m. 241.7° (42% yield); oxime of I, m. 190.6°; semicarbazone, m. 241.7°. Julius White

The action of hydrobromic acid on benzenearsonic and *p*-aminobenzenearsonic acids. J. Prat. *Compt. rend.* 198, 583-5 (1934); cf. C. A. 27, 495.—By the action of aq. HBr (d. 1.76) on PhAsO<sub>3</sub>H<sub>2</sub> (I) and *p*-NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>AsO<sub>3</sub>H<sub>2</sub> (II) the Br derivs. were obtained. These undergo 2 types of decompn. (cf. La Coste and Michaelis, *Ann.* 201, 198 (1880)). In the decompn. of I, PhBr, AsBr<sub>3</sub>, and PhAsBr<sub>2</sub> were isolated. II gave *p*-BrC<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, HBr, 2,4-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>NH<sub>2</sub>, HBr, AsBr<sub>3</sub> and a small amt. of HBr.H-N-C<sub>6</sub>H<sub>4</sub>AsBr<sub>2</sub>. W. A. Moore

Biaryls. VII. 4,4'-Dihydroxy- and 3,3',3''-tetrahydroxy-tetraphenylbiaryl. Reaction between 4-hydroxy- and 4-aminophenylarsine and tetraphenylarsyl oxide. F. F. Blicke and J. F. Oneto. *J. Am. Chem. Soc.*

56, 685-7(1934); cf. C. A. 28, 1674<sup>3</sup>.—4-Nitrodiphenylarsinic acid, m. 177-8°; the 4-NH<sub>2</sub> deriv., m. 215-6°, and the 4-HO deriv., m. 203-4°; the action of H<sub>3</sub>PO<sub>4</sub> gives 4,4'-dihydroxytetraphenylbiarsyl, m. 161-3°. 3,3'-Dihydroxydiphenylarsinic acid (I), darkens about 202°; di-MeO deriv., m. 151-3°. I and HBr in AcOH, satd. with SO<sub>2</sub>, give 3,3'-dihydroxydiphenylbromoarsine (II), m. 131-3°; I deriv. (III), orange, m. 130-1°. I and H<sub>3</sub>PO<sub>4</sub> give 3,3',3'',3'''-tetra(hydroxyphenyl)biarsyl (IV), m. 207-8°; it decolorizes I instantly, giving III. Heating II with 10% NaOH gives 3,3',3'',3'''-tetra(hydroxyphenyl)arsyl oxide, a gum, which yields IV with Ph<sub>3</sub>AsH. 4-IO(C<sub>6</sub>H<sub>4</sub>)AsH<sub>2</sub> and (Ph<sub>3</sub>As)<sub>2</sub>O yield 4,4'-dihydroxyarsenobenzene and Ph<sub>3</sub>As; 4-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>AsH<sub>2</sub> gives the 4,4'-di-NH<sub>2</sub> deriv. and Ph<sub>3</sub>As. C. J. West

Hydrolysis of substituted sulfonanilides. II. Margaret Pezold, R. S. Schreiber and R. L. Shriner. *J. Am. Chem. Soc.* 56, 996-7(1934); cf. C. A. 28, 1674<sup>4</sup>.—A study of the alk. cleavage of substituted benzenesulfonanilides indicates that NO<sub>2</sub> groups are more effective in promoting the cleavage than Br or Me groups. Wt., size or steric hindrance effects are not factors in this cleavage. The following new compds. are reported: 2,4-dibromobenzene-sulfonanilide, m. 145.4-6.5° (N-Me deriv., b. 210-4°); 2,4,6-tri-Br deriv., m. 118° (N-Me deriv., m. 148-8.5°); 2,4,6-tri-Me deriv., m. 108-9° (N-Me deriv., m. 95-6°). The following figures give the temp. and percentage of hydrolysis by means of 80% NaOH: PhSO<sub>2</sub>NHPh, 250°, 0; 2,4,6-Me<sub>3</sub>C<sub>6</sub>H<sub>2</sub>SO<sub>2</sub>NHPh, 170-225°, 0; N-Me deriv., 185-225°, 0; 2,4-Br<sub>2</sub>C<sub>6</sub>H<sub>3</sub>SO<sub>2</sub>NHPh, 210-5°, 0.8%; N-Me deriv., 210-5°, 0.56%; 2,4,6-Br<sub>3</sub>C<sub>6</sub>H<sub>2</sub>SO<sub>2</sub>NHPh, 210-5°, 5.3%; N-Me deriv., 210-5°, 3.4%; 2,4-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>SO<sub>2</sub>NHPh, 155°, 79%; N-Me deriv., 155°, 71%. *o*-m-C<sub>6</sub>H<sub>3</sub>(NO<sub>2</sub>)<sub>3</sub> could not be sulfonated and all attempts to obtain 2,4,6-(O<sub>2</sub>N)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>SO<sub>2</sub>Cl have failed. Picryl chloride and Na<sub>2</sub>S<sub>2</sub> give almost quant. 2,2',4,4',6,6'-hexanitrodiphenyl sulfide, decomp. 227-8°. C. J. W.

The hydrolytic decomposition of *o*-xylenesulfonic acid. N. Kirzhner. *J. Gen. Chem.* (U. S. S. R.) 3, 578-80(1933). When 20 cc. *o*-xylene (I) was shaken with 24 cc. concd. H<sub>2</sub>SO<sub>4</sub> (II) 68% of I dissolved in 0.5 hr. and 82% in 2 hrs. Earlier expts. (C. A. 20, 2316) showed that under the same conditions 64% of *p*-xylene (III) dissolves in 0.5 hr. and only 68% in 2 hrs. The sulfonic acid (IV) from I is more stable toward hydrolysis than that (V) from III. This greater stability is attributed to the fact that the SO<sub>3</sub>H group occupies a position para to one Me group. 2,3-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>SO<sub>3</sub>H in the presence of H<sub>2</sub>SO<sub>4</sub> isomerizes to the 3,4-acid at a temp. below that required for hydrolysis to I. When I (40 cc.), dissolved in 48 cc. II by heating on a water bath, was dild. with 40 cc. H<sub>2</sub>O and heated, regeneration of I began at 150° and continued to 210° when the I formation practically ceased because of concn. of the H<sub>2</sub>SO<sub>4</sub>; 23.2% of the IV was decompd. in this 1st distn. After repeating the process 6 times, adding 40 cc. H<sub>2</sub>O and recovering I from 160-210° each time, 73.6% of the IV had been hydrolyzed. Under similar conditions V is 67% hydrolyzed after 1 distn. and 96% after 2 distns. If III is dissolved in 1.8 vols. of II instead of 1.2 vols. and the soln. is dild. with 0.5 vol. of H<sub>2</sub>O and distd., 93% of III is regenerated by 1 distn. With I no increase in yield of the hydrocarbon was observed following an increase in the proportion of II taken. Lewis W. Butz

Hydrogenation of oxygen-containing compounds. I. The catalytic reduction of phenol and *o*-cresol. B. L. Moldavskii and S. E. Livshitz. *J. Gen. Chem.* (U. S. S. R.) 3, 603-14(1933).—Phenol (I) and *o*-cresol (II) were hydrogenated at various pressures at 330-70° in the presence of MoS<sub>3</sub>. The app. consisted of a Bergius autoclave rotating 50 times per min. and furnished with a thermocouple. The catalyst was prepd. by reducing MoS<sub>3</sub> in the autoclave with H<sub>2</sub> at 60 atm. and 350-80° for 6 hrs., the MoS<sub>3</sub> being poured from the autoclave into a vessel filled with CO<sub>2</sub> (freshly prepd. MoS<sub>3</sub> is pyrophoric) and then sieved and kept in CO<sub>2</sub>. The MoS<sub>3</sub> was prepd. by satg. an NH<sub>4</sub>OH soln. of NH<sub>4</sub> molybdate with H<sub>2</sub>S and decomp. the resulting soln.

with dil. H<sub>2</sub>SO<sub>4</sub>. Natural MoS<sub>3</sub> (molybdenite) was an inferior catalyst. I gave 90% PhH at 25 atm. As the pressure increased more C<sub>6</sub>H<sub>12</sub> + C<sub>6</sub>H<sub>10</sub> was formed (25 atm. 10%, 50 atm. 17%, 100 atm. 30%), although the ratio C<sub>6</sub>H<sub>10</sub>:C<sub>6</sub>H<sub>12</sub> decreased. C<sub>6</sub>H<sub>11</sub>Ph (III) and *p*-C<sub>6</sub>H<sub>4</sub>(C<sub>6</sub>H<sub>5</sub>)OH (IV) were by-products. II gave similar yields of PhMe, C<sub>6</sub>H<sub>11</sub>Me, C<sub>6</sub>H<sub>5</sub>Me and a substance which is probably MeC<sub>6</sub>H<sub>4</sub>C<sub>6</sub>H<sub>4</sub>Me (V). No MeC<sub>6</sub>H<sub>4</sub>H<sub>2</sub>C<sub>6</sub>H<sub>4</sub>(OH)Me was found. The yields of C<sub>6</sub>H<sub>10</sub> under given conditions were greater than those of C<sub>6</sub>H<sub>5</sub>Me. Satd. alcs. were not found. Hydrogenation of PhH and PhMe at 350° and 125 atm. with 5% MoS<sub>3</sub> gave only 4% conversion. It is therefore concluded that the hydroaromatic substances are formed directly from I and

II, e. g., I  $\xrightarrow{3H_2}$  C<sub>6</sub>H<sub>11</sub>OH  $\xrightarrow{-H_2O}$  C<sub>6</sub>H<sub>10</sub>  $\xrightarrow{H_2}$  C<sub>6</sub>H<sub>12</sub>. IV may arise from condensation of C<sub>6</sub>H<sub>11</sub>OH and PhOH, and C<sub>6</sub>H<sub>11</sub>Ph by hydrogenation of IV. This mechanism is supported by the observation that V is oxidized to *m*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub>, since direct condensation of MeC<sub>6</sub>H<sub>4</sub>OH and PhMe would give hydrocarbons oxidizing to *o*- and *p*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub>. There were calcd. the energy of activation and the temp. coeff. of av. velocity of reduction and hydrogenation of I and II for the temp. interval 330-70°. Lewis W. Butz

Rearrangement of phenyl ethers. Course of the reaction in the presence of foreign aromatic bodies. Richard A. Smith. *J. Am. Chem. Soc.* 56, 717-18(1934); cf. C. A. 27, 5067. —PhOCHMe<sub>2</sub> and AlCl<sub>3</sub> gave 65% of phenolic products, of which 10% was diisopropylphenol, 5% high-boiling material and the remainder *o*- and *p*-Me<sub>2</sub>CHC<sub>6</sub>H<sub>4</sub>OH, the *p*-isomer predominating; in the presence of 1/2 mol. quantity of Ph<sub>2</sub>O the yield of the same products was 30%; the other products were *o*- and *p*-isopropylphenyl Ph ether, the *p*-isomer b. 288.9°, d<sub>4</sub> 1.041, n<sub>D</sub><sup>20</sup> 1.5609; the *o*-isomer b. 263.4°, d<sub>4</sub> 1.053, n<sub>D</sub><sup>20</sup> 1.5688; free PhOH in 33% yield was obtained. *p*-MeC<sub>6</sub>H<sub>4</sub>OCMe<sub>2</sub> with AlCl<sub>3</sub> alone gives 70% of 4,2-Me(C<sub>6</sub>H<sub>4</sub>)C<sub>6</sub>H<sub>4</sub>OH; in the presence of 3 vols. of C<sub>6</sub>H<sub>6</sub>, *p*-MeC<sub>6</sub>H<sub>4</sub>OH is the predominant alkali-sol. product; the alkali-insol. material consisted of C<sub>6</sub>H<sub>6</sub>, cumene (60%) and higher-boiling materials; in the presence of excess Ph<sub>2</sub>O there was 8 10% isomerization product, about 5% *p*-MeC<sub>6</sub>H<sub>4</sub>OH and about 40% isopropyl-substituted Ph<sub>2</sub>O. PhOCH<sub>2</sub>CHMe<sub>2</sub> in the presence of excess C<sub>6</sub>H<sub>6</sub> yields 5-6% *p*-Me<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>OH, 70% of the ether being converted into PhCMe<sub>2</sub> and some di- and tri-*tert*-butylbenzene. In the cases of Ph ether isomerizations reported the primary course of the reaction is intermol. in character and the reaction therefore involves scission. C. J. West

*p*-Nitrodiphenyl ether. Ray Q. Brewster and Theodore Groening. *Org. Syntheses* 14, 66-7(1934). —PhOK and *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>Cl with Cu catalyst give 80-2% of *p*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OPh; the *o*-NO<sub>2</sub> deriv. results in 84% yield. Details are given of the prepn. of Cu powder. C. J. West

*o*-Bromophenol. Ralph C. Huston and Murel M. Ballard. *Org. Syntheses* 14, 14 16(1934). —PhOH is sulfonated, the Na salt brominated and the SO<sub>3</sub>H groups are removed by hydrolysis, giving 40-4% *o*-BrC<sub>6</sub>H<sub>4</sub>OH. C. J. West

Diphenyl sulfide. W. W. Hartman, L. A. Smith and J. B. Dickey. *Org. Syntheses* 14, 36-7(1934). —See C. A. 27, 71. C. J. West

Some derivatives of 3,5-dibromo-1-ethoxy-2-aminobenzene and 4,6-dibromo-1-ethoxy-2-aminobenzene. E. Bureš and B. Tusarová. *Časopis Českoslov. Lékárnictva* 14, 1-14(1934). —3,5-Dibromo-1-ethoxy-2-aminobenzene (I), m. 57°, was prepd. by bromination of *o*-phenetidine in glacial AcOH. Derivs. of I prepd. were: HCl salt; sulfate, m. 145°; di-Ac deriv., m. 108°; Bz deriv., m. 151°; *N*-Et deriv., b. 152°. 3,5-Dibromo-1-ethoxybenzene (II), b. 268°. Derivs. of II: 4-nitro, m. 128°; 2-HO; 2-Cl; 2-Br, m. 72°; 2-I, m. 82°. The bromination of *o*-acetophenetidine, in glacial AcOH, leads to 4,6-dibromo-1-ethoxy-2-acetamidobenzene, m. 141°, which on sapon. gave 4,6-dibromo-1-ethoxy-2-aminobenzene (III), m. 60°. Derivs. of III prepd. were: HCl salt; di-Ac deriv., m. 151°; Bz deriv. m. 159°;

di-Me deriv. Derivs. of 4,6-dibromo-1-ethoxybenzene: 2-HO; 2-Cl, m. 61°; 2-Br, m. 73°; 2-I, m. 69°.

William J. Husa

Action of nascent thiocyanogen on bi- and trivalent phenols. Guido Machek. *Monatsh.* 63, 216-19 (1933).—Nascent SCN does not react with hydroquinone, resorcinol, pyrogallol and phloroglucinol. With pyrocatechol it gives the compd.  $C_6H_3(OH)_2SCN$ , m. 142° (48% yield); the di-Ar deriv. m. 58° (both m. ps. corr.). C. J. W.

Tautomerism of quinone oxime-*p*-nitrosophenol systems. Leigh C. Anderson and R. L. Yanke. *J. Am. Chem. Soc.* 56, 732-5 (1934).—Absorption spectra data indicate that the equil. mixt. of quinone monoxime and *p*-ONC<sub>6</sub>H<sub>4</sub>OH exists largely in the quinonoid modification in dioxane, CHCl<sub>3</sub>, abs. EtOH and aq. acid solns. The absorption spectrum of 3-chloroquinone 4-oxime is very similar to that of its Me ether, while that of 3,4-Cl-(ON)C<sub>6</sub>H<sub>3</sub>OH is unlike that of its ether or isomeric quinonoid modification. This difference is due neither to ionization nor to assocn. of the ONC<sub>6</sub>H<sub>4</sub>OH form. The absorption spectra of alk. solns. of the quinone oximes are due to a highly ionized form, and it appears probable that they are also due mostly to the ion from the quinonoid modification. Various curves are given. C. J. West

Optical method for the study of reversible organic oxidation-reduction systems. II. Halogenated benzoquinones. D. E. Kvalnes. *J. Am. Chem. Soc.* 56, 667-70 (1934); cf. *C. A.* 26, 4314. —The detn. of the oxidation-reduction potentials of the known haloquinones has been completed. The relative potentials in C<sub>6</sub>H<sub>6</sub> of benzoquinone, its Cl, 2,6-, 2,5- and 2,3-di-Cl, tri-Cl and tetra-Cl, Br, 2,6- and 2,5-di-Br, tri-Br and tetra-Br, I and 2,6-di-I derivs. have been calcd. by arbitrarily assigning the value of 0.711 v. to the benzoquinone hydroquinone system in C<sub>6</sub>H<sub>6</sub>; these values have been compared with the electrochemically detd. potentials in EtOH and H<sub>2</sub>O. The introduction of any 1 of the 3 halogens results, in aq. soln., in only a slight increase in the potential (13, 16 and 7 mv. for Cl, Br and I), but in EtOH the increase amts. to 25 and 26 mv. for Cl and Br, and in C<sub>6</sub>H<sub>6</sub> it is practically the same (23, 26 and 26 mv. for Cl, Br and I). The relationship approaches more nearly that for the gaseous state in C<sub>6</sub>H<sub>6</sub> than in either of the other solvents. Any conclusions regarding the influence of the positions of the substituents seem hardly justified. 3-Iodo-4-amino-phenol, m. 140° with charring; oxidation gives iodoquinone, reddish orange, m. 62°; iodoquinone, m. 115-16°; diacetate, m. 86-7°. III. Preparation and use of a new optically active standard. *Ibid.* 670-2.—*d*-Camphor-10-sulfonyl- $\alpha$ -naphthohydroquinone, m. 159-60°,  $[\alpha]_{D}^{25}$  44.7° (C<sub>6</sub>H<sub>6</sub>, c 0.3916); the quinone, bright yellow, m. 131°,  $[\alpha]_{D}^{25}$  355° (C<sub>6</sub>H<sub>6</sub>, c 0.2524). The *p*-tolylsulfonyl derivs. m. 181° and 172-3°; the *p*-bromophenylsulfonyl derivs. m. 221-2° (decompn.) and 175°. The introduction of a Me group into benzoquinone results in a marked decrease (59 mv.) in the relative potential of the quinone; the effect of the 2nd Me group is not quite as great as the 1st and its position is of no importance. The decrease in the potential due to the 1st MeO group is more than twice that due to the 2nd MeO group (69 and 30 mv., resp.). A PhO group is less efficient than a Me or MeO group in decreasing the potential of the quinone structure. With an increase in the size of the substituted alkyl group little change in potential results. A HO group causes a lowering of 111 mv. The introduction of 2 Br atoms in 2,6-dimethoxyquinone and *p*-xyloquinones causes a rise in the potential of about 40 mv. The *d*-camphor-10-sulfonyl group raises the relative potential of *p*-xyloquinone by 135 mv. In general the relative potentials in C<sub>6</sub>H<sub>6</sub> are higher than the potentiometrically detd. potentials in EtOH. C. J. West

Action of alkali on dianilindibromobenzoquinone. Murray M. Sprung. *J. Am. Chem. Soc.* 56, 691-3 (1934). —2,5-Dianilino-3,6-dibromo-*p*-benzoquinone (I), KMnO<sub>4</sub>-brown, m. 261° (decompn.), was prepd. from PhNH<sub>2</sub> and bromoanil in EtOH or from 2,5-diphenoxy-3,6-dibromoquinone and PhNH<sub>2</sub> in EtOH. I (10 g.) in 40 cc. 95% EtOH and 250 cc. 12.5% NaOH, heated 5 min.

and treated with about 450 cc. 2 N HCl, give about 3.1 g. of the 3,6-di-HO deriv. (II), lemon-yellow, m. 206° (decompn.), and about 3.2 g. of the monoanil of II, chocolate-brown, m. 139-41°; the structure of the anil was established by its hydrolysis to II and its synthesis from II and PhNH<sub>2</sub>. Both II and its anil are acidic but the former is a considerably stronger acid than the latter. Bromoanilic acid is unaffected when heated with PhNH<sub>2</sub> or when boiled with excess alkali. HO groups markedly decrease the ease of replacement of other substituent in such symmetrically substituted quinones; the ease of replacement under comparable conditions is roughly in the order PhO > Br > PhNH > OH. C. J. West

The stycerols. Ch. Prevost and Losson. *Compt. rend.* 198, 659-61 (1934).—The two *dl*-mixts. of PhCH(OH)CH<sub>2</sub>OH can be sepd. by their different solubilities as tribenzoates. The  $\beta$ -form (85% of the total of the 2 *dl*-mixts.), m. 116.5°, crystallizes from ligroin. A study of a mixt. of the  $\alpha$ - and  $\beta$ -forms gave a eutectic m. 109.5° which contained 78% of the  $\beta$ -racemic form. Benzoylation of PhCH(OBz)CH<sub>2</sub>CH<sub>2</sub> gave 10% of the  $\beta$ -form. Julius White

Constitution of tannins. I. Reduction products of chalcones and the synthesis of a typical phlobatannin. Alfred Russell. *J. Chem. Soc.* 1934, 218-21. —Since catechol is the only member of its class known to occur naturally, it is likely that phlobatannins are related, not to 3-hydroxy- but to 4-hydroxyflavans. Substances hydroxylated in position 4 have been prepd. and compared with typical natural phlobatannins. Gallacetophenone 3,4-di-Me ether and piperonal give 60% of 2-hydroxy-3,4-dimethoxy-3',4'-methyleneoxyflavone (I), orange, m. 175°; *p*-HOC<sub>6</sub>H<sub>4</sub>CHO gives 45% of 2,4'-dihydroxy-3,4-dimethoxychalcone, bright yellow, m. 106°; gallacetophenone tri-Me ether and *p*-MeOC<sub>6</sub>H<sub>4</sub>CHO give 2,3,4,4'-tetramethoxychalcone, light yellow, m. 94°. Reduction of I with Zn in EtOH-AcOH gives amorphous 4-hydroxy-7,8,4'-trimethoxyflavan, cream, m. 85-95°; 4-hydroxy-7,8,3',4'-tetramethoxyflavan, m. 90-110° (80% yield); 4-hydroxy-7,8-dimethoxy-3',4'-methyleneoxyflavan, m. 110-25° (90% yield); 4,4'-dihydroxy-7,8-dimethoxyflavan, light cream, amorphous, m. 120-5°; it turns dark red in daylight. Reduction of chalcone gives an unsatd. compd., C<sub>20</sub>H<sub>18</sub>O<sub>6</sub>, m. 192°, the 4'-HO deriv. and the 2,3,4,4'-tetra-MeO deriv. gave products m. 204-5° and 168°, resp. Resacetophenone dibenzoate and protocatechuic aldehyde dibenzoate with HCl in AcOEt give after hydrolysis 2,1,4,1'-tetrahydroxychalcone (butein), reduced by Zn in EtOH-AcOH to 4,7,3',4'-tetrahydroxyflavan, golden red vitreous mass, changing to a light red, amorphous product on grinding; a comparison with hemlock and mimosa tannins showed the same behavior in all 3 cases toward various reagents. C. J. West

Color and structure of aromatic oximes. Mine. Ramat Lucas. *Compt. rend.* 198, 97-9 (1934).—Of the 3 possible structures :C.NH.O (I), :C:NOH (II), and :C:CNH.OH

(III), I is the "transparent" and II is the "absorbent" form. Absorption spectra of compds. which must have the structure II, where type III is definitely excluded, are very similar in the form of the curve and the position of the absorption max. to those of compds. in which :NOH is replaced by either :CH<sub>2</sub> or :CHMe groups. The main differences are the lowered absorption coeffs. in the ethylenic analogs. Absorption spectrographs of the following compds. are given: PhCH:NOH, PhCH:C(H)Me, PhCMe:NOH, PhCMe:CH<sub>2</sub>, 4-MeOC<sub>6</sub>H<sub>4</sub>CH:NOH, 4-MeOC<sub>6</sub>H<sub>4</sub>CMe:CH<sub>2</sub>, 3,4-CH<sub>2</sub>O<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH:NOH, 3,4-CH<sub>2</sub>O<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CH:C(H)Me, 3,4-CH<sub>2</sub>O<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CMe:NOH and 3,4-CH<sub>2</sub>O<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CMe:CH<sub>2</sub>. *Ibid.* 267-9. —When the :NOH group in "absorbent" oximes is replaced by :CH or :CHMe, the absorption spectra are scarcely altered. However, :CHPh has the effect of changing the form of the absorption curve and shifting it nearer the visible spectrum. Oximes of all ketones examd. have the CHCR:NOH (I) form. The tautomeric C:CR(NH)OH form can only be present in traces, as evidenced by the

similarity in the shape and position of the absorption curves of  $\text{PhCH}_2\text{Bz}$  and  $\text{BzMe}$  oximes with that of  $\text{PhCMe:CH}_2$  and their dissimilarity from that of  $\text{PhCMe:C(H)Ph}$ . Spectrographs of 4-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>Bz and 4-MeOC<sub>6</sub>H<sub>4</sub>Ac oximes resemble closely that of 4-MeOC<sub>6</sub>H<sub>4</sub>CMe:CH<sub>2</sub> but not that of 4-MeOC<sub>6</sub>H<sub>4</sub>CMe:CHPh. The curve of  $\text{AcCO}_2\text{Et}$  is much like that of  $\text{PhCH}_2\text{CO}_2\text{Et}$  but both differ from that of  $\text{PhCH:CMeCO}_2\text{H}$ . Oximes of the following ketones evidently have form I:  $\text{ArCOCH}_2\text{Ph}$  (where  $\text{Ar} = \text{Ph}$  and 4-MeC<sub>6</sub>H<sub>4</sub>-),  $\text{Ph}_2\text{CHBz}$ ,  $\text{PhCH}_2\text{COCO}_2\text{Et}$ ,  $\text{ArCOCH}_2\text{R}'$  and  $\text{CH}_2\text{O}_2\text{C}_6\text{H}_4\text{COCH}_2\text{R}'$  (where  $\text{R}' = \text{H}$ , Me or Et). Eleven absorption curves are given. Louis E. Wise

**Anil of 2-hydroxy-6-methylbenzaldehyde.** Thomas Love. *J. Chem. Soc.* 1934, 244.—Tl<sub>2</sub> anil of 6,2-Mc-(HO)C<sub>6</sub>H<sub>3</sub>CHO, yellow, m. 51.5°; the 4-Me deriv. m. 93°. C. J. West

**Aceto-*p*-cymene.** Charles F. H. Allen. *Org. Syntheses* XIV, 1-3 (1934).—*p*-MeC<sub>6</sub>H<sub>4</sub>CHMe<sub>2</sub> and  $\text{AcCl}$  with  $\text{AlCl}_3$  give 50-55% of 2,5-Me(Me<sub>2</sub>CH)C<sub>6</sub>H<sub>3</sub>Ac; the method may be used with cumene and *tert*-butylbenzene. C. J. W.

**Gallacetophenone (2,3,4-trihydroxyacetophenone).** 1. C. Badhwar and K. Venkataraman. *Org. Syntheses* XIV, 40-1 (1934).—Pyrogallol and  $\text{Ac}_2\text{O}$  with  $\text{ZnCl}_2$  give 54-77% of 2,3,4-(HO)<sub>3</sub>C<sub>6</sub>H<sub>2</sub>Ac. Other phenolic ketones may be prep'd. in the same way. C. J. West

**Reversible addition of aromatic compounds to benzalacetophenone.** J. T. Eaton, D. B. Black and Reynold C. Fuson. *J. Am. Chem. Soc.* 56, 687-8 (1934).—*m*-Chlorobenzalacetophenone (I) m. 75-6°. I, the *o*- and *p*-isomers, the *m*- and *p*-Br and the *p*-Me deriv., in C<sub>6</sub>H<sub>6</sub>, sat'd. with  $\text{HCl}$  and treated with  $\text{AlCl}_3$ , give  $\text{Ph}_2\text{CHCH}_2\text{Bz}$ . With  $\text{PhCl}$  under similar conditions these compts. give  $\beta,\beta$ -bis-(*p*-chlorophenyl)propiofenone, m. 120-1°; this reacts with C<sub>6</sub>H<sub>6</sub> to form  $\text{Ph}_2\text{CHCH}_2\text{Bz}$ . These results are in accord with the theory that the addn. of aromatic compts. to  $\alpha,\beta$ -unsat'd. CO compts. (and similarly constituted compts.) is reversible. C. J. West

**Perkin's reaction. I. First phase of the Perkin's reaction.** Seiichi Ishikawa and Ryoji Kojima. *Science Repts. Tokyo Bunrika Daigaku* 1, 289-96 (1934); cf. C. A. 26, 115.—The hypothesis of Kalnin (C. A. 23, 823) as to the enolization of  $\text{Ac}_2\text{O}$  in the 1st phase of the Perkin's reaction is supported by findings on the enolization of  $\text{Ac}_2\text{O}$  in the presence of org. bases or salts of carboxylic acids (C. A. 22, 384) and by the isolation of an enolate of homophthalic anhydride and its condensation with  $\text{BzH}$  to form a lactone of the corresponding HIO acid (C. A. 26, 1269). Detn. of the active H content of various acid anhydrides by the method of Zerevitinov has shown that, in pyridine, any anhydride such as  $\text{Ac}_2\text{O}$ , butyric, isovaleric, succinic or phenylacetic, which contains neighboring CO<sub>2</sub>H and Me or :CH<sub>2</sub> groups, invariably has an active H content varying from 1.21 for phenylacetic to 0.14 for isovaleric. Anhydrides such as maleic and  $\beta$ -methylcrotonic, which do not possess vicinal CO<sub>2</sub>H and Me or :CH<sub>2</sub> groups show no active H under these conditions. Thus pyridine acts as an enolizing agent for acid anhydrides and the 1st phase of the Perkin's reaction may take place through such an enolization. Measurements of the active H content of  $\text{PhCH}_2\text{CN}$ , fluorene and  $\text{Ph}_2\text{CH}_2$  show that the 1st is highly enolized, fluorene is only slightly so and the latter not at all. The tautomerization of fluorene may be due to the influence of the base on the :CH<sub>2</sub> group and it is surmised that the 1st phase of the Perkin's reaction is a loosening of the H atom of the Me or :CH<sub>2</sub> group adjacent to the CO<sub>2</sub>H group of the acid anhydride by the basic substance. Since it was found that enolization phenomena take place also in anisole and xylene (C. A. 26, 4009; 27, 1620) the degree of enolization of the anhydride may depend not only on the basicity but on some other property of the solvent used in the reaction. A modified Zerevitinov reaction flask permitting the use of an inert gas in the detn. and the methods of purification of the materials are described. A tabulation of the exptl. results is recorded. II. Condensation of  $\beta$ -methyl crotonic anhydride with aldehydes. Seiichi Ishikawa and Hatusaka Katoh. *Ibid.* 297-305.—

In the presence of  $\text{NEt}_3$  condensation of  $\beta$ -methylcrotonic anhydride (I) with  $\text{BzH}$  gave 38% of  $\alpha$ -isopropenylcinnamic acid (II), C<sub>11</sub>H<sub>10</sub>O<sub>2</sub>, m. 133° (cor.). II formed  $\text{HCHO}$  on ozonization and by catalytic hydrogenation in the presence of  $\text{Pd-BaSO}_4$  was reduced to a tetrahydro acid which, on warming with  $\text{SOCl}_2$  and  $\text{PhNH}_2$  in pyridine, was converted into the anilide, C<sub>11</sub>H<sub>11</sub>NO, m. 126.1° (all m. ps. cor.), identical with the comp'd. prep'd. synthetically from  $\beta$ -benzylacetoacetic ester, b<sub>3</sub> 149-154°, by conversion through  $\alpha$ -benzyl- $\alpha$ -isopropylacetoacetic ester, b<sub>3</sub> 143-54°, into  $\alpha$ -isopropylhydrocinnamic acid, b<sub>3</sub> 155-60°. Substitution of  $\text{AcOK}$ , pyridine and quinoline for  $\text{NEt}_3$  gave decreasing amts. of II, suggesting that the yields are directly proportional to the strength of the base employed. Chem. structure and other factors than the basic strength must be considered since the secondary amines piperidine and  $\text{HNEt}_2$  are ineffectual in promoting the reaction. I was also condensed, in the presence of  $\text{NEt}_3$ , with  $\text{PhCH:CHCHO}$ , *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO, MeO-C<sub>6</sub>H<sub>4</sub>CHO, piperonal and furfural to give  $\alpha$ -isopropenylcinnamylacrylic acid, m. 167°;  $\alpha$ -isopropenyl-*o*-nitrocinnamic acid, C<sub>12</sub>H<sub>11</sub>NO<sub>3</sub>, m. 192°;  $\alpha$ -isopropenyl-*p*-methoxycinnamic acid, C<sub>12</sub>H<sub>11</sub>O<sub>3</sub>, m. 175.6°;  $\alpha$ -isopropenyl-3,4-methylenedioxycinnamic acid, C<sub>13</sub>H<sub>12</sub>O<sub>4</sub>, m. 154-8°;  $\alpha$ -isopropenylfurfuralacetic acid, C<sub>10</sub>H<sub>10</sub>O<sub>4</sub>, m. 127°. Condensation of vanillin under these conditions was not possible. In the presence of  $\text{Ac}_2\text{O}$  and  $\text{NEt}_3$  the condensation of  $\beta$ -methylcrotonic acid instead of the anhydride was successfully effected. C. R. Aldinal

**Alkaline halogenation. I. The chlorination of sodium benzoate.** J. C. Smith. *J. Chem. Soc.* 1934, 213-18; cf. C. A. 27, 3023. Analysis of the products of the chlorination of  $\text{BzONa}$  gives *o*-substitution 47, *m*- 33 and *p*- 20%. Details of the method of analysis of the chlorination products are given. The f. p.-solv. curves are given for the systems *o*- and *m*-ClC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H,  $\text{BzOH}$  *m*-ClC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, ternary mixts. of  $\text{BzOH}$  with *o*- and *m*-ClC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and quaternary mixts. of the 4 acids. C. J. West

**Orienting influences in the benzene ring. A review of experimental evidence.** John Smith Reese, IV. *Chem. Rev.* 14, 55 102 (1934). A review of exptl. evidence regarding the orienting influences of 9 substituent groups—CO<sub>2</sub>H, NO<sub>2</sub>, SO<sub>3</sub>H, CCl<sub>3</sub>, OH, NH<sub>2</sub>, Cl, Br and I—upon 3 types of secondary substitution—halogenation, nitration and sulfonation in the benzene ring. Some attention is given to derived substituents and to the role of mol. rearrangements. Many references are given. L. K.

**Benzonitrile.** M. S. Rozhdestvenskii and L. A. Zepalova-Mikhailova. *J. Applied Chem.* (U. S. S. R.) 6, 274-7 (1933).— $\text{PhCN}$  was prep'd. as follows: (I) Prepn. of the complex salt To 275 g. of com.  $\text{CuSO}_4$  (98.5-98%) in 500 cc.  $\text{H}_2\text{O}$  (70-80°) is added in a no. of batches 286 g. of KCN (100% prep'n.) in 400 cc.  $\text{H}_2\text{O}$ , 186 g. of 24%  $\text{NH}_3$  having been previously added to the KCN soln. The ppt., which is formed in the course of the reaction finally redissolves. (II) Diazotization. Aniline (186 g.) is gradually added under const. agitation to 530 g. (461 cc.) of  $\text{HCl}$  (d. 1.146) with cooling, the aniline gradually dissolving. The agitation is continued until a temp. of 20-5° is reached, when a ppt. of aniline-HCl appears. The agitation is still continued and ice is added to the substance and the temp. brought down to 2° to 0°, and finally to -15° to -20°. One hundred and thirty-eight g. of  $\text{NaNO}_2$  in 50 g.  $\text{H}_2\text{O}$  and 140 g. ice are added and the temp. is raised to 2°; this is followed by the addn. of 115 g. of  $\text{HCl}$ . (III) Steam distn. of the  $\text{PhCN}$  formed. (IV) Purifying. Washing with a  $\text{HCl}$  soln. of  $\text{SnCl}_4$  with a preliminary addn. of ether to the  $\text{PhCN}$  to facilitate the sepn. of the latter from the wash water. The ether soln. is washed a few times with 2 *N*  $\text{NaOH}$  and with water till neutral, dried with  $\text{CaCl}_2$  and distd. *in vacuo* after distg. off the ether. The air passed through the substance is dried with  $\text{CaCl}_2$  and  $\text{P}_2\text{O}_5$ . The yield is 71% of a product of which 81% b. 190°, d<sub>4</sub><sup>20</sup> 1.00664, d<sub>4</sub><sup>20</sup> 1.00485. These consts. are in agreement with those of Perquin. The appended literature index contains 32 references. A. A. Boechtingk

**Phenylmalonic and nitrophenylmalonic acids and esters.** S. Basterfield and L. A. Hamilton. *Trans. Roy. Soc. Can.* III, 27, 125-31 (1933).—Shaking  $\text{PhCH}(\text{CO}_2\text{Me})_2$  (I) in  $\text{Et}_2\text{O}$  with dil. aq.  $\text{NaOH}$  for 1 hr. at room temp. gives an aq. alk. soln. which with acid gives 80-90% of  $\text{PhCH}(\text{CO}_2\text{H})_2$  (II). The method of Wialicemus (*Ber.* 27, 1091 (1894)) gives only a 25% yield. I with concd.  $\text{HNO}_3$  and concd.  $\text{H}_2\text{SO}_4$  gives *Me p-nitrophenylmalonate* (III), m. 95°. III on hydrolysis by the above method gives only  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CO}_2\text{H}$ . II with concd.  $\text{HNO}_3$  and concd.  $\text{H}_2\text{SO}_4$  gives *o-nitrophenylmalonic acid*, m. 133° (decompn.). Contrary to expectations  $p\text{-O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{CO}_2\text{Me}$  does not condense with  $(\text{OC}_2\text{Me})_2$  (cf. Rising and Stieglitz, *C. A.* 12, 908).  $p\text{-EtOOCNHC}_6\text{H}_4\text{CH}_2\text{CO}_2\text{Me}$  condenses with  $(\text{CO}_2\text{Me})_2$  to give *Me p-carboethoxyaminophenylmalonate*, viscous oil, b<sub>p</sub> 110°. Reduction of  $2,4(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{CH}(\text{CO}_2\text{Me})_2$  (IV) with  $(\text{NH}_4)_2\text{S}$  gives 2 isomeric *Me nitroaminophenylmalonates*, m. 131° and 190°. IV on hydrolysis does not give the expected acid.

R. B. Sandin  
**Preparation of  $\gamma$ -(*p*-aminophenyl)butyric acid and  $\epsilon$ -(*p*-aminophenyl)caproic acids.** J. van der Scheer. *J. Am. Chem. Soc.* 56, 744-5 (1934).— $\text{Ph}(\text{CH}_2)_3\text{CO}_2\text{H}$  (30 g.), slowly added to 140 cc. concd.  $\text{HNO}_3$  at 20-5° and allowed to stand 6 hrs., gives 5 g. of the *p-NO* deriv., m. 92-3°; reduction of 10 g. with Zn and HCl gives 6.8 g. of the *p-NH* deriv., m. 130-1°.  $\text{Ph}(\text{CH}_2)_5\text{CO}_2\text{H}$  (30 g.) gives 11 g. of the *p-NO* deriv., m. 64-5°; 10 g. give 7.5 g. of the *p-NH* deriv., m. 108-9°.

C. J. West  
**Hydrogenation of optically active compounds over nickel and copper-chromium oxide.** Everett Bowden and Homer Adkins. *J. Am. Chem. Soc.* 56, 689-91 (1934).—In these expts. the temp., rate and extent of hydrogenation and probably other variables det. the extent to which racemization occurs during the reduction of optically active esters, but no definite conclusions can be drawn with regard to these factors. In general the expts. were carried out at 250° and 150-200 atm. over various samples of Cu-Cr oxide in a Cu liner. Et  $\alpha$ -phenylpropionate,  $[\alpha]_D -22.9^\circ$ , gives 17% ester,  $[\alpha]_D -2.4^\circ$ , 33% iso-PrPh and 16% 2-phenylpropan-1-ol,  $[\alpha]_D 2.5^\circ$  (2 g. catalyst and 16 g. ester); with 6 g. catalyst to 12 g. ester there results 80% iso-PrPh and 4 g. ester,  $[\alpha]_D 1.8^\circ$ . Bu lactate,  $[\alpha]_D 4.9^\circ$ , gives 9 g. ester,  $[\alpha]_D 3^\circ$ , and 81 g. propane-1,2-diol. Menthyl  $\alpha$ -phenylbutyrate, m. 58°,  $[\alpha]_D -82^\circ$ , gives 23 g. ester with  $[\alpha]_D -66.1^\circ$ , 17 g. 2-phenylbutan-1-ol,  $[\alpha]_D -3.7^\circ$ , and 26 g. sec-BuPh,  $[\alpha]_D 0.4^\circ$ . Menthyl  $\beta$ -phenylbutyrate,  $[\alpha]_D -90.3^\circ$ , forms 9-20 g. ester and 73-61% 3-phenylbutan-1-ol,  $[\alpha]_D -26^\circ$  or  $-31.4^\circ$ , depending upon the amt. of catalyst used; a sample with  $[\alpha]_D -40.9^\circ$  gives 33-61% alc. with  $[\alpha]_D 12.2^\circ$  to  $15.7^\circ$ , depending upon the time of reduction. The recovered "menthol" has  $[\alpha]_D -17^\circ$ , d<sub>4</sub><sup>20</sup> 0.927, n<sub>D</sub><sup>20</sup> 1.4610, and is apparently an isomeric compd. or a mixt. of isomers. Et  $\alpha$ -phenylbutyrate with  $[\alpha]_D -6^\circ$  gives 3.5% ester, 50% 2-phenylbutan-1-ol,  $[\alpha]_D -0.50^\circ$ , and 24% sec-BuPh; a sample with  $[\alpha]_D -2.3^\circ$  gives 5% ester and 61% alc. with  $[\alpha]_D -0.10^\circ$ . Et  $\alpha$ -methylbutyrate,  $[\alpha]_D 3.04^\circ$ , gives 80% of 2-methylbutan-1-ol, inactive; an ester with  $[\alpha]_D -8.3^\circ$  gives 97% of alc. with  $[\alpha]_D 1.2^\circ$ ; Et  $\beta$ -methylvalerate, with  $[\alpha]_D 1.79^\circ$ , gives 90% of 3-methylpentan-1-ol,  $[\alpha]_D 1.8^\circ$ .  $\alpha$ -Ethylpelargonic acid b<sub>p</sub> 117-18°; the *l*-Et ester b<sub>p</sub> 131°, d. 0.879,  $[\alpha]_D -0.65^\circ$ ; reduction gives 50% of recovered acid,  $[\alpha]_D -0.6^\circ$ , and 50% of 2-ethylnonan-1-ol, b<sub>p</sub> 126°, d. 0.860,  $[\alpha]_D -0.20^\circ$ .  $\alpha$ -Ethyl- $\beta$ -phenylvaleric acid b<sub>p</sub> 141-3°; *d*-Et ester b<sub>p</sub> 162-5°, d. 1.000,  $[\alpha]_D 0.26^\circ$ ; reduction gives 55% recovered ester and 47% of 2-ethyl-5-phenylpentan-1-ol, b<sub>p</sub> 150-3°, d. 0.984,  $[\alpha]_D 0.26^\circ$ . 3-Phenylbutan-1-ol,  $[\alpha]_D 14^\circ$ , gives 91% of *d*-3-cyclohexylbutan-1-ol, b<sub>p</sub> 130°, d. 0.946,  $[\alpha]_D 4.02^\circ$ . The 2-Ph isomer,  $[\alpha]_D -2.4^\circ$ , gives 68% of the *l*-2-cyclohexyl isomer, b<sub>p</sub> 119-21°, d. 0.948,  $[\alpha]_D -1.22^\circ$ . In 1 expt. camphor gave 100% of "born-ol," m. 197°,  $[\alpha]_D -9.2^\circ$ , and in another expt. an " $\alpha$ -isoborneol," m. 208-9°,  $[\alpha]_D -22.3^\circ$ .

The oxidation of organic compounds by potassium

permanganate under the conditions of the Kubel-Tiemann method. M. L. Compennolle. *Natuurw. Tijdschrift* 15, 237-43 (1933).—The attack of various org. compds. in dil. soln. by  $\text{KMnO}_4\text{-H}_2\text{SO}_4$  under the conditions of the Kubel-Tiemann oxidation method (for detn. of org. material in drinking water) was studied. For various concns. the extent of the oxidation is tabulated. For *o*-, *m*- and *p*-hydroxybenzoic acid the oxidation is complete at the highest concn. (5 mg.); it drops off for lower concns. (0.5 mg.), salicylic acid being oxidized most readily. For aminobenzoic acids the oxidation is incomplete (max. 12% at the lowest concn.), the *o*-compd. being most easily attacked. The nitrobenzoic acids are still harder to oxidize, the *o*-acid again being the easiest. Increased oxidation is observed in the series of N compds. urea, hippuric acid, asparagine, aspartic acid, glycine, dimethylphenylpyrazolone, uric acid, the action increasing with decreasing concn. Many references are given.

B. J. C. van der Hoeven  
**2-Hydroxy-3,5-diiodobenzoic acid (diiodosalicylic acid).** G. H. Woollett and W. W. Johnson. *Org. Syntheses* 14, 52-3 (1934).— $\text{o-HOC}_6\text{H}_3\text{CO}_2\text{H}$  in AcOH with ICl gives 91-2% of 3,5,2-I<sub>3</sub>(HO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H; 4-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H gives 84% of the 3,5-di-I deriv. Directions are given for the prepn. of ICl in 87% yield.

C. J. West  
***p*-Hydroxybenzoic acid.** C. A. Buehler and W. E. Cate. *Org. Syntheses* 14, 48-50 (1934).—Heating  $\text{o-HOC}_6\text{H}_4\text{CO}_2\text{K}$  (from the acid and  $\text{K}_2\text{CO}_3$ ) at 230° and acidification give 70-80% of  $p\text{-HOC}_6\text{H}_4\text{CO}_2\text{H}$ .

C. J. W.  
**The reactions of diphenyl thiocarbonate with the salts of heavy metals.** G. A. Garkusha. *J. Gen. Chem.* (U. S. S. R.) 3, 596-602 (1933).— $(\text{PhO})_2\text{CS}$  (I) reacts with salts of heavy metals as follows:  $\text{I} + 2\text{AgCl} + \text{H}_2\text{O} \rightarrow (\text{PhO})_2\text{CO}$  (II) +  $\text{H}_2\text{S} + 2\text{AgCl}$ ;  $\text{H}_2\text{S} + 2\text{AgCl} \rightarrow \text{Ag}_2\text{S} + 2\text{HCl}$ . Boiling dry I (2.3 g.) and 1.4 g. freshly pptd. AgCl in PhH for 64 hrs. gave no decompn. products. In 90% EtOH the same substances did not react during 12 hrs. in the cold, but after 40 hrs. boiling reaction was complete according to the above equations. I and AgI in 90% EtOH had not reacted after 80 hrs. boiling. I (2.3 g.) and 2.7 g.  $\text{HgCl}_2$  in  $\text{Et}_2\text{O}$  in the presence of a little  $\text{H}_2\text{O}$  gave II and  $\text{Hg}_2\text{Cl}_2$ . I (4 g.) and 8.2 g. red  $\text{HgI}_2$  did not react when heated 6 hrs. at 200° and 20 mm. The same substances heated for 18 hrs. in aq. EtOH gave  $\text{HgS}$  and II.  $\text{AcOAg}$ ,  $\text{C}_6\text{H}_4(\text{CO}_2\text{Ag})_2$ ,  $(\text{CO}_2\text{Ag})_2$ ,  $\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{Ag})$  and  $(\text{BzO})_2\text{Cu}$  react with I in moist PhH to give the corresponding acids,  $\text{Ag}_2\text{S}$  or  $\text{CuS}$  and II, in dry PhH the reaction is much slower, the products being metallic sulfide, II and acid anhydride, except that  $(\text{CO}_2\text{Ag})_2$  gives  $\text{CO} + \text{CO}_2$ , and  $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{Ag}$  an intermol. polymer of  $\text{C}_6\text{H}_4(\text{OH})\text{CO}_2\text{H}$ . I reacts with  $(\text{AcNH})_2\text{Hg}$  or  $(\text{BzNH})_2\text{Hg}$  in the presence of  $\text{H}_2\text{O}$  to give II,  $\text{HgS}$  and  $\text{AcNH}_3$  or  $\text{BzNH}_3$ . There is no reaction in the absence of  $\text{H}_2\text{O}$  on heating at 100° for 20 hrs.

Lewis W. Butz  
**Oxidation of some  $\alpha$ -hydroxy acids with lead tetraacetate.** Haruomi Oeda. *Bull. Chem. Soc. Japan* 9, 8-14 (1934).—Oxidation with  $\text{Pb}(\text{OAc})_4$  in  $\text{C}_6\text{H}_6$  or glacial HOAc of the acids  $\text{RCH}(\text{OH})\text{CO}_2\text{H}$  gives aldehydes  $\text{RCHO}$ , where  $\text{R} = \text{Me}$ , iso-Bu, Ph,  $\text{PhCH}_2$  and *p*- $\text{HOC}_6\text{H}_4\text{CH}_2$ .

H. A. Beatty  
**Reactions of certain  $\beta$ -ketonic acids.** I. Ketonic  $\beta$ -lactones. E. P. Kohler and R. H. Kimball. *J. Am. Chem. Soc.* 56, 729-31 (1934).— $\text{PhCH}(\text{CO}_2\text{H})\text{CHBrBz}$  in 1%  $\text{NaHCO}_3$  gives 90% of  $\alpha$ -phenyl- $\beta$ -benzoylpropiolactone (I), m. 95°; the action of  $\text{NaHCO}_3$  on I gives  $\alpha$ -phenyl- $\beta$ -hydroxy- $\beta$ -benzoylpropionic acid, m. 182°, the MeOH soln., satd. with HBr, gives the Me ester of the original Br acid. A 2nd HO acid is also formed. The action of 5% aq. NaOH on I gives a small amt. of  $\text{PhCH}_2\text{CPh}(\text{OH})\text{CO}_2\text{H}$ , m. 165°, *hydroxydiphenyl ketone*, m. 115° (whose structure was established by its synthesis from  $(\text{PhCH}_2)_2\text{CO}$  through the Br deriv.), and  $\alpha$ -hydroxy- $\beta$ -phenylpropionophenone, m. 66° (whose structure was established by brominating  $\text{PhCH}_2\text{CH}_2\text{Bz}$  (the  $\alpha$ -Br deriv. m. 56-7°) and replacing the Br by HO). The Br acid, dissolved in  $\text{C}_6\text{H}_6\text{N}$ , gives the  $\text{C}_6\text{H}_6\text{N}$  salt of *cis*-phenylbenzoylacrylic acid (II), but when it is extd. from

an  $\text{Et}_2\text{O}$  soln. with a dil. aq. soln. of the base it forms a  $\text{C}_8\text{H}_8\text{N}$  salt, m.  $135^\circ$  (disocc.). Traces of  $\text{C}_8\text{H}_8\text{N}$ , like traces of  $\text{AcOK}$ , generally induce polymerization of I in  $\text{MeOH}$  or  $\text{Me}_2\text{CO}$ , but excess of  $\text{C}_8\text{H}_8\text{N}$  dissolves the polymer and both the lactone and polymer are converted quantitatively into II. I and 10%  $\text{H}_2\text{SO}_4$ , boiled 20 hrs., give  $\alpha$ -phenyl- $\beta$ -hydroxy- $\beta$ -benzoylpropionic acid, m.  $132^\circ$ ;  $\text{H}_2\text{SO}_4$  in  $\text{MeOH}$  gives the *Me ester*, m.  $89^\circ$ , of this acid. I and  $\text{HBr}$  give the original  $\text{Br}$  acid;  $\text{HBr}$  in  $\text{MeOH}$  gives the *Me ester* of the higher-melting  $\text{Br}$  acid.

**Preparation of homopiperonylic acid.** K. H. Slotta and G. Haberland. *J. prakt. Chem.* 139, 211–19 (1934).—Piperonal is transformed through the nitrile (I) and the imino ether into *Me 3,4-methylenedioxy-mandelic acid*, m.  $99^\circ$  (87% yield); with  $\text{SOCl}_2$  in  $\text{C}_6\text{H}_6$  there results 92% of *Me 3,4-methylenedioxyphenylchloroacetate* (II), b.p.  $173^\circ$ . With  $\text{MeOH-NaOH}$  II gives *3,4-methylenedioxyphenyl-methoxyacetic acid*, m.  $80^\circ$  (94.5% yield). Reduction of II with  $\text{Zn}$  in dil.  $\text{Me}_2\text{CO}$  gives 30–6% of homopiperonylic acid and 53–60% of methylenedioxy-mandelic acid. I treated with  $\text{Ac}_2\text{O}$  and  $\text{C}_6\text{H}_5\text{N}$  and then with  $\text{HCl}$  in  $\text{MeOH-HCl}$  forms 80.5% of the imino ether, m.  $131^\circ$  (decompn.), of *Me 3,4-methylenedioxy-O-acetylmandelate*, m.  $102^\circ$ . 3,4,5-( $\text{MeO}$ ),  $\text{C}_6\text{H}_3\text{CHO}$  and  $\text{KCN}$  give 91% of the nitrile of trimethoxymandelic acid, m.  $101^\circ$ ; warming with  $\text{Ac}_2\text{O}$  and  $\text{C}_6\text{H}_5\text{N}$  and satg. with  $\text{HCl}$  give the imino ether, m.  $120^\circ$ , of *Me 3,4,5-trimethoxy-O-acetylmandelate*, m.  $82^\circ$  (82% yield).

**2-Nitrohomoveratric acid.** K. H. Slotta and F. Lauer sen. *J. prakt. Chem.* 139, 220–8 (1934).—Details are given of the prepn. of 2-nitrovanillin through the  $\text{Ac}$  deriv.; this was transformed into 2,3,4- $\text{O}_2\text{N}(\text{MeO})_3\text{C}_6\text{H}_2\text{CHO}$ , 2,3,4- $\text{O}_2\text{N}(\text{MeO})_3\text{C}_6\text{H}_2\text{CH}_2\text{OH}$  and 2,3,4- $\text{O}_2\text{N}(\text{MeO})_3\text{C}_6\text{H}_2\text{CH}_2\text{Cl}$ ; through the nitrile and imino ether this yields 2-nitrohomoveratric acid (29% on the original vanillin). Reduction of 2,3,4- $\text{O}_2\text{N}(\text{MeO})_3\text{C}_6\text{H}_2\text{CHO}$  in abs.  $\text{EtOH}$  with  $\text{Al}(\text{OEt})_3$  gives 97% of 2,3,4- $\text{O}_2\text{N}(\text{MeO})_3\text{C}_6\text{H}_2\text{CH}_2\text{OH}$ ; this yields 99% of the bromide, b.p.  $155$ – $80^\circ$ , m.  $71^\circ$ ; the yield of the cyanide is 85%. The reduction of 2- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  with  $\text{Al}(\text{OEt})_3$  gives nearly quantitatively 2- $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{OH}$ ; this does not form a chloride with concd.  $\text{HCl}$ .

**Chemical studies of algine and alginic acid.** Manuel López Gómez. *Inst. espan. oceanograf. Notas y resúmenes Ser. II*, No. 74, 98 pp. (1933).—Alginic acid (I), from *Fucus vesiculosus*, *Laminaria flexicaulis* and *Ascophyllum nodosum*, by extn. with  $\text{Na}_2\text{CO}_3$  and pptn. with  $\text{HCl}$ , is thermostable, carbonizes at 250–300° after softening at  $180^\circ$ , has an acid no. of 194, and contains ash varying in different preps. from 0.47 to 2.5%, depending on the source and method of purification and consisting of  $\text{Al}$ ,  $\text{Ca}$  and  $\text{Mg}$ . This appears not to be bound in salt formation and is incompletely removed by dialysis. *Na salt* of I,  $[\alpha]_D^{20}$  –130.5–132°,  $n_D^{20}$  1.3343. From analyses of many other salts the formula  $(\text{C}_6\text{H}_7\text{O}_7)_n$  is indicated, where  $n$  is 4 or a multiple thereof and with 1 replaceable  $\text{H}$  per unit. When heated with mineral acids I gives  $\text{CO}_2$  and furfural, indicating the presence of uronic acids, and it also gives the characteristic reactions of a pentose. No evidence of a free aldehyde group was obtained. Acid hydrolysis gives exclusively *d-mannuronic acid* (II), identified by the cinchonine salt, and in quantities warranting the assumption that I is a polymer of II. In acidic strength I is of the order of  $\text{ClCH}_2\text{CO}_2\text{H}$ . Contrary to the experience of previous workers G.'s algin contained no  $\text{N}$ . The cellulose in the so-called cellulose residue after extn. of I does not possess the properties of true cellulose. A very good bibliography is given.

**Synthesis of pinastric acid.** Georg Koller and Adolf Klein. *Monatsh.* 63, 213–15 (1934).—*p*- $\text{MeOC}_6\text{H}_4\text{CH}_2\text{CN}$  and  $\text{PhCH}_2\text{CN}$  with  $(\text{CO}_2\text{Na})_2$  in  $\text{EtOH}$  give *p*-methoxy-pulvic acid dinitrile, decomp.  $255^\circ$ ; heating with concd.  $\text{HCl}$  2 hrs. at  $130^\circ$  gives a crude dilactone, which yields pinastric acid with  $\text{MeOH-KOH}$  (*C. A.* 27, 2683).

**Saxatilis acid and capraric acid.** Georg Koller, Adolf Klein and Karl Pöpl. *Monatsh.* 63, 301–10 (1933).—

Protocapreric acid,  $\text{C}_{16}\text{H}_{32}\text{O}_8$ , is obtained by extg. *Parmelia caperata* with  $\text{Et}_2\text{O}$ , extg. the residue with  $\text{C}_6\text{H}_6$  and crystg. from  $\text{Me}_2\text{CO}$ ; the monobromoanilide was prepd. Boiling the acid with  $\text{EtOH}$  for 12 hrs. ( $\text{H}$  atm.) gives an *EtO deriv.*, decomp.  $260^\circ$ . With  $\text{Zn}$  and  $\text{NaOH}$  the acid gives orcinol. The hydroxylactone ring is shown by the addn. of  $\text{AcOH}$  (splitting off of 1  $\text{H}$ ), giving the compd.  $\text{C}_{16}\text{H}_{32}\text{O}_{10}$ ; the acid also probably contains an ether  $\text{O}$  atom. Saxatilis acid,  $\text{C}_{16}\text{H}_{32}\text{O}_{10}$ , is obtained in 30 g. yield (crude) from 800 g. *Parmelia saxatilis*; it is a dibasic acid; it yields a *di-m-bromoanilide*, decomp.  $280^\circ$ ; heating with  $\text{EtOH}$  causes the introduction of 2  $\text{EtO}$  residues (2  $\text{H}$  displaced), the compd. decomp.  $172^\circ$ ;  $\text{Zn}$  and  $\text{NaOH}$  give atranol but no orcinol. The di- $\text{EtO}$  compd. gives a monobromoanilide, yellow. Provisional formulas are suggested.

***d*- $\Delta^8(9)$ -*p*-Menthadiene from *d*-pulegone.** Wm. J. Grubb and John Read. *J. Chem. Soc.* 1934, 242–3.—*d*-Pulegone reacts slowly with (iso- $\text{PrO}$ ) $_2\text{Al}$  in dry iso- $\text{PrOH}$ ; no pulegol is found, the sole product being *d*- $\Delta^8(9)$ -*p*-menthadiene, b.p.  $69^\circ$ ,  $n_D^{20}$  1.4966,  $d_4^{25}$  0.8585,  $[\alpha]_D^{25}$  140.6°; oxidation gives  $\beta$ -methyladipic acid.

**Constituents of Indian turpentine from *Pinus longifolia*, Roxb. III (continued).** A. H. Bradfield, E. M. Francis and J. L. Simonsen. *J. Chem. Soc.* 1934, 188–97; cf. *C. A.* 18, 247.—The oxidation of longifolene (I) with  $\text{O}_3$  gives  $\text{HCHO}$  and a mixt. of acid and aldehyde, which, oxidized with excess  $\text{H}_2\text{O}_2$ , gives  $\alpha$ -longifolic acid,  $\text{C}_{14}\text{H}_{26}\text{O}_2$ , m.  $140$ – $2^\circ$ ,  $[\alpha]_{441}$  –31° ( $\text{EtOH}$ ,  $c$  3.86); a labile form m.  $121$ – $2^\circ$ . Isolongifolic acid has been found to have  $[\alpha]_{441}$  –12.7° ( $\text{EtOH}$ ,  $c$  14.064); its *Me ester* has  $[\alpha]_{441}$  5.94° ( $\text{MeOH}$ ,  $c$  4.68). Thus I contains a vinyl side chain. Oxidation of I with  $\text{MnO}_2$  and  $\text{H}_2\text{SO}_4$  gives trimellitic acid and an acid, decomp.  $261$ – $5^\circ$ , whose *Me ester*,  $(\text{C}_6\text{H}_5\text{O})_n$ , m.  $145$ – $7^\circ$ . Oxidation of I with  $\text{HNO}_3$  is somewhat difficult to control and gives the following products: a tribasic acid,  $\text{C}_{14}\text{H}_{18}\text{O}_8$ , m.  $283$ – $5^\circ$ ,  $[\alpha]_{441}$  –36.25° ( $\text{Na}$  salt in  $\text{H}_2\text{O}$ ); the acid can be crystd. from concd.  $\text{HNO}_3$  and is not attacked by hot alk.  $\text{KMnO}_4$  or  $\text{CrO}_3$  in  $\text{AcOH}$ ;  $\text{Se}$  at  $300^\circ$  has no action nor has fusion with  $\text{KOH}$  or  $\text{HBr}$  in  $\text{AcOH}$  at  $180^\circ$ ; *Me ester*, m.  $73$ – $4^\circ$ ,  $[\alpha]_{441}$  42.2° ( $\text{AcOEt}$ ,  $c$  3.556); a 2nd tribasic acid,  $\text{C}_{14}\text{H}_{20}\text{O}_8$ , decomp.  $222$ – $4^\circ$ ,  $[\alpha]_{441}$  52.81° ( $\text{EtOH}$ ,  $c$  2.630); with  $\text{AcCl}$  it gives a gummy anhydride; in 1 expt., an isomeric acid, m.  $190$ – $200^\circ$  and yields a cryst. anhydride, m.  $103^\circ$ ; a dibasic acid,  $\text{C}_{11}\text{H}_{18}\text{O}_6$ , m.  $183$ – $5^\circ$ ; *as*-dimethylsuccinic acid and  $\text{Me}_2\text{C}(\text{CO}_2\text{H})_2$ . The relation of these products to the structure of I is discussed.

The acid chloride of longifolic acid in ligroin, added during 2 hrs. to twice as much ligroin, cooled and mechanically stirred, while a rapid stream of  $\text{NH}_3$  is passed in, gives a good yield of longifolamide,  $[\alpha]_{441}$  –20.5° ( $\text{MeOH}$ ,  $c$  4.197); ordinary prepn. of the amide gives principally longifonitrile, b.p.  $145$ – $50^\circ$ ; the urethan m.  $76$ – $77^\circ$ ,  $[\alpha]_{441}$  –11.1° ( $\text{MeOH}$ ,  $c$  2.624); heating with  $\text{AmONa}$  at  $160^\circ$  for 8 hrs. gives *l*-amino-*l*-methyl-longifane (II),  $\text{C}_{15}\text{H}_{25}\text{N}$ , b.p.  $150^\circ$ ,  $[\alpha]_{441}$  –35.3° ( $\text{EtOH}$ ,  $c$  10.874); *HCl salt*, decomp.  $280$ – $2^\circ$ ; *nitrile*, decomp.  $132^\circ$ ; *as*-*Ac deriv.*, m.  $191$ – $2^\circ$ ,  $[\alpha]_{441}$  –56.4° ( $\text{EtOH}$ ,  $c$  2.146); *as*-*Ac deriv.*, m.  $163$ – $5^\circ$ ; *3,5-dinitrobenzoate*, pale yellow, m.  $199$ – $200^\circ$ ,  $[\alpha]_{441}$  –12.2° ( $\text{CHCl}_3$ ,  $c$  2.372); *as*-methiodide, m.  $258$ – $9^\circ$ ; *as*-methiodide, crystals with 1 mol.  $\text{H}_2\text{O}$ , decomp.  $184^\circ$ . The hydroxides from these 2 methiodides on distn. lose  $\text{MeOH}$  with the formation of the dimethylamino base, isolated as the *HCl salt*,  $\text{C}_{14}\text{H}_{27}\text{N}\cdot\text{HCl}$ , m. above  $280^\circ$ . II, on treatment with  $\text{NaNO}_2$  in  $\text{H}_3\text{PO}_4$  and heating of the alc. mixt. with  $\text{KHSO}_4$  at  $200^\circ$ , gives a hydrocarbon, b.p.  $124^\circ$ ,  $d_4^{25}$  0.95,  $n_D^{25}$  1.4995,  $[\alpha]_{441}$  6.04° ( $\text{Me}_2\text{CO}$ ,  $c$  18.222); this is a mixt., since titration with camphoric acid peroxide gives only 54.8% unsatn.;  $\text{HCl}$  yields a liquid *HCl deriv.*,  $\text{C}_{14}\text{H}_{25}\text{Cl}$ . Oxidation of this mixt. with alk.  $\text{KMnO}_4$  is very slow but gives very small yields of a dibasic acid,  $\text{C}_{14}\text{H}_{20}\text{O}_8$ , m.  $235$ – $6^\circ$ , which forms a liquid anhydride, and a lactone,  $\text{C}_{11}\text{H}_{18}\text{O}_2$ , m.  $190^\circ$ . Oxidation with  $\text{O}_3$  and decompn. of the ozonides by catalytic hydrogenation gives  $\text{HCHO}$ , a ketone,  $\text{C}_{12}\text{H}_{18}\text{O}$  (*semicarbazone*, m.  $208$ – $9^\circ$ ) (this contains a  $\text{CH}_2$  group adjacent to the

CO group, since it yields a liquid hydroxymethylene deriv. whose semicarbazone,  $C_{14}H_{21}O_2N_2$ , m. 190°, and 1-methyldehydrolongifane,  $b_p$  125-7°,  $d_4^{25}$  0.9514,  $n_D^{25}$  1.4967,  $[\alpha]_D^{25}$  18.8° (AcOEt,  $c$  17.10), which yields a liquid HCl deriv.,  $C_{15}H_{21}Cl$ ; the mol. refraction shows an exaltation of 0.51, which is of the same order as that shown by tricyclics. A 2nd fraction of the ketone yields a 2,4-dinitrophenylhydrazon, terra cotta, m. 250-1°. Oxidation of II with  $KMnO_4$  in  $Me_2CO$  gives as the main products the  $\alpha$ -Ac deriv. of II and an acid,  $C_{16}H_{23}O_2N$ , m. 122-4°, which gives by loss of  $CO_2$  a substance, m. 144°,  $[\alpha]_D^{25}$  -69.8° (EtOH,  $c$  1.146) isomeric with the  $\alpha$ -Ac deriv. The acid yields a semicarbazide, decomp. 179-80°.

C. J. West

**Carvone series. I. Some ketones and amines.** John Read and Robert G. Johnston. *J. Chem. Soc.* 1934, 226-33.—*d*-Carvone,  $[ \alpha ]_D$  about 62°, catalytically reduced with Pd-CaCO<sub>3</sub> in MeOH, gives a *l*-rotatory carvomenthone (I),  $b_p$  98-9°,  $n_D^{25}$  1.4552,  $[\alpha]_D^{25}$  -30.62°. Oxidation of *d*-carvomenthone with  $CrO_3$  gives a *l*-carvomenthone,  $b_p$  90-6.5°,  $n_D^{25}$  1.4548,  $[\alpha]_D^{25}$  -6°; the oxime m. 99-100°,  $[\alpha]_D^{25}$  -38.7° (EtOH,  $c$  2). The dynamic isomerism of the menthones and carvomenthones may be summarized in a preliminary form as follows: *d*-menthone ( $[\alpha]_D^{30}$ )  $\rightleftharpoons$  *l*-isomenthone (-92°); *l*-carvomenthone (-6°)  $\rightleftharpoons$  *l*-isocarvomenthone (? -90°). In the carvomenthone series the equil. appears to lie further to the left and to be attained more rapidly than in the menthone series. *d*-Carvomenthylamine, prep'd. from *l*-carvomenthone oxime with  $[\alpha]_D$  -37° (EtOH,  $c$  2) by reduction with Na in abs. EtOH, and purified by crystn. of the HCl salt from AcOEt,  $b_p$  89.8-90°,  $d_4^{25}$  0.8505,  $n_D^{25}$  1.4578,  $[\alpha]_D^{25}$  12.47°,  $[\alpha]_D^{25}$  14.58°; 15.20° (CHCl<sub>3</sub>); HCl salt, m. above 250°,  $[\alpha]_D^{25}$  12.2°; formyl deriv., m. 95°,  $[\alpha]_D^{25}$  62.1°,  $[\alpha]_D^{25}$  72.8° (CHCl<sub>3</sub>,  $c$  1); Ac deriv., m. 160-1°,  $[\alpha]_D^{25}$  67.8, 79.6° (for I and 5461, so given for other derivs. also); propionyl deriv., m. 128-9°,  $[\alpha]_D^{25}$  65.7°, 77°; butyryl deriv., m. 123-1°,  $[\alpha]_D^{25}$  59.4°, 71.2°; hexoyl deriv., m. 104°,  $[\alpha]_D^{25}$  55.5°, 63.8°; octoyl deriv., m. 97-8°,  $[\alpha]_D^{25}$  50°, 56.6°; phenylacetyl deriv., m. 177°,  $[\alpha]_D^{25}$  41.7°, 47.7°; Bz deriv., m. 161°,  $[\alpha]_D^{25}$  45.1, 52.6°; *d*-camphor-10-sulfonyl deriv., m. 95°,  $[\alpha]_D^{25}$  61.2°; carbimide, m. 206-7°; the salicylidene deriv. is phototropic and the optical rotatory dispersion is anomalous; the formate m. 152°,  $[\alpha]_D^{25}$  12.1° ( $H_2O$ ,  $c$  2); *H d*-tartrate, m. 143-4°,  $[\alpha]_D^{25}$  20.1° ( $H_2O$ ,  $c$  2); *d*-camphor-10-sulfonate, m. 138-40°,  $[\alpha]_D^{25}$  19.5° ( $H_2O$ ,  $c$  2); it is too sol. to be fractionated; the *l*-isomer m. 144-5°,  $[\alpha]_D^{25}$  -8.4° ( $H_2O$ ,  $c$  2). The above reduction also gives 7.5% of a 2nd base, termed *l*-neocarvomenthylamine (II); the best source of II is the mixt. of stereoisomeric formylcarvomenthylamines formed when I is heated with  $HCO_2NH_4$  at 130° for 48 hrs. II  $b_p$  87.8-88°,  $d_4^{25}$  0.8558,  $n_D^{25}$  1.4560,  $[\alpha]_D^{25}$  -26.55°,  $[\alpha]_D^{25}$  -31°; in CHCl<sub>3</sub> ( $c$  4)  $[\alpha]_D^{25}$  -20.13°,  $[\alpha]_D^{25}$  -23.94°; HCl salt,  $[\alpha]_D^{25}$  -31.9° ( $H_2O$ ,  $c$  2); formate, m. 131.5-2°,  $[\alpha]_D^{25}$  -31.5° ( $H_2O$ ); *H d*-tartrate, m. 162°,  $[\alpha]_D^{25}$  -5.7° ( $H_2O$ ); formyl deriv.,  $b_p$  298-9°, m. 50°,  $[\alpha]_D^{25}$  -61.2°,  $[\alpha]_D^{25}$  -74.2° (CHCl<sub>3</sub>,  $c$  2); Ac deriv., m. 114°,  $[\alpha]_D^{25}$  -61.9°, -75.4°; propionyl deriv., m. 101°,  $[\alpha]_D^{25}$  -60.1°, -72.4°; butyryl deriv., m. 98°,  $[\alpha]_D^{25}$  -57.6°, -69°; Bz deriv., m. 120°,  $[\alpha]_D^{25}$  -33.0°, -38.3°; phenylacetyl deriv., m. 81°,  $[\alpha]_D^{25}$  -40.6°, -48°; salicylidene deriv., yellow, m. 36-7°, exhibits anomalous rotatory dispersion. The sirupy product formed in the oximation of carvomenthone,  $[\alpha]_D^{25}$  -24.85°,  $b_p$  135-40°,  $[\alpha]_D^{25}$  -43.5° (EtOH,  $c$  2); reduction with Na and EtOH gives a new base, whose HCl salt has  $[\alpha]_D^{25}$  -11.8° ( $H_2O$ ) and whose Bz deriv. m. 151-2°,  $[\alpha]_D^{25}$  -38.8°. A product accompanying II is dicarvomenthylamine,  $b_p$  178-9°,  $b_p$  187-8°,  $d_4^{25}$  0.8956,  $n_D^{25}$  1.4787,  $[\alpha]_D^{25}$  -3.5°, which is probably a mixt. of isomers and does not yield characteristic derivs. Reduction of *d*-carvoxime with Na and EtOH gives *d*-dihydrocarvylamine,  $b_p$  111°,  $d_4^{25}$  0.8775,  $n_D^{25}$  1.4781,  $[\alpha]_D^{25}$  16.4° (CHCl<sub>3</sub>,  $c$  5.8); Bz deriv., m. 182°,  $[\alpha]_D^{25}$  48.3° (CHCl<sub>3</sub>); formate, m. 145°,  $[\alpha]_D^{25}$  21.2° ( $H_2O$ ); Ac deriv., m. 131-2°,  $[\alpha]_D^{25}$  91.8° (CHCl<sub>3</sub>); salicylidene deriv., lemon-yellow, m. 58°; it displays anomalous rotatory disper-

sion; catalytic reduction of the Bz deriv. gives benzoyl-*d*-carvomenthylamine, m. 180-1°. *d*-Camphor-10-sulfonyl-*m*-hydroxybenzaldehyde, m. 87°; the vanillin deriv. m. 128°,  $[\alpha]_D^{25}$  35.8°.  $\beta$ -Naphthalenesulfonylsalicylaldehyde, m. 74-5°; vanillin deriv., m. 98°.  $\beta$ -Naphthalenesulfonylsalicylidene-*d*-carvomenthylamine, m. 104°,  $[\alpha]_D^{25}$  44.5°. II. Some unsaturated alcohols. R. G. Johnston and J. Read. *Ibid.* 233-7.—Reduction of *d*-carvone ( $[\alpha]_D^{25}$  62.4°) in iso-PrOH with (iso-PrO)<sub>2</sub>Al at 110° gives a carveol (77-9 g.)  $b_p$  98-104°,  $n_D$  1.4984,  $[\alpha]_D^{25}$  100.9 108.2°; this was transformed into the 3,5-dinitrobenzoates and fractionated from abs. EtOH (3 parts) and AcOEt (1 part): *d*-trans-carveol (I),  $b_p$  102.2-2.4°,  $n_D^{25}$  1.4942,  $d_4^{25}$  0.9484,  $[\alpha]_D^{25}$  213.1°; *p*-nitrobenzoate, m. 77°,  $[\alpha]_D^{25}$  264.4° (CHCl<sub>3</sub>,  $c$  2); *o*-isomer, sirup,  $[\alpha]_D^{25}$  110° (CHCl<sub>3</sub>,  $c$  2); acetate,  $b_p$  106-6.5°,  $n_D^{25}$  1.4770,  $[\alpha]_D^{25}$  177.5°; 3,5-dinitrobenzoate, pale brown, m. 111.5°,  $[\alpha]_D^{25}$  232° (CHCl<sub>3</sub>,  $c$  2); with *d*-camphor-10-sulfonyl chloride in  $C_6H_5N$  dehydration occurs, giving a mixt. of a terpene and *p*-cymene. *d*-cis-Carveol (II),  $b_p$  101.2-1.4°, m. 24-5°,  $n_D^{25}$  1.4959,  $d_4^{25}$  0.9521,  $[\alpha]_D^{25}$  23.9°; 3,5-dinitrobenzoate, yellow, m. 92.5°,  $[\alpha]_D^{25}$  -43.8° (CHCl<sub>3</sub>,  $c$  2); *p*-nitrobenzoate, m. 20.5-8°,  $[\alpha]_D^{25}$  -57.4° (CHCl<sub>3</sub>,  $c$  2); acetate,  $b_p$  108-8.5°,  $n_D^{25}$  1.4779,  $[\alpha]_D^{25}$  46.4°. II reacts more slowly with  $p$ -O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>COCl than does I. I-I and -II are also prep'd. from *l*-carvone; the two 3,5-dinitrobenzoates m. 111-1.5° and 92-2.5° and have  $[\alpha]_D^{25}$  -230.7° and 44.2° (CHCl<sub>3</sub>,  $c$  2), resp. *dl*-I  $b_p$  108°,  $d_4^{25}$  0.9510,  $n_D^{25}$  1.4950; it is very viscous at -25°; *p*-nitrobenzoate, m. 101°; 3,5-dinitrobenzoate, m. 119°; *dl*-II  $b_p$  108°,  $n_D^{25}$  1.4972; *p*-nitrobenzoate, m. 94°; 3,5-dinitrobenzoate, m. 91.5°. *d*-I is practically unaffected by Na in boiling EtOH; catalytic reduction (1 mol. H<sub>2</sub>) gives a small quantity of carvotanacetol 3,5-dinitrobenzoate, m. 109-10°,  $[\alpha]_D^{25}$  177.5° (CHCl<sub>3</sub>,  $c$  5), complete hydrogenation gives 2 new carvomenthols with  $[\alpha]_D^{25}$  -36.42° and 57.56°, resp., to be described later. Reduction of *d*-carvone with Na and dry EtOH gives *d*-dihydrocarveol,  $b_p$  106.8-7.2°,  $d_4^{25}$  0.9223,  $n_D^{25}$  1.4781,  $[\alpha]_D^{25}$  34.2°; *p*-nitrobenzoate, m. 37°,  $[\alpha]_D^{25}$  52.5° (CHCl<sub>3</sub>,  $c$  2); 3,5-dinitrobenzoate, m. 121.5-2°,  $[\alpha]_D^{25}$  55.2° (CHCl<sub>3</sub>). Reduction of *l*-dihydrocarvone ( $[\alpha]_D^{25}$  -16.91°) with (iso-PrO)<sub>2</sub>Al gives, among other products, a *l*-neodihydrocarveol,  $b_p$  101-2°,  $n_D^{25}$  1.4812,  $[\alpha]_D^{25}$  -33.22°; 3,5-dinitrobenzoate, pale yellow, m. 138-8.5°,  $[\alpha]_D^{25}$  6.8°; *p*-nitrobenzoate, m. 107°,  $[\alpha]_D^{25}$  14.9° (CHCl<sub>3</sub>,  $c$  2); *d*-camphor-10-sulfonate, m. 91-3°; heating at 125° gives  $\alpha$ -phellandrene; *dl*-Carvenone is reduced by (iso-PrO)<sub>2</sub>Al to a product  $b_p$  99-102°,  $n_D^{25}$  1.4799, which yields a *dl*-carvenyl 3,5-dinitrobenzoate, yellow, m. 75-6°; the *p*-nitrobenzoate m. 65°.

C. J. West

**Catalytic reduction of diosphenol.** James Walker and John Read. *J. Chem. Soc.* 1934, 238-42.—Catalytic reduction of diosphenol (I) in Et<sub>2</sub>O gives a dihydro deriv. (2-hydroxymenthone),  $b_p$  108-15°,  $n_D^{25}$  1.4648,  $d_4^{25}$  0.9915; semicarbazone, m. 210-11° (decompn.); *p*-toluenesulfonyl deriv. (II), m. 106-7°; the *d*-camphor-10-sulfonyl deriv. (III) is a sirup,  $[\alpha]_D^{25}$  22.1° (CHCl<sub>3</sub>,  $c$  1.75); thermal decompn. of III at 150° gives a mixt. of *dl*-piperitone (IV) (oxime, m. 115-16°) and *dl*- $\Delta^4$ -menthen-3-one (V) (oxime, m. 64-5°). The *p*-toluenesulfonyl deriv. of I, m. 76°, and II are not catalytically reduced at 3 atm. pressure of H<sub>2</sub>. *dl*-Piperitone oxide (13.9 g.), on reduction, gives 12.7 g. of an oil, from which were obtained 5.2 g. of an oil,  $b_p$  125°,  $n_D^{25}$  1.4570, and 7.1 g. of 1-hydroxymenthone (?),  $b_p$  137-9.5°, m. 88.5-90.5°,  $n_D^{25}$  1.4695. *dl*-Carvenone oxide gives 4-hydroxycarvomenthone (?),  $b_p$  137-42°, m. 72.5-4°. This work affords the first passage from menthone (VI) to IV (the I used being prep'd. entirely from VI), opens a new route from VI to V, and discloses the important fact that I may be used as a "turn-table" between the menthone and the carvomenthone series.

C. J. West

The use of phosphorus pentoxide in the preparation of *p*-benzoylbiphenyl and 4-benzoylacenaphthene. Angela Cannoni de Degiorgi. *Annales assoc. chim. Argentina* 21, 135-41 (1933).—By means of the Lecher method (C. A. 8, 100),  $C_{16}H_{12}Bz$  was obtained by substituting  $P_2O_5$  for

$\text{AlCl}_3$ . The use of  $\text{P}_2\text{O}_5$  instead of  $\text{AlCl}_3$  to produce  $p$ - $\text{BzC}_6\text{H}_4\text{Ph}$  gives 2.5% of an isomer, structure yet unknown, and in the prepn. of 4-benzoylacenaphthene  $\text{P}_2\text{O}_5$  increases the yields 15%. Chlorination of  $o$ - $\text{PhC}_6\text{H}_4\text{CO}_2\text{H}$  by  $\text{SOCl}_2$  should be at as low temp. as possible, because heating to 70–90° for 2 hrs. forms fluorene quantitatively. E. M. S.

**Diphenylmethane.** W. W. Hartman and Ross Phillips. *Org. Syntheses* 14, 34–5 (1934).— $\text{PhCH}_2\text{Cl}$  and  $\text{C}_6\text{H}_5\text{I}$  with  $\text{Al-Hg}$  give 49.5–52.5% of  $\text{Ph}_2\text{CH}_2$ . C. J. West

**Benzopinacol.** W. B. Bachmann. *Org. Syntheses* 14, 8–10 (1934).— $\text{Ph}_2\text{CO}$  (150 g.), 1 drop  $\text{AcOH}$  and 665 g.  $\text{Me}_2\text{CHOH}$ , warmed to 45°, and then exposed to bright sunlight for 8–10 days, give 93.5–4% of benzopinacol; abs.  $\text{EtOH}$  may be used but the reaction is slower.

**$\beta$ -Benzopinacolone.** W. E. Bachmann. *Org. Syntheses* 14, 12–13 (1934).— $\text{Ph}_2\text{C}(\text{OH})\text{C}(\text{OH})\text{Ph}$  (100 g.) in 500 cc.  $\text{AcOH}$  contg. 1 g.  $\text{I}$ , refluxed for 5 min., gives 95.6% of  $\text{BzCPh}_2$ ; the  $\text{AcOH}$  may be used for further rearrangements until 500 g. have been used. C. J. West

**Structure of ethyl bis(diphenylmethyl)malonate.** Arthur C. Cope. *J. Am. Chem. Soc.* 56, 721–5 (1934).—Et bis(diphenylmethyl)malonate (I) (Kohler, *Am. Chem. J.* 34, 132 (1905)) has been proved to be  $(\text{Ph}_2\text{CH})_2\text{C}(\text{CO}_2\text{Et})_2$  rather than a ketene acetal,  $\text{Ph}_2\text{CHC}(\text{CO}_2\text{Et})_2$ ;  $\text{C}(\text{OEt})\text{OCiPrPh}$ , as was originally proposed. At Et  $\text{I}$  was obtained as plates, m. 136–6.5°; after several months a sample which had been exposed to the air of the lab. for a few days m. 176–7°; after once melting or recrystg. all samples m. 176°; the high-melting form is much less sol. in  $\text{EtOH}$  and seps. from  $\text{EtOH}$  or  $\text{AcOH}$  in prisms. In the hydrolysis the 1st reaction is the cleavage of a  $\text{Ph}_2\text{CH}_2$  group; this cleavage originally led to the formulation of the compd. as an  $O$ -alkyl deriv. but must be interpreted as resulting from the breaking of a  $\text{C}$  to  $\text{C}$  linkage weakened by the substituent groups. Et  $p$ -toluylmalonate and  $p$ - $\text{MeC}_6\text{H}_4\text{MgBr}$  give 90% of the  $\text{Et}$  ester, m. 71–1.5°, b<sub>1</sub> 192–6°, of (di- $p$ -tolylmethyl)malonic acid, m. 184° (decompn.), giving  $\beta$ , $\beta$ -di- $p$ -tolylpropionic acid, m. 187–8°; if in this reaction, after refluxing 30 min. ( $p$ - $\text{MeC}_6\text{H}_4$ ) $_2\text{CHCl}$  is added, it gives 88% of Et bis(di- $p$ -tolylmethyl)malonate (II), m. 148.9°; this was also prepd. through the Na enolate. Et benzalmalonate and  $\text{PhMgBr}$ , refluxed 30 min. and treated with ( $p$ - $\text{MeC}_6\text{H}_4$ ) $_2\text{CHCl}$ , give 81% of Et (diphenylmethyl)(di- $p$ -tolylmethyl)malonate (III), m. 122–3°; when Et  $p$ -toluylmalonate was treated with  $p$ - $\text{MeC}_6\text{H}_4\text{MgCl}$  and then with  $\text{Ph}_2\text{CHBr}$ , there resulted a mixt. of I, II and III; the formation of I and II involves the disproportionation of an unsym. dialkylmalonic ester into the 2 sym. homologs. II reacts with the bromomagnesium enolate of Et (diphenylmethyl)malonate to give III. By analogy the deriv. of  $\text{NCCH}_2\text{CO}_2\text{Et}$  corresponding to I is probably a dialkylcyanooacetic ester rather than an  $O$ -alkyl deriv. C. J. W.

**Grignard reaction in the synthesis of ketones.** IV. A new method of preparing isomeric unsymmetrical benzoinis. Sanford S. Jenkins. *J. Am. Chem. Soc.* 56, 682–4 (1934); cf. *C. A.* 27, 3929.—The method depends on the fact that ketones of the type  $\text{R}'\text{CH}_2\text{COR}$  and  $\text{R}(\text{H})_2\text{COR}$ , in the presence of a source of light energy of sufficient intensity, can be converted into Br derivs., which react with  $\text{RONa}$  to give the diacetals, hydrolyzed by mineral acids to benzoinis.  $p$ - $\text{MeOC}_6\text{H}_4\text{CH}_2\text{Bz}$  yields an  $\alpha$ -Br deriv., m. 93–4° (all m. ps. cor.) (84% yield), and an  $\alpha$ -H( $O$ ) deriv., m. 90° (74%);  $p$ - $\text{MeOC}_6\text{H}_4\text{COCH}_2\text{Ph}$  yields an  $\alpha$ -Br deriv., m. 72.5–3.5° (80%), and an  $\alpha$ -H( $O$ ) deriv., m. 106.5° (94%);  $p$ - $\text{ClC}_6\text{H}_4\text{COCH}_2\text{Ph}$  gives an  $\alpha$ -Br deriv., m. 67.5–8.5° (78%), and an  $\alpha$ -H( $O$ ) deriv., m. 90–1° (94%);  $p$ - $\text{ClC}_6\text{H}_4\text{CH}_2\text{Bz}$  gives an  $\alpha$ -Br deriv., m. 62–2.5° (79%), and an  $\alpha$ -H( $O$ ) deriv., m. 116–17° (93%). The  $\alpha$ -Br derivs. may be analyzed by boiling 0.2–0.3 g. in  $\text{MeOH-KOH}$ , refluxing about 15 min. and titrating with 0.1  $N$   $\text{HCl}$ . C. J. West

**Alleged color and dyeing properties of some derivatives of tetraarylmethanes.** Arnold Weissberger and Johannes Hueck. *J. Chem. Soc.* 1934, 148–51; cf. Sen and Banerji, *C. A.* 25, 4255; Sen, Chattopadhyay and Sen-Gupta, *C. A.* 25, 3043. The color and dyeing property of the

condensation products obtained by S. and B. from  $p$ -rosaniline (I) and phenols are to be ascribed to the I with which they are contaminated; the compds. are complex but probably contain derivs. of  $\text{CPh}_4$ . The N content of the compd. from I and  $\text{PhOH}$  varies with the agent used to ppt. it;  $\text{NH}_3$  gives a product with 12.4% N;  $\text{AcONa}$ , 9% N. Details are given of the isolation of  $p,p',p''$ -triamino- $p'''$ -hydroxytetraphenylmethane, m. 257° (cor., decompn.), from the reaction product in a yield of 0.62 g. from 5 g. of initial reaction mixt. The color and dyeing properties of the compds. obtained from  $m$ - $\text{C}_6\text{H}_4(\text{OH})_2$  and ketones by S., C. and S.-G. are considered due to substances formed from the  $m$ - $\text{C}_6\text{H}_4(\text{OH})_2$  alone by the action of dehydrating agents used for the condensation or at high temps. The products obtained from  $m$ - $\text{C}_6\text{H}_4(\text{OH})_2$  and  $\text{ZnCl}_2$  both with and without the addn. of  $\text{Ph}_2\text{CO}$  are similar dark brown powders, which show a strong green fluorescence in alkali; their absorption spectra are nearly the same and their behavior shows that they are not homogeneous. C. J. West

**Derivatives of 2-methylnaphthalene.** Francisco Giral y Gonzalez. *Rev. acad. cienc. Madrid* 30, 519–54 (1933).—The prepn. of 25 derivs. of 2- $\text{C}_{10}\text{H}_7\text{Me}$  is described. New compds. prepd. are: 1,4-dimethoxy-2-methylnaphthalene, orange liquid, b<sub>1</sub> 175.8°; 2-methyl-1-nitro-8-naphthylamine and its sulfate; 2-methyl-1,8-naphthylendiamine (I), red crystals, m. 63°, b<sub>1</sub> 213.14°, nearly insol. in water, sol. in most org. solvents; actanuide of I, m. 136°; neutral sulfate of I, m. 197°; and 1-amino-2-methyl-8-naphthol, by boiling I first with  $\text{NaHSO}_3$  and then with  $\text{NaOH}$ , large white needles from benzene, m. 133°, very sol. in hot water. Forty-four references. L. E. Gilson

**Derivatives of 1,6-dimethylnaphthalene.** Franz Feist. *J. prakt. Chem.* 139, 261–8 (1931).—1,6- $\text{C}_{10}\text{H}_6\text{Me}_2$  and Br with a little Fe powder give a mixt. of 2 di-Br derivs., m. 134.5° and 62–4°, the action of Br in  $\text{CHCl}_3$  for 4 days gives a 4,5,8-tri-Br deriv., m. 115.16°, which also results on bromination in  $\text{H}_2\text{O}$ ; still further bromination gives a tetra-Br deriv., m. 180.1°. The tri-Br deriv. does not react with  $\text{AcCl}$  ( $\text{AlCl}_3$  in  $\text{CS}_2$ ). 1,6- $\text{C}_{10}\text{H}_6\text{Me}_2$  with 1 or 2 mols.  $\text{AcCl}$  and 1 or 2 mols.  $\text{AlCl}_3$  in  $\text{CS}_2$  or  $\text{PhNO}_2$  gives only a mono-1c deriv., m. 43°, which yields a tetra-Br deriv., m. 183.4°; part of the Br is in the Ac group; chlorination of the Ac deriv gives a perchloride,  $\text{C}_{10}\text{H}_4(\text{CCl}_3)_2\text{COCCl}_3$ , golden yellow, b<sub>1</sub> 244.50°, setting to a resin; hydrolysis with  $\text{H}_2\text{SO}_4$  did not give the desired  $\text{C}_{10}\text{H}_4(\text{CO}_2\text{H})_2$ ; hydrolysis with  $\text{KOH}$  at 170° for 8 hrs. gives trumalic acid (?),  $\text{C}_{10}\text{H}_4\text{O}_6$ , m. 222° (decompn.). Oxidation of the Ac deriv. with  $\text{CrO}_3$  in  $\text{AcOH}$  gives acetyl-1,6-dimethylnaphthoquinone, canary yellow, m. 150°. C. J. West

**Nitration of some  $\alpha$ -naphthalides.** Herbert H. Hodgson and John Walker. *J. Chem. Soc.* 1934, 180–1; cf. *C. A.* 27, 5737.—The ortho/para ratio for mononitration of aceto- $\alpha$ -naphthalide has been found to be 0.37–0.44; values are now reported for the formo (I), benzo (II) and  $o$ -carboxybenzo derivs. to be 0.4–0.6, 1.1–1.3 and 1.1–1.3, resp.; considerable dinitration occurs with the  $p$ -toluenesulfono deriv (III). The nitration product of I was extd. 3 times with 5% aq.  $\text{NaOH}$ , the insol. part being the 4-nitroformo deriv., greenish yellow, m. 182°; rapid working is necessary because of the ease of hydrolysis of the 2- $\text{NO}_2$  deriv. II gives 88% of mixed 2- $\text{NO}_2$ , m. 175°, and 4- $\text{NO}_2$  deriv., m. 224°. In the prepn. of III there results 2–3% of di- $p$ -toluenesulfono- $\alpha$ -naphthalide, m. 224°, and 94.5% III; the nitration of III was studied in dil.  $\text{HNO}_3$ ,  $\text{AcOH}$ ,  $\text{C}_2\text{H}_4\text{Cl}_2$  and  $\text{PhNO}_2$ ; with 30%  $\text{HNO}_3$  the 2,4-di- $\text{NO}_2$  deriv. (IV) resulted; in  $\text{AcOH}$  and the theoretical quantity of  $\text{HNO}_3$  some IV is formed; with 100% excess  $\text{HNO}_3$  the product was mainly IV; nitration with 20%  $\text{HNO}_3$  at 5° did not improve the yield of the mono- $\text{NO}_2$  deriv.; in  $\text{PhNO}_2$  50% excess  $\text{HNO}_3$  gives 40% of the mono- $\text{NO}_2$  deriv. Di- $p$ -toluenesulfonamide, m. 184°;  $o$ -toluide, m. 169°;  $p$ -toluide, m. 158°. C. J. West

**Derivatives of 8-bromo- and 8-chloro-1-naphthoic acids and their orientation by dehalogenation and de-**

carboxylation. H. Gordon Rule, Wm. Pursell and Robert R. H. Brown. *J. Chem. Soc.* 1934, 169-71.—The orientation of a substituted 8-halo-1-naphthoic acid may be detd. by (a) dehalogenation by boiling the acid in PhMe with Cu bronze, followed if necessary by (b) decarboxylation in boiling quinoline with the aid of Cu bronze. These acids are nitrated first in position 5 and eventually in the 4,5-positions. Halogenation occurs readily only in position 5. 8-Bromo-1-naphthoic acid (I), for which a method of prepn. is given (*Et ester*, m. 52°), with concd. HNO<sub>3</sub> at 65° gives the 5-NO<sub>2</sub> deriv., yellow, m. 245° (*Me ester*, m. 97°; *Et ester*, m. 103°). Further nitration with H<sub>2</sub>SO<sub>4</sub>-HNO<sub>3</sub> gives the 4,5-di-NO<sub>2</sub> deriv., grayish white to yellow, m. 280-2° (decompn.); *Me ester*, m. 155°; *Et ester*, m. 127-8°; dehalogenation gives 4,5-dinitro-1-naphthoic acid, buff, m. 265° (*Et ester*, m. 143-4°). I and Br in AcOH, heated at 150° for 2 hrs., give the 5,8-di-Br acid, m. 232°. Further action of Br gives a mixt. of C<sub>10</sub>H<sub>6</sub>Br<sub>2</sub> and C<sub>10</sub>H<sub>4</sub>Br<sub>4</sub>.

C. J. West

The addition of hydrogen to acetylene derivatives. XXI. The synthesis of symmetrical diphenylid- $\alpha$ -naphthylbutenediol and its hydrogenation. Yu. S. Zalkind and S. V. Nedzvetzki. *J. Gen. Chem.* (U. S. S. R.) 3, 573-7(1933).—A warm satd. soln. of 35 g.  $\alpha$ -C<sub>10</sub>H<sub>7</sub>Bz (I) in Et<sub>2</sub>O, added with stirring to (BrMgC≡), prepd. from 6 g. Mg, 30 g. Et<sub>2</sub>O and C<sub>2</sub>H<sub>2</sub>, gave after standing 20 hrs., refluxing 5 hrs. on a H<sub>2</sub>O bath and standing 20 hrs. more, a mixt. which sepd. into 2 layers. The Et<sub>2</sub>O layer with ice H<sub>2</sub>O and dil. AcOH yielded 1.5 g. I. The heavy lower layer by extrn. with Et<sub>2</sub>O, drying with fused K<sub>2</sub>CO<sub>3</sub>, distn. of the Et<sub>2</sub>O, and recrystn. successively from PhH and EtOH, gave 17 g. of sym. diphenylid- $\alpha$ -naphthylbutenediol (II) [Ph(C<sub>10</sub>H<sub>7</sub>)C(OH)C≡]<sub>2</sub>, with 1 mol. of EtOH of crystn. Removal of the EtOH by heating at 125° for 2.5 hrs. gave II, m. 182-3°. II adds Br, does not react with KMnO<sub>4</sub> soln. in the cold, and gives with concd. H<sub>2</sub>SO<sub>4</sub> an intense green coloration destroyed by diln. with H<sub>2</sub>O. II (0.8 g.), heated at 140° with powd. KOH in H<sub>2</sub>, gave I and C<sub>2</sub>H<sub>2</sub>, the latter identified by passing into NH<sub>3</sub>-CuCl, forming C<sub>2</sub>Cu<sub>2</sub>. Only 1 optical isomer of II was obtained. II is hydrogenated more slowly than [PhC(OH)C≡]<sub>2</sub> (III) in EtOH with colloidal Pd, 0.005 mol. II with 50 mg. Pd requiring 5 hrs. for addn. of 2 H, 0.005 mol. III, 1.5 hrs. After addn. of 2 H, H<sub>2</sub> is much more slowly absorbed. II gives 2 geometric isomers, [Ph(C<sub>10</sub>H<sub>7</sub>)C(OH)CH]<sub>2</sub>, 96% of  $\alpha$ -1,4-di- $\alpha$ -naphthyl-1,4-diphenylbutenediol (IV) and 4% of the  $\beta$ -compd. (V). IV is difficultly sol. in EtOH and crystallizes out during the hydrogenation. IV seps. from EtOH with 1 mol. EtOH of crystn., m. 132-4° (decompn.). The EtOH-free IV thus formed or crystd. from petr. ether, m. 167°. IV adds Br more slowly than II, does not react with KMnO<sub>4</sub> in the cold and gives with concd. H<sub>2</sub>SO<sub>4</sub> an intense green coloration changing rapidly to red and destroyed by diln. with H<sub>2</sub>O. Oxidation of IV with KMnO<sub>4</sub> in AcMe with or without heating gave only CO<sub>2</sub>. IV treated with CrO<sub>3</sub> in glacial AcOH gave an unidentified substance, yellow crystals, m. 190-3°. IV was the *cis*-compd. since it gave 2,6-di- $\alpha$ -naphthyl-2,5-diphenyl-2,5-dihydrofuran (VI) when warmed for 1 hr. with 10 cc. Ac<sub>2</sub>O and fused AcONa. VI was isolated from the reaction mixt. by pptg. the oil by addn. of H<sub>2</sub>O, washing with H<sub>2</sub>O, dissolving in PhH, and pptg. with petr. ether, crystals, m. 221-2° from EtOH. VI reacts with Br but not with cold KMnO<sub>4</sub>. IV (1.3 g.) in AcOEt with 1.8 g. Pt added 2 H after 8.5 hrs. giving 1,4-di- $\alpha$ -naphthyl-1,4-diphenylbutenediol (VII), m. 220°, from PhH. Addn. of 4 vols. H<sub>2</sub>O to the mother liquor from IV gave a ppt. of IV + V. Successive recrystn. from PhH and EtOH gave V, m. 231-2°, which in contrast to IV, did not crystallize with EtOH. V resembled IV in its behavior toward Br, KMnO<sub>4</sub>, and concd. H<sub>2</sub>SO<sub>4</sub>. The slower hydrogenation of II, the greater the yield of V. V (1 g. in 15 cc. AcOEt with H<sub>2</sub> and 0.7 g. Pt gave VII in 2 hrs. V is the *trans*-isomer. The solubilities in 100 cc. PhH (temp. not given) were II 2.13 g., IV 0.26 g., V 0.99 g., VII 0.40 g., VI undetd. but very sol. VII

was also prepd. from II in Et<sub>2</sub>O by addn. of H<sub>2</sub> in the presence of Pt black.

Lewis W. Butz

Technical naphthalene hydrogenation products and their uses. R. C. Bickmore. *Chem. Industries* 34, 205-8(1934).

E. H.

Trihalomethylketonic acids of the naphthalene series. Benton A. Bull and Reynold C. Fuson. *J. Am. Chem. Soc.* 56, 736-8(1934).—1-Aceto-2-naphthoxyacetic acid (I) in 10% NaOH and NaOCl give the 1-trichloroacetyl deriv. (II), m. 163-5° (decompn.); this is stable in a mixt. of 10 cc. EtOH and 24 cc. 0.01 N NaOH for at least 5 min.; the 1-tribromoacetyl deriv. (III) m. 171-2° and has the same stability. Heating I and NaOCl for 1 hr. gives the 1-carboxy deriv., m. 189° (decompn.), with NaOBr 2 hrs.' boiling were necessary; II and III give the same acid after heating 30 min. with 10% NaOH. 2-Aceto-1-naphthoxyacetic acid (IV) and NaOBr or NaOCl give the 2-carboxy deriv. (V), m. 206-7°. IV, treated with a soln. of Cl in Na<sub>2</sub>CO<sub>3</sub>, gives the 4-Cl deriv., m. 184-5° (decompn.), and the 4-Cl deriv. of V, m. 245-6°; the corresponding 4-Br deriv. m. 195-6° (decompn.) and 242-3°. These results show that the ease with which a trihalomethyl ketone is cleaved by aq. alkalis is diminished by the introduction of steric hindrance and enhanced by an increase of soly. of the ketone.

C. J. West

2-Methyl-1,4-naphthoquinone. Juan Madinaveita. *Anales soc. españ. fis. quim.* 31, 750-9(1933).—Reactions resembling diene addn., i. e., addn. at the same time to one of the O atoms and in the 3-position with formation of a 1,2-double bond, are much more difficult with 2-methyl-1,4-naphthoquinone than with 1,4-naphthoquinone. 2,3-Addn. can be readily effected. Oxidation with HClO gives 1,4-diketotetrahydronaphthalene 2,3-bis-oxide, m. 102°. With HBr this oxide gives 2-methyl-3-bromo-1,4-naphthoquinone and with PhNH<sub>2</sub> it gives 2-methyl-3-anilino-1,4-naphthoquinone, m. 163°. Five g. of the oxide in 50 cc. H<sub>2</sub>SO<sub>4</sub> and 150 cc. H<sub>2</sub>O, at 95° for 12 hrs. with frequent stirring, gives 4.5 g. 2-methyl-3-hydroxy-1,4-naphthoquinone (I), m. 173° when recrystd. from boiling EtOH, slightly sol. in cold EtOH and AcOH, cold or hot Et<sub>2</sub>O, more sol. in boiling AcOH, sol. in concd. H<sub>2</sub>SO<sub>4</sub>, reprecip. on diln. I is a strong acid, decomposing carbonates, forming highly colored salts, and at pH 4.7 changing from light yellow to orange-red. I is not methylated with MeOH satd. with HCl; its 1% AcOH soln. dyes wool directly. It can be exposed to light without change. Sunlight decolorizes 2-methyl-1,4-naphthoquinone with formation of a compd., m. 235°, which is probably 2,3,2',3'-tetrahydro-2,3'-dimethyl-2,3,2',3'-binaphthylene-1,4,1',4'-tetrone. E. M. Symmes

Constitution of dinitronaphthenequinone and of dinitronaphthalic acid. Preparation of a new dinitronaphthalene. H. Gordon Rule and Robert R. H. Brown. *J. Chem. Soc.* 1934, 171-4.—The oxidation of the mono-NO<sub>2</sub> deriv. of acenaphthenequinone (I) gives 4-nitronaphthalic anhydride, which upon mercuration and bromination gives a small yield of 8-bromo-4-nitro-1-naphthoic acid (II), m. 201-3°. Similarly the di-NO<sub>2</sub> deriv. of I gives the 4,5-di-NO<sub>2</sub> analog of II, m. 248-52° (decompn.). Naphthalic anhydride was converted into 3-nitronaphthalic acid, mercurated and brominated giving 8-bromo-3-nitro-1-naphthoic acid, m. 240-2°, the structure of which was established by dehalogenation to 3-nitronaphthoic acid; *Me ester*, m. 173°; *Et ester*, m. 155-6°. In a similar manner was prepd. 8-bromo-3,6-dinitro-1-naphthoic acid, m. 273-5° (*Me ester*, m. 137-8°; *Et ester*, m. 205-7°). The Hg deriv. warmed with dil. NaOH, then treated with concd. HCl and boiled for 4 hrs., gives 3,6-dinitro-1-naphthoic acid, buff, m. 273.5-4° (*Me ester*, m. 196-7°; *Et ester*, m. 145-6°). The orientation of the NO<sub>2</sub> groups in the above derivs. is dependent upon the structure of the dinitronaphthalic acid, which was detd. by decarboxylation, giving 2,7-dinitronaphthylene, yellow, m. 234°; thus the acid is the 3,6-compd.

C. J. West

1-Methylhydrindene-4-carboxylic acid. Hans Hoyer. *J. prakt. Chem.* 139, 242-4(1934).—o-BrC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CH<sub>2</sub>

give  $\alpha$ -benzoyl- $\alpha$ -ethanol- $\alpha$ -phenylthiourea (I), m. 154°; on standing in 80%  $\text{H}_2\text{SO}_4$  or in 48%  $\text{HBr}$  for 48 hrs. there results 80–90% of 2-benzoylimino-3-phenylthiazolidine, m. 122°; oxidation of I with yellow  $\text{HgO}$  in  $\text{C}_6\text{H}_6$  gives 2-benzoylimino-3-phenylloxazolidine, m. 117°.  $\beta$ -Benzoyl- $\alpha$ -ethanol- $\alpha$ -(*o*-tolyl)thiourea, m. 141°; *p*-tolyl deriv., m. 138°; 2-benzoylimino-3-(*o*-tolyl)thiazolidine, m. 137–8°; *p*-tolyl deriv., m. 154°; 2-benzoylimino-3-(*o*-tolyl)oxazolidine, m. 103°; *p*-tolyl deriv., m. 134°.  $\beta$ -Benzoyl- $\alpha$ -ethanolthiourea, m. 128°; 2-benzoyliminothiazolidine, m. 168°.  $\beta$ -Benzoyl- $\alpha$ -phenyl- $\alpha$ -propanolthiourea, m. 94°; 2-benzoylimino-3-phenylthiazane, m. 137°. *Et* ( $\beta$ -benzoyl- $\alpha$ -phenylthioureido)acetate, m. 165°; the free acid m. 166–7°; with  $\text{H}_2\text{SO}_4$  both give 3-benzoyl-1-phenyl-2-thio-4-imidazole, m. 163°. Anthranilic acid gives *o*-( $\beta$ -benzoylthioureido)benzoic acid, m. 160° (decomp.), and then at 190–200°; above its m. p. it loses  $\text{H}_2\text{S}$ , giving a S-free compd., m. 207–8°;  $\text{H}_2\text{SO}_4$  gives the 3-Bz deriv., m. 158°, of 4-keto-2-thiotetrahydroquinazoline, m. 305–10°, methylation of which gives the 2-methylthio deriv., m. 219°, or with excess  $\text{Me}_2\text{SO}$ , 2,4-diketo-3-methyltetrahydroquinazoline, m. 236°. The Me ether of phenylthiourea and  $\text{BzSCN}$  give 7-methylthio-1,7-diphenyl-7-thiodihydrotriazine, yellow, m. 211°. The following derivs. of furoyl isothiocyanate (thiouras) were prepd.: furoyl, m. 183°;  $\alpha$ -furoyl- $\beta$ -methyl, m. 142°;  $\beta$ -*Et* deriv., m. 101–2°;  $\alpha$ -benzyl- $\beta$ -furoyl, m. 122°;  $\alpha$ -furoyl- $\beta$ -phenyl, m. 116°;  $\beta$ -(*o*-tolyl) deriv., m. 115–6°; *m*-isomer, m. 99°; *p*-isomer, m. 130°;  $\alpha$ -naphthyl deriv., m. 186°;  $\beta$ -isomer, m. 139–40°;  $\beta$ -furoyl- $\alpha$ -methyl- $\alpha$ -phenyl, m. 98–9°;  $\alpha$ -benzyl- $\beta$ -furoyl- $\alpha$ -phenyl, m. 124°;  $\beta$ -furoyl- $\alpha$ -*di*-phenyl, m. 139–40°;  $\alpha$ -ethanol- $\beta$ -furoyl- $\alpha$ -phenyl, m. 111°; 2-furoylimino-3-phenylthiazolidine, m. 123°. Methods of hydrolyzing some of these compds. are given.

C. J. West  
Dioximes. C. G. Ponzio. *Gazz. chim. ital.* 63, 730–43 (1933); cf. C. A. 27, 3708. The new peroxides which are described differ from those previously known in that they are not transformed by bases into isomers, but into compds. contg. 1 less O atom. These peroxides are dioximes,  $\text{ArC}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NOH})\text{Ar}$ , of the peroxides,  $\text{ArCO}(\text{C}_2\text{N}_2\text{O})\text{COAr}$ , of diarylglyoximes,  $\text{ArCOC}(\text{:NOH})\text{C}(\text{:NOH})\text{COAr}$ , and the compds. formed from them by elimination of 1 O atom are the dioximes,  $\text{ArC}(\text{:NOH})\text{C}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{Ar}$ , of aroylformylarylfurazans,  $\text{ArCOCO}(\text{C}_2\text{N}_2\text{O})\text{Ar}$ .  $\alpha$ -Phenylglyoxime peroxide,  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$ , let stand and poured into water, yield the *di-Ac* deriv. of dibenzoylfuroxan dioxime,  $\text{PhC}(\text{:NOAc})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOAc})\text{Ph}$  (I), m. 117–18°, which is the same compd. as that considered in earlier work to be  $\text{PhC}(\text{:NOAc})\text{CNO}$  (cf. C. A. 17, 3875). There is also formed another unidentified compd., which will be studied later. Heated several hrs. at 125–30° it forms an isomer,  $\text{C}_{10}\text{H}_{11}\text{O}_5\text{N}_3$  (II), m. 125–30°; in boiling  $\text{EtOH}$  it reverts to I. In 20% aq.  $\text{NaOH}$ , both I and II ppt. the Na salt of dibenzoylfuroxan dioxime,  $\text{PhC}(\text{:NONa})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NONa})\text{Ph}$ , which with dil.  $\text{H}_2\text{SO}_4$  forms dibenzoylfuroxan dioxime (III), m. 115°, decomp. slowly in dry air; it gives yellow solns. in dil.  $\text{NaOH}$  (repptd. by acids). In dil.  $\text{EtOH}$  with  $\text{Cu}(\text{OAc})_2$  it ppts. a Cu deriv., grass-green. It does not form a Ni salt. In concd.  $\text{HNO}_3$ , III evolves nitrous vapors and is transformed into the compd.  $\text{C}_{10}\text{H}_{11}\text{O}_5\text{N}_3$ , m. 122°, the constitution of which was not identified. Its formula indicates, however, that 1 of the 2 NOH groups in III is oxidized, which is in contrast to the behavior of  $\text{PhC}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NOH})\text{Ph}$ ,  $\text{MeC}(\text{:NOH})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOH})\text{Me}$  and  $\text{MeC}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NOH})\text{Me}$  with  $\text{HNO}_3$  (cf. Vianello, C. A. 26, 4053). III is an isomer of the dioxime (IV), m. 156°, formed by the action of  $\text{Na}_2\text{CO}_3$  on phenylchloroglyoxime.  $\text{Ph}[\text{C}(\text{:NOH})]_2\text{Ph}$ , previously prepd. from IV by reduction with Zn and  $\text{AcOH}$  or with  $\text{PhHNH}_2$  (cf. C. A. 18, 661; Borino, C. A. 21, 1098), is also formed by reduction of IV with  $\text{SnCl}_2$  in a mixt. of glacial  $\text{AcOH}$  and concd.  $\text{HCl}$ . On the other hand, III is not reduced by any of these reagents. In hot 5%  $\text{NaOH}$ , III, II and I yield on acidification  $\text{PhC}(\text{:NOH})\text{C}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{Ph}$  (cf. C. A.

27, 3708). It is also formed by heating in 5%  $\text{NaOH}$  (contg.  $\text{EtOH}$ ) a compd. m. 139°, which was earlier thought to be  $[\text{PhC}(\text{:NOBz})\text{CNO}]_2$  (cf. C. A. 26, 708), but which is instead a *di-Bz* deriv. of dibenzoylfuroxan dioxime,  $\text{PhC}(\text{:NOBz})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOBz})\text{Ph}$ . When fused or in boiling dil.  $\text{HCl}$  the acid at 120° inhibits the formation of resin, III forms  $\text{Ph}(\text{C}_2\text{N}_2\text{O})_2(\text{C}_2\text{N}_2\text{O})\text{Ph}$  (cf. C. A. 27, 3708). If in all the peroxides, the  $\text{C}_2\text{N}_2\text{O}$  group had the furoxan  $[(\text{C}_2\text{N}_2\text{O})\text{O}]$  structure, then on the geometric isomerism theory III and IV would be 2 forms of dibenzoylfuroxan dioxime. However, their behavior is too different to be accounted for by spatial differences in the NOH groups. They are probably structural isomers, which would be in accord with earlier results on  $\text{Bz}(\text{C}_2\text{N}_2\text{O})_2\text{Bz}$  (cf. C. A. 26, 5564). In this case III would be dibenzoylfuroxan dioxime,  $\text{Ph}(\text{HON})$ :-

$\text{CC}(\text{:N O N}(\text{:O}))\text{CC}(\text{:NOH})\text{Ph}$ , while III would be 4,5-dibenzoyl-1,2,3,6-dioxdiazine dioxime,  $\text{Ph}(\text{HON})$ :-

$\text{CC}(\text{:N O O N}(\text{:O}))\text{CC}(\text{:NOH})\text{Ph}$ . This would explain the isomerism of methylaryl peroxides studied by P. and Milone (cf. C. A. 23, 3665; Milone, C. A. 25, 955; 26, 5564) and of the dioximes prepd. from  $\text{MeC}(\text{:NOH})\text{C}(\text{:NOH})\text{Cl}$  and  $\text{MeC}(\text{:NOH})\text{C}(\text{:NOH})\text{NO}_2$  by Vianello (cf. C. A. 26, 4053). The transformations of III are very complicated, and it is possible that further investigations will show fallacies in the present interpretations. However, it is certain that the furazan ring,  $(\text{C}_2\text{N}_2\text{O})$ , is much less stable than has been generally believed; in fact, since in III and in  $\text{PhC}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NOH})\text{Ph}$  the  $\text{C}_2\text{N}_2\text{O}$  ring is displaced from the center to the end of the aliphatic chain, it is easily opened and reformed in new positions. By the procedure used in prep. I,  $\alpha$ -*p*-tolylglyoxime yields the *di-Ac* deriv. of *di-p*-tolylfuroxan dioxime,  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOAc})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOAc})\text{C}_6\text{H}_4\text{Me-p}$  (V), m. 136°. The mother liquor yields an unidentified compd., m. 111°, which is not a monomer. V was obtained by Avogadro (cf. C. A. 18, 1401) and believed to be  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOAc})\text{CNO}$ . In hot 5%  $\text{NaOH}$  (contg.  $\text{EtOH}$ ), V yields on acidification  $\alpha$ -*p*- $\text{MeC}_6\text{H}_4\text{C}(\text{:NOH})\text{C}(\text{:NOH})(\text{C}_2\text{N}_2\text{O})\text{C}_6\text{H}_4\text{Me-p}$  (VI) (cf. C. A. 27, 3708). VI is also formed from a compd., m. 174°, which was earlier believed to be  $[p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOBz})\text{CNO}]_2$  (cf. C. A. 26, 708), but which should now be considered to be a *di-Bz* deriv. of *di-p*-tolylfuroxan dioxime,  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOBz})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOBz})\text{C}_6\text{H}_4\text{Me-p}$ . When the diacyl derivs. are heated with alc.  $\text{PhHNH}_2$ , they lose 1 extranuclear O atom of the  $[(\text{C}_2\text{N}_2\text{O})\text{O}]$  ring, while the 2  $(\text{:NOCOR})$  groups are replaced by  $(\text{:NNHPh})$  residues, with the final formation of furazan *o*-azones. These latter are not, as might be expected, the already known *o*-azones of diarylfurazans, i. e.,  $\text{ArC}(\text{:NNHPh})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NNHPh})\text{Ar}$ , but isomers which are *o*-azones of aroylformylarylfurazans,  $\text{ArC}(\text{:NNHPh})\text{C}(\text{:NNHPh})(\text{C}_2\text{N}_2\text{O})\text{Ar}$ , since the furazan group is easily displaced to the end of the chain in all the compds. studied in the present work and earlier. Either  $\text{PhC}(\text{:NOAc})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOAc})\text{Ph}$  or  $\text{PhC}(\text{:NOBz})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOBz})\text{Ph}$  form, on addn. of excess, dil.  $\text{AcOH}$ , benzoylformylphenylfuroxan *o*-azone,  $\text{PhC}(\text{:NNHPh})\text{C}(\text{:NNHPh})(\text{C}_2\text{N}_2\text{O})\text{Ph}$  (VII), brown-yellow, m. 177–8°; like  $\text{PhC}(\text{:NNHPh})(\text{C}_2\text{N}_2\text{O})\text{C}(\text{:NNHPh})\text{Ph}$  (VIII), it is not hydrolyzed by acids or bases. According to Angeli (*Ber.* 26, 529 (1893)), VII m. 172°, but prepd. otherwise in the present work, viz. by heating alc.  $\text{Bz}(\text{C}_2\text{N}_2\text{O})\text{Bz}$  with  $\text{PhHNH}_2$ ,  $\text{HCl}$ , it m. 175–6°. A mixt. of VII and VIII m. 150–60°, so that they are different compds. Prepd. similarly to VII, but from  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOAc})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOAc})\text{C}_6\text{H}_4\text{Me-p}$ , or  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NOBz})[(\text{C}_2\text{N}_2\text{O})\text{O}]\text{C}(\text{:NOBz})\text{C}_6\text{H}_4\text{Me-p}$ , *p*-tolylformyl-*p*-tolylfuroxan *o*-azone,  $p\text{-MeC}_6\text{H}_4\text{C}(\text{:NNHPh})\text{C}(\text{:NNHPh})(\text{C}_2\text{N}_2\text{O})\text{C}_6\text{H}_4\text{Me-p}$ , is brown-orange, m. 179°. Its isomer is already known (cf. De Paolini, C. A. 22, 578). In general the work proves the facility with which dioximes of diarylfuroxans and their diacyl derivs. are transformed into derivs. of aroylformylarylfurazans. CI. M. Milone.

*Ibid.* 744-6.—Though there are numerous data on the transformation of labile compds., including oximes, to stable geometric isomers by sunlight, no data are available on even the simplest dioximes. Most aromatic glyoximes exist in a form characterized by complex Ni salts of the  $(\text{DH})_2\text{Ni}$  type, which can be detd. with precision. The present work shows that ultra-violet radiation (Gallois Hg-vapor lamp, 4000 c. p., 50 cm. distance) isomerizes the  $\alpha$ - and  $\gamma$ -forms of certain glyoximes, both in the solid state and in dil. EtOH, at 18° to the  $\beta$ -forms, from which the  $(\text{DH})_2\text{Ni}$  salts can be obtained. This is the same phenomenon which is brought about by heat and chem. reagents. The isomerization is also promoted by sunlight but very slowly, while Wood light (3650 Å.) is ineffective. Isomerization is more rapid in 30-40% EtOH than in the solid state, as shown by the following data, which give the hrs. exposure and the percentage of  $\beta$ -compd. formed from EtOH and the hrs. exposure and percentage from the solid state, resp.:  $\alpha$ -phenylglyoxime, 23, 44.8; 17, 20.7;  $\alpha$ -*p*-tolylglyoxime, 22, 38.8; 19, 20.2;  $\alpha$ -methylphenylglyoxime, 21, 30.3; 19, 15;  $\alpha$ -diphenylglyoxime, 20, 29; 20, 15.9;  $\gamma$ -diphenylglyoxime, 28, 41; 10, 22.4. In sunlight behind glass,  $\alpha$ -phenylglyoxime yielded only 0.93% of  $\beta$ -compd. after 16 months. CII. E. Durio. *Ibid.* 747-51.—Nothing has been known about the behavior of sym. and asym. glyoximes with  $\sigma\text{-C}_6\text{H}_4(\text{NH}_2)_2$  (I). Since  $\text{AcC}(:\text{NOH})\text{I}$  and  $\text{BzC}(:\text{NOH})\text{I}$  react with I to form 2-methyl- and 2-phenylquinoxaline, resp., there may be a general reaction:  $\text{I} + \text{H}(\text{HON}:\text{O})\text{CC}(:\text{O})\text{R} \rightarrow$

$\text{C}_6\text{H}_4\text{N}:\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{CR}:\text{N} + 2\text{NH}_2\text{OH} + \text{H}_2\text{O}$ , and corresponding a general reaction of glyoximes thus:  $\text{I} + \text{HO}-$

$\text{N}.\text{CRC}(:\text{NOH})\text{R}(\text{or R}') \rightarrow \text{C}_6\text{H}_4\text{N}:\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{CR}:\text{N} + 2\text{NH}_2\text{OH}$ . Expts. with various sym. and asym. glyoximes show, however, that none reacts with I, and that there is no difference between the  $\alpha$ - and  $\beta$ -form of the same glyoxime. Likewise,  $\text{MeC}(:\text{NOH})\text{Rz}$  and  $\text{PhC}(:\text{NOH})\text{Ac}$  fail to react with I. On the contrary, chloroglyoximes react easily with 2 mols. of I, with formation of quinoxalines in which 1 of the substituents is the  $\text{HNC}_6\text{H}_4\text{NH}_2$  residue, thus:  $2\text{I} + \text{HON}:\text{CCIC}(:\text{NOH})\text{R} \rightarrow$

$\text{C}_6\text{H}_4\text{N}:\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{CR}:\text{N} + 2\text{NH}_2\text{OH} + \text{HCl}$ . The same quinoxalines are formed from chloroantrosos ketones, thus:  $2\text{I} + \text{HON}:\text{CCIC}(:\text{O})\text{R} \rightarrow$

$\text{C}_6\text{H}_4\text{N}:\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{CR}:\text{N} + \text{NH}_2\text{OH} + \text{H}_2\text{O} + \text{HCl}$ , and are basic compds. which can be acetylated and hydrolyzed by HCl to the corresponding hydroxyquinoxalines.  $\alpha\text{-HC}(:\text{NOH})\text{C}(:\text{NOH})\text{Cl}$  does not react with I, which confirms the doubt already expressed regarding its structure (cf. C. A. 25, 70). On the other hand, alc.  $\beta\text{-IC}(:\text{NOH})\text{C}(:\text{NOH})\text{Cl}$  and excess I form directly 3-phenylenediaminoquinoxaline,

$\text{C}_6\text{H}_4\text{N}:\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{CII}:\text{N}$ , greenish yellow, decomp. 160-70°; it gives red solns. in very dil. acids and is decompd. by bases. Alc.  $\text{AcC}(:\text{NOH})\text{Cl}$  or  $\text{MeC}(:\text{NOH})\text{C}(:\text{NOH})\text{Cl}$  and excess I yield, after purification with dil. HCl and NaOAc, 2-methyl-3-phenylenediamino-

quinoxaline,  $\text{C}_6\text{H}_4\text{N}:\text{C}(\text{Me})\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{N}$ , brown-yellow, m. 242° (decompn.); its solns. in very dil. acids are red. Prolonged heating in 20% HCl yields

$\text{C}_6\text{H}_4\text{N}:\text{C}(\text{Me})\text{C}(\text{OH})\text{N}$  and I.  $\text{BzC}(:\text{NOH})\text{Cl}$  or  $\text{PhC}(:\text{NOH})\text{C}(:\text{NOH})\text{Cl}$ , heated with I, and purified with HCl and NaOAc, yield 2-phenyl-3-phenylenediaminoquinoxaline, yellow, decomp. 217-8°; in warm  $\text{Ac}_2\text{O}$  it

forms an *Ac deriv.*,  $\text{C}_6\text{H}_4\text{N}:\text{C}(\text{Ph})\text{C}(\text{NHC}(\text{C}_6\text{H}_4\text{NH}_2-\sigma))\text{N}$ , yellow, m. 155-6° (decompn.), which hydrolyzes in dil. HCl at room temp.  $\beta\text{-MeC}_6\text{H}_4\text{COC}(:\text{NOH})\text{Cl}$  (II) or  $\beta\text{-MeC}_6\text{H}_4\text{C}(:\text{NOH})\text{C}(:\text{NOH})\text{Cl}$  and I give 2-*p*-tolyl-3-phenylenediaminoquinoxaline, yellow, m. 217° (decompn.). II, described by Rheinboldt and Schmitz-

Dumont (C. A. 20, 300), can be prepd. more conveniently by treating  $\beta\text{-MeC}_6\text{H}_4\text{COC}(:\text{NOH})\text{H}$  in glacial AcOH with Cl under the conditions used for  $\text{BzC}(:\text{NOH})\text{Cl}$  (cf. C. A. 26, 2733). Contrary to Richter-Anschütz (cf. Chemie der Kohlenstoffverbindungen, 12th Ed. 1930, p. 300), quinoxalines are formed by the action of I, not on all oximes of 1,2-dicarboxylic compds., but only on monoximes of  $\alpha$ -keto aldehydes. C. C. Davis

Guanazole. R. Stollé and W. Dietrich. J. prakt. Chem. 139, 193-210 (1934).—For purposes of naming the compds. described in this paper, guanazole (I) is assumed to be  $\text{H}_2\text{NC}:\text{N}:\text{N}:\text{C}(\text{NH})\text{NH}$ . I (2 g.) and 2.4 g.

$\text{AmNO}_2$  in EtOH give a mono-NO deriv (3-amino-5-nitrosoamino-1,2,4-triazole), canary-yellow, decomp. about 172°; warming with AcOH causes the splitting off of  $\text{HNO}_2$ ; with concd. HCl it rearranges to 3-amino-1,2,4-triazole-5-diazonium chloride. I (5 g.) in 28.5 cc. 7 N EtOH-HCl and 11.7 g.  $\text{AmNO}_2$  give 6.5 g. of the *di-NO deriv.* (3,5-dinitrosoamino-1,2,4-triazole) (II), orange-red, amorphous, decomp. 187°. Reduction of II with  $\text{SnCl}_2$  and concd. HCl gives 3-amino-5-hydrazino-1,2,4-triazole *di-HCl* (III), m. 217° (decompn.), which reduces Fehling soln. and  $\text{NH}_4\text{OH-AgNO}_3$  in the cold;  $\text{FeCl}_3$  gives a blue-violet color; with excess  $\text{BzH}$  there results 3-benzaldehydeamino-5-benzalhydrazino-1,2,4-triazole,  $\text{PhCH}(\text{OH})\text{NHC}:\text{N}:\text{N}:\text{C}(\text{NH}:\text{CHPh})\text{NH}$ , pale yel-

low, m. 232°; with EtOH-AgNO<sub>3</sub> there results a canary-yellow ppt.; dil. HCl splits off BzH; heating 2 hrs. at 139° in a vacuum drying app. gives the 3-benzal-amino deriv., citron-yellow, m. 232°. With NaNO<sub>2</sub> the ice-cold aq. soln. of III gives 5-azido-3-nitrosoamino-1,2,4-triazole, ochre, amorphous, detonates at 134°; HCl gives a diazonium chloride; in the presence of HCl, coupling with  $\beta\text{-C}_6\text{H}_4\text{OH}$  gives 5-azido-3-[(2-hydroxy-1-naphthyl)-azo]-1,2,4-triazole, orange, m. 105°; concd.  $\text{H}_2\text{SO}_4$  gives a violet, alkali a red soln.; the 3-(4-dimethylamino-1-benzene)azo deriv., Bordeaux-red, decomposes 185°. The diazo soln. of I (10 g. I, 21 g. NaNO<sub>2</sub> and 200 cc. concd. HCl) on heating gives 8 g. 3,5-dichloro-1,2,4-triazole, m. 148°, and a compd., possibly 3-amino-5-chloro-1,2,4-triazole-HCl, m. 112°. Coupling of the diazo soln. with PhOH gives a mixt. of 3,5-bis(4-hydroxyphenylazo)-1,2,4-triazole (IV) and 3-amino-5-(4-hydroxyphenylazo)-1,2,4-triazole-HCl (V), sep'd. by extn. of V with hot H<sub>2</sub>O. IV, cinnamon-red, m. 270° (decompn.), could not be crystd. IV (10 g.) and 50 g.  $\text{Ac}_2\text{O}$ , boiled 2 hrs., give 7.5 g. of the *di-Ac deriv.* (VI), orange, m. 235°; when 3.1 g. IV and 80 g.  $\text{Ac}_2\text{O}$  are boiled 15 hrs., there results the 4-*Ac deriv.* of VI, cinnamon-red, m. 107°. V, yellow-red, crystals with 1 mol. H<sub>2</sub>O, decomp. about 240°; the free base, ochre, m. 286° (decompn.), crystals with 1 mol. H<sub>2</sub>O. I (3 g.) and 30 g.  $\text{Ac}_2\text{O}$ , boiled 3 hrs., give a 3,5-di-Ac deriv., does not m. 300°. The 3,5-di-Bz deriv. m. 300° (decompn.). I (3 g.) and 0.4 g. BzH, heated 0.5 hr. on the water bath, give the monobenzal deriv., yellow, m. 234°. I (4 g.) in 80 cc. 2 N HCl, treated with 100 cc. 65% HNO<sub>3</sub>, gives a dinitrate of I, pale yellow, decomp. at 145°. I (5 g.) in 200 cc. bleaching powder soln. contg. 7% perchloron gives 7 g. of 3,5-dichloroimino-3,5-dihydro-1,2,4-triazole,  $\text{ClN}:\text{C}:\text{N}:\text{N}:\text{C}(\text{NCl})\text{NH}$ , amorphous, yellow, detonates

at 135°  $\beta\text{-C}_6\text{H}_7\text{NH}_2$  gives a brown-red dye, m. 285°, which gives a diazo soln., coupling in alk. soln. with  $\beta\text{-C}_6\text{H}_4\text{OH}$  and R salt. Aminoguanazole (triamino-1,3,4-triazole) yields a benzal deriv., yellow, m. 184°; the diazo soln. couples with alk.  $\beta\text{-C}_6\text{H}_4\text{OH}$  to give a violet dye. A dibenzal compd. is also formed in the above reaction. C. J. West

Synthetic experiments with methyltrihydroxybenzenes. I. Synthesis of 2,6-dimethylpolyhydroxyflavanones. Shin-ichiro Fujise and Sekio Mitsui. Bull. Chem. Soc. Japan 9, 24-6 (1934); cf. C. A. 27, 4233; Shinoda and Sato, C. A. 23, 4210.—Two g. 2,4-dimethylphloroglucinol, m. 162-3°, with 3.45 g. piperonylacrylyl chloride and 6 g.  $\text{AlCl}_3$  in  $\text{PhNO}_2$  give a tar which on extn. with dil.

alc. NaOH yields 0.2 g. 5,7-dihydroxy-6,8-dimethyl-3',4'-methylenedioxyflavanone, m. 207°, together with an isomeric yellow compd., m. 222-3°, which gives no flavanone reaction and may be a chalcone deriv. The same reaction with carbethoxyferulyl chloride (the free acid m. 178°) yields 0.3 g. 5,7-dihydroxy-6,8-dimethyl-3'-methoxy-4'-hydroxyflavanone, yellow needles, m. 254.5-5.5°, giving a dark green color with FeCl<sub>3</sub> and cherry-red with Mg and HCl. Absorption spectra of these flavanones are given. H. A. Beatty

**Synthesis of flavones at room temperature.** H. S. Mahal and K. Venkataraman. *Current Sci.* 2, 214-15 (1933).—NaNH<sub>2</sub> converted 2-acetyl-1-naphthyl benzoate in Et<sub>2</sub>O into 2-acetyl-1-naphthol (I). Treatment of I with cold concd. H<sub>2</sub>SO<sub>4</sub> gave α-naphthoflavone. Since these reactions occurred below 16°, the reaction is of obvious phytochem. significance. C. H. Peet

**Ononin.** II. Fritz Wessely, Franz Lechner and Konstantin Dinjaski. *Monatsh.* 63, 201-9 (1933); cf. C. A. 25, 3327.—Ononin yields a tetra-Ac deriv., C<sub>20</sub>H<sub>20</sub>O<sub>11</sub>, m. 182.5°. Formononetin, C<sub>16</sub>H<sub>14</sub>O<sub>8</sub>, m. 265°; the Ac deriv. m. 170° and the Me deriv. m. 156-60°. These compds. show no depression in m. p. when mixed with the isoflavone derivs. previously described. 2,4-(HO)-C<sub>6</sub>H<sub>3</sub>COCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe-p and α-acetobromoglucose give a compd. identical with natural onospin; the Me deriv., on hydrolysis, gives 4,2-HO(MeO)C<sub>6</sub>H<sub>3</sub>COCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe, m. 173°, which was synthesized from m-HOC<sub>6</sub>H<sub>4</sub>OMe and p-MeOC<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>CN with ZnCl<sub>2</sub> and HCl. C. J. W.

**The yellow dahlia pigment.** Leopold Schmid and Ludwig Haschek. *Monatsh.* 62, 317-22 (1933).—In addn. to apigenin yellow dahlia blooms contain an isomeric pigment, dahlia II. It is not a flavonol nor is it a chalcone deriv. It gives a red color with alkalis. Its Me deriv. is identical with that of apigenin and yields the latter on demethylation. Ac<sub>2</sub>O converts it into a tri-Ac compd., m. 182°, identical with triacetylapiogenin and capable of yielding apigenin upon sapon. Its absorption spectrum is different from that of apigenin. It may be a dimorph of apigenin, but if so should yield phloroglucinol when subjected to decompn. by alkali; none of this substance has been observed, but p-HOC<sub>6</sub>H<sub>4</sub>COMe is formed. It may be a stereoisomer, or even a position isomer, of apigenin easily convertible into the latter. The material at hand did not suffice to permit the isolation of intermediate products of detd. structure, the possible syntheses of which would test the latter view. G. A. H.

**The volatile base of valerian roots.** A. E. Chichibabin and M. P. Oparina. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 119-20 (in English 121-2) (1934).—Dry valerian roots (2 kg.) were treated with HCl, steam-distd. with soda, acidified and extd. with ether; the acid aq. portion was made alk., extd. with ether, dissolved in alc. and picric acid added. Recrystn. from hot alc. gave 0.24 g. picrate, C<sub>10</sub>H<sub>11</sub>N<sub>3</sub>C<sub>6</sub>H<sub>5</sub>(NO<sub>2</sub>)<sub>3</sub>OH. The free base with HCl and H<sub>2</sub>PtCl<sub>6</sub> gave the chloroplatinate (C<sub>10</sub>H<sub>11</sub>NHCl)<sub>2</sub>PtCl<sub>6</sub>. The free base is a colorless oil at 0°, insol. in H<sub>2</sub>O, has a pyridine homolog odor, gives ppts. with HgCl<sub>2</sub> or I<sub>2</sub> in KI and slowly reacts with KMnO<sub>4</sub>. F. H. Rathmann

**2,6-Dimethylpyridine.** Alvin Singer and S. M. McElvain. *Org. Syntheses* XIV, 30-3 (1934).—Detailed directions are given for the condensation of AcCH<sub>2</sub>CO<sub>2</sub>Et, HCHO and NH<sub>3</sub> with Et<sub>3</sub>NH to 1,4-dihydro-3,5-dicarbethoxy-2,6-dimethylpyridine (84-9% yield), oxidation with HNO<sub>3</sub> in H<sub>2</sub>SO<sub>4</sub> to 3,5-dicarbethoxy-2,6-dimethylpyridine, its hydrolysis and distn. of the Ca salt giving 30-6% 2,6-dimethylpyridine (based on the AcCH<sub>2</sub>CO<sub>2</sub>Et used). C. J. West

**Reaction of organic halides with piperidine.** IV. Bromo esters. W. V. Drake and S. M. McElvain. *J. Am. Chem. Soc.* 56, 697-700 (1934); cf. C. A. 27, 1884.—The rate and course of the reaction of 13 Br esters with piperidine have been detd. and from the results obtained mechanism for the elimination of halogen acid and for the reaction involving replacement of the halogen by the piperidine (I) radical have been suggested. Results are given for BrCH<sub>2</sub>CO<sub>2</sub>Et, MeCHBrCO<sub>2</sub>Et, EtCHBr-

CO<sub>2</sub>Et, Me<sub>2</sub>CBrCO<sub>2</sub>Et, Br(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>Et, Br(CH<sub>2</sub>)<sub>3</sub>CO<sub>2</sub>Et, Br(CH<sub>2</sub>)<sub>4</sub>CO<sub>2</sub>Et, BrCH<sub>2</sub>CHMeCO<sub>2</sub>Et, MeCHBrCH<sub>2</sub>CO<sub>2</sub>Et, MeCHBr(CH<sub>2</sub>)<sub>2</sub>CO<sub>2</sub>Et, MeCHBr(CH<sub>2</sub>)<sub>3</sub>CO<sub>2</sub>Et, MeCHBr(CH<sub>2</sub>)<sub>4</sub>CO<sub>2</sub>Et and MeCHBr(CH<sub>2</sub>)<sub>5</sub>CO<sub>2</sub>Et at 90° for periods from 0.25 to 168 hrs. With certain exceptions the order of reactivity as detd. by the amt. of I. HBr produced in a given time is primary > secondary > tertiary, the same as with the alkyl bromides. There is, however, a general activating effect of the CO<sub>2</sub>Et group which is quite marked when this group is close to the halogen and persists even when the halogen is in the β-position. The esters contg. the Br in the β-position are definitely the most reactive. Even though these esters give mainly *tert* amines with I, their high reactivities indicate that the reaction product is not the result of a simple replacement reaction; the reaction is probably the formation of an unsatd. ester, which then adds I. Org. bromides may undergo 2 distinctly different and, in some cases, simultaneously occurring reactions with I, (a) the replacement of the halogen by the piperidine radical with the formation of a *tert* amine and (b) the elimination of HBr with the formation of an unsatd. compd. With the exception of the β-Br esters, the order of reactivity for reaction (a) is primary > secondary > tertiary, while for reaction (b) the order is reversed. The mechanism of the reaction of the β-Br esters is discussed in detail. The following HCl salts of *piperidino* esters were prepd., in which N is C<sub>4</sub>H<sub>9</sub>N and Y is CO<sub>2</sub>Et: NCH<sub>2</sub>Y, m. 130-1°, MeCHN<sup>+</sup>Y<sup>-</sup>, m. 131-2°; EtCHN<sup>+</sup>Y<sup>-</sup>, m. 118-4°; N(CH<sub>2</sub>)<sub>2</sub>Y, m. 163-4°; N(CH<sub>2</sub>)<sub>3</sub>Y, m. 128 0°; N(CH<sub>2</sub>)<sub>4</sub>Y, m. 154 5°; NCH<sub>2</sub>CHMeY, m. 134 5°; MeCHNCH<sub>2</sub>Y, m. 177-8°; MeCHN(CH<sub>2</sub>)<sub>2</sub>Y, m. 128-9°; MeCHN(CH<sub>2</sub>)<sub>3</sub>Y, m. 135-6°; MeCHN(CH<sub>2</sub>)<sub>4</sub>Y, m. 121 2°; MeCHN(CH<sub>2</sub>)<sub>5</sub>Y, m. 116 7°. C. J. West

**Quinoline derivatives. XLIV. Synthesis of α-arylated 2-phenylquinolyl-4'-β-aminoacetic acids.** Hanns John and Ernst Pietsch. *J. prakt. Chem.* 139, 237 41 (1934); cf. C. A. 28, 2356°.—2-Phenyl-4'-β-aminoquinoline, NaCN and BzH give 2-phenylquinolyl-4'-β-(α-phenyl)aminoacetic acid, C<sub>16</sub>H<sub>14</sub>N<sub>2</sub>CH<sub>2</sub>NHCHPhCO<sub>2</sub>H, yellow, m. 178 80° (Et ester, m. 173°); the α-p-tolyl deriv., m. 158 62° (Et ester, m. 95°); the α-p-isopropylphenylene deriv., orange, m. 102-5°; the α-benzyl deriv., m. 120°; the α-ethyl-ω-phenyl deriv., yellow, m. 170-90°. XLV Derivatives of 2-phenyl-4-quinolyl-β-aminoacetic acid II. John and Georg Behmel. *Ibid.* 284 8.—2-Phenyl-4-quinolyl-β-aminoacetic acid, PhC<sub>6</sub>H<sub>4</sub>NNHCH<sub>2</sub>CO<sub>2</sub>H, yields a *Pr* ester, m. 91° (HCl salt, m. 180-2°, soly. in H<sub>2</sub>O at room temp. about 0.5%); the *Bu* ester m. 74.5° (HCl salt, m. 181°, soly. 0.7%); *iso-Bu* ester, m. 105° (HCl salt, m. 130°, soly. 1%); *iso-Am* ester, m. 76° (HCl salt, m. 140°, soly. 0.5%); *Ph* ester, m. 108° (HCl salt, m. 232° (decompu.)); *benzylamide*, m. 187°; *p-phenetide*, m. 127°; *α-pyridineamide*, m. 233°; *piperidide*, m. 192°. C. J. West

**The synthesis of β-aryl-β-uraminopropionic acids and their phenyl and naphthyl derivatives.** V. M. Rodionov and S. A. Vyazkova. *J. Gen. Chem. (U. S. S. R.)* 3, 628-35 (1933).—A soln. of 2 g. β-phenylalanine (I) in 40 cc. hot H<sub>2</sub>O heated on a water bath for 4 hrs. with 1.5 g. KCNO gave on cooling, filtering, acidification of the filtrate with HCl to Congo red paper, and standing for 10-12 hrs., 80% of β-phenyl-β-uraminopropionic acid (V), m. 190° from hot EtOH. β-Piperonylalanine (II) (5 g.) and 3.5 g. KCNO similarly gave 80% of β-piperonyl-β-uraminopropionic acid (VIII), m. 176°, from EtOH. Addn. of 3 g. PhNCO with const. cooling and stirring to a soln. of 4 g. I in 32 cc. of 1 N NaOH (the mixt. is allowed to react until the odor of PhNCO and the superficial scum has disappeared) and acidification with HCl to Congo red gave 97% of β-phenyl-β-phenyluraminopropionic acid (VII), m. 170° from EtOH, insol. in H<sub>2</sub>O, EtO and CHCl<sub>3</sub>. II (5 g.) in 50 cc. of 1 N NaOH and 3.2 g. PhNCO similarly gave 98% of β-piperonyl-β-phenyluraminopropionic acid (III), m. 165° from EtOH. III (3 g.) in 18 cc. abs. EtOH satd. with HCl and warmed at 40-50° for 0.5 hr. gave a viscous yellow soln. which

on dilg. with  $H_2O$  gave 57% of the Et ester of III, m. 65°. An excess of  $C_{10}H_7NCO$  added with const. shaking to 3 g. I in 120 cc.  $H_2O$  and 30 cc. 1 N NaOH gave after 0.5 hr. a ppt. of  $(C_{10}H_7NH)_2CO$  which was filtered out. Acidification of the filtrate with HCl gave  $\beta$ -phenyl- $\beta$ -naphthyluraminopropionic acid, m. 180° from EtOH. II (3 g.) in 180 cc.  $H_2O$  and 30 cc. 1 N NaOH and 3.2 g.  $C_{10}H_7NCO$  similarly gave  $\beta$ -piperonyl- $\beta$ -naphthyluraminopropionic acid (IV), m. 176° from EtOH. The Et ester of IV was prepd. in 31% yield, m. 105°. Attempts to esterify V resulted in the formation of 4-phenyl-4,5-dihydropyrimidine (VI). V (1 g.) in 350 g. HCl, d. 1.124, heated 0.5 hr. on cooling, gave VI, m. 218° from EtOH. By concg. the mother liquor a quant. yield of VI is obtained. VII (1 g.) in 400 g. concd. HCl, heated for 0.5 hr., on cooling gave 83% of 1,4-diphenyl-dihydropyrimidine, m. 224° from hot EtOH. The  $C_{10}H_7$  derivs. did not give dihydropyrimidines. VII (2 g.) in 15 cc. cold abs. EtOH satd. with HCl and heated on a water bath for 2 hrs. gave on standing 4-piperonyl-4,5-dihydropyrimidine, m. 225°. Lewis W. Sutz

Reaction of benzoyl chloride and  $\alpha$ -naphthylamine. K. Dzienowski and L. Sternbach. *Bull. intern. acad. polonaise, Classe sci. math. nat.* 1933A, 416-31.—Ten g.  $\alpha$ - $C_{10}H_7NH_2$  (I), heated at 175-80° with 15-20 cc.  $BzCl$  for 5 min. with gradual addn. of 5 g.  $ZnCl_2$  gave 1-benzoyl-amino-4-benzoylnaphthalene (II), m. 178° (crystd. from AcOH), which on alk. sapon. gave 1-amino-4-benzoylnaphthalene (III), m. 103-6° ( $C_8H_6$ ); *picrate*, m. 142°. III on diazotization and coupling in the presence of NaOAc with  $\beta$ - $HOC_{10}H_7$  gave 4-benzoyl-2'-hydroxy-1,1'-azonaphthalene, m. 220° ( $PhNO_2$ ). III coupled with  $PhN_2Cl$  gave 1-amino-2-benzoyl-4-benzoylnaphthalene, m. 209-10° (AcOH), which with  $Na_2S_2O_4$  gave 4-benzoyl-1,2-naphthylenediamine, m. 198° (alc.), in which the relative positions of the  $NH_2$  groups were shown by condensation with phenanthraquinone to give phenanthrobenzoylnaphthiazine, m. 252-5° (AcOH). II on further heating at 190° with  $BzCl$  and  $ZnCl_2$  gave 1-benzoylamino-2,4-dibenzoylnaphthalene, m. 224-6° (AcOH). I (200 g.) was heated with 300 cc.  $BzCl$  at 180° with gradual addn. of 120 g.  $ZnCl_2$  until the evolution of HCl moderated and then heated for 2 hrs. at 240°. Extn. of the reaction mass with boiling HCl and AcOH left the  $ZnCl_2$  salt of 2,4-diphenyl-3-1'-naphthyl-7,8-benzoquinazolinium chloride (IV), m. above 310° ( $PhNO_2$ ). IV also resulted from fusion of II with  $BzCl$  and  $ZnCl_2$  at 180° for 1 hr. and from iso-1-benzoylamino-2-benzoylnaphthalene (V) with I and  $ZnCl_2$  for 10 min. IV warmed with 50% alc. KOH gave 2,4-diphenyl-3- $\alpha$ -naphthyl-4-hydroxy-7,8-benzo-3,4-dihydroquinazoline (VI), m. 184° ( $C_8H_6$ ); *HCl salt*, m. 209°; *picrate*, m. 260-1°. VI on crystn. from EtOH gave the Et ether, m. 224° (*HCl salt*, m. 202°) and from MeOH gave the Me ether, m. 193°. VI on warming to 200° passed into a yellow isomer, m. 265°, and on refluxing with alc. HCl the pyrimidine ring was ruptured with the formation of V and I. On refluxing in  $PhNO_2$  for 30 min. VI gave 2,4-diphenyl-2-hydroxy-3- $\alpha$ -naphthyl-7,8-benzo-2,3-dihydroquinazoline (VII), m. 265° ( $PhNO_2$ ), which on short warming with alc. HCl gave V or the cyclized isomer, 4,5-naphtho-2,6-diphenyl-6-hydroxymetoxazine, m. 161-2° (alc.). V on sapon. gave 2-benzoyl-1-aminonaphthalene (VIII),  $b_p$  263-5° (*picrate*, m. 200-1°). This with  $Ac_2O$  gave 1-acetamido-2-benzoylnaphthalene, m. 194-5°, and with  $BzCl$  gave 1-benzoylamino-2-benzoylnaphthalene (IX), m. 202°. V with  $NH_4OH$  gave the oxime of IX, m. 211°, which on sapon. gave the oxime of VIII, m. 178°, and which by passage of dry HCl through its satd. soln. in  $Ac_2O$  for 1 hr. gave 3,7-diphenyl-4,5-naphtho[2',1']hept-1,2,6-oxadiazine, m. 188-9° ( $C_8H_6$ ); *HgCl\_2 salt*, m. 209°. IV in  $H_2O$  suspension treated with excess concd.  $NH_4OH$  gave 2,4-diphenyl-7,8-benzoquinazoline, m. 160° ( $C_8H_6$  alc.); *HgCl\_2 salt*, m. 212-5° decompn.; *picrate*, m. 168-70°. This was also prepd. from VI or VII and alc.  $NH_3$  in the cold or from V by heating in a sealed tube at 180° with alc.  $NH_3$  for 4-6 hrs. R. C. Elderfield

Bisbenzothiazine; several regularities in the formation

of thiazoles and thiazines. Georg Walter, Richard Hübsch and Hans Pollak. *Monatsh.* 63, 186 200 (1933).—A homogeneous product is not obtained by the action of  $o$ - $H_2NC_6H_4SNa$  (I) or  $[4,2-Cl(NH_2)C_6H_4S]_2Zn$  (II) upon dichloroquinoxaline, even in the presence of  $AlCl_3$ ;  $o$ - $H_2NC_6H_4SH$  gives diphenasinthiazine (III), yellow, m. 270°. I (2 mols.) and 1 mol.  $Cl_3CCOCl$  give 2'-amino-phenyl benzothiazole-3-thiocarboxylate (IV), reddish yellow, decompg. 160-70°; the presence of the  $NH_2$  group is shown by diazotizing and coupling with  $\beta$ - $C_{10}H_7OH$  (red dye); the CO group is indicated by the formation of a phenylhydrazone, m. 198°.  $ZnCl_2$  did not split off a mol. of  $H_2O$ ; the thiazole ring was indicated by the reaction with HI and P, CS,  $PhNH_2$  and ethenylamino-phenyl mercaptan being formed. II and  $Br_2CHCO_2H$ , heated 3 hrs. at 150°, give 2-(4'-chloro-2'-aminophenyl-mercapto)-6-chloro-3-ketodihydro-p-benzothiazine (V), m. 202°; phenylhydrazone, yellow, m. 210°.  $C_6Cl_4$  does not react with  $o$ - $H_2NC_6H_4SH$ ;  $(COCl)_2$  gives bisbenzothiazole (VI). 2,3-Diketodihydrobenzo-1,4-thiazine and  $o$ - $H_2NC_6H_4SH$ , heated 8 hrs. at 200°, give 13.3% of 1,1'-bisbenzothiazine (VII),  $C_{18}H_{12}N_4S_2$ , yellow, decompg. 301-5°,  $n$  1.42447 (for VI,  $n$  is 1.42407); the concd.  $H_2SO_4$  soln. is orange-red with fluorescence; *Br deriv.*, brown, decompg. 157°; *di-Br deriv.*, m. above 300°. The absorption spectra for VI and VII are given. Dichloroketodihydrobenzothiazine and  $o$ - $H_2NC_6H_4SH$  give a yellow compd., m. 204°, analyzing for  $C_{18}H_{12}O_2N_4S_4$ , for which no structural formula can be given at present. The results of this study indicate that acids and acid halides react with  $o$ - $H_2NC_6H_4SH$  to form  $\mu$ -substituted benzothiazoles; halogenated acid halides give aminophenylmercaptobenzothiazoles; monohalogenated acids give benzothiazines and polyhalogenated acids give aminophenylmercaptobenzothiazines.

C. J. West

Hydrastinine and its preparation from narcotine. K. Topchiev. *J. Applied Chem.* (U. S. S. R.) 6, 529-35 (1933).—Hydrocotarnine.—One kg. of air-dry cotarnine is dissolved in approx. 10 l. cold dil.  $H_2SO_4$  (9 l.  $H_2O$  and 1 l.  $H_2SO_4$  of d. 1.82) and 1 kg. of granulated Zn is added to the cold soln., the whole being slightly agitated for 24 hrs. The mixt. is filtered, the residue washed with small amts. of 5%  $NH_4OH$  and water and the filtrate and the wash waters are then poured into 6-7 l. of 25%  $NH_4OH$ . The residue is left for 12 hrs., filtered with suction and washed first with weak  $NH_4OH$ , then with  $H_2O$  and dried in air. The resulting hydrocotarnine contg. some water of crystn. is dried *in vacuo* on a water bath. The red sirup is filtered while hot through cloth, yielding finally about 750 g. of a solid vacuum-dry hydrocotarnine. Reduction of hydrocotarnine to hydrohydrastinine.—From 400 to 500 g. hydrocotarnine is dissolved in 5 vol. anhyd. AmOH, 600-750 g. Na is added and the mixt. is heated on an oil bath (178-180°) to 145-150°, 20 vols. of AmOH (in comparison to hydrocotarnine used) is introduced. The reaction should be carried out in 50 min.; the hot soln. is then carefully poured off the excess of Na and water (equal vol.) is carefully added to the soln. The AmOH layer is sepd. from the aq. layer after 10-12 hrs. and the AmOH is removed by vacuum distn. The residue is vacuum-distd., the portion  $b_p$  170-75° being collected. The higher- and lower-boiling fractions are combined and redistd. Oxidation of hydrohydrastinine to hydrastinine.—Two hundred g. hydrohydrastinine is dissolved in 0.5 l. alc. and 140 g. anhyd. NaOAc, the contents are heated to the b. p. of the alc. and 320 g. of I in 3.2 l. of alc. is introduced within

1 hr. through the reflux condenser. The mixt. is allowed to crystallize during 12 hrs., filtered by suction and the hydrastinine-HI is washed with 200-300 cc. alc., followed by drying. The yield of the HI salt and periodide of hydrastinine amounts to 300-400 g. *Hydrastinine base*.—From 300 to 400 g. of the oxidation product of hydrohydrastinine with I is dissolved in 3 vols. boiling H<sub>2</sub>O and the insol. periodide is filtered off. The filtrate is shaken until cold and converted to a finely cryst. mass; a cold soln. of 100 g. KOH in 200 cc. is then added, the shaking is continued and the sepd. base, after proper cooling for 0.5 hr., is filtered off with suction, washed with water and dried with air. The yield amounts to 100-110 g. *Hydrastinine-HCl*.—The hydrastinine base (650 g.) is dissolved in 1.5 l. cold alc., filtered from the insol. material, the ppt. is carefully washed with 0.5 l. cold alc. and alc. HCl is then added to the absolutely clear filtrate to a slightly acidic reaction with Congo red. If the acid contains 37-40% HCl about 300 cc. of the latter is needed. Three vols. of ether is added to the lukewarm soln. which is left standing for 12 hrs. The substance is then filtered with suction, washed with a mixt. of alc.-ether (1:3) and finally with ether, followed by drying first with air and then *in vacuo*. About 500-520 g. of the HCl salt, m. 212°, is thus obtained. The EtOH left from the above operation contains hydrastinine-HI and some of the hydrohydrastinine which was not oxidized. The alc. is distd. off to dryness and the residue is dissolved in hot H<sub>2</sub>O and is boiled with animal charcoal, filtered and some CaH<sub>2</sub> and NH<sub>4</sub>OH to a noticeable NH<sub>3</sub> odor are then added. The last 2 substances promote the sepn. of the entire hydrohydrastinine and hydrastinine-HI in a solid form. They are washed with alc. and dried. The alc. which contains the AcOH ester and AcOH is boiled with KOH on a reflux condenser and distd. off, a small amt. of H<sub>2</sub>SO<sub>4</sub> is then added (5 cc. H<sub>2</sub>SO<sub>4</sub> of d. 1.82 per l. of alc.) and the liquid is redistd. The AmOH is regenerated after distg. off the product of reaction with Na, is distd. and the fraction b. 128-32° is collected. The H<sub>2</sub>O contained in the alc. is used for decomp. the AmONa in a new portion of the product to be reduced. The periodide after grinding into fine powder, which cannot be dissolved with water, is added in small portions to the warm (50-60°) soln. of an equal amt. (by wt.) of Na hyposulfite and a double amt. of H<sub>2</sub>O. The sepd. S is filtered off and the hydrastinine-HI sepd. after 12 hrs. is filtered off by suction and finally converted into the base by the method described above, yielding about 70% of the hydrastinine base. A. A. B.

*Licorice extract and glycyrrhizic and glycyrrhetic acids*. Daniel Sanroma y Beovide. *Rev. acad. cienc. Madrid* 30, 555-76(1933).—K glycyrrhizate was prepd. from com. licorice ext. by Karrer's method (*C. A.* 15, 2427), then hydrolyzed by heating with 100 parts of 1% H<sub>2</sub>SO<sub>4</sub> for 2 hrs. at 140° in an autoclave, and the pptd. glycyrrhetic acid (I) collected on a filter. Glucuronic acid was recovered from the filtrate. The best solvent for crystg. I was found to be CCl<sub>4</sub>. White crystals m. 245° were obtained. When I was heated with Zn dust or Se powd. no C<sub>10</sub>H<sub>8</sub> was formed; hence it is concluded that the mol. does not contain the C<sub>10</sub>H<sub>8</sub> nucleus. L. E. G.

*Constitution of saponins. IV. Hederagenin and oleanolic acid* (3). Zenjiro Kitasato and Chuzaburo Sone. *J. Chem. Soc. Japan* 54, 461-74(1933).—See *C. A.* 27, 4807.

*Chlorophyll. XL. Oxoporphyrins*. The fine structure of chlorophyll *a*. Hans Fischer, Josef Riedmair and Johann Hasenkamp. *Ann.* 508, 224-49(1934); cf. *C. A.* 28, 1641.—Pheophorbide *a* (1 g.) in 100 cc. C<sub>6</sub>H<sub>5</sub>N, heated 5 hrs., gives 700 mg. of pyropheophorbide *a* (I), extd. with 15-16% HCl. I (100 mg.) in 100 cc. AcOH at room temp., treated with 0.1 cc. HI (d. 1.96) and, after 12 hrs., with 0.3 cc. HI, gives 60% of *oxyphytyloerythrin* (II), C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>8</sub>; *Me ester*, m. 275° (dioxime, brick-red, acid no. 7; *Fe complex*, C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>8</sub>FeCl). II and its dioxime are completely destroyed by Al-Hg; amalgamated Zn does not reduce II. II and MeOH-KOH in O<sub>2</sub> atm. give a tricarboxylic acid. Dihydro-

1 pheophorbide *a* reacts very slowly with HI in AcOH, while the leuco compd. of pheoporphyrin *a*<sub>1</sub> gives neg. results. Oxochloroporphyrin *a*<sub>1</sub> tri-Me ester yields an *oxime*, C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>7</sub>, brick-red, m. 257°. The degradation of pheophorbide *a* allomerized by I with HI at room temp. gives neopheoporphyrin *a*<sub>1</sub> (cf. below) and a new porphyrin extd. by 14% HCl, termed *oxoneopheoporphyrin a*<sub>1</sub>; on standing in 14% HCl for 24 hrs. there results *oxorhodoporphyrin*, acid no. 7; *Me ester*, C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>8</sub>, m. 274° (*oxime*, decomp. 268°, acid no. 6); reduction of the porphyrin gives principally rhodoporphyrin with Na in C<sub>6</sub>H<sub>5</sub>N-EtOH; EtOH-KOH gives *oxyrhodoporphyrin*. The oxo-reaction appears to be a general reaction for chlorophyll derivs. Methylpheophorbide *a* and NH<sub>4</sub>OH. HCl in C<sub>6</sub>H<sub>5</sub>N after 8-10 days give 88% of the *oxime* (III); with HI in AcOH at 65° there results pheoporphyrin *a*<sub>1</sub> *oxime*. Hydrolysis of III with HCl gives 30% chlorin *e* ester and also pyropheophorbide; purpurin was not observed. *Me chlorophyllide a* and *b* and NH<sub>4</sub>OH. HCl in C<sub>6</sub>H<sub>5</sub>N after 60 hrs. give III and possibly the *b* *oxime*! The position of the CO group in the oxo-compds. is discussed and several structural formulas are given. **XLI. Transformation of pheoporphyrin *a*<sub>1</sub> into pheoporphyrin *a*<sub>1</sub> and neopheoporphyrin *a*<sub>1</sub>**. H. Fischer and Josef Heckmaier. *Ibid.* 250-62.—Pheoporphyrin *a*<sub>1</sub> *Me ester* (I) in EtOH with I<sub>2</sub> and AcONa, warmed 0.5 hr. on the water bath, gives *neopheoporphyrin a*<sub>1</sub> *di-Me ester acetate* (II), m. 305° (Cu salt, m. 305° (decompn.)); hydrolysis with concd. H<sub>2</sub>SO<sub>4</sub> and esterification gives *neopheoporphyrin a*<sub>1</sub> *Me ester* (III), m. 276°. Hydrolysis of II with alkali in C<sub>6</sub>H<sub>5</sub>N-EtOH gives as the principal product allopheoporphyrin *a*<sub>1</sub> (IV) and a porphyrin spectroscopically identical with rhodoporphyrin- $\gamma$ -carboxylic anhydride. Oxidation of I with I and Na<sub>2</sub>CO<sub>3</sub> gives pheoporphyrin *a*<sub>1</sub> *ester*. Neopheoporphyrin *a*<sub>1</sub>, Ac<sub>2</sub>O and AcONa, heated 2 hrs. in a boiling water bath, give the *Ac deriv.* (V), m. 305°; the *p-nitrobenzoyl ester* of III m. 257°; the *Bz deriv.* m. 202° (cor.). Methylpheophorbide *a*, I and AcONa in abs. EtOH give the *Ac deriv.* of 10-hydroxymethylpheophorbide *a*, which yields V with HI and AcOH. Pheoporphyrin *a*<sub>1</sub> and 15% HCl give traces of IV, and as the main product, isopheoporphyrin *a*<sub>1</sub>. The lactone of chloroporphyrin *a*<sub>1</sub> *di-Me ester* with 30% oleum at room temp. for 3 days gives IV. The mono-*ester* with I and AcONa in EtOH give pheoporphyrin *a*<sub>1</sub>. Methylchlorophyllide *a* + *b* on allomerization gives pheoporphyrin *a*<sub>1</sub> *di-Me ester*. Isopheoporphyrin *a*<sub>1</sub> *di-Me ester* and 30% oleum for 24 hr. give pheoporphyrin *a*<sub>1</sub>. **XLII. Mesorhodin and its transformation to chlorophyllporphyrins, as well as its oxidation to phytyloerythrins**. H. Fischer and Josef Ebersberger. *Ibid.* 509, 19-37.—Mesoporphyrin *di-Me ester* (100 g.) in 300 cc. concd. H<sub>2</sub>SO<sub>4</sub>, treated with 325 cc. 20% oleum, gives 75% mesorhodin (I), C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>7</sub>, the *di-Me ester* m. 269°. Its *oxime* and that of I were prepd. Oxidation of I with KMnO<sub>4</sub> in NaOH-C<sub>6</sub>H<sub>5</sub>N gives rhodoporphyrin- $\gamma$ -carboxylic acid (II) and chloroporphyrin *a*<sub>1</sub> (III), identified by its *Me ester* and other derivs. II was also prepd. by passing O<sub>2</sub> through a soln. of III in 1:1 HCl on the water bath for 2 days. III was further characterized by reduction to chloroporphyrin *a*<sub>1</sub>, its reduction by TiCl<sub>3</sub> in concd. HCl to hydroxymethylrhodoporphyrin lactone and its degradation to pyropheoporphyrin IX. II was degraded to rhodoporphyrin. Pheoporphyrin *a*<sub>1</sub> is reduced by TiCl<sub>3</sub> to chloroporphyrin *a*<sub>1</sub> lactone. Oxidation of phytyloerythrin with SeO<sub>2</sub> gives a *hydroxyphytyloerythrin* and a *diketone*, whose *ester*, C<sub>41</sub>H<sub>52</sub>N<sub>4</sub>O<sub>8</sub>, m. 273° (cor.); the *monoxime*, steel-blue needles, does not m. 300°.

**C. J. West**  
9 **Polyterpenes and polyterpenoids. LXXXVI. Dehydrogenation of cholesterol, ergosterol, cholic acid and phytosterols**. L. Ruzicka, G. Thomann, E. Brandenberger, M. Furter and M. W. Goldberg. *Helv. Chim. Acta* 17, 200 21(1934); cf. *C. A.* 27, 4809.—From absorption spectra measurements Diels asserts the identity of the chrysene obtained by treatment of cholesterol with Pd with that of tar chrysene (Schuchardt) and believes the statement of Ruzicka, Goldberg and Thomann (*C. A.*

27, 4808), that the hydrocarbons  $C_{27}H_{48}$  obtained by him from cholesterol and ergosterol are not identical, to be erroneous. To clear up these matters the dehydrogenation of cholic acid has been repeated and an addnl. dehydrogenation of phytosterols has been performed. After dehydration, ten 100-g. portions of cholic acid (cholatrienic acid) were each heated with 150 g. of Se in a metal bath for 6 hrs. at 280–300° and then for 60 hrs. at 350–400° (bath temp.). The product was twice fractionally distd. at high vacuum and the following cuts were taken: (1) 80–150° at 12 mm., and at 0.1 mm., (2) 100–50°, (3) 160–70°, (4) 170–210°, (5) 210–30°, (6) 230–40°, (7) 240–80°. The fractions 6 and 7 solidified on cooling and were taken up in pyridine to which hexane was gradually added. Recrystn. from AcOBu yielded conglomerated thin scales of picene (I),  $C_{27}H_{48}$ , m. 354–5° (cor., Berl block) (2,7-dinitroanthraquinone deriv.,  $C_{27}H_{48}N_2O_6$ , m. 291–2°), showing a pale blue fluorescence in ultra-violet light and identical in every respect with tar picene. Fractional crystn. of fraction 6 from pyridine and BuOAc gave, after more than 20 seps., a hydrocarbon (II),  $C_{27}H_{48}$ , m. 273–4° (cor.). The mother liquor of 5, together with fractions 3 and 4, yielded a mixt. of hydrocarbons, m. about 250°, depressed by admixt. with tar chrysene (III) and contg. traces of II. By repeated fractionation was obtained a very small quantity of leaflets of impure chrysene (IV), analyzing for  $C_{28}H_{48}$  instead of  $C_{28}H_{42}$  and m. 243–5°, mixed m. p. with III (m. 251°), 247–8°, 2,7-dinitroanthraquinone deriv. m. 297–9° (mixed m. p. with corresponding deriv. of III (m. 304–5°), 300°); trinitrobenzene complex, m. 194–5°, identical with that from III. Traces of a needle-like material, m. 243–5°, not depressed on admixt. with III and analyzing for  $C_{28}H_{48}$ , were obtained. Two 100-g. lots of cholic acid were dehydrated and heated with 150 g. of Se in a metal bath for 4 hrs. at 300–20°. In the course of 4 hrs. the temp. was raised to 420° and the heating was continued at this temp. for 60 hrs. The reaction mixt. gave, after distn., sublimation and fractional crystn., I and IV, m. 248–9°. The differences between the former findings of R. *et al.* and those of Diels and Karstens are fully explained. The smooth formation of IV, as noted by D. and K., was due to the use of a higher temp. than that actually recorded. The 275° compd. of R. is either not formed or is destroyed at 420° (bath temp.) and this elimination facilitates the ready isolation of IV, which is also formed in greater amt. at 420° than at 360°. It is vital to the understanding of the mechanism of dehydrogenation of cholic acid that more I than IV is formed at both 360° and 420°, since under similar conditions no trace of I is yielded by cholesterol. A mechanism for the formation of I, IV and cyclopentanophenanthrene by the dehydrogenation of cholic acid is offered. Two 100-g. lots of a mixt. of phytosterols, b. 437–8°,  $[\alpha]_D^{25} -28^\circ$  (in  $F_2O$ ),  $I_2$  no. 80.8, prepd. from soya bean, were vacuum-dried and each heated with 150 g. of Se up to 320° in 2 hrs., at 320° for 35 hrs. and finally at 350° for 10 hrs. After extn. and distn. the fraction b.p. 220° was carefully purified by recrystn., treatment with 1% alc. KOH and further recrystn. to yield rhomboidal leaflets of a hydrocarbon (V),  $C_{27}H_{48}$ , m. 202–3°; 2,7-lindroanthraquinone deriv.,  $C_{27}H_{48}N_2O_6$ , m. 246–7°. If the sterols, cholesterol (VI) and ergosterol (VII), contg., resp., 27 and 28 C atoms, both give the same dehydrogenation product as maintained by D., then the same product must be obtained by a similar treatment of phytosterol (VIII) with its 29 C atoms. If, on the contrary, the dehydrogenation product of VII is the next higher homolog of the dehydrogenation product of VI, then V, the dehydrogenation product of VIII; must be the next higher member of the homologous series. The step-wise nature of the consts. for the dehydrogenation products of VI, VII and VIII is demonstrated by the C and H analyses, the m. ps. and the m. ps. of the dinitroanthraquinone derivs. As a further control, absorption spectra (to 367 m $\mu$  in contrast to the 334 m $\mu$  limit in the D. observations) and röntgenograms of these products and of I and IV were

taken. From these results, together with addnl. published crystallographic data, it is concluded that the differences in the dehydrogenation products from VI and VII do not depend on variations in the state of purity of a single substance but that they are homologous compds. with the same fundamental ring structure, differing only in the length of the side chain. C. R. Addinall

Constitution of estrin. J. F. Danielli. *J. Am. Chem. Soc.* 56, 740–7 (1934); cf. Butenandt, *C. A.* 27, 3211.--B.'s work, when taken in conjunction with the results obtained with unimol. films of estrin derivs., offers a clear proof of the fact that the 5-membered ring is in the same position as in the sterols, *i. e.*, 14, 13. The elimination of the 8,14-structure is supported by the work of Bernal (*Chemistry & Industry* 1932, 259). C. J. W.

Position of the nucleus double bond in stigmasterol. E. Fernholz. *Ann.* 508, 215–24 (1934); cf. *C. A.* 28, 1687.—Stigmasterol acetate (20 g.) and  $BzO_2H$  in  $CHCl_3$  (12 hrs. at 5°) give 11 g. of the acetate (I), m. 143°,  $[\alpha]_D^{25} -36.7^\circ$  (18.1 mg. in 2 cc.  $CHCl_3$ ), of  $\alpha$ -stigmasterol oxide (II), m. 152°; there also results 0.6 g. of the acetate, m. 170°,  $[\alpha]_D^{25} -32^\circ$  (16.9 mg. in 2 cc.  $CHCl_3$ ), of the  $\beta$ -oxide, m. 153°. II and 1:1 HCl, heated 4 hrs., give stigmasteretriol, m. 254°, oxidized by  $CrO_3$  in AcOH at room temp. to a diol,  $C_{28}H_{48}O_2$ , m. 280° (decompn.); with HCl gas in  $CHCl_3$  there results a dienedione, yellow, m. 155° (phenylhydrazone, yellow, m. 250° (decompn.)), reduced by Zn and AcOH to the diene,  $C_{28}H_{46}O_2$ , m. 197°;  $N_2H_4 \cdot H_2O$  gives a pyridazine deriv.,  $C_{28}H_{46}N_2$ , decompn. 260°. Catalytic reduction of 3.3 g. of I gives much resin but 0.8 g. stigmasterol monooxalate, m. 200°. II is stable to Na and EtOH. These results prove that the double bond must be between  $C_5$  and  $C_6$ , as originally assumed from analogy with cholesterol; stigmasterol differs from cholesterol only in the structure of the side chain. Sitosteronol and HCl in  $CHCl_3$  give a sitosteronediene, yellow, m. 120°; pyridazine deriv., m. 197–200°. Thus sitosterol contains 1 component in which the double bond and HO group are situated as in cholesterol. C. J. West

Electrolytic oxidation of glycolic acid in alk. soln. (Tommila) 4. Spectrum of infra-red absorption and the structure of polyat. mols. (Titeica) 3. Richter's Organic Chemistry. Vol. I. Aliphatic Series. 12th ed., edited by Richard Anschütz and Fritz Reindel. Translated and enlarged by E. N. Allott. London: Routledge Kegan Paul. 42s.

Treating hydrocarbons. I. G. Farbenind. A.-G. Fr. 757,453, Dec. 26, 1933. In processes such as distn., decompn., polymerization, etc., of hydrocarbons, the metal parts coming in contact with the heated hydrocarbons are partly or completely covered with elements of high m. p. of the 4th group, C excepted, particularly Si or Ti, the coatings being produced by baking the substances in a powd. form. No deposition of C is produced.

Oxidizing aliphatic hydrocarbons. Theodor Hellthaler and Erich Peter (to A. Riebeck'sche Montanwerke A.-G.). U. S. 1,947,989, Feb. 20. Hydrocarbon material such as paraffin is subjected in liquid state to the action of O (suitably at a temp. of about 180–200° in the production of alcs., esters, etc., from paraffin) in the presence of boric, phosphorous or arsenious acids, which serve to esterify alcs. formed by the oxidation. Various examples with details are given.

Hydrogenation of aromatic hydrocarbons. Edward

D. Kamm and Imperial Chemical Industries Ltd. Brit. 401,724, Nov. 20, 1933. A W sulfide catalyst is used for hydrogenating aromatic hydrocarbons at not exceeding 10 atm. at 170–300°. Sufficient S must be present to insure the continuance of the catalyst as sulfide and S or H<sub>2</sub>S may be added to the reactants for this purpose. The conversion of C<sub>10</sub>H<sub>8</sub> into tetrahydronaphthalene is described.

Refining hydrocarbon mixtures. I. G. Farbenind. A.-G. (Carl Krauch, Mathias Pier and August Eisenhut, inventors). Ger. 536,794, Sept. 13, 1933 (Cl. 12o. 1.04). Natural or synthetic high-boiling hydrocarbons are refined by washing with aromatic or satd. cyclic hydrocarbons and MeOH. Examples are given.

Separating mixed hydrocarbons of different series. Charles O. Young and Granville A. Perkins (to Carbide & Carbon Chemicals Corp.). U. S. 1,948,777, Feb. 27. See Can 328,052 (C. A. 27, 991).

Absorbing cyclic hydrocarbons such as cyclohexene in acids. Adrianus J. van Peski (to N.-V. de Bataafsche Petroleum Maatschappij). U. S. 1,948,891, Feb. 27. A catalyst comprising a metal of group 8 of the periodic system (such as ferrocyanic acid) is used in absorbing unsatd. hydrocarbons, such as cyclohexene, in acids such as 80% H<sub>2</sub>SO<sub>4</sub> for the production of cyclohexanol (by further hydrolysis) or like processes.

Partial oxidation products of hydrocarbons (suitable for denaturing alcohol). Wm. P. Bitler (to C. P. Byrnes, trustee). U. S. 1,948,161, Feb. 20. A liquid partial-oxidation product such as may be made as described in U. S. 1,697,653 (C. A. 23, 1136) is agitated with 8 lb. lime per 100 gal. oxidized oil, to form lime soaps; the non-saponifiable oil is then distd. off while agitating to prevent the soaps from burning onto the walls of the still, and toward the end of this step the lime soaps and resins take a colloidal state and the residue may be drained off. A distillate is obtained of light yellow color, practically free from high-boiling resins and metallic compds., having an acid number of less than 0.30 and contg. a mixt. of aldehydes, alcs., unsatd. hydrocarbons and satd. hydrocarbons.

Amino-nitrogen-containing conversion products of aliphatic hydrocarbons containing at least nine carbon atoms. Karl Keller (to General Aniline Works). U. S. 1,948,924, Feb. 27. A dichlorinated (or more highly chlorinated) deriv. of paraffin, paraffin oil, transformer oil or the like is heated with NH<sub>3</sub> (suitably in an alc. soln.) in a closed vessel at 140–190°. The products are generally viscous oils which may be isolated in the form of their salts and may be used as acid soaps in dyeing processes, etc.

Halogenated pyridines. Johan P. Wibaut and Hermann J. den Hertog, Jr. Brit. 401,356, Nov. 13, 1933. See Ger. 574,655 (C. A. 27, 4542) and Dutch 29,614 (C. A. 27, 4542).

Stereochemical models. Oskar Huppert. Austrian 136,357, Jan. 25, 1934 (Cl. 42.). Structural features are described.

Alcohols. Air Reduction Co., Inc. Brit. 402,613, Dec. 7, 1933. In continuously converting alkylene hydrocarbons into alcs. by passing them with steam, preferably under pressure, over a catalyst, a combined boiler and heat exchanger, preferably working in counter-current, is provided to vaporize H<sub>2</sub>O and heat the hydrocarbon and steam by means of the reacted gases which are cooled thereby and the alc. recovered from the condensate. Cf. C. A. 27, 1983.

Alcohols. Helmut Legerlotz. Ger. 522,790; Jan. 13, 1934 (Cl. 12q. 32.21). See U. S. 1,903,927 (C. A. 27, 3222).

Secondary alcohols. Benjamin T. Brooks (to Standard Alc. Co.). U. S. 1,948,286, Feb. 20. For obtaining secondary alcs. with 3 to 6 C atoms per mol. from acid reaction products formed by treating olefins with aq. H<sub>2</sub>SO<sub>4</sub>, such an acid reaction product is dild. with water, the dild. material is permitted to stratify, forming an aq. layer and a layer consisting mainly of hydrocarbons; the hydrocarbon layer is sepd. and is washed with dil. aq. H<sub>2</sub>SO<sub>4</sub>, thus producing an aq. H<sub>2</sub>SO<sub>4</sub> contg. secondary

alc. in soln. and hydrocarbon material substantially free from secondary alc. and these materials are sepd. and the secondary alc. is recovered. Cf. C. A. 28, 2013.

Purifying secondary alcohols. Robert B. Lebo (to Standard Alc. Co.). U. S. 1,949,211, Feb. 27. For removing tertiary alc. from secondary alcs. such as isopropyl alc. contg. tertiary alcs. in minor proportion, the material is heated to not higher than about 40° with aq. H<sub>2</sub>SO<sub>4</sub> of not more than 40% strength in the presence of a catalyst including V, Al or Cu, such as V pentoxide, for a prolonged period, and the hydrocarbon formed by the decompn. of the tertiary alc. is removed as by distn. and absorption with H<sub>2</sub>SO<sub>4</sub>.

Diacetone alcohol. British Industrial Solvents Ltd and Ernest E. Cornolly. Brit. 402,788, Dec. 8, 1933. The sepn. of diacetone alc. from unchanged Me<sub>2</sub>CO is effected by distn. under ordinary pressure in presence of added H<sub>2</sub>O, which may be 10% by vol. of the alc. After the temp. of the still reaches 105–107° practically all Me<sub>2</sub>CO and some H<sub>2</sub>O have been distd. off and the rest of the H<sub>2</sub>O is then distd. off under considerably reduced pressure to prevent a rise of temp. above 105°, and finally the alc. is distd. Alternatively, the initial stages of distn. may be effected before the addn. of H<sub>2</sub>O which must be added below 105°.

Ketones. Martin De Simo (to The Shell Development Co.). Can. 339,529, Feb. 20, 1934. Ketones are manufd. by dehydrogenation of secondary aliphatic alcs. by means of a catalyst contg. Cu and Zn below 500° and in the absence of O.

Ketones. Antares Trust Registered. Swiss 165,822, Feb. 16, 1934 (Cl. 36o.). Ketones are obtained by treating satd. non-aromatic hydrocarbons with COCl<sub>2</sub> in the presence of non-volatile metal halides at temps. below normal. Thus, the mineral oil fraction b. 29–32° consisting mostly of *n*- and iso-pentane, is mixed with COCl<sub>2</sub> and AlBr<sub>3</sub> at –15° to give a ketone b. 80–90° at 15 mm. Another example is given.

Aliphatic ketones. Henry Dreyfus. U. S. 1,949,412, March 6. For making a ketone such as acetone, the vapor of an alc. or aldehyde such as EtOH or acetaldehyde or of an ester such as EtOAc is contacted with a Ca silicate catalyst at temps. of 200–700° in admxt. with steam. Other alk. earth silicates, borates or phosphates also may be used. Cf. C. A. 27, 5337.

Primary aromatic amines. Wm. C. Calvert (to Wingfoot Corp.). U. S. 1,948,330, Feb. 20. In reactions such as the production of 2,4-diaminodiphenylamine, a nitro-substituted aryl compd. such as 2,4-dinitrodiphenylamine is subjected to reduction with finely divided Fe and NH<sub>4</sub>Cl (suitably with moderate heating).

Polycyclic amines. I. G. Farbenind. A.-G. (Walter Mieg, Rudolf M. Heidenreich and Heinrich Nerebumer, inventors). Ger. 592,202, Feb. 6, 1934 (Cl. 12q. 37). Pyridinium derivs. of anthracene, anthraquinone and other condensed-ring compds. are treated with basic reagents. Under relatively energetic conditions, the pyridine ring is split off, and simple amino derivs. of the condensed-ring compds. are obtained. Under milder conditions, the pyridine ring is disrupted to form a chain, which remains attached to the N atom. Thus, anthraquinone-1-pyridinium chloride yields 1-aminoanthraquinone when boiled for 10 mins. in PhNH<sub>3</sub>, but yields AN:CHCH:CHCH:CHOH, where A is the 1-anthraquinonyl residue, when boiled for a short time with dil. Na<sub>2</sub>CO<sub>3</sub> soln. Other compds. which have been prepd. include *Bs*-1-aminobenzanthrone, m. 240°, 2,7-diaminoanthanthrone and 9-chloro-10-aminoanthracene, m. 158°.

Esters. Carl Zerbe. Ger. 590,052, Dec. 21, 1933 (Cl. 12o. 11). Addn. to 563,969 (C. A. 27, 4812). Esters of carboxylic acids are obtained by heating water-free metal salts of the acid (obtained by treating the acid with a weak base) with an alc. contg. the desired alkyl group, under pressure. Thus, anhyd. (BzO)<sub>2</sub>Fe is heated to 180° in a pressure vessel with EtOH to give BzOEt. Other examples are given.

Esters. H. Th. Böhme A.-G. (Heinrich Bertsch,

inventor). Ger. 592,053, Jan. 31, 1934 (Cl. 12o. 11). Esters of mono- or poly-basic aliphatic carboxylic acids contg. more than 9 C atoms, with monohydric alcs. contg. more than 3 C atoms, are prepd. by heating equimol. amts. of the acid and the alc. with a mineral acid catalyst to a temp. not above 90°. The water formed in the reaction seps. at the bottom of the mixt. and is withdrawn. When  $\text{H}_2\text{SO}_4$  is used as the catalyst, about 5–10% of anhyd.  $\text{Na}_2\text{SO}_4$ , calcd. on the org. acid, is preferably added also. Examples are given of the prepn. of butyl ricinoleate and sebacate.

Esters such as those of secondary hexyl, heptyl and octyl alcohols with phthalic and other polycarboxylic acids. Robert H. Van Schaack, Jr. (to Van Schaack Bros. Chemical Works). U. S. 1,949,093, Feb. 27. Esters suitable for use as plasticizers for pyroxylin may be chosen from simple or mixed esters such as the secondary hexyl, heptyl or octyl esters of phthalic acid which may also include esterification groups such as Me, Et, isopropyl, butyl, amyl or the radicals of ethylene glycol, diethylene glycol or ethoxyethanol, mention also being made of the sec. hexyl, sec. heptyl and sec. octyl esters of oxalic, tartaric, citric, maleic, isophthalic, chlorophthalic, phenylglutaric and mellitic acids.

Producing esters by catalytic dehydrogenation of polyhydric alcohols. Wilbur A. Lazier (to E. I. du Pont de Nemours & Co.). U. S. 1,949,425, March 6. For producing an ester such as glyceryl glycerate, an aliphatic polyhydric alc. such as glycerol is contacted under superatm. pressure and at temps. of 250–500° with a dehydrogenation catalyst such as may contain Zn and Cu chromites and oxides.

Esters of organic acids. James R. Buckley and Carrol A. Doran (to E. I. du Pont de Nemours & Co.). U. S. 1,949,267, Feb. 27. For prepg. an ester such as EtOAc or BuOAc by reacting an aliphatic monohydroxy alc. with an aliphatic monocarboxylic acid such as HOAc and distg. off the ester formed from the reaction mixt., the acid, in liquid phase, is subjected to the action of a reducing agent such as a metal,  $\text{NaHSO}_3$  or  $\text{SnCl}_2$  of sufficient strength to reduce impurities in the acid without effecting material reduction of the alc. and acid.

Esters of sulfated higher aliphatic organic acids. Heinrich Bertsch (to H. Th. Böhme A.-G.). U. S. 1,947,673, Feb. 20. A "polybasic," higher aliphatic carboxylic acid such as the "dibasic" hydroxy acid,  $\text{C}_{11}\text{H}_{21}\text{O}_3$ , is reacted with a monohydroxy deriv. of a hydrocarbon such as BuOH and with a sulfating agent such as concd.  $\text{H}_2\text{SO}_4$ , to form a dispersing agent.

Esters of gluconophosphoric acid. Schering-Kahlbaum A.-G. (Walter Schoeller, Hans Goebel, Erwin Schwenk and Siegfried Michael, inventors). Ger. 591,822, Jan. 27, 1934 (Cl. 12o. 11). The above are prepd. by treating gluconic acid or its alk. earth salts with alkyl esters of  $\text{HPO}_4$ . Thus, the Ca salt of gluconic acid is treated with  $\text{EtPO}_4$  in the presence of  $\text{CaCO}_3$  to give a gluconophosphoric acid ester contg. 20.5%  $\text{P}_2\text{O}_5$ . Other examples are given.

Refining liquid alkyl esters such as dibutyl phthalate. Franklin D. Smith (to Monsanto Chemical Co.). U. S. 1,948,281, Feb. 20. For refining liquid alkyl esters derived from acids produced by the catalytic oxidation of aromatic hydrocarbons, so that distn. of the ester is rendered unnecessary, and the color and cast of the ester is improved, the material is exposed to the action of ultra-violet light.

Sulfuric esters of aminoanthrahydroquinones. David A. W. Fairweather and John Thomas (to Scottish Dyes, Ltd.). U. S. 1,949,299, Feb. 27. Sulfuric acid esters of aminoanthrahydroquinones are formed by the treatment of acyl aminoanthraquinones such as anthraquinonyl urethans with pyridine- $\text{SO}_3$  in the presence of a metal such as Cu powder and a tertiary org. base, with hydrolysis of the resulting ester to remove the acyl group and, if desired, conversion of the product into a Na or other salt. 2-Aminoanthrahydroquinone 9,10-disulfuric acid ester in the form of its di-Na salt dyes bright brownish yellow converted to bright blue by boiling acid  $\text{CuSO}_4$

soln. Some other examples also are given. Cf. C. A. 27, 3482.

Methyl ether. John C. Woodhouse (to R. I. du Pont de Nemours & Co.). U. S. 1,949,344, Feb. 27. See Can. 334,121 (C. A. 27, 4818).

Monoalkyl ethers of aromatic polyhydroxy compounds. I. G. Farbenind. A.-G. (Karl Marx and Erich Lehmann, inventors). Ger. 591,534, Jan. 23, 1934 (Cl. 12q. 14.04). Anhyd. monoalkali salts of polyhydroxy compds. are suspended in org. liquids and the suspension treated with alkyl chloride. Thus, a soln. of 1,2-dihydroxybenzene in abs. alc. is treated with metallic Na to give the mono-Na salt. This is suspended in PhCl and treated with  $\text{CH}_3\text{Cl}$  to give a 75% yield of 1-methoxy-2-hydroxybenzene. Other examples are given.

Monoalkyl ethers of protocatechuic aldehyde. J. D. Riedel-E. de Haën A.-G. Brit. 401,502, Nov. 16, 1933; Fr. 751,687, Sept. 7, 1933. The monoalkyl ethers are produced by treating pyrocatechol monoalkyl ethers with salts of glyoxalic acid in a basic medium and subjecting the product, preferably without isolation, to mild oxidation, e. g., with a reducible heavy metal compd. or an aromatic nitro compd. In an example a soln. of glyoxalic acid, obtained by the electrolytic reduction of  $(\text{COOH})_2$ , is neutralized with NaOH and allowed to stand some days with a soln. of guaiacol in the equiv. amt. of NaOH; after removal of excess guaiacol by steam distn.,  $\text{CuSO}_4$  and more NaOH are added and the mixt. heated; by extn. of the filtered soln. with  $\text{C}_6\text{H}_6$ , vanillin is obtained. Cf. C. A. 27, 4243.

Inhibiting decomposition of liquid amino compounds. George R. Boud, Jr. and Clark W. Davis (to E. I. du Pont de Nemours & Co.). U. S. 1,947,578, Feb. 20. Compds. such as aniline or toluidine, etc., are rendered relatively light-stable by displacing the dissolved O which they contain by an inert gas such as N.

Arylides. Soc. pour l'ind. chim. à Bâle. Swiss 162,895, Sept. 16, 1933 (Cl. 36p.). Addn. to 159,665. New arylides of the pyrazolone series are obtained by condensing 1-(3'-carboxyphenyl)-3-methyl-5-pyrazolone with  $\beta$ -naphthylamine in the presence of tertiary bases and with addn. of chlorides such as  $\text{PCl}_5$  or  $\text{POCl}_3$ . Examples are given.

Halohydrins. N. V. de Bataafsche Petroleum Maatschappij. Brit. 402,880, Dec. 14, 1933. See Fr. 740,850 (C. A. 27, 2160).

Indophenols. Imperial Chemical Industries Ltd. Fr. 757,453, Dec. 27, 1933. Indophenols are prepd. by condensing compds. of the formula  $\text{Ar}-\text{NH}-\text{CHXY}$  (Ar is an aryl radical having a free p-position, X is H, alkyl or aryl and Y is CN or  $\text{CONH}_2$ ) with a nitrosophenol or a quinone chloroimide or by oxidizing a compd. of the above formula with p-aminophenol. Leuco-indophenols and S dyes are prepd. from the compds. Examples are given starting with anilinoacetamide (by boiling the corresponding nitrile with a soln. of  $\text{Na}_2\text{CO}_3$  and p-aminophenol), o-toluinopropionitrile (from o-toluidine, AcH-bisulfite and NaCN),  $\text{C}_6\text{H}_5\text{NHCH}(\text{C}_6\text{H}_5)\text{CN}$  (from PhNH $_2$ , BzH-bisulfite and NaCN) and  $\text{C}_{10}\text{H}_7\text{NHCH}(\text{CH}_3)\text{CN}$  (from  $\alpha$ -naphthylamine, AcH and NaCN). Cf. C. A. 27, 4935.

Quinones. I. G. Farbenind. A.-G. (Hermann Hagenest, Erich Reiche and Emanuel Blümel, inventors). Ger. 591,821, Jan. 27, 1934 (Cl. 12o. 10). Addn. to 589,777 (C. A. 26, 2374). The method of 589,777 for producing quinones and  $\text{CrCl}_3$  by reducing aq. chromate soln. acidified with HCl by anthracene, is modified by replacing the latter by other quinone-forming substances such as hydroquinone, phenanthrene, aniline, etc. Examples are given.

Tetrazoles. Knoll A.-G. Chemische Fabriken. Brit. 401,887, Nov. 23, 1933. Tetrazoles are prepd. by (1) the process of Ger. 574,943 (C. A. 27, 4541) (the components of the compds. may be used) or (2) sulfonating a hydrocyclic ketoxime and simultaneously or subsequently treating the resulting sulfoperamidic acid compd. with an azide. Examples are given.

Anthraquinone derivatives. Paul Nawiasky, Artur

Krause and Berthold Stein (to General Aniline Works). U. S. 1,948,183, Feb. 20. Derivs. of 1,4-diaminoanthraquinone are obtained by treating 1-amino-4-arylsulfamidoanthraquinone-2-sulfonic acids with dil. alkali metal alcoholates, *i. e.*, solns. in mono- or poly-hydric alcs. of alkali metals or alkali metal hydroxides. Generally the 1-amino-4-arylsulfamido-2-alkoxyanthraquinones are formed as the final products, so that no saponification of the acyl group takes place. The reaction is usually carried out at temps. between 50° and 120° (preferably between 70° and 100°). The alcs. are preferably chosen from the lower members of the aliphatic series. The resulting acyl derivs. are initial materials for the manuf. of dyes and may also be used as dyes themselves. Details are given of the production of 1-amino-2-methoxy-4-*p*-toluenesulfamidoanthraquinone and the 2-monoglycol ether of 1-amino-4-*p*-toluenesulfamidoanthraquinone. Cf. C. A. 28, 2016<sup>4</sup>.

**Anthraquinone derivatives.** I. G. Farbenind. A.-G. (Paul Nawiasky and Albert Palm, inventors). Ger. 592,366, Feb. 7, 1934 (Cl. 12o. 10). Nitroanthraquinones are prepd. by treating 2-(3'-nitrobenzoyl)-benzoic acid or its substitution products with P<sub>2</sub>O<sub>5</sub>, preferably at about 200° in an inert solvent.

**Quinoline derivatives.** J. D. Riedel-E. de Haën A.-G. Ger. 592,199, Feb. 3, 1934 (Cl. 12p. 1.10). Addn. to 579,226 (C. A. 27, 4542). See Brit. 383,920 (C. A. 27, 4246).

**Asymmetric arseno compounds.** I. G. Farbenind. A.-G. Ger. 589,187, Dec. 4, 1933 (Cl. 12q. 32.30). Addn. to 554,951 (C. A. 26, 6071). Two different sym. arson compounds. contg. no primary amino groups and one of which contains two hydroxyacetic acid residues are heated together in alk. soln. Thus, 3,3'-diacetyldiamino-4,4'-dihydroxyarsenobenzene and Na 4,4'-diacetyldiaminoarseno-2,2'-phenoxycetate are heated together in NaOH to give an asym. product. Other examples are given. Cf. C. A. 28, 859<sup>1</sup>.

**Purifying aromatic nitro compounds.** Clark W. Davis (to The Canadian Industries Ltd.). Can. 339,579, Feb. 27, 1934. Trinitrotoluene, trinitronaphthalene, tetranitroaniline, etc., are purified by washing the surface of the crystals with an aq. soln. contg. 40-70% of acetone at a temp. not exceeding 30°, sepg. the purified nitro compd. from the soln., and dilg. the extg. medium with water to complete pptn. of the dissolved material. The dissolved material and acetone are separately recovered.

**Condensation products.** Soc. anon. M. Naef & Cie. Swiss 152,906, Sept. 16, 1933 (Cl. 36o). A mixt. of 1,1,7-trimethylcycloheptene-2-aldehyde and acetone is condensed by the aid of a non-neutral condensing agent such as NaNH<sub>2</sub> or HCl. Examples are given.

**Condensation products from aldehydes and phenols.** Max Weiler, Berthold Wenk and Hermann Stötter (to I. G. Farbenind. A.-G.). U. S. 1,948,894, Feb. 27. A phenolic compd. such as 2,4-dichlorophenol is reacted upon with about an equimol. proportion of an aldehydic compd. such as Na benzaldehyde-*o*-sulfonate in the presence of either an alk. condensing agent or an acid condensing agent such as oleum or ZnCl<sub>2</sub>, and the resulting product is then condensed with about one mol. proportion of the same or another phenolic compd. such as *p*-chlorophenol. Products may be obtained which are colorless or nearly colorless powders, sol. in alkalies and at least nearly insol. in water with the exception of the compds. contg. a sulfonic acid group, suitable for use as *reserving* and *moldproofing agents* or for preserving canned goods, glue, paste, etc. Several examples with details of procedure are given.

**Resin acid condensation products.** Ewald Fonrobert and Arthur Greth (to Resinous Products & Chemical Co.). U. S. 1,948,573, Feb. 27. Resin acid is transformed into its anhydride by heating it with the anhydride of an aliphatic monocarboxylic acid of the lower aliphatic acid series such as Ac<sub>2</sub>O and the anhydride thus formed is treated with alcs. such as EtOH, BuOH or PhOH, to form esters.

**Polymerized pentoses.** Holzhydrolyse A.-G. (Fried-

rich Koch, Eduard Färber, Hugo Koch and Helmut Urban, inventors). Ger. 585,739, Jan. 19, 1934 (Cl. 12o. 7.03). Solns. of monomeric pentoses in mineral acids are dried, *e. g.*, by atomization, and subjected to a hot air current to polymerize the pentoses.

**Polymerized carbohydrates.** Holzhydrolyse A.-G. (Friedrich Koch, Eduard Färber, Hugo Koch and Helmut Urban, inventors). Ger. 587,975, Jan. 23, 1934 (Cl. 12o. 6). Addn. of 585,739 (preceding abstr.). Solns. of monomeric aldohexoses are treated with a small amt. of HCl and evapd. to dryness. The product is then treated with a hot air current after the manner of 585,739 to polymerize the aldohexoses.

**Acetylene polymers.** E. I. du Pont de Nemours & Co. Brit. 401,678, Nov. 13, 1933. Addn. to 384,654 (C. A. 27, 4251) and 390,179 (C. A. 27, 4541). The processes of 384,654 and 390,179 are modified by removing monovinylacetylene from the reaction mixt. before substantial amts. of divinylacetylene are formed so that a product consisting mainly of monovinylacetylene is obtained. App. is described.

**Formic acid and sodium nitrate.** Gewerkschaft Victor (Hans Schmalfeldt and Alfred Braune, inventors). Ger. 592,054, Jan. 31, 1934 (Cl. 12o. 11). HCOONa is prepd. in known manner from Na<sub>2</sub>SO<sub>4</sub>, CuO and CO, and then treated at 20° with HNO<sub>3</sub> of not more than 40-50% concn.

**Acetic and formic acids.** I. G. Farbenind. A.-G. (Walter Flemming and Walter Speer, inventors). Ger. 590,305, Jan. 8, 1934 (Cl. 12o. 12). Addn. to 583,704 (C. A. 28, 1055<sup>4</sup>). The method of 583,704 for producing AcOH and HCO<sub>2</sub>H by the catalytic oxidation of methyl ethyl ketone is modified by replacing the latter by acetone. Examples are given.

**System for recovering concentrated acetic acid from aqueous solutions by extraction.** Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler (Karl Grunert, inventor). Ger. 592,119, Feb. 8, 1934 (Cl. 12o. 12).

**Glutamic acid and its compounds.** Reisque Masuda, Celestian L. Royal and Albert E. Marshall (to Larrow-Suzuki Co.). U. S. 1,947,563, Feb. 20. A glutamic "mother substance" such as Steffen's waste water is hydrolyzed in an alk. soln. having an alkyl. of 3-7% expressed as NaOH at a temp. and for a time sufficient to form glutamate. A concd. soln. of a *d*-glutamic acid compd. and HCl having a *pH* of about 2.1 may be treated with NH<sub>3</sub> until the *pH* is about 3.2, and the *d*-glutamic acid then crystd. Cf. C. A. 28, 1364<sup>4</sup>.

**Separation of active glutamic acid without racemization.** K. K. Suzuki Shōten (Seiō Kanan, inventor). Japan. 99,153, Jan. 24, 1933. Addn. to 97,583. In the sepn. of active glutamic acid from its hydrochloride or salts of mineral acids, glycine derivs. (such as betaine or sarcosine) are used as a neutralization material, in order to avoid racemization.

**Oxalic acid.** Hans G. Duus (to E. I. du Pont de Nemours & Co.). U. S. 1,948,441, Feb. 20. An alkali metal oxalate such as that of Na is treated in soln. with an acid such as H<sub>2</sub>SO<sub>4</sub> in an org. medium such as MeOH contg. acid such as that recovered as a residue from a later stage of the process involving distn. and crystn.

**Benzoic acid and benzoates.** Bozel-Malétra Société industrielle de produits chimiques. Brit. 402,882, Dec. 14, 1933. See Ger. 585,332 (C. A. 28, 1364<sup>4</sup>).

**Benzoic acid and benzoates.** Bozel-Malétra (Société industrielle de produits chimiques). Ger. 591,880, Jan. 29, 1934 (Cl. 12o. 14). Addn. to 573,982 (C. A. 27, 4248). See Fr. 753,918 (C. A. 28, 1056<sup>4</sup>).

**Barbituric acids.** Alexander Wacker Ges. für elektrochemische Industrie G. m. b. H. Fr. 787,655, Dec. 30, 1933. Barbituric acids are made by condensing malonic esters and urea by means of alkali alcoholates contg. more than 3 C atoms, *e. g.*, butylate or amylate.

**Aminocarboxylic and iminodicarboxylic acids.** I. G. Farbenind. A.-G. Brit. 395,074, July 13, 1933. In the manuf. of  $\alpha$ -aminocarboxylic acids, iminodicarboxylic acids and salts thereof by condensation of an aliphatic aldehyde with NH<sub>4</sub>CN and sapon. of the resulting  $\alpha$ -

aminocarboxylic acid nitrile, the condensation is carried out in the presence of an amt. of free  $\text{NH}_3$  corresponding at least to that present in the  $\text{NH}_4\text{CN}$ . The nitriles are saponified, preferably directly after prepn. and without previously removing the  $\text{NH}_3$ , by an alkali or alk. earth metal hydroxide, strong bases, e. g.,  $\text{NaOH}$ ,  $\text{Ba}(\text{OH})_2$ , being used advantageously while heating as rapidly as possible to obtain  $\alpha$ -amino carboxylic acids and weaker bases, e. g.,  $\text{Ca}(\text{OH})_2$ , to produce iminodicarboxylic acids. Among examples (1)  $\text{AcH}$  is treated with  $\text{NH}_4\text{CN}$  and  $\text{NH}_3$ , with cooling, to produce  $\alpha$ -aminopropionitrile, which is saponified with  $\text{NaOH}$  to yield  $\alpha$ -aminopropionate, and (2)  $\text{CH}_3\text{O}$  is condensed with  $\text{NH}_4\text{CN}$  and  $\text{NH}_3$  to produce aminoacetone nitrile, which is saponified with  $\text{Ca}(\text{OH})_2$  to yield  $\text{Ca}$  iminodiacetate.

**Alkoxy-2-hydroxynaphthalene-3-carboxylic acids.** Arthur Zitscher, Hans Mildner and Wilhelm Luee (to General Aniline Works). U. S. 1,947,819, Feb. 20. By mild alkylation of substances such as 2,6- or 2,8-dihydroxynaphthalene-3-carboxylic acid, products are obtained such as 6-methoxy-2-hydroxynaphthalene-3-carboxylic acid, yellow needles, m.  $233^\circ$ , the corresponding 6-ethoxy compd., m.  $219^\circ$ , or 8-methoxy-2-hydroxynaphthalene-3-carboxylic acid, m.  $248^\circ$ . Various examples with details of procedure are given.

**1,4,5,8-Naphthalenetetracarboxylic acid and its substitution products.** Heinrich Greune and Wilhelm Eckert (to General Aniline Works). U. S. 1,949,202, Feb. 27.  $\text{H}_2\text{SO}_4$  of high concn. is caused to act on a 1,4,5,8-naphthalenetetracarboxylic acid diimide or a deriv. at a temp. of about  $160$ – $270^\circ$ , to produce the corresponding 1,4,5,8-naphthalenetetracarboxylic acid.

**Substituted benzocarbazolecaboxylic acids.** Georg Kalischer, Otto Limpach and Karl Hager (to General Aniline Works). U. S. 1,948,923, Feb. 27. The Na salt of 2,8-dihydroxynaphthalene-3-carboxylic acid, on heating with a  $\text{NaHSO}_4$  soln., and further heating of the resulting bisulfite addn. compd. with phenylhydrazine in the presence of an acid such as  $\text{H}_2\text{SO}_4$ , yields 7,8-benzocarbazole-3'-hydroxy-2'-carboxylic acid, m.  $329$ – $30^\circ$ . Similarly, except with use of  $N$ -methylphenylhydrazine, 7,8-benzo- $N$ -methylcarbazole-3'-hydroxy-2'-carboxylic acid, m.  $310^\circ$ , is obtained; and, in a generally similar manner, there may be formed: 3-methyl-7,8-benzocarbazole-3'-hydroxy-2'-carboxylic acid, m.  $334^\circ$ ; 7,8-benzo-1-methylcarbazole-3'-hydroxy-2'-carboxylic acid, m.  $330^\circ$ ; 2-chloro-7,8-benzocarbazole-3'-hydroxy-2'-carboxylic acid, m.  $330^\circ$ ; 1,2,7,8-dibenzocarbazole-3'-hydroxy-2'-carboxylic acid, 3,4,7,8-dibenzocarbazole-3'-hydroxy-2'-carboxylic acid; a chloro-1,2,7,8-dibenzocarbazole-3'-hydroxy-2'-carboxylic acid, bi(1,2,7,8-benzocarbazole)-3',3'-dihydroxy-2',2'-dicarboxylic acid; and 1-methyl-7,8-benzocarbazole-2'-hydroxy-3'-carboxylic acid. These products are, in general, yellow substances sol. in dil.  $\text{Na}_2\text{CO}_3$  soln.

**Anilinesulfonic acids.** Erich Fischer, Albert Kissling and Herbert Kracker (to General Aniline Works). U. S. 1,947,837, Feb. 20. See Ger. 565,412 (C. A. 27, 1004).

**Dehydrating acids.** Rudolf Scheuble. Ger. 575,677, Dec. 5, 1933 (Cl. 120. 11). Solns. of low-mol. aliphatic monocarboxylic acids, especially  $\text{AcOH}$ , are partly dehydrated by extn. with liquid  $\text{SO}_2$ .

**Aliphatic acids and anhydrides.** Henry Dreyfus. Brit. 403,075, Dec. 6, 1933. Ethylidene chloride, alone or mixed with other liquids, e. g., kerosene,  $\text{C}_6\text{H}_6$ , ethers, etc., is used for removing  $\text{H}_2\text{O}$  as vapor from org. liquids such as  $\text{AcOH}$ , propionic and other aliphatic acids or the mixts. of acid and anhydride obtained by thermal decomn. of such acids.

**Aliphatic anhydrides.** Henry Dreyfus. U. S. 1,947,977, Feb. 20. For making an anhydride such as  $\text{Ac}_2\text{O}$ , the vapor of an aliphatic acid such as  $\text{HOAc}$  is subjected to thermal decomn. in the presence of at least one aliphatic polyhydroxy compd., contg. at least 2  $\text{Ox}$  groups where  $x$  represents  $\text{H}$  or a satd. lower alkacyl residue, attached to sep.  $\text{C}$  atoms, such as glycerol.

**Aliphatic anhydrides.** Henry Dreyfus. Brit. 402,462, Dec. 4, 1933.  $\text{H}_2\text{O}$  is removed from the anhydrides as

1 an azeotropic mixt. with methylene chloride which may be used alone or with other liquids, e. g., light paraffins, gasoline, kerosene, ethers or mixts. of ethers with petroleum hydrocarbons.

**Mixed anhydrides.** Henkel & Cie. G. m. b. H. Brit. 402,973, Dec. 14, 1933. See Fr. 751,571 (C. A. 28, 10574).

**Benzoic anhydride.** Michael N. Dvornikoff (to Monsanto Chemical Co.). U. S. 1,948,342, Feb. 20. Benzoic acid is caused to react with benzoyl chloride under sub-atm. pressure (suitably at a temp. of about  $220^\circ$ ), and other anhydrides of monocarboxylic acids of the benzene series may be similarly formed.

**Solid diazo salts.** I. G. Farbennind. A.-G. Brit. 403,013, Dec. 14, 1933. Diazo salts are made by monodiazotizing a halogenated  $p$ -phenylenediamine (no  $\text{HSO}_3$  or  $\text{COOH}$  groups) and sepg. the monodiazoo compd. as a solid, mineral acid salt or stabilized salt, according to known methods. In examples the 2,5- and 2,6-dichloro, 2,6-dibromo, 2-chloro-5-methyl, 2-chloro, 2-chloro-6-bromo and 2-bromo derivs. are monodiazotized and the diazonium compds. pptd. as the (1) chloride, (2) sulfate, (3)  $\text{ZnCl}_2$  or  $\text{CdCl}_2$  double salt, (4) fluoroborate, (5) 1,5- or 2,6-naphthalenedisulfonate, (6)  $p$ -chloro-benzenesulfonate, etc.

**Caustic alkali fusions.** Joseph E. Jewett (to National Aniline and Chemical Co.). U. S. 1,947,852, Feb. 20. In a process such as the production of indoxyl by fusing a phenylglycine compd. with caustic alkali and sodamide, the caustic alkali is circulated in molten condition as a stream into which the reacting material is introduced. App. is described.

**Metal carbamates.** Alwin Mittasch and Paul Chall (to I. G. Farbennind. A.-G.). U. S. 1,948,002, Feb. 20. A metal salt such as  $\text{Ca}(\text{NO}_3)_2$  in an inert liquid such as  $\text{MeOH}$  in which this salt is at least slightly sol. but in which the resulting carbamate is difficultly sol. is reacted on with  $\text{NH}_3$  and  $\text{CO}_2$ .

**Potassium formate.** Rudolph Koepp & Co. Chemische Fabrik A.-G. Fr. 757,381, Dec. 25, 1933.  $\text{HCOOK}$  is made by causing  $\text{CO}$  to act on  $\text{K}_2\text{SO}_4$  and  $\text{CaO}$  in aq. medium at a relatively high temp. and pressure, the amt. of  $\text{K}_2\text{SO}_4$  being calcd. so that there is formed a solu. 6 which contains practically exclusively  $\text{HCOOK}$  and a compd.,  $(\text{CaSO}_4)_x \cdot \text{K}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ , which is made usable again by decomn. Cf. C. A. 28, 13629.

**Sodium ethyl oxalacetate.** Ray M. Carter and Wm. L. Johnson (to U. S. Industrial Alc. Co.). U. S. 1,948,201, Feb. 20.  $\text{Na}$  is dissolved in abs.  $\text{EtOH}$ , the soln. is cooled to  $0$ – $15^\circ$ , diethyl oxalate and  $\text{EtOAc}$  in substantially stoichiometrical proportions are added and the reaction is allowed to proceed substantially to completion at the lowered temp. and the liquid reaction mixt. is then warmed for about 15–30 min., cooled to a pasty mass, and a substantially solid product is obtained by expressing liquid from the mass under high pressure.

**Peroxide of tetrahydronaphthalene.** Soc. pour l'ind. chim. à Bâle. Swiss 162,998, Sept. 16, 1933 (Cl. 360.). A cryst. peroxide is prepd. by heating 1,2,3,4-tetrahydronaphthalene to temps. below  $100^\circ$  and subjecting 8 it to the action of  $\text{O}$  or air, the resulting peroxide being isolated from the reaction mixt. The product 1,2,3,4-tetrahydronaphthalene 1-peroxide, m.  $53$ – $4^\circ$ , has com. and therapeutic uses. Examples are given.

**A sulfonyl chloride.** Soc. pour l'ind. chim. à Bâle. Swiss 162,735, Sept. 16, 1933 (Cl. 362.). The substance  $p$ -nitroaniline- $o$ -sulfonyl chloride is prepd. by the action of a chloride of  $\text{H}_2\text{P}_2\text{O}_5$ , such as  $\text{POCl}_3$  or  $\text{PCl}_5$ , on  $p$ -nitroaniline- $o$ -sulfonic acid.

**Triarylstibine iodides.** Ludwig Kaufmann. Ger. 580,515, Feb. 7, 1934 (Cl. 120. 26.01). See U. S. 1,917,207 (C. A. 27, 4630).

**Polyglycol nitrates.** Westfälisch-Anhaltische Sprengstoff A.-G. Ger. 592,007, Jan. 31, 1934 (Cl. 120. 5.04). Polyglycol nitrates are recovered from spent acid from the nitration of polyglycols by washing the acid with a nitrate of another polyhydric alc., e. g., nitroglycerol. The nitrate used for washing may be produced in the

spent acid, if necessary after addn. of a further amt. of nitrating acid, or it may be produced simultaneously with the polyglycol nitrates. Cf. Ger. 548,427 (C. A. 26, 3670).

**Dialkyl sulfates.** Thomas F. Carruthers (to Carbide and Carbon Chemicals Corp.). U. S. 1,949,366, Feb. 27. Gaseous olefins such as  $C_2H_4$  are absorbed in concd.  $H_2SO_4$  which contains appreciable amts. of carbonaceous impurities, and there is added to the acid liquid water and at least one liquid solvent for dialkyl sulfate such as ether which is substantially immiscible with water, for effecting sepn. and recovery of dialkyl sulfate.

**Dialkyl sulfates.** Henry L. Cox (to Carbide and Carbon Chemicals Corp.). U. S. 1,949,369, Feb. 27. A gaseous olefin such as  $C_2H_4$  is absorbed in concd.  $H_2SO_4$  which contains appreciable amts. of carbonaceous impurities and there is added to the acid liquor formed a solvent liquid comprising at least one volatile O-contg. solvent such as  $EtOAc$ ,  $MeOH$ ,  $EtOH$ , ether, acetone or ethylene glycol and the flocculated carbonaceous impurities are removed, the solvent is removed from the acid liquor, and the dialkyl sulfate formed is sepd. and removed in an immiscible layer.

**$\beta$ -Bromoethyltrimethylammonium double salt.** Hermann Koch (Heinrich Hornstein, inventor). Ger. 576,712, Nov. 29, 1933 (Cl. 12p. 7.10). See U. S. 1,920,697 (C. A. 27, 4818).

**Stable salts of cyclohexenylethylbarbituric acid.** I. G. Farbenind. A.-G. (Clemens Lutter, inventor). Ger. 591,938, Jan. 29, 1934 (Cl. 12p. 7.02). The acid is converted to its solid Ca, Sr, Mg or Li salts by usual methods.

**Acetylene.** Franz Fischer and Kurt Peters. Ger. 591,756, Jan. 26, 1934 (Cl. 12o. 19.01). A mixt. of  $CH_4$  or other hydrocarbons and steam is subjected to an elec. discharge at very low pressure, e. g., 80 mm. The amt. of steam present is at least equal to the amt. of hydrocarbon. Examples are given.

**Methyl formate.** Ges. fur Kohlentechnik m. b. H. (Wilhelm Gluud, Fritz Brodkorb and Walter Klemp, inventors). Ger. 591,581, Jan. 24, 1934 (Cl. 12o. 11). In prepg.  $HCOOCH_3$  by the action of CO at high pressure on  $MeOH$  in the presence of alkali alcoholate at room temps., the amt. of the latter present is equal to about 3 g. of alkali metal per 100 cc. of  $MeOH$ .

**Ethylene oxide.** Société française de catalyse generalisée. Brit. 402,438, Dec. 4, 1933. See Fr. 739,562 (C. A. 27, 2163); 402,749, Dec. 4, 1933, addn. to 402,438. See Fr. 41,811 (C. A. 27, 4546).

**Paraformaldehyde.** Otto Fuchs and Erich Naujoks (to Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler). U. S. 1,948,069, Feb. 20. See Ger. 558,470 (C. A. 27, 312).

**Separating thiourea from ammonium thiocyanate.** Max Donauer (to Koppers Co. of Del.). U. S. 1,949,738, March 6. The mixt., at ordinary room temp., is treated with a quantity of a solvent such as water which at such temp. serves as a selective solvent for the  $NH_4CNS$ .

**Recovering benzene vapors in sulfonation.** E. A.

Piotrovskii. Russ. 31,428, Oct. 31, 1933. The gases obtained in the neutralization of crude sulfonated  $C_6H_6$  with carbonates are passed through concd.  $H_2SO_4$  with or without a preliminary removal of  $H_2O$ , for the absorption of  $C_6H_6$  and the spent acid is returned for the sulfonation of a new batch of  $C_6H_6$ .

**$\alpha$ -Naphthol.** Wm. J. Cotton (to National Aniline & Chemical Co.). U. S. 1,949,243, Feb. 27. A mixt. contg. 1-naphthalenemonosulfonic acid and a naphthalene-disulfonic acid is fused with  $NaOH$  to form a mixt. contg. the alkali metal compds. of 1-naphthol and of a naphthol-sulfonic acid but contg. substantially no alkali metal dihydroxynaphthalene compd., and 1-naphthol is recovered from the mixt.

**Optically active menthols.** John Read and Wm. J. Grubb. U. S. 1,949,329, Feb. 27. A mixt. of *d*-menthol and *l*-menthol is converted into their esters of an optically active menthoxyacetic acid, one of the esters is isolated by fractional crystn. and the isolated ester is hydrolyzed under conditions under which the menthoxyacetic acid liberated during the hydrolysis is not decompd.

**Acetylation of linalool.** V. I. Isagulyantz, and E. Smol'yaninov. Russ. 31,430, Oct. 31, 1933. Linalool is treated with  $Ac_2O$  in the presence of phosphoric acid. The reaction temp. is thus lowered.

**Trimethylcycloheptanone.** Soc. anon. M. Naef & Cie. Swiss 163,533, Oct. 16, 1933 (Cl. 36o). The compd. 1,1,7-trimethylcyclo-2-heptanone,  $b_p$  80-83°, is obtained by heating a metal salt of 2,3-dimethylheptane-2,7-dicarboxylic acid to 300-400°. Examples are given.

**Isoviolanthrone.** Lucas P. Kyrides (to National Aniline Chemical Co.). U. S. 1,947,858, Feb. 20. The fusion of a *Bs*-halobenzanthrone compd. such as *Bs*-chlorobenzanthrone with an alc. and an alkali metal hydroxide in the absence of an inert solvent or diluent liquid is effected with a reaction mixt. contg. about 5 to 18 mols. alkali metal hydroxide per mol. of halobenzanthrone compd.

**Camphene.** Soc. pour l'ind. chim. à Bâle. Swiss 163,004, Dec. 1, 1933 (Cl. 36o). Camphene is obtained by heating bornyl chloride above its m. p. with a small amt. of heavy metal as catalyst, with exclusion of moisture. An example is given.

**Indene.** Rütgerswerke-A.-G. and Leopold Kahl. Ger. 590,233, Jan. 4, 1934 (Cl. 12o. 1.04). Addn. to 589,560 (C. A. 28, 2373<sup>3</sup>). Tar oil fractions contg. at least 80% indene are cooled to low temps. to solidify the indene. This is mechanically sepd. from the liquid constituents, melted, recooled and again sepd., to give indene.

**Protocatechualdehyde.** Vanillin-Fabrik G. m. b. H. (Hans Puttfarcken and Leo Schulz, inventors). Ger. 591,888, Jan. 29, 1934 (Cl. 12o. 9). Heliotropin is treated with  $AlCl_3$  in the presence of a mixt. of an aromatic  $NO_2$  compd. and an aromatic hydrocarbon, and the  $CH_3$  group split off by mild heating. Thus, heliotropin is heated to 40-50° with anhyd.  $AlCl_3$ ,  $PhNO_2$ , and toluene to give a 93.5% yield of the aldehyde.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

### A—GENERAL

ARTHUR W. DOX

**Evidence for the existence of [blood] protoporphyrin by the fluorescence spectrum of its stannous complex.** H. Bierry and B. Gouzon. *Compt. rend.* 198, 615-17 (1934); cf. C. A. 27, 4500.—By the action of  $SnCl_2$  on hematin or hemoglobin a stannous deriv. of protoporphyrin is formed.

**Morphology of chemical reactions in gels.** VI. Significance of "autoform" and of "form" catalysis in colloidal media for the interpretation of certain biological phenomena. F. M. Shemyakin. *J. Gen. Chem. (U. S. S. R.)* 3,

137-43 (1933); cf. C. A. 27, 5230.—"The close resemblance between the morphology of periodic reactions taking place in gels and certain figures encountered in living cells is discussed."

**Problems of asymmetry in biochemical processes.** M. Schoen. *Ann. bull. soc. roy. sci. méd. nat., Bruxelles* 1932, Ann. 51-84.—A review covering 41 references, dealing with specificity of microorganisms and enzymes in their action on sugars, polyhydric alcs., acids and esters.

**Determination of inorganic and lipid phosphorus in blood during and after ultra-violet irradiation.** H. Stiemens and G. C. Heringa. *Nederl. Tijdschr. Genees-*

*hunde* 77, II, 1035-9(1933).—Lipoid P remains unchanged, but inorg. P is increased. R. Beutner

The potassium in serum. Heinrich Walsch and Sigurd Kittel. *Kolloid-Z.* 66, 200-5(1934).—In serums to which  $K_2SO_4$ -NaCl was added, and in acidified serums at  $pH$  4, K was found to migrate with albumin anodically in the Fürth app. (cf. C. A. 20, 865). Na behaves normally, migrating to the cathode. Arthur Fleischer

Increase of yeast fermentation by animal, plant and chemical substances. K. Heinrich Zeller. *Biochem. Z.* 266, 367-76(1933); cf. C. A. 28, 793<sup>4</sup>.—The substances tried included juices of common fruits and vegetables, juices of various animal organs and 40 pharmaceutical products, chiefly animal tissue preps. The substances were added in several proportions to a standard yeast-glucose soln. mixt. and the rate of  $CO_2$  formation was observed at intervals. After an initial period of slow fermentation a large increase in  $CO_2$  output was observed in nearly all cases. Sometimes the increase was large (as high as 24-fold in some cases) but transient, sometimes less marked but lasting several hrs. Owing to the great variety of substances used no definite conclusions can be drawn. A method of calcg. the sp. accelerating effect is given. L. E. Gilson

Action of some pure metals on the growth of osteoblasts in vitro. G. Ménégau, D. Odiette and P. Moysse. *Compt. rend. soc. biol.* 115, 38-40(1934); cf. C. A. 28, 1724<sup>1</sup>.—The expts. previously reported were repeated on osteoblasts instead of fibroblasts, with identical results. Action of some alloys on the growth of fibroblasts and osteoblasts in vitro. *Ibid.* 504-6.—By using the same technic as before, Al bronze was found to be very toxic, duralumin nontoxic, and other Al alloys more or less toxic. Ordinary steels were very toxic and stainless steels nontoxic or nearly so. L. E. Gilson

Influence of the constituents of glutathione on a certain spectral property of hemoglobin. G. Litarczek, G. T. Dinischiotu and I. Cosmulesco. *Compt. rend. soc. biol.* 115, 678-80(1934); cf. C. A. 27, 5402.—The span between the  $\alpha$ -bands of oxyhemoglobin and carboxyhemoglobin, previously discussed, is influenced by the —SH of reduced glutathione. The addn. of cysteine increases the span in a similar way. L. E. Gilson

Activation of trypsin at the surface of membranes polarized by an electric current. Philippe Fabre and Paul Boulanger. *Compt. rend. soc. biol.* 115, 681-3(1934). L. E. Gilson

Physicochemical properties of the chlorocruorin of *Spirographis spallanzanii*. Jean Roche. *Compt. rend. soc. biol.* 115, 776-8(1934); cf. C. A. 28, 181<sup>6</sup>, 1045<sup>2</sup>.—The neutralization curve is given. Oxygenated chlorocruorin acts like a monoacid base with  $pK = 2.8-2.9$  and a tribasic acid with  $pK = 5.8, 8.1$  and  $10.2$ . L. E. G.

The law of mass action and the chemical reactions in living cells. Otto Rahn. *Scientia* 55, 130-8(1934).—Discussion. Even in the smallest cells the law of mass action can be applied to all processes except cell division. L. E. Gilson

Biology of heavy water. G. N. Lewis. *Science* 79, 151-3(1934).—Tobacco seeds germinated slowly in  $H_2O$  contg. 50%  $D_2O$ , but not at all in  $H_2O$ . Bacteria and molds did not grow in  $H_2O$ . Flat-worms (*Planaria maculata*) lost their activity over several hrs., but, when replaced in  $H_2O$ , regained it. A 10-g. mouse drank 0.66 g. of  $H_2O$  in 3 hrs., and showed temporary signs of intoxication. The effect of the  $H_2O$  is to be found in the reduced rate of all physicochem. processes when  $H^+$  is substituted for  $D^+$ . W. D. Langley

The permeability of the skin to radium emanation. W. Santholzer. *Strahlentherapie* 48, 519-34(1933).—The radioactivity of blood taken during bathing in radioactive water demonstrates the permeability of the skin to Rn in small amts. Milton Levy

Enzymic hemolysis. Dionys Kanócz. *Z. ges. expl. Med.* 91, 56-66(1933).—Lecithin becomes markedly hemolytic after gastric lipase has acted on it. Rabbits fed lecithin and injected with gastric lipase have a second

dary regenerative anemia. Cholesterol inhibits the hemolysis both *in vitro* and *in vivo*. Milton Levy

"Trypsin poisoning" in acute pancreatic necrosis and a sensitive method for the determination of trypsin. Johannes Baumann. *Z. ges. expl. Med.* 91, 120-77(1933).—The method depends on detg. the exact amt. of soln. required to digest casein under standard conditions. Simple ligation of the pancreatic duct does not increase the active trypsin of urine but oil injections which produce necrosis increase the urinary trypsin greatly. Milton Levy

The effect of parenteral lipase on the lipase contents of the blood of rabbits. Tomaso Oliaro and Josef Adler. *Z. ges. expl. Med.* 91, 362-5(1933).—Parenteral lipase injections increased the blood lipase and diminished the blood fat. Milton Levy

Carbonic anhydrase. Its preparation and properties. N. U. Meldrum and F. J. W. Roughton. *J. Physiol.* 80, 113-42(1933).—An enzyme which is present in red blood cells and catalyzes both phases of the reaction  $H_2CO_3 \rightleftharpoons CO_2 + H_2O$  was sepd. by 3 methods. Without this enzyme  $CO_2$  could not be excreted in the lung rapidly enough for the needs of the body. It seems to be entirely distinct from any enzyme previously described. J. F. Lyman

The occurrence of carbonic anhydrase in lower marine animals. R. Brinkman. *J. Physiol.* 80, 170-3(1933).—In lower marine animals carbonic anhydrase occurs quite independently of hemoglobin or of catalase or peroxidase. J. F. Lyman

The microchemical behavior of certain splenic cells of the cat. Augusto Corradetti. *Boll. soc. ital. biol. sper.* 8, 1381-2(1933).—Feulgen's test on the cat spleen revealed the fact that certain cells showed reddish violet granulations which are round, regular, distributed around the nucleus and covering part or all of it or gathered at one or both poles. There are 2 types of cells: (a) cells with a diam. of 4-6.5  $\mu$  with minute, well-colored granulations; (b) cells with a diam. of 6-16  $\mu$  with larger but less colored granulations. The granulations do not take the Giemsa stain or the more common dyes. These cells have been observed only in the cat spleen; human, guinea-pig or frog spleen do not contain them. Peter Masucci

Variations in the electrical conductivity of certain natural colloidal systems with varying temperatures. I. The behavior of the conductivity of chicken egg yolk at various temperatures. A. Orru. *Boll. soc. ital. biol. sper.* 8, 1386-7(1933).—Egg yolk subjected to gradual heating shows 3 crit. points (76, 84, 96°) with regard to variations in elec. cond. These crit. points are related to the profound changes caused by heat in the colloidal system constituting the egg yolk. Peter Masucci

The phenomenon of blood radiation as applied to the study of certain organic conditions (normal blood radiometry). G. Protti. *Boll. soc. ital. biol. sper.* 8, 1412-17(1933).—The radiant power of the blood is a physicochem. property manifested by an emission of electromagnetic radiation belonging to the ultra-violet field. This photoelec. manifestation is closely assoc. with processes of combustion of polypeptides and carbohydrates. Previous exptl. data support the view that the radiant power of blood is an index of the oxidative and enzymic processes occurring in the organism. Blood radiometric results are discussed in relation to age groups, sex, diet, glucemia, azotemia, alk. reserve, basal metabolism, fatigue, menstruation and pregnancy. The av. inductive effect (av. of male and female detns.) is +44.4. Bloods are classified according to their radiant power: sub-radiant (0 to +30); normoradiant (+35 to +60); super-radiant (+60 to +90). Blood radiometric data seem to support the hypothesis that equal radiometric figures correspond to equal or equiv. metabolic rhythms. P. M.

Formation and destruction of methylglyoxal during glycolysis. Camillo Artom. *Boll. soc. ital. biol. sper.* 8, 1426-9(1933).—Rabbit liver was fried and defatted with acetone according to the Willstätter method and allowed to act on Ca or K hexosediphosphate or on synthetic AcCHO. The system had a vol. of 20 cc. and included:

(a) dried liver powder 0.5 g.; (b) Ca hexosediphosphate 100 mg. or K hexosediphosphate 50 mg. or synthetic AcCHO 8 mg.; (c) a phosphate buffer soln. 0.04 *M*, *pH* 6.7; (d)  $\text{Na}_2\text{SO}_3$  (0.03 *M*). Toluene was added to the tubes, the mixt. was incubated at 38° for 22 hrs., brought to 50 cc. with colloidal  $\text{Fe}(\text{OH})_3$  and  $\text{MgSO}_4$  and filtered through paper and aliquot portions were taken for tests. Conclusions: (1) Dried defatted rabbit liver splits hexosediphosphates with formation of AcCHO. (2) In the presence of  $\text{Na}_2\text{SO}_3$ , the reaction is almost completely arrested at this point, but in the absence of sulfite, the AcCHO is in most part further transformed into products not reactive with sulfite. (3) Although dried liver forms and destroys AcCHO without producing lactic acid, it contains "glycolase," but not "glyoxalase." The results of this investigation preclude the new transformation of AcCHO through the lactic acid stage. (4)  $\text{NaF}$  or  $\text{ICl}_2\text{CO}_2\text{H}$  in sufficient concn. to arrest the production of lactic acid in muscle is without effect on the destruction of AcCHO formed as an intermediate product of hexosediphosphate scission. (5) Synthetic AcCHO behaves differently from that formed by the enzymic splitting of hexosediphosphate whether in the presence or absence of sulfite. In the absence of sulfite it is also transformed by the liver, but the transformation ceases with formation of reactive products with sulfite; in the presence of sulfite, synthetic AcCHO is also largely transformed into products reactive with sulfite. The presence of  $\text{NaF}$  or  $\text{ICl}_2\text{CO}_2\text{H}$  does not modify the transformation of synthetic AcCHO. The following hypothetical scheme of transformation is suggested:

**Peter Masucci**

The presence of phosphatidases in the suprarenal cortex and in the pancreas. I. The lecithinase power of aqueous extracts. V. Gronchi. *Boll. soc. ital. biol. sper.* 8, 1596 9(1933).—The aim of this investigation was to determine whether there was present in the suprarenal cortex and in the pancreas an enzyme capable of splitting lecithin into lysocethin. The results indicate that aq. exts. of the suprarenal cortex, of the pancreas and of bee poison have marked lipolytic power; they contain enzymes with phosphatidase activity. Suprarenal cortex exts. of the ox or horse when placed in contact with emulsions of egg yolk or ovo lecithin do not produce lysocethin; guinea-pig suprarenal exts. rarely produce traces of lysocethin. Ox or horse pancreatic exts. when placed in contact with emulsions of lecithin produce lysocethin in contact for 4 hrs. at 38°, but only traces are found after 20 hrs. Bee poison placed in contact with lecithin produces lysocethin. II. Lecithinase power of the enzymes. *Ibid.* 1599-1603.—The enzyme extd. from the pancreas is a lecithinase. There are also present other phosphatidases which split lecithin further and attack lysocethin. Phosphatidases are present in suprarenal exts. which attack lecithin and lysocethin but no lecithinase is demonstrable. P. M.

**The esterases of enteric secretion. III. Lorio Reale.**  
*Boll. soc. ital. biol. sper.* 8, 1622 5(1933); cf. C. A. 28, 187f. -The aim of this investigation was to ascertain the effects of neutral salts and of high temp. on the activity of enteric esterases. Inactivation by neutral salts: Detns. were made at  $p_H$  5.8 and 8.6. The  $p_H$  played a minor part. The important factors were concn. and the nature of the anion or cation involved. At  $p_H$  8.6, the intensity of inactivation for the chloride of various cations was: concn. 0.75*N*, Ca > Mg > K > Ba > Na > Li; concn. 0.50*N*, Ca > Ba > Mg > K; Na and Li produced some activation; concn. 0.1*N*, all the cations showed more or less marked activation. At  $p_H$  8.6 the intensity of inactivation of the Na salts of various anions was: concn. 0.75*N*, F > I,  $\frac{1}{2}$  SO<sub>4</sub>, Br, Cl, NO<sub>3</sub>; concn. 0.50*N*, F >  $\frac{1}{2}$  SO<sub>4</sub> > NO<sub>3</sub>; Br, I, Cl, showed activation; concn.

**1** 0.10 *N*, all the anions showed activation. Inactivation by heat: (a) Moist heat at  $p_H$  7.3. At a temp. of 38–70° for 1 hr. the activity of the enzyme decreased with increasing temp., becoming zero at 80–70°. At 53° for 1 hr.  $\frac{1}{4}$  of the enzyme became inactivated. (b) Dry heat. Complete inactivation resulted after 1 hr. at 100°. At 76°,  $\frac{1}{2}$  of the enzyme became inactivated. At 80°,  $\frac{1}{2}$  to 2 hrs., the inactivation process proceeds as an irreversible unimol. reaction. Peter Masucci

2 The electrophoresis of calcium in blood serum and its dialyzate. G. Peretti. *Boll. soc. ital. biol. sper.* 8, 1645 9(1933).—Three groups of expts. were made: (1) Whole serum was introduced in the middle compartment of the app., 0.9% NaCl in the lateral compartments. (2) Dialyzed serum was introduced in the middle compartment, the dialyzate of the same serum in the lateral compartments. (3) The serum dialyzate was introduced in the middle, 0.9% NaCl in the lateral compartments. At the end of the electro dialysis, the liquid in each compartment was made up to vol. and Ca detd. in each. In (1) and (2) the protein content was also detd. Results: (1) there was from 0 to 5.2% more Ca transported to the anode; also 10 to 23% protein was transported to the anode, none to the cathode; (2) there was from 2.9 to 12% more Ca transported to the cathode, while the proteins in amts. similar to (1) were transported to the anode; (3) in half the expts. more Ca migrated to the anode and in half more Ca migrated to the cathode. The results indicate that there are present in serum complex anions which behave similarly to artificial systems of  $\text{CaCl}_2$  + alk. citrate.

**Peter Masucci**

**Significance of carotene in the living organism** S. D. Balakhovskii. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1, 28-9 (in French 29-30) (1934). -Expts. show that the rate and the amt. of O absorbed by erythrocytes are increased by addn. of carotene in water or EtOH. Osmotic stability of erythrocytes is also improved by addn. of a colloidal soln. of carotene. Application of carotene in water or dil. EtOH is beneficial in curing burns, eye diseases (diseases of cornea, burns by ultra-violet light, trachoma, etc.), and infected open wounds. N. N. M.

The reabsorption of exudates and transudates; proteolytic activity. G. Barbaro-Forleo. *Arch. sci. med.* 6 57, 285 324(1933).--Reabsorption is facilitated by a proteolytic enzyme present in the fluids. A. E. M.

**The reductases of liver and milk and enzyme activation by mineral waters.** M. Loeper, A. Mougeot and V. Aubertot. *Bull. acad. m'ed.* 109, 179-82 (1933). Mineral waters accelerate the reduction of methylene blue by formol in presence of liver and milk. A. E. Meyer

**Inhibition and activation of pancreatic enzymes:** lipase, amylase, trypsin. II. Adsorption of enzymes on proteins. H. Dyckerhoff, H. Michler and V. Tadsen. *Biochem. Z.* **268**, 17 33(1934); cf. *C. A.* **27**, 2165.—The pancreas contains substances which inhibit the activity of the enzymes hydrolyzing fats, glucides and proteins. This factor has not been completely eliminated in quantitative studies of the pancreatic enzymes. In addition to these substances, pancreatic trypsin contains also a sp. inhibitor which is removed by the enterokinase.<sup>4</sup> It is also found that trypsin can split protein without enterokinase.

**S. Morgulis**

**Crystalline myoglobin. II. Sedimentation constant and molecular weight of myoglobin.** Hugo Theorell. *Biochem. Z.* 268, 46-54 (1934); cf. C. A. 26, 5587.—The sedimentation const. of the myoglobin present in the press juice from horse, cow and cat skeletal muscles is about  $2 \times 10^{-13}$ . The myoglobin from horse muscle is a monodisperse system of mol. wt. 34800. In the aq. ext. of the washed horse heart muscle 2 myoglobins are present with sedimentation consts. of  $2 \times 10^{-13}$  and  $4 \times 10^{-13}$ , corresponding to mol. wts. of 34000 and 68000. The  $p_H$  range of stability of the myoglobin of lower mol. wt. is extraordinarily large, extending from  $p_H$  6 to 13. The sp. vol. at  $20^\circ$  in salt-free medium is 0.741, the mol. extremely aspherical with an asymmetry index of 1.8. The permeability of the kidney to myoglobin is probably due to its low mol. wt. III. Absolute light absorption of oxy-, car-

boxy-, meta- and reduced myoglobin. *Ibid.* 55-63.—The light absorption of various forms of myoglobin is recorded. The absorption can be heat used for detns. of myoglobin in the form of metaglobin provided the  $p_H$  is properly controlled. IV. Myoglobin in equilibrium with oxygen and carbon monoxide. *Ibid.* 64-72.—The detns. were made either in a salt-free medium or in a phosphate buffer at 20° and 37° and at  $p_H$  6.0 and 7.4, and under a const. mild illumination. In a salt-free medium or in a phosphate buffer at 20° the value of  $K = [MgbO_2]pCO/[MgbCO]pO_2$  is 19.2. The ratio of CO and O<sub>2</sub> affinity of myoglobin is quite different from that of hemoglobin, but the relation between the log  $K$  and the "span" (in A. units) is linear just as in the latter. The effect of temp. on the reaction of myoglobin with CO and O<sub>2</sub> is quantitatively and qualitatively similar to that of the hemoglobin. The  $p_H$  has no influence on the  $K$  values. V. Oxygen-binding curve of myoglobin. *Ibid.* 73-82.—Myoglobin has a very high affinity for O<sub>2</sub>. At 37° and  $p_H$  7.4 myoglobin is half satd. with O<sub>2</sub> at a pressure of 3.26 mm. whereas for hemoglobin a pressure of 20 mm. is required; in other words, its O<sub>2</sub> affinity is 6 times as great. The O<sub>2</sub>-binding curves of myoglobin are strongly hyperbolic, whereas those of hemoglobin are S-shaped. Hill's formula for hemoglobin  $y/100 = Kx^n/(1 + Kx^n)$  is applicable here, the value of  $n$  being 1. The influence of temp. and  $p_H$  on the magnitude of  $K$  has been detd. in a no. of expts. van't Hoff's coeff. of the heat of reaction between O<sub>2</sub> and myoglobin, corrected for molar concn. of O<sub>2</sub>, was found to be  $q = -17,500$  Cal. at 32°. By calcn. the coeff. for the CO reaction,  $q = 22,300$  Cal. at 32°. For hemoglobin, under comparable conditions,  $q_0 = -30,500$  Cal.; in other words, the combination with O<sub>2</sub> is affected more than in the case of myoglobin. The myoglobin + O<sub>2</sub> reaction is only slightly affected by the changes in  $p_H$ , not did the salt concn. (2.5-6.5%) have any effect. The myoglobin plays apparently a very important role as an O<sub>2</sub> reservoir in muscle (red), and since it contains  $1 \times 10^{-4}$  to  $5 \times 10^{-4}$  g. Fe per g. dry substance it is more important in this respect than cytochrome with only  $1 \times 10^{-6}$  g. Fe per g., but their function is thought to be reciprocal. Thus, fly muscle contains much cytochrome but very little myoglobin while in mammalian skeletal muscle the myoglobin predominates and in cardiac muscle both substances are present.

Alcoholdehydrogenase from yeast. II. D. Müller. *Biochem. Z.* 268, 152-7 (1934); cf. *C. A.* 27, 4824. Alcoholdehydrogenase from yeast has an optimum activity from  $p_H$  7.5 to 10; from  $p_H$  10 to 11 the activity decreases abruptly to a min. while it decreases more slowly from  $p_H$  7.5 to 3.5. Heating for 30 min., at 58° at  $p_H$  6.3 causes a destruction of 50% of the enzymic activity. HCN at 0.01  $M$  has little effect, but at 0.1  $M$  causes a loss of 50% in activity.

Quinones as enzyme models. XII. Metal salts as activators of the enzyme model. Bruno Kisch and K. Schwirith. *Biochem. Z.* 268, 158-63 (1934); cf. *C. A.* 27, 4825. The catalytic deamination of glycine by quinone in the presence of various salts in concns. ranging from 0.001  $M$  to 0.0000005  $M$  has been studied. CdCl<sub>2</sub> was found to exert the greatest effect under the conditions of the expt.

Activation of prochymosin. Rich. Ege and Erling Lundsteen. *Biochem. Z.* 268, 164-73 (1934).—Aq. exts. from calf stomachs contain very little active chymosin. Acid activation begins at  $p_H$  5 at 40° although the optimum  $p_H$  for chymosin activity is between 5 and 6. The activation velocity increases with acidity, and at  $p_H$  3.4 50% activation requires 30 min. but at  $p_H$  3.0 only about 1.5 min. Activation also results spontaneously at  $p_H$  7 on long standing or with the aid of pancreatin. S. M.

Determination of pancreatic lipase. Ernst Waldschmidt-Leitz and Renate Junowicz. *Biochem. Z.* 268, 178-80 (1934).—Reply to Steudel's criticism (*C. A.* 27, 5348) of the method for lipase detn. S. confused the relation between degree of splitting of substrate (olive oil) and amt. of lipase (lipase units) with that of the degree of hydrolysis and amt. of gland used. S. Morgulis

Specificity of dipeptidase and aminopolypeptidase. W. Grassmann and H. Bayerle. *Biochem. Z.* 268, 211-19 (1934).—The peptidase system of yeast consists of 2 components: one splits dipeptides, the other polypeptides. Expts. with dipeptides in which the NH<sub>2</sub> group either of asparagine or aspartic acid is combined with another amino acid show that these are hydrolyzed by dipeptidase but not by aminopolypeptidase from yeast or from intestine, while glycylglycyl-L-asparagine is hydrolyzed by aminopolypeptidase but not by the dipeptidase. The aspartic acid peptides are not as easily hydrolyzed as those of asparagine. S. Morgulis

The transformation of amino acids in buds. W. Grassmann and H. Bayerle. *Biochem. Z.* 268, 220-8 (1934).—The buds from *Rosacea*, but not of other families, decompose with considerable speed added amino acids but the only product under anaerobic conditions is NH<sub>3</sub>, so that no decarboxylation occurs. Formation of primary amines was never observed. The biol. amine production must therefore be due either to intact cellular activity or to some secondary product of dehydration or decamination of the amino acids:

Solubility of lead and zinc sulfides in organ pulp. C. G. Santesson. *Skand. Arch. Physiol.* 67, 196-200 (1934). The soly. of HgS, Bi<sub>2</sub>S<sub>3</sub> and CuS in Ringer soln. is markedly increased by the presence of liver tissue pulp. The soly. of PbS or ZnS is not increased by the liver tissue. Addn. of HCl increases the soly. of the sulfides but much less so in the presence of the liver pulp, except with CuS, which dissolves readily. The slight effect of PbS or ZnS as compared to that of HgS, Bi<sub>2</sub>S<sub>3</sub> or CuS is attributed to their low soly.

Hydrolysis of starch by amylose and amylose complement. K. Myrback and S. Myrback. *Svensk. Kem. Tids.* 45, 230-6 (1933).  $\alpha$ - and  $\beta$ -Amylose separately do not hydrolyze starch completely but leave about 30% of amylose as dextrin. Acting jointly they convert the amylose completely into maltose, leaving 15% residue in the case of raw starch. So-called amylose complement (cf. Pringsheim, *et al.*) from autolyzed yeast is not a complement but a protective agent analogous to peptic protein products.

Significance of cytochrome in cell respiration. Keita Shibata and Hiroshi Tamiva. *Acta Phytochim.* (Japan) 7, 191-231 (1933).—After reviewing in detail the theories of Warburg and of Keilin on the mechanism of action of respiration enzymes, the authors present some new data that bear out their own theory. In the oxygenation of cytochrome, O<sub>2</sub> is not bound to a single component of the cytochrome complex, but to several, and CO is bound to but a fraction, 1/ $m$ , of the complex. The quant. effect of CO in inhibiting respiration is expressed by the formula  $\sqrt{N}/(1 - N) \times \sqrt{CO}/O_2 = K$ , in which  $N$  is the residual respiration after the addn. of CO, and  $K$  a const. The spectral characteristics of 3 components of cytochrome are given. J. J. Willaman

Systematic study of the cytochrome spectra of various microorganisms. Hiroshi Tamiya and Seizaburo Yamaguchi. *Acta Phytochim.* (Japan) 7, 233-44 (1933).—Spectral analyses are given of the cytochrome of 44 species of bacteria and 17 of yeast. A no. of spectral types are classified. J. J. Willaman

Enzyme studies. Hans v. Euler and Erika Klusmann. *Arkiv Kemi, Mineral., Geol.* 11B, No. 23, 6 pp.—Yeast dehydrogenase transfers H from hexosemonophosphate to methylene blue very rapidly. It dehydrogenates glucose and xylose very slowly. Cozymase is required for the dehydrogenase of corpus luteum, ovarian tissue, anterior and posterior pituitary. J. J. Willaman

Enzymic oxido-reduction by yeast dehydrogenase. Hans v. Euler and Carl Martius. *Arkiv Kemi, Mineral.,*

1. 11B, No. 22, 6 pp.—Yeast dehydrogenase transfers H from lactic acid to methylene blue and decolorizes the latter. It dehydrogenates lactylglycine more slowly, lactic acid still more slowly, and EtOH more rapidly than lactic acid. Cozymase is required in the system.

J. J. Willaman

Constitution of estrin (Danielli) 10. Oxidation-reduction properties of glucides formed out of contact with O (Mayer-Reich) 2. Optically active allantoin (Fosse, *et al.*) 10.

Onderstepoort Journal of Veterinary Science and Animal Industry (*New Journal*). Published quarterly by the Dept. of Agriculture, Onderstepoort, Pretoria, S. Africa. Vol. 1, No. 1 appeared in July 1933.

Hewitt, L. F.: Oxidation-Reduction Potentials in Bacteriology and Biochemistry. 2nd ed. Issued by London County Council. London: P. S. King & Son, Ltd.

Biochemical and Allied Research in India in 1932. Bangalore: Society of Biological Chemists. 86 pp.

Chemie der Enzyme. Edited by Hans v. Euler. Tl. II. Spezielle Chemie der Enzyme. Abschnitt 3. Die Katalasen und die Enzyme der Oxydation und Reduktion. Edited by H. v. Euler, W. Franke, R. Nilsson and K. Zeile. Berlin: J. Springer. About 650 pp. Cf. C. A. 23, 2997.

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Determination of lactose in blood. R. Moracchini and B. Cossu. *Diagnostica tec. lab. (Napoli) Riv. mensile* 3, 140-8(1932).—In Folin and Malmros' micro method fermentation with brewer's yeast gives good results in differentiating blood glucose and lactose. B. C. A.

Iron hematoxylin [stability of staining solutions]. R. T. Hance. *Stain Tech.* 8, 117(1933).—Stock solns. of Fe hematoxylin (10% EtOH solns.) should be renewed yearly. A trace of NaHCO<sub>3</sub> added to a new 0.5% soln. enables it to be used immediately. B. C. A.

Determination of the fat content of the blood. H. Festen. *Nederland. Tijdschr. Geneeskunde* 77, II, 1893-6(1933).—The method, based upon sapon. and titration of the free fatty acids, can be applied to 0.2-cc. samples. The alc.-ether ext. of the blood is purified by extn. with petr. ether; glucose is thus eliminated and the formation of org. acids from sugar by means of the NaOH used for saponification of the fats is avoided. A buret is described which can be used for the titration of very small quantities of fatty acids. R. Beutner

Determination of indican in the blood serum. J. Broekmeyer. *Nederland. Tijdschr. Geneeskunde* 77, II, 2795-8(1933); cf. C. A. 27, 5357.—Indican is detd. by means of Obermayer's reagent. The color obtained from standardized indican made from urine is used as a stable colorimetric standard. R. Beutner

A modified respiration vessel for the manometric determination of  $p_H$ . Hans Borei. *Z. vergleich. Physiol.* (Abt. C, Z. wiss. Biol.) 19, 583-6(1933).—A Barcroft-Warburg respiration vessel is designed to provide for a single side arm for storage of H<sub>2</sub>SO<sub>4</sub> and a divided side arm for storage of KMnO<sub>4</sub> and NaI. The  $p_H$  is detd. according to Dickens and Sinner (C. A. 26, 1312, 3578). After mixing slightly acid KMnO<sub>4</sub> and NaI (cf. Krebs, C. A. 24, 4066), the alkali produced absorbs the CO<sub>2</sub> originally present plus CO<sub>2</sub> from carbonates. Subtraction gives the CO<sub>2</sub> initially present. Since the ratio of free to total CO<sub>2</sub> is known, the  $p_H$  can be read from a reference curve giving this ratio as a function of the  $p_H$  (cf. C. A. 27, 2500 for use of similar app. on sea-urchin eggs).

B. C. Brunstetter

Gasometric determinations carried out with a ureometer of the calcimeter type. IV. Determination of urea, ammonium salts, total nitrogen and the alkaline reserve

of body fluids. G. D'Este. *Boll. chim. farm.* 72, 601-14(1933); cf. C. A. 27, 476. Lewis W. Butz

The osazone reaction in glucosuria and lactosuria. Guggero Forti. *Boll. chim. farm.* 72, 802-4(1933).—Glucose and lactose can be detected in concns. of 0.02 and 0.05%, resp., in urine (20 cc. sample) by the Quagliarello and Caponetto method (C. A. 21, 1967) modified by using PhNHNH<sub>2</sub>.HCl instead of PhNHNH<sub>2</sub>. The mixed osazones can be sepd. by dissolving out the lactosazone (I) with hot H<sub>2</sub>O. By adding 1 cc. of Q.'s buffer to the filtrate, characteristic crystals of I were formed on cooling. Lewis W. Butz

Some recent methods for the determination of blood bilirubin. G. Ferrari. *Diagnostica tec. lab. (Napoli), Riv. mensile* 4, 696-716(1933).—All methods proposed so far have practical defects and sources of error. Bilirubin detn. is of considerable clinical significance, especially if both the H<sub>2</sub>O-sol. and the CHCl<sub>3</sub>-sol. fractions are detd. Lewis W. Butz

The pathology of creatinine. I. Analytical technic. Giovanni Ferro-Luzzi. *Diagnostica tec. lab. (Napoli), Riv. mensile* 4, 932-55(1933).—F.-L. suggests modifying Folin's method for creatinine as follows: The use of 2 cc. of serum, deproteinization with tungstic acid, colorimetric detn. with a standard soln. of 0.5 N K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, and correction of results by means of tables. L. W. B.

The determination of albuminoid nitrogen. I. S. Yaichnikov. *J. Gen. Chem.* (U. S. S. R.) 3, 434-6(1933).—The ppts. obtained by treatment of spermine with Cu(OH)<sub>2</sub>, (CH<sub>3</sub>COO)<sub>2</sub>Pb and phosphotungstic acid are not of albuminoid nature; these ppts. contain xanthine and hexone bases. W. P. Bricks

The relative concentrations of esterase and lipase in adipose tissue. Joseph S. Hepburn and Harry McDuffy Moore. *Am. J. Pharm.* 106, 14-15(1934).—Mix 50 g. chopped tissue with sand, triturate with several successive portions of water, filter through wire gauze, then through several thicknesses of cotton gauze, obtaining 500 cc. of filtrate. Place a 100-cc. aliquot portion in a 250-cc. Erlenmeyer flask for each detn. proper and each blank or control expt. For the control expts. boil the filtrate, then cool it to room temp. before addn. of the other reagents. Add 1 cc. of the proper substrate (ethyl butyrate for esterase, and tributyrin for lipase) and 0.3 cc. of phenolphthalein soln. (1% in alc.) to each flask, mix thoroughly and neutralize with 0.1 N NaOH; add 1 cc. of toluene as a bactericide, stopper the flask and keep at 37.5° for 72 hrs. Titrate with 0.1 N NaOH. The numerical difference between the vols. of standard alk. soln. required to titrate the sample and the control is a measure of the butyric acid liberated by the hydrolytic enzyme. Three samples of chicken fat showed, resp. esterase 210, 240 and 265; lipase 9.25, 9.90 and 10.10. Turkey fat gave esterase 4.40, 4.50; lipase 9.90, 11.20. Goose fat contained esterase 9.55, 9.25; lipase 8.60, 9.00. Lamb fat contained esterase 44.35; 47.50; lipase, 19.25, 17.80. Human fat contained esterase 7.15, 7.80; lipase 5.50, 5.95. W. G. Gaessler

New technic for the colorimetric determination of adrenaline by reaction with iodine. Georges Weller. *Bull. soc. chim. biol.* 15, 1308-16(1933).—The fresh or dried tissue is ground with sand, treated with 10% CCl<sub>4</sub>-CO<sub>2</sub>H soln. to ppt. protein and filtered. The  $p_H$  of the filtrate is raised to about 4 by the addn. of KOAc, a dil. soln. of I added, the excess of free I removed by Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, and the resulting red soln. compared with a standard. By means of this method, no adrenaline was detected in the liver, spleen, pancreas, thyroid, kidneys, lungs, heart or skeletal muscles of dogs. The fresh adrenals of male dogs averaged 1.425 mg. adrenaline per g., those of females 1.482 mg. Thirty references. L. E. Gilson

Determination of adrenaline in fresh adrenal glands. Léon Binet and Georges Weller. *Compt. rend. soc. biol.* 115, 598 9(1934); cf. preceding abstract.—Addnl. comment on the method. L. E. Gilson

Technical remarks on the use of the Zeiss interferometer in the interferometric method of Hirsch. C. O. Guillaumin. *Bull. soc. chim. biol.* 15, 1392-414(1933);

cf. "C. A. 27, 2973.—Sources of error in Hirsch's method of detg. endocrine conditions are discussed.

L. E. Gilson  
Chemical study of the nitrogen balance. H. Pénau and J. Gauduchon. *Bull. soc. chim. biol.* 15, 1483 (1933).—Analytical methods are discussed. L. E. G.

Technic for the microdetermination of magnesium in blood serum. Léon Velluz. *Compt. rend. soc. biol.* 115, 253-4 (1934).—An *o*-hydroxyquinoline method.

L. E. Gilson  
The preparation of vagotonin completely free from insulin. D. Santenaise, G. Fuchs and M. Vidacovitch. *Compt. rend. soc. biol.* 115, 472 5 (1934); cf. C. A. 27, 4552.

L. E. Gilson  
Value of the Takata-Ara reaction as a test for hepatic insufficiency. G. Hugonot and R. Sohler. *Compt. rend. soc. biol.* 115, 708-11 (1934).—The technic of the method is given, and the interpretation of the results discussed.

L. E. Gilson  
Colorimetric method of determining the polypeptides of serum. R. Goiffon and J. Spaey. *Compt. rend. soc. biol.* 115, 711-13 (1934).—A colorimetric method of detg. tyrosine in the  $\text{CCl}_3\text{CO}_2\text{H}$  filtrate is described. The peptide content is said to be in direct proportion to the tyrosine.

L. E. Gilson  
Fermentation of blood sugars. Humberto Giovannibattista. *Rev. facultad cienc. quim.* (Univ. La Plata) 8, Pt. 2, 47-63 (1933).—In detg. fermentable sugar in blood identical results were obtained by using *Saccharomyces cerevisiae*, *S. ellipsoideus* and *Zygosaccharomyces mullis*. Whole blood defecated with tungstic acid gave higher values for nonfermentable reducing substances than when defecated with  $\text{Zn}(\text{OH})_2$ . With plasma or serum there was little or no difference observed. Defecation by  $\text{Hg}(\text{AcO})_2$  and  $\text{NaHCO}_3$  gave still lower values. L. E. G.

New simple quantitative microcrystallographic estimation of phosphates in blood serum. E. A. Fribrum. *Arch. Path.* 16, 520 1 (1933). The pptn. of phosphates by means of a proper  $\text{NH}_4\text{Mg}$  sulfate reagent (Dowd's reagent, *Ill. Med. J.* 56, 286 (1924)) can be used for an estn. of the phosphates in the blood serum. Equal quantities of serum, dild. with increasing amts. of 2.5%  $\text{NaCl}$ , are pptd. with the reagent; the last tube in which the crystals are found within 45 min. contains 3 mg. of P in 100 cc. of serum. The percentage of serum phosphates is calcd. from the dild. Harriet F. Holmes

The estimation of urea by urease methods in fluoride blood. C. F. M. Rowe. *Brit. J. Exptl. Path.* 14, 339 42 (1933).—Means of treating fluoride blood to permit urease activity has been examd. Mg is suggested as the most suitable metal for counteracting the inhibitory effect of fluoride, and in the form of caffeine Mg salicylate is very suitable for this purpose. It is not probable that the organically combined Mg merely replaces the  $\text{NaF}$  as 25 mg. of caffeine Mg salicylate is capable of rendering non-effective between 20 and 30 mg. of fluoride, that is to say, about 6 times as much as the max. on this assumption. It is inferred, therefore, that the principal mechanism involved is one of adsorption. Harriet F. Holmes

Chemical blood studies. I. Comparative studies on blood, laked and unlaked blood filtrates of animals in health and disease, with particular reference to methods and technic employed. H. Graf. *Onderscheppoor J. Vet. Sci.* 1, 269 78 (1933).—Methods for the prepn. of laked and unlaked blood filtrates and for the detn. of amino acids, uric acid, urea, nonprotein N, creatinine, total N and sugar are outlined. II. A contribution to the determination of urea in animal blood filtrates (laked and unlaked). T. J. Wilken-Jorden and H. Graf. *Ibid.* 279-83. —In the detn. of urea by the Folin and Svedberg method (cf. C. A. 24, 5780) the urease activity reaches an optimum at  $pH$  5.0-5.5. Below  $pH$  5.0 there is a very sudden fall in activity resulting ultimately in stagnation. In order to insure max. efficiency of the urease, 1.5-2.0 cc. of the acetate buffer soln. should be used per 5 cc. of blood filtrate, instead of the 2 drops recommended by F. and S. K. D. Jacob

Test for cholesterol. H. Mühlpfordt. *Dermatol. Woch-*

*schr.* 97, 1651-3 (1933).—To 2 cc. of cholesterol soln. in  $\text{CHCl}_3$  add 3 drops of 1% digitonin in MeOH and 5 cc. water. A crystalline ppt. at the junction is cholesterol digitonide. Milton Levy

The measurement of insensible weight loss of man in the laboratory and clinic. Francis G. Benedict. *Z. ges. exptl. Med.* 91, 340 61 (1933).—A discussion of conditions and balances and the relationship of weight loss to metabolism. Milton Levy

Is the picric acid reaction practically useful for blood-sugar determinations? E. Kaufmann. *Z. ges. exptl. Med.* 92, 480 9 (1933).—The rapidity of and convenience of the picric acid method recommends it as a clinical method. Milton Levy

The determination of the plasma volume and the blood volume of the rabbit by the injection of homologous anti-crystallized egg-albumin serum. J. T. Culbertson. *Am. J. Physiol.* 107, 120 7 (1934).—Blood-plasma vol. in the rabbit can be detd. by finding the dild. which a known amt. of homologous pptg. antiserum undergoes after injection into the circulation. In the rabbit, plasma vol. = 3.21 and total blood vol. = 5.82% of the body wt. J. F. L.

A sensitive physical test for adrenaline. J. H. Gaddum and H. Schild. *Proc. Physiol. Soc., J. Physiol.* 80, 9P (1933).—If adrenaline solus., in faintly acid soln. and in the presence of O, are irradiated with ultra-violet, a fluorescence develops. This is more sensitive for adrenaline than any other known chem. test. Interfering substances in blood have prevented the application of the test successfully to that fluid. J. F. Lyman

The localization of mineral salts in cells of some mammalian tissues by microincineration. Gordon H. Scott. *Am. J. Anat.* 53, 243 248 (1933). Only Fe and Si can be recognized with certainty. Ca in aggregates of small cells or large ones can be recognized. Microincineration does indicate location and amount of total minerals. In dividing cells the mineral is concd. in the chromatin. Exposed surfaces such as cell surfaces along vascular channels show concn. of inorg. salts. C. M. McCay

A new test for glucolytic insufficiency. Michel Polonovski and Henri Warenbourg. *Presse méd.* 41, 793-6 (1933). The C corresponding to unknown compds. in the plasma is detd. as follows: Heat 2 cc. of Folin-Wu filtrate with 0.1 N  $\text{K}_2\text{Cr}_2\text{O}_7$  contg. 25%  $\text{H}_2\text{SO}_4$  to 100° for one hr. Det. the excess of  $\text{K}_2\text{Cr}_2\text{O}_7$  iodometrically. The chromic index is the quantity of 0.1 N  $\text{K}_2\text{Cr}_2\text{O}_7$  soln. necessary to oxidize one cc. of plasma. One g. of glucose requires 1.33 cc. The difference between the chromic factor for glucose and the total index gives the residual chromic index. An increase of the latter beyond 0.6 45 min. after the ingestion of 100 g. glucose indicates a disturbance of the glucose metabolism. A. E. Meyer

Studies on the galactose test. Torben Geill. *Acta Med. Scand.* 81, 31-62 (1934).—To obtain correct galactose values in the urine, the latter must be shaken with animal charcoal and AcOH in a 1-10 ratio. In hepatitis cases the galactose test is generally pos. In acute cases neg. results were found in very mild attacks. In cases of stagnation icterus all the tests were neg. Pos. tests were frequently obtained in Basedow patients, and are attributed to a thyrotoxic liver effect. The test, however, must be interpreted in conjunction with other clinical observations. S. Morgulis

Preparation of hemin with formic acid. Josef Brückner. *Biochem. Z.* 268, 181-6 (1934).—Coagulate by heat, with addn. of 1 g.  $\text{Na}_2\text{SO}_4$  per l., horse blood or a soln. of horse oxyhemoglobin, press the coagulum, wash several times with alc. and ext. with a 3-4% formic acid in alc. (EtOH or MeOH). Filter the ext. through a cotton wad and leave at room temp. to crystallize out. Dissolve the crude prepn. in a mixt. of 3.5 cc. pyridine and 5 cc.  $\text{CHCl}_3$ , filter and pour slowly into 100 cc. 10% alc. soln. of formic acid. The cryst. substance is easily sol. in aq. or alc. alkali, 5%  $\text{Na}_2\text{CO}_3$ , pyridine; it is difficultly sol. in hot or cold acidified alc., and is insol. in cold pure EtOH, MeOH,  $\text{CHCl}_3$ , ether, acetone and dil. mineral acid. The substance yields typical Teichmann crystals when heated with  $\text{NaCl}$  and AcOH. Its empirical compn. is  $\text{C}_{26}\text{H}_{30}\text{O}_4\text{N}_4\text{Fe}$ .

2( $C_2H_5OH$ ), and represents a formic acid hemin, which shows an absorption curve very closely resembling that of hemin.

**Determination of citric acid in blood serum by Thunberg's method.** Otto Østberg. *Skand. Arch. Physiol.* 68, 265-74(1934).—Some modifications in the Thunberg procedure are discussed. S. Morgulis

**An improvement in the methylene blue reduction test.** L. A. Burkey. *J. Bact.* 27, 67-8(1934). The addn. of 0.1-0.5% of peptone to milk-methylene blue mixts. shortens the reduction time 25-30%. John T. Myers

**The estimation of trypsin with hemoglobin.** M. L. Anson and A. E. Mirsky. *J. Gen. Physiol.* 17, 151-7(1933).—The formation from hemoglobin of split products which are not pptd. by  $CCl_3CO_2H$  is a measure of the tryptic activity. Add 1 cc. enzyme soln. to 5 cc. of specially prep'd. hemoglobin soln., whirl and place in the water bath at 25°. After 5 min., add 10 cc. of 5%  $CCl_3CO_2H$ , thoroughly mix, allow to stand 5 min. and filter. To 5 cc. of the filtrate add 10 cc. of 0.5 N NaOH and 3 cc. of the phenol reagent of Folin and Ciocalteu (*C. A.* 21, 3210) which has been dild. 3 times. Read the blue color, appearing in 1-10 min., colorimetrically against that of a standard (0.15 mg. tyrosine dissolved in 5 cc. of 0.2 N HCl soln.). The standard is prep'd. from thrice-crystd. tyrosine; its concn. is estd. by Kjeldahl, 100 mg. tyrosine being equiv. to 7.74 mg. N. It may be stored at room temp. if 0.5% HCHO is added.  $CuSO_4$  soln. or a blue glass may be used as a standard in a fairly monochromatic red light. The hemoglobin soln. is prep'd. from red corpuscles from defibrinated bovine blood. Water is added to give a soln. contg. 10.5 g. hemoglobin (1.86 g. N) per 100 cc. It is stored in a frozen condition. For use, it is denatured as follows: 220 cc. of 10.5% hemoglobin soln. and 11 cc. of N NaOH soln. are heated to 50-60°, and then 1300 cc. water, previously brought to 100°, is added. Then 26 cc. of a soln. 5 M in respect to NaCl and 0.5 M in respect to  $KH_2PO_4$  is added with mech. stirring. The soln. is filtered, the ppt. is washed with water, and water is added to it to make 400 g.; 400 g. urea and 160 cc. of N NaOH soln. are stirred into the ppt.; after complete soln. of the ingredients, 200 cc. of M  $KH_2PO_4$  and 240 cc. water are added. The soln. is kept in a cool place with toluene as a preservative. Methods are given for the prep'n. of solns. of com. dried proteins which can be used instead of freshly prep'd. hemoglobin. Charts show the color values of various amts. of tyrosine in hemoglobin filtrates, and the relation of trypsin concn. to the color value of digestion products. The method is rapid and different samples of hemoglobin yield the same result. **The estimation of active native trypsin in the presence of inactive denatured trypsin.** *Ibid.* 159 64.—Inactive denatured trypsin changes to active native trypsin in protein solns. which have been used to est. tryptic activity. This change does not take place, however, if sufficient alk. and urea are present in the digestion mixt. A method, a modification of the above, is described for the estn. of active native trypsin in the presence of inactive denatured trypsin. C. H. Richardson

**The determination of the sugar content of urine.** Gerhard F. Materna. *Med. Klin.* 29, 259-60(1933)

Louis J. Soffer

**Micro method of determination of serum calcium and potassium.** Kinei In. *J. Chosen Med. Assoc.* 23, 1844-52 (in German 142 (1933)).—The Kramer-Tisdall method is so modified that instead of titrating with  $KMnO_4$ , an excess of  $KMnO_4$  is added, then 5% KI soln., and then the iodine set free is titrated as usual with  $Na_2S_2O_3$  soln. S. Tashiro

**Zinc hydroxide powder as a precipitant in a simplified procedure for the preparation of protein-free filtrate of blood.** T. V. Letonoff. *Am. J. Med. Sci.* 187, 146 (1934).—Powd.  $Zn(OH)_2$  possesses many advantages that recommend its more general application in place of other protein precipitants. It offers all the advantages of the Somogyi procedure, yet eliminates the need for standardized solns. of NaOH and  $ZnSO_4$ . Only traces of Zn appear in the filtrate. Saccharides are removed completely, so

that the level of true fermentable sugar can be detd. directly by alk. Cu reagents. The filtrates are neutral and can be used also for detns. of urea N, nonprotein N, creatinine and creatine. R. C. Willson

**Detection and detn. of small quantities of cholesterol and other sterarins (Wasitzky) 7.** Use of Benedict's soln. for the microdetection of sugar in urine (Taubert) 7. Micro-manipulator for pure culture and microchem. work (Fitz) 1. Detn. of Hg in urine (Fraser) 7.

**Koch, Frederick C.: Practical Methods in Biochemistry.** Baltimore, Md.: Williams & Wilkins Co. 280 pp. \$2.25.

## C—BACTERIOLOGY

CHARLES B. MORREY

**Nature of the reaction of Escherichia coli on Endo's medium.** L. A. Margolena and P. A. Hansen. *Stain Tech.* 8, 131-8(1933).—The typical reaction is caused by MeCHO. B. C. A.

**A study of actinomycosis.** L. R. Vawter. *Cornell Veterinarian* 23, 126-49(1933).—A study was made of the fermentation of carbohydrates by 17 strains of *Actinobacillus* isolated from soft tissue lesions of bovines and grown under aerobic conditions on a sugar-free basic medium of meat infusion peptone broth. Dextrose, levulose, galactose, maltose, sucrose and mannitol were fermented in 1 day, lactose and raffinose in 4-10 days and glycerol in 14-21 days. Fermentation was slight and irregular in xylose; definite acidity appeared in 2 days with some strains and was delayed and almost negligible with others; a reversion in reaction occurred in all strains, the acidity disappearing in 14-28 days. Dulcitol, inulin, salicin and arabinose were not fermented; no change occurred in litmus milk in 30 days, and gelatin was not liquefied. Gas was not produced by any strain. Ten strains of Type I *Actinomyces* isolated from bone lesions of bovines slowly fermented dextrose, levulose, galactose, maltose, sucrose and salicin without gas production; acidity developed in 3-7 days in all except salicin, which developed acidity in 14-21 days. Arabinose, xylose, inulin, raffinose, dulcitol, mannitol and glycerol were not fermented. Gelatin was not liquefied but a granular sediment slowly formed in the tubes when they were incubated at 37° for 2 weeks or longer. This type of *Actinomyces* did not digest meat particles and hemolysis did not occur on blood agar plates in the presence of 10-15%  $CO_2$ . With Type II *Actinomyces*, isolated from bone lesions, gas and acidity occurred in mono- and disaccharides; this did not occur consistently with any individual strain, which indicates that the cultures designated as *Actinomyces* Type II may consist of more than 1 species. In many respects, *Corynebacterium pyogenes*, isolated from bone lesions, resembled *Actinomyces* Type I; it fermented xylose but not salicin. Thirty-four references. K. D. Jacob

**Sterilizing action of acids. IV. Sterilizing action of unsaturated monobasic acids.** Sogo Tetsumoto. *J. Agr. Chem. Soc. Japan* 9, 761-7(1933); cf. *C. A.* 27, 5144.—Acrylic and crotonic acids have approx. equal sterilizing powers at the same mol. concn. Though undecylenic acid is difficultly sol. in  $H_2O$ , its action is remarkable. Acrylate and crotonate have no sterilizing power but undecylenate has a strong action. The sterilizing action of unsatd. acids is generally stronger than that of satd. acids at the same concn. V. Sterilizing action of dibasic aliphatic acids on putrefactive bacteria, *Eberthella typhi* and *Vibrio cholerae*. *Ibid.* 1284-93.—The sterilizing action of oxalic acid was strongest among dibasic acids in equal mol. concn. The salts of  $Na$ ,  $Ca$  and  $NH_4$  had little or no action. For the acids  $C_2$ ,  $C_3$  the action of dibasic acids was stronger than that of monobasic acids. This is due to  $p_H$ . For acids over  $C_4$  the relation was the reverse. This is due to the properties of non-dissoc. mols. The action of monobasic satd. acid was strongest in aq. soln. at an equal  $p_H$ . This is due to the mol. concn. of the acids. No relation could be found between the no. of COOH groups and the sterilizing action. Y. K.

A bacterium that requires a vitamin-like substance for

1934).—*Micrococcus cytharidis* n. sp. grows on peptone unless a product from other bacteria is provided. The product is heat-stable and not pptd. by photophoretic acid. Milton Levy

Fixation of atmospheric nitrogen by enzymes extracted from *Azotobacter chroococcum*. A. N. Bakh, Z. V. Ermol'eva and M. P. Stepanian. *Compt. rend. acad. sci. U. R. S. S.* [N. S.], 1, 22-4 (1934).—Ext. of *Azotobacter* culture filtered at 300 atm. through a Chamberlain L<sub>2</sub> candle fixes atm. N in presence of glucose or mannitol soln. Thus 1 cc. of ext. analyzing 1.976 mg. N (0.622 mg. as NH<sub>3</sub>) contained after 9 days 2.783 mg. N (0.551 mg. as NH<sub>3</sub>), while in presence of glucose the N content was 14.683 mg. (10.678 mg. as NH<sub>3</sub>), and in presence of mannitol 10.645 mg. (8.269 mg. as NH<sub>3</sub>). N. N. M.

Direct spectroscopic demonstration of the oxygen-transferring enzyme in *Azotobacter*. Erwin Negelein and Waltraut Gerischer. *Biochem. Z.* 268, 1-7 (1934).—*Azotobacter* has a very high O<sub>2</sub> consumption, 2000 cu. mm. per mg. dry substance per hr. Spectroscopic evidence points to a mechanism similar to that ascribed to respiration of aerobic cells (C. A. 28, 791<sup>9</sup>). In this scheme an Fe compd. is the O<sub>2</sub>-transferring enzyme, while a second and a third Fe are the 2 cytochrome components. O<sub>2</sub> changes the Fe<sup>++</sup> to Fe<sup>+++</sup> of the enzyme with a shift of the band from 632 to 647 mμ; CO reacts with the Fe<sup>++</sup> form shifting the band from 632 to 637 mμ; HCN reacts with the Fe<sup>++</sup> form and the band 647 mμ disappears. The cytochrome (Fe compounds 2 and 3) reacts with neither O<sub>2</sub>, CO nor HCN, and when the 1st Fe<sup>++</sup> compd. is blocked by CO or the 1st Fe<sup>++</sup> compd. by HCN, the 1c<sup>+++</sup> forms of compds. 2 and 3 can still be reduced but the Fe<sup>++</sup> form can no longer be oxidized, and even in the presence of much O<sub>2</sub> their bands 563 and 550 mμ remain unchanged. The enzyme band *Azotobacter* differs from that of the AcOH bacteria, being in the red region, 632, instead of the yellow, at 589 mμ. Such bands in the red region have never been found in the pheohemins but occur in the group of substances which result when the Mg in chlorophyll is replaced by Fe. S. Morgulis

Nitrogen assimilation by *Aspergillus niger* under different nutritive conditions. Heinrich Hardtl. *Biochem. Z.* 268, 104-15 (1934).—The N assimilation begins with the development of mycelium, reaching a max. in relation to the growth in the first few days, but an abs. max. is not reached until a much later phase. Changes in the N value occur with alterations in the available amts. of C and N, and the higher their supply the lower is the N percentage. A limited C supply at first occasions a quick and intensive N assimilation which stops sooner but the N percentage never reaches such low values as on a high sugar concn. The max. utilization of N is obtained with low quantities of N. With high N concns. the utilization of the sugar is also improved, apparently for purposes of a more intensive respiratory process. The formation of citric acid depends upon the amt. of N in the medium, being always present when the N supply is low, but only for a short time after development begins when there is much N. S. Morgulis

Fermentative capacity and anaerobic growth of paratyphus-B bacilli. Kurt Aaron. *Biochem. Z.* 268, 121-51 (1934).—Paratyphus-B bacilli activate as H donors the following compds.: org. acids: formic, acetic, propionic, lactic, pyruvic, butyric, succinic, fumaric, glutaric, dl- and l-malic and citric; alcs.: EtOH, glycerol, adonitol, mannitol, dulcitol, sorbitol; carbohydrates: arabinose, xylose, glucose, levulose, galactose, maltose, raffinose; nitrogenous compds.: alanine, serine, valine, leucine, arginine, histidine, proline, glycylglycine, uric acid, asparagine and the Na salts of aspartic and glutamic acids. Apparently there is no relation between the ability of the paratyphus organism to dehydrogenate these substrates and their function as a source of C. The paratyphus-B organism activates the following as H acceptors: NaNO<sub>3</sub>, Na fumarate, Na malate, Na asparaginate and asparagine. With NaNO<sub>3</sub> as H acceptor and lactic acid as H donor, the paratyphus-B organism can grow an-

aerobically on synthetic media with the following sources: leucine, serine, lysine, arginine, phenylalanine, tryptophan, histidine, proline, glycylglycine, asparagine and Na salts of aspartic and glutamic acids, but cannot utilize NH<sub>4</sub>Cl, glycine, alanine, urea or uric acid. Glycine can be utilized when glucose is used as a source of C. With serine anaerobic growth is obtained when only Na lactate alone, without NaNO<sub>3</sub>, is available. Sixteen strains of coli were unable to grow anaerobically in the presence of lactate + NaNO<sub>3</sub> or NH<sub>4</sub>Cl + glucose. A no. of other combinations were found which made anaerobic growth possible. S. Morgulis

The Endo medium as a trapping agent and indicator for aldehyde. Lubow A. Margolena and P. Arne Hansen. *J. Bact.* 27, 33 (1934).—The color is caused by AcH which is normally absent in cultures of coli but invariably present when sulfite is added. The restored color is chemically different from the original fuchsin. John T. Myers

Can Endo medium be standardized? H. J. Conn and Mary A. Darrow. *J. Bact.* 27, 33-4 (1934).—Any fuchsin in America is satisfactory if the ratio between Na<sub>2</sub>SO<sub>3</sub> and fuchsin is 12.5:1. John T. Myers

An apparatus for the control of composition and rate of flow of gas mixtures through culture solutions. C. L. Senseman. *J. Bact.* 27, 62-3 (1934). J. T. M.

The physiology of acetic bacteria. I. Formation of gluconic acid. Kiyoshi Tanaka. *Acta Phytochim.* (Japan) 7, 265-97 (1933).—The gaseous exchange of *Acetobacter aceti* is greatly enhanced by the presence of glucose in the medium, although the O absorption is increased more than the CO<sub>2</sub> evolution. This is due to the formation of gluconic acid. If CH<sub>3</sub>ICOOH is present, CO<sub>2</sub> production is almost completely inhibited, and this indicates that EtOH is being formed. The oxidation of glucose by this organism is at an optimum at pH 5-6. The ease of oxidation of the various sugars is: glucose 100, mannose 34, galactose 25, maltose 21. Fructose, sucrose and lactose are not oxidized. If glucose and EtOH are both present, the latter is consumed first. Not only O, but methylene blue and quinone can act as acceptors for H, indications that a typical dehydrogenase is involved. Gluconic acid fermentation with O is inhibited by KCN, CO and toluene, whereas with quinone the KCN is not an inhibitor. J. J. Willaman

## D—BOTANY

THOMAS G. PHILLIPS

Localization of fatty oils and starch in cells of cultivated beets. S. Kopuil-Gomolyako. *Nauk. Zapiski Tsukrovoi Prom* 10, No. 33, 91-100 (1933).—Fatty oils in the cells serve as a characteristic sign of cultivated beets. Differences of fat content between individual groups are not as great as among sep. plants of the same group. During the digging period roots have a greater amt. of fat than sprouts or roots in their early stages of development. The deposition of fatty oils chiefly in the peripheral parts of the root indicates their action probably as a protecting substance of the covering tissue against rotting and freezing. The variation in the fatty oil may indicate importance of the fatty oils as reserve substance in the beet. Starch is found only in the Mangold group and may serve as a distinguishing feature of this group. Several photomicrographs are given. V. E. Baikow

Nutrition of *Euglena*. II. *E. stellata*, *klebsii*, *anabaena*, *deses* and *pisciformis*. H. Dusi. *Ann. inst. Pasteur* 50, 840-90 (1933); cf. C. A. 28, 2030<sup>1</sup>.—*E. stellata* is very sensitive to the reaction of the medium, pH 5.5 being the optimum for growth. A significant an. of Ca must be present in the medium for cultivation to occur, and in this respect *E. stellata* differs from all the other *Euglena* studied. Lysine exerts a most favorable influence on the growth of these cultures. *E. klebsii* shows optimum growth at pH 6-7, and gives very poor growth with mineral salts (nitrate and NH<sub>4</sub> salts) as the source of N, but good growth with certain amino acids (I) and with peptones (II). *E. anabaena* is difficultly cultivated in mineral media, NH<sub>4</sub> phosphate alone of the

salts tested being satisfactory as a source of N; I are not very satisfactory, but II are very favorable to growth. Culture is possible over the range pH 5.5-8.5 and best at 6.0-8.0. *E. deses* does not multiply in a purely mineral medium contg. nitrate or  $\text{NH}_4$  salts, but requires org. N in the form of I or II. No culture of *E. pisciformis* was possible with nitrate,  $\text{NH}_4$  salts, I or with hydrolyzed silk as the source of N, but II mixts. from muscle proteins gave good growth. The results of the expts. with these *Euglena* and with *E. gracilis* are tabulated and the findings discussed in relation to the function of chlorophyll and light. B. C. A.

Sap stains of wood in Japan. I. *Ceratostomella* sp., Rumbold, the cause of a blue stain of pine trees in western Japan. Y. Nishikado and K. Yamauchi. *Ber. Ohara Inst. landw. Forsch.* 5, 501-39 (1933).—The growth and activity of the organism are described.  $\text{O}_2$  is necessary for its growth. B. C. A.

Action of injected nutrient substances on plants. A. Mazzaron. *Boll. soc. Eustach.* 29, 61-9 (1931).— $\text{NH}_4$  salts and nitrate are equally effective whether injected or absorbed by the root. B. C. A.

Algae which excrete soluble organic pigmented matter in the sea. G. Ranson. *Compt. rend.* 196, 1927 30 (1933).—The pigmented substance excreted by *Navicula ostrearia* Bory is probably a phosphatide. B. C. A.

Formation of components of wood from the plant sap. Fructose as the source of "lignin." H. Wislizenus and H. Hempel. *Cellulosechem.* 14, 149-68 (1934).—A study of substances in wood saps, involving sepn of sap components, sedimentation speeds, adsorptions with  $\text{Al}_2\text{O}_3$ , viscosity and pH measurements, sp. grs., chem. tests, use of some specialized equipment, etc. Adsorption increases in the oxidative synthesis of *d*-glucose to pyrogallol, gallic acid and tannin. Sieve tube sap of young red oak contains 16-19% total solids while the descending cambial sap contains about 1/2 as much. Sap changes in these 2 wood structures are described in detail. The sieve tube sap of young red oak contains about 80% sucrose, 2.6% *d*-glucose and 1.1% *d*-fructose, computed on the dry basis. With a sp. gr. of 1.06, about 15% sugar is present, and with a sp. gr. of 1.03 there is about 8% sugar. Some albumin is present in the saps together with very small amts. of pentose and tannin-like substances. The effect of other sugars such as xylose on rotation was considered. No adsorbable high-mol. wt. compds. were found and sucrose is not appreciably adsorbed from the dil. saps. Sugars were detd. in the slimy cambial saps from the wood and bark sides of conifers. Adsorption measurements after treatment with dil.  $\text{KMnO}_4$  solns indicate that *d*-fructose absorbs much more O than *d*-glucose under the same conditions. *d*-Fructose can therefore be regarded as the mother substance of lignin. C. A. B.

Lead assimilation by plants in litharge-containing soil. W. Stoldt. *Pharm. Zentralhalle* 75, 97 8 (1934); cf. C. A. 28, 6597.—It is shown that 320 g. of grass (thoroughly washed) grown in such soil, some 30 m. distant from a bridge sprayed with paint, contained 4 mg. Pb, while the sandy residue from the washed grass yielded 10 mg. Pb. Furthermore, it is shown that grass (about 500 g. thoroughly washed) grown on soil, otherwise Pb-free, but subsequently strewn with  $\text{PbO}$ -contg. sand, yielded 5 mg. Pb. Thus it appears that Pb-contg. soil permits assimilation of Pb by the grass rootlets, subsequently passing into the aerial portion of the plant. W. O. E.

Protoplasmic and nutrient tissues for phosphorus compounds. Their physiology. M. Javillier. *Ann. bot.* 15, 1552-62 (1933).—The protoplasmic, nucleic, phytin and mineral tissues are described. The values found for dried lentils, resp., 0.381, 0.046, 0.001, and for dried wheat germ 1.356, 0.001, 0.001.

L. E. Gilson. The effect of lipid concentrations (steroids) on the growth of the bulb. *Compt. rend.* 200, 1000-1002 (1935).—The

bodies contain a mixt. of phospholipids, phytosterols and other lipoids, enclosed in a protein envelope. L. E. Gilson.

Atlantic Coastal Plain plants in the sand barrens of northwestern Wisconsin. W. T. McLaughlin. *Ecological Monographs* 2, 335-83 (1932).—The relation between the pH of the natural waters and the distribution of plant species in this region is discussed. K. D. J.

The structure and growth of the tea bush. W. Wight. Indian Tea Assoc., Sci. Dept., *Quart. J.* 1932, 150-62, 200-17.—The chem., phys. and enzymic processes concerned in the structure and growth of plant cells and of tea leaves are discussed. K. D. Jacob

Study of some aspects of the physiology of the tendrils of Cucurbitaceae. R. H. Dastur and M. C. Billimoria. *J. Indian Bot. Soc.* 11, 148-68 (1932).—The curled tendrils have very little respiratory activity in comparison to straight tendrils, and there is no increased output of  $\text{CO}_2$  when the tendrils curve. As the age advances respiration decreases. The temp. in the plant organs is lower than that of the atm., and the temp. at the base is lower than that at the apex; it is also lower in curled tendrils than in straight tendrils of corresponding lengths. As the age of the tendril advances the water content increases per unit length and per unit dry wt., and reaches a max. in the fully grown tendril. In straight tendrils the suction pressure increases with length and is higher at the apex than at the base; it is also higher in straight tendrils than in curled tendrils of corresponding lengths. K. D. Jacob

Influence of some solutions on the rate of permeability in *Zea mays* seeds. R. C. Malhotra. *J. Indian Bot. Soc.* 11, 188-201 (1932).—As detd. by the wt. increase method, the absorption of liquids and solns. by corn seeds in 64 hrs. at 25° was in the descending order 0.1 M NaOH, 0.05 M NaOH, 0.1 M NaOH plus CaO, 0.1 M AcOH, 0.05 M AcOH, 0.1 M caffeine, 0.05 M caffeine, 0.05 M  $\text{NaHSO}_4$ , 0.1 M  $\text{NaHSO}_4$ , pure water, 0.05 M NaCl, 0.1 M NaCl and abs. EtOH. The various solns. were absorbed at different rates and, as a rule, the less concd. permeated more than the more concd. ones. Ca showed distinct ability to counteract NaOH injury, probably because of its effect in inhibiting the rapid entrance of  $\text{Na}^+$  ions. There was no visible sign of injury to the seeds, except for those immersed in NaOH and 0.1 M AcOH. Thirty-four references. K. D. Jacob

Variability of the osmotic strength of the sap of *Cuscuta reflexa* Roxb. P. Parija and A. B. Saran. *J. Indian Bot. Soc.* 11, 271-5 (1932). The concns. of the cell sap of the host plants and of the parasite *C. reflexa* were detd. before and after glucose injection by the plasmolytic method, with  $\text{KNO}_3$  as the plasmolyzing medium. The osmotic strength of *C. reflexa* growing on 7 species of host plants was always higher than that of the host, and ranged from 0.40 to 0.45 in terms of mols. of  $\text{KNO}_3$ . With 0.6 and 0.8% glucose the cells of the parasite contained more starch grains than before, and in the last case signs of wilting occurred. When the parasite was grown on *Duranta plumieri* Jacq., the osmotic strength of its cell sap could be varied from 0.43 mol.  $\text{KNO}_3$  to a max. of 0.45 mol. beyond which the excess glucose was converted into starch. K. D. Jacob

Germination of *Zea mays* seeds as influenced by their protoplasmic immersion in water and desiccation. R. C. Malhotra. *J. Indian Bot. Soc.* 11, 276-84 (1932).—Germination of *Zea mays* was hastened by soaking the seed in water for 1-5 hrs. and then drying them in a current of air for 36 hrs. Immersion of the seed for 40-200 hrs. had a decidedly adverse effect on germination and the seedlings made poor growth. It is suggested that long immersion followed by desiccation inhibited the action of the enzymes to such an extent that the embryo was unable to utilize the nutrient reserves present in the seed. K. D. Jacob

The effect of the type of water on *Zea mays* germination. R. C. Malhotra. *J. Indian Bot. Soc.* 11, 285-90 (1932).—Corn seeds were germinated in distilled water, tap water, river, sea water and in water from a well. The seeds in

(III) tap water that had been subjected to the action of an elec. current; (IV) tap water; (V) distd. water and (VI) electrified distd. water. The effect of the waters on the total length of the 10-day seedlings was in the descending order I, II, III, IV, V, VI; the total dry wt. of the seedlings was in the same order, except that V made more growth than IV. The favorable effect of I is attributed to the presence of org. matter and inorg. compds. The max. chlorophyll development was also obtained in I. The favorable effect of the elec. current on tap water is attributed to its action in increasing the ionization of the inorg. compds. present.

K. D. Jacob

A note on the emission of globules of basophilic material from the nucleus into the cytoplasm during the telophase of nuclear division. N. S. Rau. *J. Indian Bot. Soc.* 12, 287-92 (1933).—The globules stain deeply with the ordinary "nuclear" dyes such as safranin, gentian violet or Fe hematoxylin. They probably represent a phase in the cyclic exchange of nucleic acid compds. between the nucleus and the cytoplasm. The increase in the intensity of the staining reaction of the chromosomes during the transfer of this material suggests that the substance thus added on is the nucleic acid component rather than the permanent protein base of the chromatin. Nineteen references.

K. D. Jacob

Changes in plants during low temperatures. III. Some chemical and anatomical changes in plants grown under controlled temperatures. R. C. Malhotra. *J. Indian Bot. Soc.* 12, 273-85 (1933); cf. *Ibid.* 10, 293 (1931).—Cabbage, lettuce, Hungarian kale and tomato plants were grown at 50° and 75°F. Half of the plants were transferred from cold to warm and vice versa. Moisture, pentosans, hemicelluloses, total proteins, ash, H-ion concn. and f. ps. were detd. Definite conclusions could not be drawn. The investigation is being continued. Nineteen references.

Studies in absorption and transpiration. I. Cut shoots treated with twenty percent formalin. T. Ekambaram and I. Madhusudana Rao. *J. Indian Bot. Soc.* 12, 293-324 (1933).—When 20% formalin was absorbed through the cut ends of shoots of *Barleria cristata* the rate of absorption of O by the leaves decreased to a min. when the leaves were completely killed; it then recovered to a certain extent and remained const. for some hrs.; the transpiration rate behaved similarly but to a smaller extent. When the leaves were killed by coating them on both sides with pure formalin the O-absorption rate reached a min. in 1 hr.; it then immediately recovered and remained const. for at least 4 hrs. The initial transpiration rate was maintained for about 4 hrs. and then slowly decreased. The cortical cells of the stem were not affected. The O-absorption rate of leaves killed by coating with pure formalin was not affected by absorption of 20% formalin through the cut end. The rate of O absorption was not affected by killing the cortical cells of a long portion of the stem with formalin.

*Psilocaulon absimile* N. E. Br. as a stock poison. I. Determination of oxalic, malic, tartaric acids, etc. Claude Rummington and D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 439-55 (1933).—Both the sun-dried and the green plants in 100-g. doses caused the death of rabbits within 15 hrs. Aq. exts. of the green plants contained acid equiv. to 5.15 cc. 0.1 N NaOH per g. of dry material. The ash, which amounted to 24.6% of the dry plants, contained K<sub>2</sub>O 5.2 and CaO 8.19%. The dry plants contained oxalic acid 8.66, tartaric acid 0.068 and malic acid 11.02%; citrates and succinates were absent. The toxicity of *P. absimile* is due in part to the presence of oxalic acid and in part to another substance, as yet unidentified, which passes through into the filtrate from the Pb acetate pptn. When 4.4 g. Na oxalate was administered per os to a 3-kg. rabbit death occurred in approx. 1 hr. The interrelations of the org. acids and their physiol. function in plants are discussed and methods for the detn. of oxalic, malic and tartaric acids in plants are outlined. Forty-five references.

K. D. Jacob

The physiological action of *Psilocaulon absimile* on the transpiration of *Psilocaulon absimile* and the effect of the transpiration on the growth of this para-

site. MARCEL SCHMIDT. *Planta (Abt. E, Z. wiss. Biol.)* 20, 407-59 (1933).—When *C. fulvum* was grown on substrates prepd. from certain parts of potato and tomato plants, the solanine content of the media had the same effect on spore germination and on the form of the germinating tubes as did the same concn. of solanine in a pure medium. Spore germination usually did not occur when 1 part of a 0.06% solanine soln. was added to 10 parts of the media. Germination occurred in very dil. concns. of solanine with the formation of short, thick, gnarled, strongly branched hyphae (BB-type), whereas in solanine-free media long, slender, weakly branched hyphae (W-type) were formed. With progressively decreasing concns. of solanine the BB-type was gradually transformed into the W-type. Germination of the conidia of *C. fulvum* did not occur in decoctions and in the expressed juice of leaves of the tomato variety, *Solanum racemigerum*, which is resistant to the brown-spot disease; the germination-preventing substance is water-sol. and loses its effectiveness when it is heated for 20-30 min. at 100° or when the leaf decoction is pptd. with tannic acid. The solanine content of *S. racemigerum* is no higher than that of other varieties of tomatoes which are not resistant to brown spot. Addn. of 5% of either KI, citric acid, berberine or nicotine to the media entirely prevented germination of spores of *C. fulvum*; MnSO<sub>4</sub> and atropine did not always prevent germination, and saponin had no effect. MnSO<sub>4</sub> completely nullified the effect of high concns. of solanine in preventing germination of the spores in decoctions of the green fruit of Bonny Best tomatoes.

The graphic registration of the transpiration of leaves. Karl Borech. *Planta (Abt. E, Z. wiss. Biol.)* 20, 448-69 (1933).

K. D. Jacob

The formation of betaine and alkaloids in plants. III. Preliminary experiments on the formation of nicotine. G. Klein and H. Linsch. *Planta (Abt. E, Z. wiss. Biol.)* 20, 470-5 (1933); cf. *C. A.* 27, 4024. —The nicotine content of cut tobacco plants, grown in nutrient media for 9 days, was increased 19-55% by the addn. of proline, ornithine-HCl or the hydrochloride of glutamic acid to the media. As compared with the controls, proline increased the nicotine content of the leaves and decreased that of the stems in some instances, whereas in others it increased the nicotine content of both stems and leaves.

K. D. Jacob

Swelling and permeability of the cell walls of *Rhizoclonium*. Karl Forster. *Planta (Abt. E, Z. wiss. Biol.)* 20, 476-505 (1933).—Org. substances (nonelectrolytes and acids) with small mols., e. g., MeOH, do not act as astringents. In high concns. substances, such as EtOH, that have medium-size mols. often act as astringents, if they prevent swelling of the cell walls. Glycerol, sucrose and other substances of high mol. wt. may cause shrivelling of the cell wall even though they act as swelling agents. Expts. with aq. solns. of numerous salts showed that the permeability of the cell walls of *Rhizoclonium* depends upon the nature of both the cations and the anions and that the ion series is very nearly the same as the ion series that has been detd. for the permeability of plasma. The nature of the solvent may have a pronounced effect on the permeability of the walls to various salts and org. compds. Salts that cause swelling in aq. soln. frequently cause more or less shrivelling of the walls in nonaq. solvents. Concd. solns. of gum arabic and dextrin, and to a less extent albumin, cause shrivelling. Data are given on the permeability of the cell walls to various dye-stuffs. Thirty-one references.

K. D. Jacob

The influence of carbohydrate on the daily course of photosynthesis. A. L. Kursanov. *Planta (Abt. E, Z. wiss. Biol.)* 20, 535-48 (1933).—Expts. were carried out with *Eriobotrya japonica*, *Pirus malus* and *Cladophora* sp. Photosynthesis was at a min. either at the beginning or toward the middle of the day. With plants suffering from carbohydrate deficiency the depression in photosynthesis during the course of the day was less pronounced than with plants grown under normal conditions; storage of carbohydrates increased the depression. K. D. J.

*Rept. 9th Ann. Date Grower's Inst.* 1932, 3-5.—Blackness (abnormal shrivelling and darkening of the tips of the fruit) was prevented on Deglet Nour dates by covering the green fruit, on the tree, with brown paper bags. The bagged fruit contained 64.8-70.2% sugar, as compared with 74.0-74.8% in unbagged fruit.

K. D. Jacob  
Carbohydrates of the bulb of *Narcissus tazetta* L. var. *chinensis* Roem. II. Enzymic hydrolysis of glucomannan. Yoshihiro Kihara. *J. Agr. Chem. Soc. Japan* 9, 770-2 (1933); cf. *C. A.* 26, 3541; 28, 1073.—Glucomannan was prepd. from *Narcissus tazetta* L. and kept with *Eulalia* ext. for 3 days. The viscosity of the soln. decreased rapidly. The soln. was evapd. to a sirup under diminished pressure and extd. with hot alc. A white ppt. was formed on cooling the ext. The product, a white cryst. powder, is sol. in  $H_2O$  and hot alc., m. 183° (decompn.), has  $[\alpha]_D^{25} +47.26^\circ$ . It does not ppt. with  $Ba(OH)_2$  and Pb acetate. It was hydrolyzed by maltase but not by emulsin. An Ac deriv., m. 137°, was prepd.

Y. Kihara  
Biochemistry of molds. II. A metabolic product of *Aspergillus melleus* Yukawa. Eijiro Nishikawa. *J. Agr. Chem. Soc. Japan* 9, 772-4 (1933); cf. *C. A.* 28, 1073.—*A. melleus* Yukawa was grown in a soln. contg. sucrose 50,  $NaNO_3$  2,  $KH_2PO_4$  1, KCl 0.5,  $MgSO_4 \cdot 7H_2O$  0.5 and  $FeSO_4 \cdot 7H_2O$  0.01 g. in 1 l. of  $H_2O$ . A substance having the odor of the mold was extd. with ether from the fermentation products. "Mellein,"  $C_{10}H_{10}O_5$ , m. 58°,  $[\alpha]_D^{25} -108.15^\circ$  in  $CHCl_3$ , was isolated from the ext. in a yield of 0.3 g. per l. of the culture soln. It is sol. in org. solvents and slightly sol. in  $H_2O$ , gives a violet color with  $FeCl_3$ ; mononitro deriv., needles, m. 183-4°,  $[\alpha]_D^{25} -171.59^\circ$  in  $CHCl_3$ .

Y. Kihara  
Chemical constituents of tobacco. III. Coloring matters of the flower of tobacco. 1. Kazuo Yamafuji. *J. Agr. Chem. Soc. Japan* 9, 797-802 (1933).—The powd. dry flower was extd. with MeOH contg. HCl. An anthocyan was isolated as an insol. picrate and decomposed into 1 mol. each of an anthocyanidin and a monosaccharide. The residue was mixed with  $CaCO_3$  and then extd. with hot alc. Flavone was detected in the ext.

Y. K.  
The influence of the composition of the air on the development of cultures of *Aspergillus niger*. Jean Bousquet. *Bull. sci. pharmacol.* 41, 28-34 (1934).—The retarding influence of  $H_2CO$  in a concn. of 1:20,000 on the growth is noticeable; at a concn. 1:5000, growth is inhibited. Aromatic oils have a variable influence;  $CHCl_3$  has an inhibiting effect. Low concn. of  $NH_3$  stimulates growth, with an optimum at 1:5750. Higher concn. inhibits growth. Favorable effects are shown by  $NH_4OAc$  and  $NMe_3$ ,  $Me_2NPh$  only in high diln. They become antiseptic rapidly with higher concn. Fumes of  $N_2O_5$  are highly poisonous. Gas produced by putrefaction has a stimulating effect.

A. R. Meyer  
Occurrence of choline in sea algae. Alfred Zeller. *Biochem. Z.* 268, 187-8 (1934).—Choline was found in the following algae Chlorophyceae: *Enteromorpha* sp.; Phaeophyceae: *Laminaria saccharina*, *Chorda filum*; Rhodophyceae: *Chondrus crispus*, *Cystoclonium purpurascens*, *Delesseria sanguinea*, *Placodium coccineum*, *Polysiphonia furciculata* and *Rhododela subfusca*. No choline could be found in the brown algae but on special treatment pos. reactions were obtained with exts. of *Fucus* and it is suggested that probably this also applies to all these algae.

S. M.  
The  $pH$  necessary for germination of pollen grains and for vital stain of vacuoles. Mme. Hurel-Py. *Compt. rend.* 198, 195-7 (1934); cf. *C. A.* 27, 3738.—Pollen grains from 6 species of plants showed optimum germination in 12% sucrose soln., having a  $pH$  less than 5. In solns. of  $pH$  between 5.2 and 7.0 germination was poor, and no germination occurred in solns. with  $pH$  7.2-7.8. Neutral red did not color pollens in solns. with  $pH$  5.2 or below. Pollen grains of *Lilium tigrinum* were colored by neutral red in a soln. having a  $pH$  of 7.2; transplanted to sugar soln. with  $pH$  of 4.7, germination occurred without showing color in the vital stain system.

James C. Munch  
Influence of antagonistic ions on inhibitive action of radium on growth of rootlets. A. Sartory, R. Sartory, J. and Ernst Meyer. *Compt. rend.* 198, 197-9 (1934).—

Mg was a more powerful antagonist than K in protecting the rootlets of *Lilium tigrinum* Mochl. from Rn. The rootlets were exposed in isotonic aq. solns. of  $MgSO_4$  and KCl for 24 hrs.

James C. Munch  
Varietal differences in nitrogen, phosphoric acid and potassium contents of wheat. L. Maume and J. Dulac. *Compt. rend.* 198, 199-202 (1934).—Chemical analyses were made on 15 varieties of wheat grown under identical conditions of soil, climate and culture. Figured on a dry basis, the N ranged from 0.54 to 1.26%; the  $P_2O_5$  from 0.28 to 0.49% and the K from 1.13 to 3.32%. Results are presented graphically. The variety of wheat appears to be an important factor.

James C. Munch  
Carbon dioxide storage. V. Breaking the dormancy of potato tubers. Norwood C. Thornton. *Contrib. Boyce Thompson Inst.* 5, 471-81 (1933); cf. *C. A.* 22, 3014; 27, 5780.—The rest period is shortened by 25-35 days when dormant potato tubers are treated for 3-7 days with 40-60%  $CO_2$  with 20%  $O_2$ . Potatoes sprout more rapidly after storage in pure  $N_2$  or  $CO_2$  than when stored in pure  $O_2$ .  $CO_2$  increased the rate of respiration of potato tubers, caused an increase in reducing properties of the juice and a change from  $pH$  6.02 to about  $pH$  6.7. The glutathione content of the juice was decreased by  $CO_2$  treatment, but was increased over controls when tubers were planted.

N. M. Naylor  
Transpiration of the tobacco plant in relation to radiant energy in the visible and infra-red. John M. Arthur and W. D. Stewart. *Contrib. Boyce Thompson Inst.* 5, 483-501 (1933); cf. *C. A.* 24, 4069.—With the light from a 1000-w., 105-v. lamp operating on a 120-v. line, an increase of 2.3 times the energy doubles the rate of water loss (temp. 76° to 78°F.), independent of humidity between 50 and 88% relative. At 98° to 100°F., high humidity decreases transpiration. A heat-transmitting filter (infra-red) decreases the rate of water loss. At 98°-100°F., the infra-red rate of water loss increases rapidly until the visible rate is about 1.3 times that of the infra-red. Stomata were completely closed under infra red. Water losses hold the leaf at a temp. not exceeding 107°F. under all test conditions.

N. M. Naylor  
The physiological role of boron. M. Ya. Shkolnik. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 141-3 (in English 143-6) (1934).—Boron increases root growth of flax and *Vicia faba*, decreases the permeability of the plasma and the absorption of  $NO_3$ ,  $PO_4$  and Ca ions but increases absorption of K ions.

F. H. Rathmann  
Capacity of cotton to withstand cold. V. I. Tzviniskii. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 147-8 (in English 149-50) (1934).—Within a group the resistance to frost of different species is proportional to the concn. of the cellular sap.

F. H. Rathmann  
The accumulation of rubber in the roots of *Tau-sagui* as a result of its disappearance from the leaves. V. A. Novikov, A. I. Grechushnikov and Ya. N. Barmenkov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 205-7 (in English 207-9) (1934).—On shading of the leaves rubber migrates from the leaves into the roots. By ringing of the roots a high concn. of rubber results in the upper part of the root.

F. H. Rathmann  
The age of plants and the photoperiodic reaction. M. Kh. Chalakhyan. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1933, 306-11 (in English 311-14).—Shortening and lengthening of the time of exposure to light produce max. changes in growth effects in very young plants and in plants in their max. growth-rate stage.

F. H. R.  
Spectroscopic study of the wood of *Pinus sylvestris* from Rascafría (Spain). Leon Lemmel. *Compt. rend.* 198, 496-7 (1934).—In the ash, which constituted 0.24% of the wood, there were present, by ultra-violet spectroscopy, Ca, Mg, Na, K, Mn, Al, B (confirmed by chemical methods), Pb, Ag, P, Fe, Si and possibly Cr and Sn.

K. V. Thimann  
Amount and distribution of manganese in the grain of wheat. P. Bruère. *Compt. rend.* 198, 504-6 (1934).—Wheat grains contain 2.5-3.9 mg. Mn per 100 g. dry wt., the figures increasing with decrease in the size of the grains. In grains of medium size, the 2.9 mg. Mn is distributed

thus: endosperm 0.58, envelope 3.02, germ 0.36 mg. In the endosperm the highest concn. is found in the peripheral part; in the envelope it is in the inner layers, which have 17 mg.%. The highest concn. is in the germ, which has 19 mg.%, calcd. on the dry wt. K. V. T.

Factors affecting assimilation of ammonium and nitrate nitrogen, particularly in tomato and apple. Victor A. Tiedjens. *Plant Physiol.* 9, 31-57 (1934); cf. C. A. 26, 4671; 27, 1702.—The expts. were carried out in sand cultures with a modified Jones and Shive soln. (*Ann. Bot.* 37, 355 (1932)) with  $\text{Ca}(\text{NO}_3)_2$  or  $\text{NaNO}_3$  or  $(\text{NH}_4)_2\text{SO}_4$  as the carrier of N. The  $\text{NO}_3$  ion was best assimilated by tomato and apple plants at  $p_{\text{H}}$  approx. 4.0, whereas the most satisfactory assimilation of  $\text{NH}_4$  ions occurred at  $p_{\text{H}}$  6.0. Previous results carried out in soil (C. A. 27, 1702) suggest that the  $p_{\text{H}}$  value of the media must be comparatively high (about 8.0) for satisfactory assimilation of  $\text{NH}_4$  ions; but the present results indicate the necessity for interpreting earlier work on the basis of values intermediate between the  $p_{\text{H}}$  of the solns. before and after dripping through the sand. Thus, the growth from  $\text{NH}_4$  salts as the source of N at a const.  $p_{\text{H}}$  of 6.0 was comparable with that produced by plants grown in a soln. changing from  $p_{\text{H}}$  8.0 to 4.0. The  $\text{NH}_4$  ions were absorbed without change and synthesized to amino acids and other N compds. directly and more rapidly than the  $\text{NO}_3$  ion because of the tendency of the  $\text{NO}_3$  ion to accumulate as the result of reduced reductase activity under certain conditions. Plants required much lower concn. of  $\text{NH}_4$  ions than of  $\text{NO}_3$  ions in the nutrient soln. to produce an equal vol. of growth. In field expts. where comparisons are made between  $\text{NaNO}_3$  and  $(\text{NH}_4)_2\text{SO}_4$  under optimum conditions for each, the only advantage one salt would have over the other would be brought about as a secondary effect by the ion with which the  $\text{NO}_3$  or  $\text{NH}_4$  ion was assocd.

Walter Thomas

New microcalorimeter for measuring the heat production of fungi. Hiroshi Tamiya and Atsui Yamamoto. *Acta Phytochim.* (Japan) 7, 245 63 (1933).—A detailed explanation, with drawings, is given of a microapp. for the simultaneous detn. of heat production, growth, O absorption and  $\text{CO}_2$  elimination of a fungus culture.

J. J. Willaman

Starchless potato induced by the introduction of foreign enzymes. R. F. Sutt and Harold Hibbert. *Science* 79, 78-9 (1934).—A culture of *B. subtilis* was introduced into the tip of the main stem of 30 potato plants every few days for 10 weeks. Tubers of 4 of the plants showed no starch, except in a peripheral zone a few mm. thick. This organism has been shown in previous work to synthesize levan from sugar.

J. J. Willaman

Plant growth hormones (auxin A and auxin B). Fritz Kogl. Brit. Assoc. Advancement Sci. Rept. 1933, 800-9; cf. C. A. 27, 4823, 5797.—A review. E. J. C.

Exchange adsorption in root systems—influence of the technic and time of introduction of fertilizers on the nature of plants (Sabunin) 15. Chemistry of lignin (Phillips) 10.

## \*B—NUTRITION

PHILIP B. HAWK

Toxicity of preparations of irradiated ergosterol. M. Schieblich. *Deut. tierärztl. Wochschr.* 39, 750 (1931).—Administration of excessive amts. of irradiated ergosterol causes hypercalcemia in dogs and hyperphosphatemia in Herbivores. Heating to 200° destroys the antirachitic properties of the prepn. without affecting its toxicity. The toxic action is ascribed directly to vitamin D rather than to secondary substances present. B. C. A.

Significance of calcium and phosphorus in the development and growth of pigs. J. H. W. T. Reimers and D. B. Smuts. *Arch. Tierernähr. Tiermucht* 7, 471-531 (1932).—Pigs developed rickets with a ration low in Ca and optimum in P (Ca:P = 1:4). The corrective action of cod-liver oil resulted from increased Ca and decreased P retention. Rations having excessive Ca and optimum P (Ca:P = 3.5:1) induced fits and blindness, high Ca and

very low P contents in blood serum, and decreased Ca and P retention. The Ca and P of the bones were unaltered. A ration having Ca:P = 1.8:1 produced no abnormal effects. The effects of excess-Ca rations were corrected by administration of  $\text{Na}_2\text{HPO}_4$ . Addn. of  $\text{CaO}$  to a rachitic diet to produce Ca:P = 1.2:1 gave excellent results, which were not further improved by supplying cod-liver oil. Addn. of Ca and P above certain limits to a ration having a normal Ca:P ratio increased the total ash content of bones without alteration of the percentage of Ca and P. B. C. A.

Digestibility, metabolism and energy exchange in hens as a basis for rational feeding. M. J. Diakow. *Arch. Tierernähr. Tiermucht* 7, 571-637 (1932).—Data are given showing respiratory and heat exchanges in hens receiving varied diets. Unbroken grain is most advantageous when used in such quantities that it is wholly utilized for heat maintenance. B. C. A.

Digestive power of, and nitrogen retention by, four types of pigs. J. Schmidt, M. P. von Lagneau and C. Zimmermann. *Arch. Tierernähr. Tiermucht* 8, 453-96 (1933).—The digestive power of pigs was not affected by age or type. N retention varied considerably among individual animals, but av. values for 6-8 individuals of each of 4 types showed significant type differences. B. C. A.

A magneto-optic method of determining the vitamin content of various substances. G. M. Wissink. *Physics* 5, 31-4 (1934).—A magneto-optic app., with the Hg 4358 line for illumination and a photoelec. cell for recording the minima, gives a min. at 32.9 with solns. of cod-liver and Haliver oils, spinach, orange and tomato juices, egg yolk and irradiated carotene crystals. This min. is not found for peanut, Wesson and oxidized cod-liver oils or normal carotene, and it is therefore ascribed to vitamin A. B. C. A.

H. A. Beatty

The comparative calcium and phosphorus retention of pigs fed rations supplemented with limestone, bone meal and "Dicapho." John M. Ramsbottom. *Iowa State Coll. J. Sci.* 8, 221 3 (1933).—Pigs receiving rations which were adequate except for deficiencies in Ca and vitamin D were fed  $\text{CaCO}_3$ , steamed bone meal and "Dicapho" (com.  $\text{CaHPO}_4$ ). No differences in retention of Ca and P were noted except when enough  $\text{CaCO}_3$  was given to make the Ca:P ratio 2.13:1. No differences in gains in wt. or in feed consumption were produced. F. E. Brown

Lactose, its properties, alimentary and dietetic value. Gaetano Cornalba. *Boll. chim. farm.* 72, 915-918 (1933). Lewis W. Butz

Activity of crystalline preparations of vitamin B<sub>1</sub>. A. G. van Veen. *Nature* 133, 137 (1934); cf. C. A. 27, 2183, 4279.—A more active antineuritic material is reported. The crystals are flatter and the m. p. is 2° higher than in the case of the previously reported material. Its behavior in other respects is the same as the earlier prepn. G. C. Crooks

Distribution of vitamin B<sub>2</sub> in the animal body. Paul György, Richard Kuhn and Theodor Wagner-Jauregg. *Z. physiol. Chem.* 223, 21-7 (1934); cf. C. A. 27, 5380.—The relative vitamin B<sub>2</sub> contents of various animal tissues were detd. by feeding them to young rats maintained on an otherwise B<sub>2</sub>-free diet. In confirmation of the findings of other investigators, liver and kidney showed the highest B<sub>2</sub> values. Heart muscle was about 5 times as effective as striated muscle in promoting growth, and was about equiv. to yeast. Skeletal muscle showed variations depending on age and species, veal and dark meat of poultry being especially high in B<sub>2</sub> content. Hemin had no growth-promoting action. Beef spleen gave a high value, thymus and pancreas much lower values, and carcinoma tissue very much lower. Boiled exts. of yeast, liver, kidney, heart and muscle showed 50-80% of the activity of the fresh tissues, but max. growth was not attained even with excessive doses, probably because a  $\text{H}_2\text{O}$ -insol. growth substance had been removed, perhaps the so-called R factor. The press juice from yeast and liver contained less B<sub>2</sub> than the corresponding boiled ext. Vitamin B<sub>2</sub> is completely diffusible through Cellophane and parch-

ment. Its activity is almost entirely destroyed in 24 hrs. in the presence of 0.25 N NaOH at room temp., whereas N H<sub>2</sub>SO<sub>4</sub> has no harmful effect.

**Preparation of vitamin B<sub>2</sub> concentrates.** Paul György, Richard Kuhn and Theodor Wagner-Jauregg. *Z. physiol. Chem.* 223, 27-35(1934).—By the following procedure the vitamin B<sub>2</sub> present in boiled ext. of beef liver was concd. 5-8-fold with a yield of 8.3-10%: pptn. with Pb(OAc)<sub>2</sub>, decompn. of the ppt. with H<sub>2</sub>S, pptn. with phosphotungstic acid in N H<sub>2</sub>SO<sub>4</sub>, removal of excess phosphotungstic acid from the filtrate by shaking with AmOH, pptn. with AgNO<sub>3</sub> in N H<sub>2</sub>SO<sub>4</sub>, pptn. of the filtrate with AgNO<sub>3</sub> at neutral reaction, decompn. of the ppt. by dil. HCl, pptn. of concomitant substances by EtOH. Further concn. was then effected by adsorption on fuller's earth in the presence of N acid and elution with dil. pyridine. Vitamin B<sub>2</sub> is a flavin pigment, and the activity of the prepn. is proportional to the intensity of the yellow color and green fluorescence. Attempts at further purification by adsorption on frankonite from neutral soln. resulted in loss of activity without loss of color, a phenomenon attributed to the sepn. of the vitamin into its components. For the prepn. of B<sub>2</sub> concentrate from boiled ext. of beef heart the following procedure is recommended: To 450 cc. of ext. add 37 cc. concd. HCl, centrifuge, and stir 1 hr. with 2.5 g. of fuller's earth. Centrifuge, wash the fuller's earth free from chloride, stir with a mixt. of 120 cc. H<sub>2</sub>O, 30 cc. MeOH and 30 cc. pyridine for 1.5 hrs. Centrifuge, conc. the soln. *in vacuo* to 60 cc. at a temp. not exceeding 60°. Centrifuge again, add an equal vol. of abs. MeOH, centrifuge and evaporate *in vacuo* to 20 cc. When this soln. was dild. so that 1 cc. was equiv. to 5 g. of fresh heart, 1.5 cc. added to the B<sub>2</sub>-free ration caused a rat to gain 19 g. in 14 days.

**Nutritive value of marine products. VI. Vitamin A potency of salmon-liver oil.** B. E. Bailey. *Contrib. Can. Biol. Fisheries* 8, 267-74(1934); cf. C. A. 27, 1918. —The vitamin A content of liver oils of 5 species of salmon in the genus *Oncorhynchus* was detd. The richest samples contained 40 times, and the poorest twice, as much vitamin A per g., as a sample of cod-liver oil stated to contain 500 American Drug Manufacturers' Assocn units per g. Potencies of samples were in the descending order: Skeena spring, Vancouver spring and sockeye, coho, pink and chum salmon. Oil content of the livers averaged 5% and percentage of liver in the fish 2%. The m.p., sapon value and I value of the oils were detd. Eleven references.

**The absorption and assimilation of food protein during pregnancy.** O. Bokelmann and W. Scheringer. *Arch. Gynakol.* 153, 201-12(1933).—Expts. carried out on pregnant and nonpregnant women showed that the absorption of protein was the same but retention of N occurred during the latter half of pregnancy. There was no retention of amino acids or nonprotein N in the blood, nor of N in the tissue fluids. Conclusion: N is retained as protein in the tissues.

**Influence of the preceding diet upon the rate of glucose absorption and glycogen synthesis.** Eaton M. MacKay and H. C. Bergman. *J. Nutrition* 6, 515-21(1933).—In the rat the diet preceding the starvation period, as varied by being composed chiefly of protein, carbohydrate or fat, was without significant effect, after 24 and 48 hrs. of starvation, upon the rate of absorption of administered glucose from the intestine or the rate of glycogen deposition in the liver or skeletal muscle. Conclusion: Variations in the blood glucose tolerance curve produced by the preceding diet are due to changes in the rate of glucose uptake by tissues other than the liver probably produced by variations in the rate of glucose oxidation.

**Peroxidase reaction. XXXVIII. Relation between Arakawa's reaction and suitability of human milk.** Kyumatsu Asakura. *Tōhoku J. Exptl. Med.* 19, 275-81(1932); *Physiol. Abstracts* 18, 117; cf. C. A. 27, 761, 4562.—Mice fed on polished rice were protected from vitamin B deficiency by milk which gave Arakawa's peroxidase reaction, but were not protected by milk which was neg. If a mother mouse with neg. milk was given

large amounts of vitamin B the pups died well, although the milk contained neg.

**Effect of dietary deficiency of cystine on tissue glutathione.** A. D. Marenzi and B. Braier. *Compt. rend. soc. biol.* 115, 337-8(1934).—When rats were put on a cystine-deficient diet the total glutathione of the various tissues decreased 24-36%. The greatest decreases occurred in the kidneys and liver. Growth was slow and mortality high. Adding extra cystine to the diet of normal rats did not appreciably increase the tissue glutathione.

**Vitamin C and the adrenals.** P. E. Galvao and D. M. Cardoso. *Compt. rend. soc. biol.* 115, 350-2(1934).—When guinea pigs were placed on a scorbutic diet the vitamin C of their adrenal cortex disappeared in a few days.

**The chemical (as distinct from physiological) tests for vitamins. Chemical evaluation of the vitamins.** A. L. Bacharach and E. Lester Smith. *Analyst* 59, 70-81(1934).—A brief summary of our present knowledge concerning the chem. compn. of the various vitamins and the chem. tests which serve for their detection, with particular reference to the blue test with SbCl<sub>5</sub> which can be used as a routine test for the control of factory operations. **Determination of vitamin A.** Norman Evers. *Ibid.* 82-4.—Data on the SbCl<sub>5</sub> color test are given. When detd. on the unsaponifiable matter of cod-liver oil, the values agree better with the biol. values than do the tests made with the original oil, but it seems doubtful whether the prepn. of the unsaponifiable matter is really worth while because the blue test on the original oil gives an approx. idea of the vitamin A content that is sufficiently accurate for com. purposes. **Relationship between the Carr-Price value and the 328 mμ absorption coefficient of preparations containing vitamin A.** Sydney K. Crews and Stanley J. Cox. *Ibid.* 85-90.—For nearly 10 years it has been customary in the British Drug Houses, Ltd., Labs. to exam. all products contg. vitamin A for their chromogen content by the Carr-Price SbCl<sub>5</sub> test, but recent work has indicated the value of measuring the selective absorption shown in the ultra-violet region of the spectrum by products contg. vitamin A, and there have also been spectroscopic studies of the blue color produced by the SbCl<sub>5</sub> reagent. The activity due to vitamin A is attributed to a chromogen showing absorption of 328 mμ in the ultra-violet. Data are given concerning the results obtained by these 2 methods of testing. **Titration of vitamin C in citrus juices.** A. H. Bennett. *Ibid.* 91-3; cf. C. A. 28, 1387<sup>1</sup>.—A discussion of results obtained by Tillmans' method of titrating with a soln. of 2,6-dichlorophenolindophenol. The exclusion of air greatly retards, but does not entirely prevent, the disappearance of the reducing factor in sterilized or preserved fruit juices kept at room temp.

**Avian carbohydrate metabolism. IV. Factors in influencing the maintenance of respiration in surviving brain tissue of the normal pigeon.** Rudolf A. Peters and Hugh M. Sinclair. *Biochem. J.* 27, 1677-86(1933); cf. C. A. 28, 507<sup>2</sup>.—The decrease in respiration rate in minced avian brain systems is reduced in the presence of lactate. It is not reduced by galactose, mannitol, Na β-glycerophosphate, hexosediol- and hexose-mono-phosphates. Lactate and pyrophosphate are essential constituents of the respiration system. α-Glycerophosphate has a remarkable addnl. influence.

**Influence of vitamin C on intracellular enzyme action.** Arnulf Purr. *Biochem. J.* 27, 1703-5(1933).—Arginine is activated by the system ascorbic acid + Fe. The conception is developed of a regulation of intracellular protein metabolism by the interaction of glutathione and ascorbic acid.

**Determination of antineuritic vitamin.** Katharine H. Coward, Joshua H. Burn, Harold Wm. Ling and Barbara G. E. Morgan. *Biochem. J.* 27, 1717-43(1933).—The methods for estg. potency are based on (1) tests in which pigeons are cured of head retraction, (2) tests in which the growth of rats is observed. With pigeons, the duration of cure and the percentage of birds cured give the same

1. of potency provided the results are interpreted by means of suitable curves relating response to dose of vitamin B<sub>1</sub> given. The rat and pigeon methods give the same estn. of potency of a soft ext. of yeast in comparison with the International Standard. In tests of 2 different samples of dried yeast, the pigeon test indicated a vitamin B<sub>1</sub> potency about double that indicated by the rat test. Although the probable error of the pigeon test is much greater than that of the rat test, the former has the great advantage of being sp. for the factor it is used to est. B. H.

Chemistry of vitamin A. Marston T. Bogert. *J. Chem. Education* 11, 203-7 (1934). E. H.

Vitamin A and lipid metabolism. H. J. Jusatz. *Naturwissenschaften* 21, 800 (1933).—The cholesterol content of the serum of rabbits fed on a vitamin-free diet is raised (colorimetric detn.) 180% after 10-14 days by addn. to the food of 0.5-1.5 cc. Vogan (Merek, 1 cc. = 40,000 R units of vitamin A) daily. This agrees with the influence of vitamin A on lipid metabolism predicted by Moll, *et al.* (C. A. 27, 2984, 4277). B. J. C. van der Hoeven

Avitaminosis. XVI. Production of gastric ulcers in the albino rat as a result of specific influence of deficiency of vitamin B. B. Sure and H. S. Thatcher. *Arch. Path.* 36, 800-16 (1933); cf. C. A. 27, 5099.—Gastric ulcers have been produced in the albino rat as a result of sp. deficiency in vitamin B, uncomplicated by the factor of inanition. It is suggested that vitamin B therapy may be indicated in human gastric ulcer. H. F. H.

Some abnormalities in rats subsisting on diets poor in mineral nutrients. A. M. Yudin, L. R. Farquhar and A. J. Wakeman. *Arch. Path.* 17, 40-5 (1934).—Rats deprived of an adequate dietary source of inorg. salts developed certain skeletal abnormalities which in some cases were accompanied by protrusion of the eyes. Histological examn. of the tissues of the eye, the suprarenals and the pituitary gland showed no striking abnormalities; apparent changes in the thyroid gland are being further investigated. A marked osteoporosis of the bones was revealed by x-ray photographs and by a chem. examn. of the femurs. The realimentation of such animals with a diet that contained an adequate supply of inorg. salts or a sufficiently high level of Ca resulted in marked calcification of the bones, an increase in the hemoglobin content of the blood and a general improvement in the appearance of the animals. Harriet F. Holmes

Amyloidosis: experimental studies. H. G. Grayzel, M. Jacobi, H. B. Warshall, M. Bogin and H. Bolker. *Arch. Path.* 17, 50-75 (1934).—Amyloidosis can be produced in all albino mice by subcutaneous or intramuscular injections of a 5% aq. suspension of Na caseinate. The earliest amyloid appears within the fixed and wandering cells of the reticular system. As these cells disintegrate, extracellular amyloid appears, grows in amt. and finally replaces the parenchyma of the organ involved. Amyloidosis is probably the result of an endogenous protein metabolic disturbance. When the rate of formation of these catabolic products exceeds the ability of the tissues to dispose of them, amyloid appears. With the present technique, amyloidosis cannot be produced in albino rats. Except in albino mice, showing precursory or very early evidences of amyloidosis no spontaneous resorption of amyloid in definite cases of amyloidosis was observed. Albino mice given a prepn. of powd. whole liver in their diet showed resorption only when the degree of amyloidosis was no more than moderate. Comparative studies indicate that a well-balanced, thoroughly adequate diet exercises a retarding influence on the production of amyloidosis. The addn. of a prepn. of desiccated powd. whole liver to the stock diet results in delay of the formation of amyloidosis. Inadequate or deficient diets do not accelerate the development of amyloidosis. Mice fed a synthetic and so-called stock diet to which vitamins A and B were added showed definite evidence of retardation of the production and formation of amyloidosis. Harriet F. Holmes

Absorption of calcium in normal animals. N. B. Taylor, C. B. Weld and J. F. Sykes. *Br. J. Exptl. Path.* 14, 355-66 (1933).—In normal animals the Ca in the diet is completely absorbed. Even if extra Ca is given, the Ca

excretion does not increase until the intake reaches a high figure. Though overdosage with irradiated ergosterol depresses the excretion of Ca through the bowel, small doses do not exert this effect, and there is no indication that the net absorption of Ca is increased by the administration of the sterol in therapeutic dosage. Though high-Ca feeding converts a neg. Ca balance to pos., such a result has not been observed as a result of ergosterol administration, and when an animal is on a high-Ca intake the administration of ergosterol does not increase the quantity of Ca absorbed. The results seem to indicate that the sterol diminishes rather than increases the net absorption of Ca. The action of Ca in augmenting the overdosage effects of ergosterol may be explained without assuming that the latter encourages Ca absorption. Overdosage with irradiated ergosterol causes the withdrawal of Ca from the skeleton. The Ca absorbed from the intestinal tract fails to be deposited in the bones at such a time that the Ca stream, as a result of overdosage with irradiated ergosterol, is flowing from bones to blood. A rise in the serum Ca and increase of its excretion would follow inevitably. Harriet F. Holmes

Metabolism studies on dry and milking animals. Balwant Singh. *Agr. Live-stock India* 3, 411-31 (1933).—Expts. on dairy cows showed that a ration consisting of concentrates and *bhoosa* as the sole roughage is deficient in Ca; the balance becomes pos. only when the animal is near its drying stage. Under all conditions pos. Ca balances were obtained by fortifying this ration with limestone or bone meal. Pos. Ca balances were obtained on heavily milking cows on a ration of berseem, *bhoosa* and concentrates, whereas dry animals showed pos. Ca and P balances on a *bhoosa* diet alone. As compared with dry animals, heavy-milking cows showed an increased assimilation of Ca and P. When an all-round maintenance ration was fed the total intake of Ca or P bore no particular relation to the digestibility of these elements. Twenty-three references. K. D. Jacob

The relation of vitamins to nutritional deficiencies and abnormalities in dogs. John F. McKenna and O. A. Longley. *North Am. Veterinarian* 14, No. 4, 33-7 (1933). K. D. Jacob

The clinical significance of vitamins and minerals in the diet of dogs. John F. McKenna and O. A. Longley. *North Am. Veterinarian* 14, No. 8, 37-46 (1933). A review, with 13 references. K. D. Jacob

Significance of copper and iron in blood restoration. C. A. Elvehjem. *Am. J. Pub. Health* 23, 1285-9 (1933).—J. A. Kennedy

Feeding experiments with decomposition products of protein. III. Shiro Maeda. *Bull. Agr. Chem. Soc. Japan* 9, 169-72 (1933); cf. C. A. 27, 123.—When rats were fed on a diet consisting of glycine 2, *dl*-alanine 13, *l*-leucine 15, *l*-proline 4, *l*-hydroxyproline 4, *l*-tyrosine 3, *l*-phenylalanine 3, *l*-cystine 3, *d*-glutamic acid 15, *dl*-aspartic acid 6, *dl*-tryptophan 2 and diamino acids 30%, they soon lost appetite and their body wt. rapidly decreased. The monocarboxylic fraction was sepd. from the monoamino fraction of the acid hydrolyzate of fish protein. From this fraction through the Cu or Zn salt was obtained hydroxyaminovaleic acid, colorless needles, m. 220°. Normal growth of the animal was obtained by the addn. of this substance to the above diet. Y. Kihara

Digestion of food. III. Digestion of synthetic fats. Shigeo Suzuki. *J. Agr. Chem. Soc. Japan* 9, 1007-18 (1933).—Tristearin and triolein, instead of fat, were given in standard ration of dogs. Triolein was generally more digestible than tristearin. Triolein had no effect on other components of the food, while tristearin retarded the digestion of other components, especially protein. The difference between the digestive coeffs. of tristearin and triolein increased with the amt. Y. Kihara

Nutritive effect of ethyl alcohol. Tsune Ariyama. *J. Agr. Chem. Soc. Japan* 9, 1035-44 (1933).—Albino rats were fed a diet contg. fish protein 29, hard 40, batter fat 25 and McCollum's salt mixt. 6%. Excess of fat had a bad effect on animal nutrition. Normal growth was observed when alc. was added. The optimum amt. of alc.

was 5%. The contents of the fat in the liver and the total body increased remarkably on the addn. of 5% EtOH. EtOH did not affect the quantity of glycogen in the liver.

Vitamin B<sub>1</sub> deficiency in carbohydrate-free diets and the behavior of ethyl alcohol toward vitamin B<sub>1</sub>. Tsune Ariyama. *J. Agr. Chem. Soc. Japan* 9, 1045-8(1938).—Though 0.4 g. of the yeast heated in an autoclave was added to carbohydrate-free diets per day as the vitamin B<sub>1</sub> source, vitamin B<sub>1</sub> deficiency could not be prevented. When glucose was added to the diets, the symptoms of vitamin B<sub>1</sub> deficiency appeared earlier. When EtOH was added, the appearance of the symptoms was delayed.

Y. Kihara

Vitamin C. XI. Efficacy of vitamin C and the manner in which it is supplied. Tomiji Matsuoka. *J. Agr. Chem. Soc. Japan* 9, 1117-23(1938); cf. *C. A.* 27, 4282.—For guinea pigs 1-1.5 g. of vitamin C source per 100 g. of the body wt. added to the basal ration was sufficient to prevent scurvy. After the appearance of the symptoms 2 g. of vitamin C source per day was necessary. Even though 4 g. of vitamin C source was given, it was difficult to cure serious scurvy. XII. Vitamin C in the liver and the adrenal glands of cattle. *Ibid.* 1124-9.—Vitamin C was extd. from the liver and the adrenal glands of cattle with alc. and acetone. The ext. of the adrenal glands was richer in vitamin C than that of the liver and was extd. again with acetone. Pb acetate was added to the ext. and then NH<sub>4</sub>OH to bring the pH of the soln. to 7-8. A yellowish white ppt. was obtained and was decompd. by H<sub>2</sub>S. From the filtrate a cryst. substance, m. 174-8°, was isolated. It showed the chem. reactions of hexuronic acid and the activity of vitamin C. XIII. Extraction of vitamin C and solvents. *Ibid.* 1130-6.—Cabbage juice was evapd. under reduced pressure and dried over H<sub>2</sub>SO<sub>4</sub>. Vitamin C is sol. in alc. and acetone, but insol. in ether and petroleum ether. XIV. Extraction of vitamin C and pH of the solution. *Ibid.* 9, 1136-40(1938).—The vitamin C in cabbage juice was extd. with the solvents at various pH values. The pH of the soln. had no effect on the soly. in alc. and acetone. Vitamin C is insol. in petroleum ether irrespective of the reaction.

Y. Kihara

Diet and teeth. F. Breese. *Brit. Dental J.* 56, 120-4(1934).—Case observation in 3 institutions showed correlation between places in teeth where lodgment of carbohydrate food occurs persistently and those where caries commences.

Frances Krasnow

Diet and dental caries. Evelyn Sprawson. *Brit. Dental J.* 56, 125-30(1934); cf. *C. A.* 27, 1920.—Raw milk is advocated as particularly helpful in preventing caries.

Frances Krasnow

Carbohydrate metabolism of the liver. I. Glycogen and other carbohydrates in decapitated cats. Chiao Tsai. *Chinese J. Physiol.* 7, 215-28(1933).—The other carbohydrates as well as the glycogen of the liver fall and then rise after anesthesia and decapitation of cats. Hence glycogen is not regenerated at the expense of these other carbohydrates. The glucose formed in the liver causes the blood sugar to rise. This blood sugar falls before the glycogen increases.

C. M. McCay

The vitamin A reaction with antimony trichloride. II. Spectroscopic investigation of some chromogens. Helene Goldhammer and Franz M. Kuen. *Biochem. Z.* 267, 406-16(1933); cf. *C. A.* 24, 1144.—Spectroscopic examn. of the color produced with SbCl<sub>3</sub> by a no. of chromogenic substances gave the following results: carotene, blue color, with strongest absorption bands 563-568 mμ; xanthophyll, greenish blue, with absorption bands at 490-504 and 580-592 mμ; ergosterol, blue, with strongest absorption band at 561-575 mμ; cholesterol, after 1 hr. red, with principal absorption bands at 492-502 and 560-569 mμ; cholesterol irradiated 3 hrs., rose color, with absorption bands at 490-504 and 568-570 mμ; cholesterol irradiated 9 hrs., immediate blue color with principal absorption band at 550-573 mμ, changing to red with the appearance of several other bands; orycholesterol, blue with chief band at 564-576 mμ. Carotene and xanthophyll thus have practically the same absorption spectrum;

cholesterol and ergosterol each have 4 bands, of which 3 are practically the same, while orycholesterol likewise gives 4 bands but entirely different from those of cholesterol. Heating cholesterol in air or irradiating it with the quartz lamp gradually changes its spectrum to that of orycholesterol. Liver oil shows 6 bands: the vitamin A band at 610 mμ, a band at 572 mμ and 4 cholesterol bands. In alc. extp. of the liver oil the spectrum is shifted toward the short-wave side, and the vitamin band lies now at 590-614 mμ, while in the unsaponified portion of the oil the bands are shifted toward the red end, and the vitamin band lies at 618-629 mμ. In the unsaponified portion of the oil there are 2 chromogens absorbing at 574-583 mμ. In the unsaponified portion of butter, on reaction with SbCl<sub>3</sub>, the characteristic absorption bands of vitamin A, carotene and cholesterol all appear. III. Placenta and serum. *Ibid.* 417-23.—In human or horse serum a colorless chromogen was found which gives a blue color reaction with SbCl<sub>3</sub> having absorption bands at 595 and 541 mμ. Carotene and xanthophyll were always present, but vitamin A was present only occasionally, in the serum. Drying human placentas at about 40° in air causes the destruction of its lipochromes with the formation of a colorless chromogen which reacts with SbCl<sub>3</sub> as that of serum. The development of the chromogen seems to be assoc. with the presence of xanthophyll. The xanthophyll is from the blood, the placental tissue contg. carotene and vitamin A. Cow placenta or human placenta, from which the blood has been well removed, retains the carotene on drying and the colorless chromogen fails to develop.

S. Morgulis

Cataract in the albino mouse resulting from a deficiency of vitamin G (B<sub>2</sub>). Wm. C. Langston, Paul L. Day and K. W. Cosgrove. *Arch. Ophthalmology* 10, 508-14(1933).—Seventy-nine % of 47 young albino mice showed keratitis after an av. of 43 days on a diet deficient only in vitamin G. Cataract was seen in 96% after an av. of 48 days, and ophthalmia in 57% after 50 days. Vitamin G deficiency appeared to be the sole cause of the eye conditions.

Bernard L. Oser

Seasonal variation in antirachitic action of Arkansas sunshine. Paul L. Day. *Am. J. Diseases Children* 43, 1455-60(1932).—The av. daily amts. of sunshine at Little Rock necessary to afford the same partial protection against rickets in rats receiving a rachitogenic diet varied from 5 min. in May, June and July, to 168 min. in December.

Bernard L. Oser

Activity of crystalline preparations of vitamin B<sub>1</sub>. H. W. Kinnerley, J. R. O'Brien and R. A. Peters. *Nature* 133, 177(1934); cf. *C. A.* 27, 2183.—Most vitamin B<sub>1</sub> crystals probably contain inactive vitamin. Analytical figures for the crystals of the authors differ significantly from those of van Veen, i. e., C 42.2% instead of 40.7%. Active lorum (from bakers' yeast) appears to be different from active oryzanin.

W. J. Peterson

Hypervitaminosis in the chicken: the mobilization of calcium under the influence of irradiated ergosterol. G. E. Hall and E. J. King. *Trans. Roy. Soc. Can.* V27, 149-58(1933).—Daily oral administration of 0.5 cc. irradiated ergosterol to young cockerels resulted in loss of wt. and an increase in serum Ca. Addn. of 10% Ca HPO<sub>4</sub>·2H<sub>2</sub>O to the basal ration increased the degree of hypercalcemia of the birds receiving ergosterol. The absence of osteoclasts from the bones of these birds leads H. and K. to suggest that loss of Ca occurs through some other mechanism than that of degradation by the osteoclasts, such as a combination of the ionized Ca of the serum in some complex form.

W. Gordon Rose

Avitaminosis A and utilization of lipides. Lucie Randoin and Roger Netter. *Compt. rend.* 198, 395-7(1934).—Rats maintained on a vitamin-A-free diet contg. lard as their source of fat lost weight after 60-70 days and eventually died. Hence lard is vitamin-A-free. The addn. of small amts. of vitamin D did not reduce the symptoms of vitamin-A deficiency.

Julius White

Effect of vitamins A and D on the humoral reactions in the tuberculous of man. J. Donato, R. Japinet and H. Penau. *Compt. rend.* 198, 397-9(1934).—In tubercular

D mist. in tubercular man resulted in an increase in blood Ca from 80-90 mg. to an av. of 115 mg., an increase in cholesterol from 1.44-1.8 g. to 2.5 g. per l. and a decrease in sero-flocculation until the normal was reached. Julius White

Frank, Carl: Die diätetische Behandlung der Allergie bei inneren Erkrankungen. Leipzig: J. A. Barth. 92 pp. M. 2.40.

Presence and effect of the ovarian hormones and gonadotropic substances. S. Aschheim. *Edinburgh Med. J.* 41(1934), *Trans. Edinburgh Obstet. Soc. Session* 93, 17-35(1933-34).—A review. Rachel Brown

Medical investigations in the 1933 FIS contests at Innsbruck. F. Gaisböck. *Wien. klin. Wochschr.* 46, 1377-80, 1418-21, 1446-9, 1477-84, 1512-15(1933).—Observations were made on many physiol. functions before and after races. D. B. Dill

Changes in  $p_n$ , neutralization curves and buffer coefficients of the constituents of hen eggs during incubation. M. Rubinstein. *Arch. phys. biol.* 11, 40-71(1933).—See C. A. 27, 125-6. L. E. Gilson

Anterior hypophysis of sheep and melanophore reactions. R. Collin and P. L. Drouet. *Compt. rend. soc. biol.* 115, 161(1934).—Criticism of Popa and Fielding, C. A. 28, 1748. L. E. Gilson

Mechanism of lactic acid formation [in muscle]. E. Aubel and E. Simon. *Compt. rend. soc. biol.* 115, 378-4(1934); cf. C. A. 28, 1061. Mg hexosediphosphate was added to an aq. ext. of muscle. Some lactic acid was produced under aerobic conditions, and over twice as much under anaerobic conditions. In both cases the addn. of glutathione greatly increased the amt. of lactic acid formed. In the same mixts., without glutathione, more methylglyoxal was formed under aerobic than under anaerobic conditions, and in both cases only traces were formed when glutathione was added. L. E. Gilson

Effect of folliculin on the fertility of the male mouse. A. Lacasagne. *Compt. rend. soc. biol.* 115, 460-71(1934).—Large repeated doses of folliculin render male mice infertile, but the mechanism is uncertain since there is no atrophy of the testicles or suspension of spermatogenesis. Action of folliculin on the fertility of male rabbits. *Ibid.* 579-81.—Large repeated doses cause atrophy of the testicles and arrest of spermatogenesis. In one case a return to normal occurred in about 10 weeks after treatment was discontinued. L. E. Gilson

Fixation of potassium by young white rats. Albert

Leukler and Georges Vanhems. *Compt. rend. soc. biol.* 115, 532-4(1934); cf. C. A. 28, 201, 1772.—The K content of the entire carcasses of rats is, at birth 0.206, 5 days old 0.223, 10 days old 0.250 (max.), 15 days old or older 0.247%. L. E. Gilson

Variations in total protein, albumin-globulin ratio and cholesterol of the blood of rabbits after heavy daily bleedings. P. Mauriac, L. Servantie and G. Demezier. *Compt. rend. soc. biol.* 115, 558-60(1934).—Graphs are given. The albumin-globulin ratio showed no marked changes. Cholesterol varied inversely as the total proteins. During the exptl. period total blood protein decreased to half and cholesterol increased to twice the normal value. L. E. Gilson

Relation between alkali reserve, corpuscle chloride-plasma chlorine ratio and plasma  $p_n$ . J. Loiseleur. *Compt. rend. soc. biol.* 115, 619 20(1934).—Math. L. E. G.

Elimination, in the bile, of thyroxine given parenterally. A. W. Elmer and Z. Luczynski. *Compt. rend. soc. biol.* 115, 647(1934); cf. C. A. 28, 515.—When 2 mg. thyroxine was given intravenously to rabbits 5-0.5% of the total I was eliminated in the bile, and when 2 mg. was given by stomach tube 0.8-1.4% was so eliminated. L. E. Gilson

Fat metabolism and heat regulation. Anna Lănczos. *Arch. ges. Physiol. (Pflügers)* 233, 787-92(1934).—Mice placed on ice maintain their body temp. for some hrs. if allowed free muscular movements. The fat content of the liver may be doubled or tripled without an appreciable diminution in the "basal" total carbohydrate content of the liver. Arthur Grollman

The oxygen saturation curve of blood of various animals. W. von Buddenbrock. *Naturwissenschaften* 22, 41-4(1934).—A study was made of all available data on O satn. curves of different blood species. Nonvertebrates with hemoglobin blood as well as the larger part of the cold-blooded vertebrates follow the Hill law:  $(Hb \times O_2)/Hb = KpO_2^n$  with const.  $n$ . A typical curvature in the logarithmic curve is found for warm-blooded animals and for *Amphiuma*, crocodiles and a few fishes. The larger  $n$  is, the lower is the O pressure required to produce satn. (95%) of the blood. An exception to this rule is the blood of birds, which has high  $n$  as well as high satn. pressure. In the series fish, amphibia, reptiles, warm-blooded animals,  $n$  becomes increasingly variable. B. J. C. van der Hoeven

The change in muscle metabolism in relation to the increased performance of work by the muscle under the influence of adrenal cortex hormone. Konrad Lang. *Naturwissenschaften* 22, 91(1934).—Increased work by the muscle due to cortex hormone goes parallel with chem. changes (C. A. 26, 3557). Isolated frog muscles treated with purified adrenal exts. show 30% increase in performance, and their phosphagen content increases by about the same amt. B. J. C. van der Hoeven

Action of vitamin D and of the parathyroid hormone on the calcium metabolism as interpreted by studying the effect of single doses on the calcification of dentin. I. Schour and A. W. Ham. *Arch. Path.* 17, 22-39(1934).—Since the dentin of the incisor of the rat is placed in apposition day by day, it was selected as an index of the normal calcification process as affected by the administration of single massive doses of either vitamin D or the parathyroid hormone. Doses of either substance resulted in the formation of, first, a stripe of dentin which was imperfectly calcified and, secondly, a stripe of dentin which was normally or excessively calcified. The poorly calcified dentin represented the area calcified while the serum Ca level was rising, and the well-calcified stripe represented that calcified while the serum Ca level was falling, after the attainment of a hypercalcaemia. As no osteoclasts were found in the dentin, the action of the parathyroid hormone in preventing calcification for a time did not appear to depend on its supposed ability to stimulate the active liberation of Ca from bone. The observation could be explained by the theory which postulates that the parathyroid hormone controls a fraction of the serum Ca. The results with vitamin D could be explained by the

theory that vitamin D acts through a parathyroid mechanism, provided the shift in Ca during the upswing of the curve is considered to be toward the blood and during the downswing of the curve, from the blood to the bones, dentin, soft tissues and intestine. Harriet F. Holmes

Urea clearance after unilateral nephrectomy in dogs. H. T. Karsner, R. F. Hanzal and R. A. Moore. *Arch. Path.* 17, 46-9(1934).—With the urea clearance test as a criterion unilateral nephrectomy is followed by a transient period during which the remaining kidney is physiologically deficient. After 6 months the remaining kidney functions as well as did both kidneys originally. Thus the enlargement of the remaining kidney of the dog is a true hypertrophy. This result agrees with those of previous expts. on the rabbit by the urea tolerance test and with the results of Ellis and Weiss (*Am. J. Med. Sci.* 186, 242 (1933)) in man with the urea clearance test. H. F. H.

Significance of sulphydryl as a growth factor. W. C. Hueper. *Arch. Path.* 17, 218-42(1934).—A general review with 74 references Harriet F. Holmes

The presence of an anterior pituitary hormone for fat metabolism in "Inkretan." Felix Boenheim and Franz Heimann. *Z. ges. expil. Med.* 83, 637-40(1932); cf. Anselmino and Hoffmann, *C. A.* 26, 2229. M. L.

Excretion of nitrogen in the bile. Hans Lucke and Joachim Frey. *Z. ges. expil. Med.* 86, 1-11(1933).—Dogs with biliary fistulas were used in N-balance expts. The N in the bile is normally less than 0.1 g. per day and about 0.5 1% of the total excretion. Renal insufficiency produced by HgCl<sub>2</sub> caused the appearance of 1 7% of the N in bile. These figures minimize the possible vicarious excretion of N waste products in the bile in renal disease. Milton Levy

Hormonal blood-sugar regulation. F. Höglér and F. Zell. *Z. ges. expil. Med.* 86, 144-57(1933); cf. *C. A.* 28, 829<sup>3</sup>.—Parathormone heightens adrenalinic hyperglucemia but does not affect the action of Mg, pyramidone or glucose. It has no effect of itself or with ergotamine or atropine nor does it influence insulin. Milton Levy

Reflex blood-sugar regulation through the sinus caroticus. Paul Thelen. *Z. ges. expil. Med.* 86, 231-43 (1933).—It was impossible to demonstrate a clear reflex blood-sugar regulation through the carotid sinus in acute expts. on rabbits. Milton Levy

The contents and distribution of the melanophore hormone in the human hypophysis. A. Jores and O. Glogner. *Z. ges. expil. Med.* 91, 91-9(1933); cf. *C. A.* 27, 2992. —Acetone-dried powder of human pituitary contains 0.25 units of melanophore hormone per mg. The anterior lobe contains 8 times as much as the rest of the gland. A basophilic adenoma contains large amts., whereas a chief cell adenoma contains very little. The hormone is probably formed in the basophilic cells of the anterior pituitary. Milton Levy

The mechanism of the action of the anti-insulin hormone of the anterior pituitary. I. Anterior pituitary, thyroid and carbohydrate metabolism. H. Lucke, E. R. Heydemann and F. Duensing. *Z. ges. expil. Med.* 91, 106-13(1933); cf. *C. A.* 27, 3510, 4569. —Removal of the thyroid does not change the hyperglucemia produced in dogs by anterior pituitary exts. Anti-insulin is not identical with the thyrotropic hormone. II. Anterior pituitary, adrenal insufficiency and carbohydrate metabolism. H. Lucke, E. R. Heydemann and H. Hahndel. *Ibid.* 91, 483-91. —Adrenalectomized dogs are very sensitive to insulin and react normally to injected adrenaline. Hyperglucemia does not occur in these animals after the injection of anti-insulin. Anti-insulin produces its effect through the mediation of the adrenals. III. Anterior pituitary, denervation of the adrenals and carbohydrate metabolism. *Ibid.* 492-501. —Hyperglucemia does not occur after anti-insulin if the adrenal is denervated. Anti-insulin reacts directly on the central nervous system. IV. The effect of the hormone in the cerebrospinal fluid. H. Lucke and H. Hahndel. *Ibid.* 499-52. —Anti-insulin is much more potent when administered intraspinally than by other methods. V.

1 The effect of sympathetic poisons on the blood sugar after anti-insulin. *Ibid.* 693-703. —Ergotamine and central narcotics reduce or abolish the hyperglucemia produced by anti-insulin. VI. The presence of anti-insulin in cerebrospinal fluid. *Ibid.* 704-9. —After intramuscular injections of large amts. of anti-insulin it could be demonstrated in the cerebrospinal fluid of dogs. Anti-insulin formed in the anterior lobe of the pituitary passes into the cerebrospinal fluid where it acts directly on the sugar center and impulses sent through the sympathetic system cause adrenaline production which produces the hyperglucemia. Milton Levy

The excretion of urinary constituents in the gastrointestinal tract of nephrectomized dogs. I. Vicarious secretion. Georg Hessel. *Z. ges. expil. Med.* 91, 267-73 (1933). II. Gastric secretion in nephrectomized animals. Georg Hessel, Emanuele Pekelis and Hans Meltzer. *Ibid.* 274-306. —The gastric secretion of nephrectomized animals was analyzed for HCl, Cl, N, rest N, urea, NH<sub>3</sub>, creatinine, indican and phenols. While the HCl and Cl did not change the N-contg. substances increased steadily to high values in the uremic state. The concn. was always less than in the blood. A true vicarious secretion does not occur. III. Bile secretion in nephrectomized animals. *Ibid.* 307-24. —Urinary constituents increase in the bile in the uremic state and may reach concns. somewhat above blood levels. Whether this is due to true secretion or to concn. of bile is not known. The amt. of secretion is too small to be of practical importance. IV. The drainage of gastric and duodenal juices through a fistula of the jejunum. *Ibid.* 325-30. —The fluids obtained from a high jejunal fistula contained higher concns. of urea and rest N than blood indicating vicarious secretion. The indican equals and the creatinine is less than that in blood. V. The course of uremia influenced by urinary substances in the digestive juices. Georg Hessel and Emanuele Pekelis. *Ibid.* 331-9. —The removal of gastric and duodenal secretions through a jejunal fistula prolonged the life and lowered the accumulation of urinary constituents in the blood of nephrectomized dogs. Milton Levy

6 Fat storage in the lungs. Tomaso Oliaro. *Z. ges. expil. Med.* 91, 366-9(1933). —Fat contents of blood from the left and right heart, peripheral veins and vena cava establish a loss of blood fat in passing through the lungs. The fat content of the lungs increases after a fat meal. Milton Levy

Comparison of the creatinine contents of blood serum and cerebrospinal fluid. Roland B. Maydell. *Z. ges. expil. Med.* 91, 455-62(1933). —In 18 normal human beings the blood creatinine averaged 1.6 mg.% and the cerebrospinal fluid contained 1.18 mg.%. In renal disease the cerebrospinal creatinine rises more slowly than that of the serum. Milton Levy

7 The liver in cholesterol and phosphatide metabolism. H. Heinlein. *Z. ges. expil. Med.* 91, 638-82(1933); cf. *C. A.* 28, 812<sup>4</sup>. —Of ingested cholesterol 30-70% and of phosphatide 3-6% are excreted by either young or grown dogs. The absorption of cholesterol does not depend on the presence of bile but that of phosphatide does. Milton Levy

8 Urine pigment excretion and intestinal putrefaction. I. The source of urochrome. L. Heilmeyer and F. Pfotenhauer. *Z. ges. expil. Med.* 91, 714-19(1933). II. Urobilin, urochrome and indican excretions of dogs after the removal of the intestinal tract. A. Billi, L. Heilmeyer and F. Pfotenhauer. *Ibid.* 720-8. —The urine of the newborn does not contain urobilin or indican until 8-24 hrs. after birth. The excretion of urochrome is large even in the first hr. The removal of the intestinal tract of dogs is followed by an increase in urochrome excretion then a drop to normal levels. Urobilin and indican fall at once. Urochrome does not originate in the intestinal tract. Milton Levy

Cerebrospinal fluid. IX. The lactic acid contents of cerebrospinal fluid. Michio Kasahara and Teiji Kai. *Z. ges. expil. Med.* 91, 784-6(1933); cf. *C. A.* 28, 4593, 27, 2488. —Rabbit cerebrospinal fluid contains 2.5-14.6

mg. % of lactic acid. The blood lactic acid is always less but changes are parallel.

The effect of splenic hormone, Prosplein, on chloride metabolism. Hans Probst. *Z. ges. expil. Med.* 92, 311-23(1933).

Theory of metabolism in oxygen deficiency. VI. Change of blood proteins after oxygen deficiency and glucose feeding. H. Elias and H. Kaunitz. *Z. ges. expil. Med.* 92, 397-408(1933); cf. *C. A.* 27, 3510.—The increase of serum protein in O deficiency is largely due to water loss. Feeding carbohydrate prevents this. VII. Water balance in oxygen deficiency. H. Elias, H. Kaunitz and R. Laub. *Ibid.* 409-29. VIII. The protein content of the liver and the effect of glucose. H. Elias and H. Kaunitz. *Ibid.* 430-5. IX. The nonprotein nitrogen and its fractions in the liver. Effect of glucose. H. Elias, H. Kaunitz and R. Laub. *Ibid.* 436 9. X. The inhibition of the characteristic changes of protein metabolism at low pressures by glucose. H. Elias and H. Kaunitz. *Ibid.* 92, 450-68. XI. The mechanism of glucose effect in oxygen deficiency. *Ibid.* 469 79.

The metabolic activity of the pancreas. E. U. Still, A. D. Bennett and V. B. Scott. *Am. J. Physiol.* 106, 509-23(1933).—The gaseous metabolism of the dog pancreas *in situ* was measured. The secretion of pancreatic juice results in an increased O consumption. The respiratory quotient of the resting gland is 0.79 and of the secreting gland 1.05.

The fatty acids of human duodenal bile, their quantitative separation; estimation and the effect of foodstuffs on their secretion. C. W. McClure, Mildred E. Huntsinger and A. T. Fernald. *Am. J. Physiol.* 107, 1-12 (1934).—Duodenal bile was collected from human subjects by means of the duodenal tube. Stimulation of bile flow was effected by introducing into the duodenum cottonseed oil, beef peptone or glucose. After cottonseed oil administration the soaps of the bile were always increased several fold, while bile fats and free fatty acids were increased to a smaller extent. Peptone stimulation produced an intermediate effect upon the fatty acid distribution of the bile, while glucose had much less effect. Cottonseed oil stimulation caused a very large increase in org. P of the bile and a somewhat smaller increase in the inorg. P. Peptone stimulation produced an intermediate effect on the bile org. and inorg. P, while glucose stimulation had the least effect. Br nos. of the fatty acids of the blood and bile indicate that the lipoids of the bile are the result of secretory activity of the liver rather than a mere filtration product from the blood.

The effects of high oxygen pressure. I. Effect of high oxygen pressure upon the carbon dioxide and oxygen contents, the acidity and the carbon dioxide-combining power of the blood. A. R. Behnke, L. A. Shaw, C. W. Shilling, R. M. Thomson and A. C. Messer. *Am. J. Physiol.* 107, 13-28(1934).—Dogs breathing pure O at 4 atms. pressure for 2-4 hrs. showed: convulsive seizures, pulmonary damage, O tension in the arterial blood equal to the tension of O in the alveolar air. Seven cc. of pure O dissolved in 100 cc. of blood, sufficient to supply the tissues without any reduction of oxyhemoglobin, normal CO<sub>2</sub>-combining capacity of the blood, a slight increase in the CO<sub>2</sub> tension of the venous blood, and a slight increase in the  $p_{H}$  of the arterial blood and a slight fall in that of the venous blood. II. Effect of high oxygen pressure on the sugar, phosphorus, nonprotein nitrogen, chloride, creatinine, calcium and potassium contents of the blood. C. W. Shilling, R. M. Thomson, A. R. Behnke, L. A. Shaw and A. C. Messer. *Ibid.* 29-36.—Dogs breathing pure O at 4 atms. for 2-4 hrs. showed, in the main, a constancy of the chem. constituents of the blood. Animals having convulsions or apnea, or those dying as a result of the exposure showed increases in blood sugar and in blood P. These changes are probably the result of the toxic effects of O rather than the cause of convulsions or lung damage which also occurred.

Lung extract and blood clotting. H. P. Smith, E. D. Warner and K. M. Brinkhaus. *Am. J. Physiol.* 107,

63-9(1934).—Thromboplastin, free from prothrombin, can be prepd. by extg. perfused lung with saline.

Effects of administration of pure foodstuffs and inorganic substances on external secretory activities of the liver, pancreas and stomach. C. W. McClure, Mildred E. Huntsinger and A. T. Fernald. *Am. J. Physiol.* 107, 94-112(1934).—The biliary, pancreatic and gastric fractions of human duodenal contents obtained after the intraduodenal administration of pure foodstuffs and inorg. compds. show: (1) the concns. of bile and pancreatic juice in the duodenum vary with the type of stimulant; (2) the acid of gastric contents is not the essential factor in stimulating the secretion of concd. bile or pancreatic juice; (3) cottonseed oil and peptone stimulate the liver and pancreas through secretagogic influences.

Changes in the viscosity of the blood in normal, splenectomized and adrenalectomized animals following emotional excitement. L. B. Nice and D. Fishman. *Am. J. Physiol.* 107, 113-19(1934).—The viscosity of the blood in rats whose adrenals have been removed is higher than in normals, both in the quiet and in the excited state. In rats 2 days after removal of the spleen, blood viscosity is higher than normal in the quiet state, but the increase after excitement is less than normal. Four days after spleen removal blood viscosity decreases markedly both in the quiet and excited states.

Relation of the oxygen and nitrogen contents of cerebrospinal fluid to barometric pressure. C. J. Cunningham, J. H. Rand, 3rd, and E. C. Weckesser. *Am. J. Physiol.* 107, 164-7(1934).—The O content of the cerebrospinal fluid is a little more than doubled, and the N content is trebled, when the barometric pressure is increased from 1 atm. to 3 atms.

The action of histaminase on the gastric secretory response to histamine and to a meal. A. J. Atkinson and A. C. Ivy. *Am. J. Physiol.* 107, 168-9(1934).—Histaminase injected intravenously did not prevent or inhibit the gastric response to histamine or to a meal.

The function of the adrenal cortex—general, carbohydrate and circulatory theories. S. W. Britton, H. Silvette and R. F. Kluc. *Am. J. Physiol.* 107, 190-206 (1934); cf. *C. A.* 27, 3246.—There is no water lack in animals whose adrenals have been removed. The carbohydrate loss alone is sufficiently critical to cause death.

The state of carbon dioxide in blood. N. U. Meldrum and F. J. W. Roughton. *J. Physiol.* 80, 143-70(1933); cf. *C. A.* 27, 4255.—If the carbonic anhydrase in blood is prevented from acting by adding HCN, CO<sub>2</sub> is taken up in two phases. Of these the rapid one is due in part to phys. soln. but in the main to some nonbicarbonate compd., whereas the 2nd slow phase is due to the formation of bicarbonate. CO<sub>2</sub> uptake with NH<sub>3</sub>, certain amino acids and peptides gives results so similar to those with cyanide blood that it may be assumed that the same type of CO<sub>2</sub> compd. is concerned in all these cases, viz., a carbamino compd.

Relation of the pituitary gland to the action of insulin and adrenaline. A. B. Corkill, H. P. Marks and W. E. White. *J. Physiol.* 80, 193-205(1933).—After removal of the pituitary gland in rabbits there is increased response to insulin and diminished response to adrenaline. Liver glycogen is abnormally stabilized after pituitary removal.

A comparison of fetal and maternal hemoglobins in the goat. E. F. McCarthy. *J. Physiol.* 80, 206-12 (1933).—There is no difference in mol. wts. of fetal and maternal hemoglobins, but fetal hemoglobin has a greater affinity for O than does that of the mother.

The effect of muscle length on the energy for maintenance of tension. W. O. Fenn and W. B. Litchford. *J. Physiol.* 80, 213-19(1933).—The energy for the maintenance of tension varies with changes in muscle length in exactly the same way as the energy for the development of tension.

The excretion of nonmetabolized sugars by the mam-

malian kidney. C. L. Cope. *J. Physiol.* 80, 229-33 (1933).—Xylose is excreted in the kidney entirely by glomerular filtration with no absorption in the tubules. After the administration of phlorizin the same holds true for glucose and sucrose, but not exactly so for creatinine.

J. F. Lyman

The chemical transmitter at synapses in a sympathetic ganglion. W. Feldberg and J. H. Gaddum. *Proc. Physiol. Soc., J. Physiol.* 80, 12P(1933).—The liberation of acetylcholine is the normal mechanism by which the effects of preganglionic impulses pass synapses in the ganglion.

J. F. Lyman

The mechanism of the nervous discharge of adrenaline. W. Feldberg, B. Minz and H. Tsudzimura. *Proc. Physiol. Soc., J. Physiol.* 80, 15P(1933).—The impulses in splanchnic nerves which cause output of adrenaline from the adrenals pass by chem. transmission, and the transmitting agent directly affecting the medullary cells has all the properties of acetylcholine.

J. F. Lyman

The chemical transmitter of effects of the gastric vagus. H. H. Dale and W. Feldberg. *Proc. Physiol. Soc., J. Physiol.* 80, 16P(1933).—The effects of the vagus on the muscular walls of the alimentary canal seem to be transmitted by a substance with the properties of acetylcholine.

J. F. Lyman

Glucoytic formation of blood lactate. C. L. Evans, Fong-Yen Hsu and Takao Kosaka. *Proc. Physiol. Soc., J. Physiol.* 80, 19P(1933).—Lactate formation in defibrinated blood perfused through ventilated lungs is 2-3 times as rapid as when the blood is oxygenated by circulation outside the body.

J. F. Lyman

Frequency and characteristics of blood groups. Umberto Izzo. *Boll. soc. ital. biol. sper.* 8, 1402-4(1933).—Group O is the most frequent among the inhabitants of Trieste, followed by the groups A, B and AB. The blood of the newborn contains agglutinogens A and B. The velocity of reaction is characteristic and is inherited. With the discovery by Landsteiner and Levine of the new properties M, N, P of the red corpuscles, the detn. of paternity is rendered more certain.

Peter Masucci

Investigations on fatigue by means of a reaction which determines the capacity of urine to produce a peculiar phenomenon (inhibition phenomenon). A. Donaggio. *Boll. soc. ital. biol. sper.* 8, 1456-9(1933).—D. has devised a reaction which reveals in urine or fluids the capacity to prevent the pptn. of thionine by  $\text{NH}_4$  molybdate. The presence of this reaction under various conditions of muscular fatigue has been investigated.

P. M.

Studies on the colloid-osmotic pressure of the blood in the pregnant and puerperal state. Michele Orru. *Boll. soc. ital. biol. sper.* 8, 1463-5(1933).

P. M.

Changes in the glucemic titer by the action of warm baths. R. De Marco and A. Imbesi. *Boll. soc. ital. biol. sper.* 8, 1485-8(1933).—Warm baths (38-40°, 45°, 50°) produce in pigeons an increase of the glucemic titer of 10-30%.

Peter Masucci

Ammoniaemia in dogs deprived of the intestine. Felice D'Arbela and Amedeo Billi. *Boll. soc. ital. biol. sper.* 8, 1504-7(1933).—Dogs deprived of the large and small intestines with the exception of a portion of the upper duodenum showed a large decrease or almost complete disappearance of  $\text{NH}_3$  in the blood. This diminution did not occur in animals with a high intestinal occlusion.

Peter Masucci

Photodynamic action of bile. Viviani Angelica. *Boll. soc. ital. biol. sper.* 8, 1536-7(1933).—Cystic bile was treated with HCl to ppt. the free insol. biliary acids; the liquid was filtered and the filtrate neutralized with NaOH. Two series of tubes were prepd., (1) containing the neutralized filtrate, (2) the same bile to which was added an amt. of NaCl corresponding to that found in neutralizing the filtrate. The intensity of hemolysis was compared in the dark and in the light. The results showed that the photodynamic action of bile on hemolysis was not decreased by removing the biliary salts. Likewise, it was shown that biliverdin has no photodynamic action on erythrocytes.

Peter Masucci

1 Variations in the phosphorus content of the sub-marginal gland of the dog. G. Scov. *Boll. soc. ital. biol. sper.* 8, 1563-6(1933).—P was detd. by the Lohmann method and Fe by the San Jim Wong method. The results show that the wt. of the fresh gland is 5-5.8 times the wt. of the dry gland at rest and 3 times that of the dry active gland. The amt. of water in the gland is greater during rest than during activity. The total P in the gland varies little with the functional state but if referred to 100 g. of substance then with respect to the fresh tissue the percentage varies from 140 to 250 mg. % according as to whether the gland is at rest or active. The percentage if referred to dried wt. varies very little. The amt. of Fe varies with the functional state; it is less in the gland at rest than in the active gland. The max. figures are 12 mg. % for the fresh tissue and 37 mg. % for the dried tissue.

Peter Masucci

3 Cylindruria, hematuria and albuminuria in normal man. Oscar Cantoni and Franco Fossati. *Boll. soc. ital. biol. sper.* 8, 1561-3(1933).—The presence of cylinders, cells and protein in appreciable amts. in perfectly normal human beings has been confirmed with the Addis method.

Peter Masucci

The phosphorus content of the saliva of the dog and of man. G. Scov. *Boll. soc. ital. biol. sper.* 8, 1570-4(1933).—The saliva secreted by a dog under the influence of pilocarpine showed: total P, in mg. %, min. 7.5, max. 14.5; orthophosphoric P min. 2.9, max. 3.8; pyrophosphoric P min. 0.4, max. 1.1; org. P min. 2.9, max. 9.6. The free flowing saliva of man showed: total P, in mg. %, min. 18.1, max. 21.0; orthophosphoric P, min. 7.4, max. 12.5; pyrophosphoric P, min. 1.5, max. 10.0; org. P min. 0.7, max. 5.5.

Peter Masucci

5 Changes in the blood cells in animals transfused with formalized heterogeneous blood. A. Cardin. *Boll. soc. ital. biol. sper.* 8, 1632-3(1933).—Dogs rendered anemic and transfused with formalized heterogeneous blood show higher blood counts compared to the animals transfused with nonformalized heterogeneous blood or compared to the control animals not transfused.

Peter Masucci

The influence of cortical-suprarenal hormones on certain biochemical constituents of the blood. S. Flandaca. *Boll. soc. ital. biol. sper.* 8, 1637-9(1933).—The results of Schmitz and Kühnau (C. A. 27, 3511) have been confirmed in regard to phosphatides and cholesterol. The injection of fraction A produces a diminution of the  $\pi$  of the blood and an increase of inorg. P. The injection of fraction B causes a diminution of the  $\pi$  and of calcemia, and an increase of inorg. P and K. The injection of fraction C produces little or no change in the  $\pi$ , glucemic titer, Ca, Cl or Na, but produces an increase in P and Mg.

Peter Masucci

7 Plastein content of the muscular tissue of the mammoth. V. S. Isupov. *Compt. rend. acad. sci.* (U. R. S. S.) 1933A, 99-102(in French 102-3).—Striated muscular tissue of mammoth was hydrolyzed by 0.5% pepsin in HCl soln. ( $pH$  1.6) at 37.5° for 24 days. The content of plastein was 5.1%, while that of ox tissue was 13.2%. This shows that albumin is not decomposed at low temps., and that pepsin obtained from living animals has a similar action on albumins of prehistoric animals.

N. N. M.

The formation of fibrinogen and thrombin in the blood as a secretory function of reticulo-endothelial tissue. Pietro Campellone. *Arch. fisiol.* 33, 92-115(1933).

A. E. M.

The influence of thyroidectomy on the glutathione of the blood and of the organs. Roberto Zanini. *Arch. fisiol.* 33, 116-23(1933).—The glutathione is reduced after thyroidectomy.

A. E. Meyer

The formation of uric acid in the surviving liver of the chick. I. Absence of a relation between urea and uric acid. Giuseppe Russo. *Arch. fisiol.* 33, 124-41(1933); cf. C. A. 27, 3746. The urea of blood streaming through the liver is not altered. Added urea was quantitatively found present after the perfusion. Uric acid is not formed from urea.

A. E. Meyer

Liver metabolism. II. Glucemic curve in the heart-lung-liver preparation. B. Bassani. *Arch. fisiol.* 33, 137-74(1934); cf. C. A. 28, 1099. The

is constantly decreasing to values of 30 mg. per 100 cc. The fraction of glucose in the liver is independent of the hormonal and nervous influences and is in proportion to the amount of glucose in the blood.

**Glutathione and adrenals.** Virgilio Martini. *Arch. f. physiol.* 33, 175-218(1934).—The glutathione in the blood is decreased by adrenalectomy, the reduced more than the oxidized. The injection of cortical hormone prevents the drop. The content of reduced glutathione is lower in the adrenal vein than in the jugular vein; the opposite is true with oxidized glutathione. Venous blood contains more reduced glutathione than the arterial; the highest content is found in the portal vein. Adrenals, liver and muscles contain a substance that reduces cystine to cysteine; the substance is not present in the blood, is stable at 100° and can be extd. It is connected with a protein complex.

**Spleen, adrenals and pancreas in relation to hemorrhage and blood coagulability.** Franz Cortese. *Arch. f. physiol.* 33, 231-46(1934).—The increase of blood coagulability in the dog obtained by frequent hemorrhages is explained by a reflex action of the adrenals, causing a deficiency of adrenaline and an increase of prothrombin in the system. The increase of coagulability is not obtained during narcosis, when the reflexes are extinguished. Adrenalectomy has the same effect. Extirpation of the pancreas causes a reduced supply of prothrombin. The contraction of the spleen is of no influence.

**The presence of pituitary hormones in the human spinal fluid.** Camillo Colombi and Virginio Porta. *Arch. f. physiol.* 33, 274-99(1934).—The presence of the hormones of the posterior lobe could be proved, while the melanophorotropic hormone and the hormones of the anterior lobe were not found.

**Relation between thyroid and spleen function.** Antonio Gasparini. *Arch. sci. med.* 57, 153-72(1933).—Splenectomy causes hypofunction of the thyroid.

**Gastric mucus and its protective action.** R. H. Monceaux and R. Fontaine. *Presse méd.* 41, 927-8(1933).—A review.

**Catabolism of cholesterol in the animal organism.** III. Studies on the elimination of metabolic products. Karl Rosert, Irvine H. Page and Wilhelm Meuschik. *Biochem. Z.* 268, 93-103(1934); cf. C. A. 27, 4286.—Studies were made on the products present in the unsaponifiable fraction from feces of rabbits which were fed with or without the addn. of cholesterol. In the former there was an increased elimination of substances not precipitable by digitonin, of low m. p., pos rotation and modified sterol color reactions. Similar expts. can be made with carnivorous animals. However, in neither case is more than a fraction of the metabolic products present in the unsaponifiable portion. In the rabbit feces a wax alc. was found which has cholesterol-like crystals. It is satd. with respect to Br, has m. p. 79.5°, is easily sol. only in warm org. solvents, and apparently has the compn.  $C_{26}H_{46}O$ . The origin of this substance is obscure. It is not present in the unsaponified fraction of oats but is in the unsaponifiable fraction of the pasture hay. It is obtained from the feces of exptl. as well as control rabbits.

**Occurrence of citric acid in tissues.** C. L. Gemmill. *Skand. Arch. Physiol.* 67, 201-10(1934).—Thunberg's method for the detn. of citric acid in tissues was applied after previous removal of the coenzyme systems by boiling and  $CH_3BrCO_2K$  and removal of glycogen by ultrafiltration. Citric acid was found in the frog liver and in muscles of frogs under anaerobic conditions. The normal resting or stimulated frog muscle contained no citric acid. Citric acid was also found in the normal resting muscle, liver, brain and kidney of the rabbit.

**The observations and the data obtained by means of Thunberg's citric acid method.** A. Lender. *Skand. Arch. Physiol.* 68, 221-5(1934).—Important methodological details are discussed for carrying out the citric acid detn. by Thunberg's method. There is no difference in the citric acid content of oxalated plasma or

serum. The serum citric acid content of a given normal person remains practically const., the differences observed in women being apparently assoc. with the menstrual cycle. During pregnancy the serum citric acid level is const. or practically const., but increases during childbirth. Two or 3 days after parturition it falls to a min. of 8-10γ, then slowly rises again and after 6 months is back to normal again. By raising the serum citric acid of the mother, the citric acid serum level of the fetus is also increased; hence the acid passes through the placenta. Both the urine of the newborn and the colostrum contain citric acid.

**Excretion of folliculin in the urine of the child, woman and man.** Gonadal, extragonadal and placental folliculin. Diet and folliculin. Bernhard Zondek and Hans v. Euler. *Shand. Arch. Physiol.* 68, 259-64(1934).—The male and female of all ages excrete 5-30 mouse units per l. of folliculin which is of endogenous but extragonadal origin. These small quantities of folliculin do not come from the food. Folliculin thus has an extragonadal source in addn. to the gonadal or placental origin.

**Does follicular fluid contain a substance influencing metabolism?** E. Dingemans and S. E. de Jongh. *Acta Brava Neerland. Physiol., Pharmacol., Microbiol.* 3, 79-81(1933).—Frog larvae were immersed in dil. soln. of menformone, follicular fluid or blood serum, and fed cooked frog muscle. The hind legs developed first in those larvae showing most rapid growth, either in blood serum or in follicular fluid.

**The cholesterol content of the suprarenal capsules.** S. E. de Jongh and W. Rosenthal. *Acta Brava Neerland. Physiol., Pharmacol., Microbiol.* 3, 86-8(1933).—Chem. detns. of the cholesterol content of the suprarenal gland of rats were in good agreement with histological exams. with Sudan as a stain. Feeding cholesterol in olive oil did not increase the cholesterol content of the blood. The suprarenal gland of the normal rats ranged from 3 to 6.9% in 8 animals, with an av. of 4.45%; in 4 fatigued animals it ranged from 1.2 to 1.7, averaging 1.45% of cholesterol.

**The constancy of cholesterol content in rat blood.** R. Kooy and W. Rosenthal. *Acta Brava Neerland. Physiol., Pharmacol., Microbiol.* 3, 135-8(1933).—The cholesterol content of the blood of normal rats was 92 mg. %. Fatigued animals or those fed cholesterol for a short time showed no change from this value. Marked hypercholesterolemia followed feeding of cholesterol for 8 days, or more. The suprarenal cortex of rats suffering from beriberi showed cholesterol values between 0.7 and 1.3%.

**Effect of anterior pituitary growth hormone on the composition of growth.** Milton O. Lee and Norwood K. Schaffer. *Ohio J. Sci.* 34, 1-3(1934).—Twelve groups of litter mates of rats were fed by the "paired feeding" technic for 8-11 weeks, then killed and analyzed. Twelve controls originally weighing 2382 g. gained 764 g. Twelve injected with an ext. of fresh beef anterior pituitary gland originally weighed 2358 g. and gained 1295 g. Chem. analyses on the original rats, the controls and the treated animals, gave, resp.: water 62.0, 58.0 and 62.5%; fat 12.7, 19.1 and 12.9%; N 3.3, 3.0 and 3.2%; total ash 4.3, 4.0 and 4.1%. Statistically these changes were believed to be significant. Conclusion: The growth hormone through its influence on metabolic processes affects growth independently of the food intake.

**Functions of the adrenal cortex.** Frank A. Hartman. *Ohio J. Sci.* 34, 4-8(1934).—Cortin given to guinea pigs on a diet deficient in vitamin C delayed the onset of scurvy. The adrenal cortex produces two hormones: (1) cortin, a general tissue hormone, and (2) "cortilactin," which is necessary for milk production.

**Oxidation-reduction processes during muscular work.** II. Oxidation-reduction potential of blood and urine as influenced by muscular labor. A. Yu. Kharit and I. I. Fedorov. *Compt. rend. Acad. Sci. U. R. S. S. [N. S.]*, 1, 180-2(in German 183-5)(1934); cf. C. A. 28, 2402.—The potential of arterial blood decreased from 0.007 to

0.578 v., of venal blood from 0.580 to 0.557 after work (in dogs), and of urine from 0.118 to 0.073 in 40 min. and was normal after 4 hrs. (in man). F. H. R.

**Biochemical studies of pregnant and puerperal blood.**

**II. Nitrogenous compounds.** Shin Kio. *J. Chosen Med. Assoc.* 23, 1019-45 (German 81-3) (1933).—The blood of ear (*E*), and uterine (*U*) veins of nonpregnant, pregnant and puerperal rabbits was analyzed for the total N, nonprotein N, urea N and amino N. There is no nitrogenous difference between *E* and *U* of nonpregnant animals. In pregnant rabbits, total N of *E* is the same as *E* of the normal, but that of *U* shows a progressive decrease. Total nonprotein N slightly increases in *U*. There is no change of urea N in *E*, but an increase in *U*. There is a slight increase of amino N in *E* during early and later stages of pregnancy, but not the middle period; and there is the corresponding, but more pronounced, change in *U*. In *E* of puerperal rabbits, there is no change in total N, but a slight increase in nonprotein N and amino N, and a pronounced increase in urea N. Total N, nonprotein N and urea N of *U* of puerperal rabbits are much greater than *E* of the same animal. **III. Serum protein.** *Ibid.* 1046-59 (German 83-4).—Serum protein contents of *E* and *U* are the same in nonpregnant animals. Total serum protein and serum albumin of *E* of pregnant animals are greater than the animals found in *E* of nonpregnant animals. In *U* of puerperal rabbits, there is no difference, but in *E*, there is a decrease. **IV. Water contents.** *Ibid.* 1060-5 (German 84-5).—H<sub>2</sub>O contents of *E* and *U* are the same in nonpregnant rabbits. In pregnant rabbits, *E* contains more H<sub>2</sub>O than *E* of nonpregnant and less than *U* of the pregnant. In the puerperal rabbit, H<sub>2</sub>O contents of both *E* and *U* increase. S. Tashiro

**Method of estimating the functional activity of the thyroid by means of urine or serum.** **IV. The influence of anterior lobes of the pituitary gland on the thyroid.** Mun Lyong Koh. *J. Chosen Med. Assoc.* 23, 1274-81 (in English 103-4) (1933); cf. *C. A.* 27, 5803.—Thyroid function test (*C. A.* 26, 5600) was made with urine and serum of the rabbits injected daily with antuitrin (0.2 cc. per kg.), to see if antuitrin contains thyrotropic principle. Thyroid function increases in 3 hrs. after the injection, reaches a max. in 3 days and tends to disappear in 9 days. By a series of injections, this hyperfunction can be sustained until the 15th day, but no longer even if a larger dose is given. This increased thyroid function was confirmed also by the histological studies. S. Tashiro

**A kidney hormone controlling nonprotein nitrogen balance in the blood.** Hayao Miyazaki. *J. Chosen Med. Assoc.* 23, 1683-709 (in English 125-31) (1933).—See *C. A.* 27, 4841. S. Tashiro

**The effect of spleen and various hormones on basal metabolism.** I, II and III. Mitsuo Takahashi. *Sei-i-kwaï Med. J.* 52, No. 3, 104-32, 133-53, 154-61 (in German 7-8) (1933).—I. With normal and splenectomized mice, the effects of various hormones on CO<sub>2</sub> production, O<sub>2</sub> consumption and R. Q. were measured. The presence of spleen influences the action of adrenaline on basal metabolism. Spleen acts as a synergetic with adrenaline. This synergetic spleen substance can be extd. by NaCl soln. II. The injection of a small amt. (0.001-0.0015 cc.) of insulin acts as an antagonistic to the spleen, but that of larger amts. produces a synergetic effect. Thyroxine acts as an antagonist. III. Both pituitrin and pituitary gland are antagonistic to the spleen, but hypophorine is synergetic. S. Tashiro

**Cahn, T., and Houget, J.: Biochimie de la contraction musculaire.** Paris: Hermann & Cie. 42 pp. P. 12.

**Harrow, Benjamin, and Sherwin, Carl P.: The Chemistry of the Hormones.** Baltimore, Md.: Williams & Wilkins Co. 218 pp. \$2.50.

**Die Hormone. Ihre Physiologie und Pharmakologie.** By Paul Trendelenburg. Bd. II. Schilddrüse. Nebenschilddrüsen. Inselzellen der Bauchspeicheldrüse. Thymus. Epiphyse. Edited by Otto Kraye. Berlin: J. Springer. 502 pp. M. 45; cloth, M. 46.80. Cf. *C. A.* 23, 4503.

## G—PATHOLOGY

H. GIDEON WELLS

**The ultra-violet absorption spectrum of syphilitic serum.** Mladen Paic. *Compt. rend.* 198, 286-8 (1934).—Normal and syphilitic human blood serums are indistinguishable by their ultra-violet absorption spectra. Syphilis does not affect the structure of the serum proteins. Philip D. Adams

**The action of infra-red, visible and ultra-violet rays on hemolytic alexin (complement) and the absorption spectrum of guinea-pig serum.** M. Paic and P. Haber. *Compt. rend.* 198, 613-15 (1934).—The inhibiting action of mixed light on complement is appreciable after irradiation for 30 min. and destruction is complete in 10 hrs. Infra-red, visible and ultra-violet rays hinder equally the complementary action. The optical density of irradiated serum is greater than that of nonirradiated, the effect being greatest at 2800 mμ. Philip D. Adams

**Mineral metabolism in inflammatory conditions of the ear, nose and throat. I. Content of fluids and total mineral content.** R. Mittermaier. *Arch. Okren-, Nasen u. Kehlkopf-heilk.* 134, 147-59 (1933).—In acute and chronic inflammatory conditions of the nose and antrum the highest mineral content (I) of the dried substance of the mucosae and nasal secretions accompanies acute rhinitis. Secretion which remains for a long period in the antrum occasionally has a high I. A change from an inflammatory to a mucous secretion increases I. The parallel increases of H<sub>2</sub>O and I in mucosae and secretion suggest osmotic regulation. B. C. A

**Relation between the growth vigor of tumors and their vitamin A contents.** E. Vogt. *Med. Klin.* 28, 1344 (1932); cf. *C. A.* 27, 1283.—Vitamin A is present in benign and malignant tumors; in myoma little or no vitamin A is present. In 2 cases sarcomatous neoplasm contained small quantities, and in carcinoma the large quantities are present in rapidly developing growths. B. C. A

**Arsenical keratoses and epitheliomas.** Gordon Mc Neer. *Ann. Surgery* 99, 348-53 (1934).—The keratoses and epitheliomas produced by the ingestion of quinquavalent As are discussed. Rachel Brown

**Silica in relation to pulmonary disease.** M. G. Stewart. *Edinburgh Med. J.* 41, 226-32 (1934). Rachel Brown

**Metabolic response to injury.** D. P. Cuthbertson. *Glasgow Med. J.* 3, 41-58 (1934).—During the initial phase of depressed vitality resulting from physical injuries anuria occurs, followed by increased vol. of urine and N<sub>2</sub> and P output. The S:N and P<sub>2</sub>O<sub>5</sub>:N ratios suggest that the material catabolized was mainly muscle. The initial period is also accompanied by a rise in body temp. and pulse rate and a 20 to 25% increase in the basal consumption of O. Metabolic disturbances in pneumonia are similar in kind to those resulting from trauma but less marked. Rachel Brown

**Tissue reactions in immunity. XIV. The specific reacting capacities of different tissues of an immunized animal.** Reuben L. Kahn. *Science* 79, 172-5 (1931)

As the result of immunization both tissue and fluid had the property of combining with antigen. The reactivities of the skin and serum of immune rabbits were not necessarily parallel. Rabbits previously immunized with horse serum and injected with 50 units of diphtheria antitoxin intravenously or into various tissues were not protected against an intracutaneous injection of 50 units of toxin, while normal rabbits were. By detg. the amt. of antitoxin which would protect these immunized rabbits, it was shown that the skin and peritoneal tissues possessed a capacity for reacting with horse serum 10 times that of *in vivo* plasma, skeletal muscle or brain tissue. R. B.

**The detection of hematoporphyrins in the feces as a method of determining the ulcerative period in typhoid fever.** Renzo Dusso. *Diagnostica tec. lab. (Napoli), R. mensile* 4, 855-62 (1933).—By using the method of fluorescence with Wood's light, hematoporphyrin was detected in the feces of 25 patients with typhoid fever at that period

which corresponds to the ulcerative stage (clinical) of the disease.

**Protein metabolism and renal function in diabetes mellitus.** O. Da Rin and M. Repetti. *Russ. clin. terap. sci. affini* 32, 127-30(1933).—A comprehensive survey of the subject with clinical analyses from 16 patients and a large bibliography.

**The acidosis question in uremia.** Joseph Csapó and Edmund Kerpel-Fronius. *Wien. klin. Wochschr.* 46, 1173-5(1933).—In 4 cases it is shown that uremic acidosis is a consequence of increase in org. acids.

**Variations in blood potassium and calcium in acute eczema and dermatitis.** G. I. Umansky and A. P. Stepanowa. *Wien. klin. Wochschr.* 46, 1262-5(1933). In dermatitis ac. acute eczema with edema serum K is increased and Ca may be decreased.

**The oxidation-reduction of cancer tissue.** Alois Fritz Ladbeck. *Wien. klin. Wochschr.* 46, 1589-90(1933). A significant decrease in reduction velocity was found in cancer tissue.

**The chemical composition of exudates.** Joseph S. Hepburn and Homer B. Fegley. *Am. J. Pharm.* 106, 16-17(1934).—A pleural exudate, from a patient who died before a diagnosis could be made, consisted of a white, milky fluid, measured approx. 26 cc., contained a small clot of fibrin which was discarded, total solids 5.96, moisture 94.04, ash 0.40, fat 0.72, total N 0.03, occult blood absent. A peritoneal exudate was slightly yellow, apparently serous, measured approx. 750 cc. and contained total solids 5.64, moisture 94.36, ash 0.48, fat 0.83, total N 0.20%, occult blood absent, esterase absent, amylase present.

**Variations in the albumin-globulin ratio of the blood of rabbits with hypercholesterolemia.** P. Mauriac, L. Servantig and G. Demeuier. *Compt. rend. soc. biol.* 115, 177-8(1934); cf. *C. A.* 28, 1771<sup>a</sup>.—When a marked hypercholesterolemia was produced in rabbits by the method previously described there occurred at the same time a marked decrease in serum albumin and a corresponding increase in globulins, the total serum protein remaining practically unchanged.

**Flocculation of various serums in distilled water.** V. Chorine and R. Prudhomme. *Compt. rend. soc. biol.* 115, 290-2(1934); cf. *C. A.* 28, 1007<sup>a</sup>.—One part serum was mixed with 9 parts water and the opacity measured with a Vernes-Bicq-Yvon photometer immediately after mixing and again after incubating 3 hrs. at 37° and cooling. Normal serums showed little or no flocculation, syphilitic serums a slight, and malarial serums a heavy, flocculation.

**Hypercholesterolemia after splenectomy.** J. Didry. *Compt. rend. soc. biol.* 115, 369-70(1934); cf. *C. A.* 28, 1393<sup>a</sup>.—In dogs splenectomy causes a large increase in blood cholesterol which returns to normal in a few weeks. Thyroidectomy causes a permanent increase (sometimes 100%) in blood cholesterol. Splenectomy decreases the already high blood cholesterol of thyroidectomized or ovariectomized dogs. After such a decrease spleen ext. causes an increase.

**[Blood] proteins and lipides in diabetes.** A. de Morais Sarmiento and M. J. Bruno da Costa. *Compt. rend. soc. biol.* 115, 451-2(1934).—In diabetes the blood albumin/globulin ratio is usually increased to 2.5 or higher, largely as the result of an increase in the albumin. Hyperlipidemia and hypercholesterolemia were not found in any of the cases studied.

**Lipoid-protein equilibrium during plasmapheresis in dogs.** A. de Morais Sarmiento and M. J. Bruno da Costa. *Compt. rend. soc. biol.* 115, 453-4(1934).—The decrease in blood proteins during plasmapheresis is not always accompanied by a decrease in blood lipoids.

**Ratio of cholesterol to cholesterol esters in hepatic diseases.** A. de Morais Sarmiento and M. J. Bruno da Costa. *Compt. rend. soc. biol.* 115, 449-51(1934).—In Laënnec's cirrhosis, without other complications, and in biliary lithiasis and cardiac liver the cholesterol/cholesterol esters ratio of the blood remains within normal limits. In severe lesions of the hepatic parenchyma the proportion of

esters decreases before impaired carbohydrate metabolism due to hepatic insufficiency becomes apparent.

**Action of diphtheria toxin on blood plasma. Effect of the toxin on the coagulation of serum by heat.** H. Goldie. *Compt. rend. soc. biol.* 115, 400-9(1934); cf. *C. A.* 28, 503<sup>a</sup>, 2054<sup>a</sup>.—Diphtheria toxin (active, or inactivated by heat) and anatoxin hinder or prevent the coagulation of human or horse serum at 80°. The toxin and anatoxin hinder the heat coagulation of the globulins of blood or egg but not albumins.

**Partition of antibodies in the blood. Presence of antibodies in the red corpuscles.** Ong Sian Gwan. *Compt. rend. soc. biol.* 115, 587-90(1934). Expts. with rabbit blood and *Es. coli* showed that the red corpuscles had a greater agglutinating power than the serum. Some specimens of human blood showed similar properties.

**Adsorption of agglutinins by red corpuscles.** *Ibid.* 695-7—Discussion.

**Albuminuria.** H. R. Olivier. *Compt. rend. soc. biol.* 115, 609-10(1934).—The albumin/globulin ratio of the proteins of the urine ranges from 0.15 to 15.0 and bears no relation to the ratio in the blood. The possible relation of different values of the ratio to certain diseases is discussed.

**Cancer and the amino acids indispensable to growth.** R. Courrier and G. Coste. *Compt. rend. soc. biol.* 115, 631-5(1934).—Feeding rats diets sufficiently low in lysine to check the growth of the animals decreased but did not entirely check the growth of grafted Jensen sarcoma.

**Protein sugar [of the blood] in tuberculosis.** G. Carrière and P. Martin. *Compt. rend. soc. biol.* 115, 684-5(1934).—The protein sugar tends to increase slightly as the disease progresses, but this condition also occurs in other diseases such as arthritis.

**Hodgkin's disease.** A. Wallhauser. *Arch. Path.* 16, 522-62, 672-700(1933).—A general review. Thirty-six references.

**Calcification of the skin in diabetes mellitus.** A. H. Davis and S. Warren. *Arch. Path.* 16, 852-61(1933).—Unexplained calcification of the subcutaneous tissue and corium was found in 2 elderly diabetic patients. The usual causes for metastatic calcification have been ruled out. The Ca of the blood was within normal limits.

**Mechanism of the formation of pure cholesterol gallstones.** H. B. Weiser and G. R. Grav. *Arch. Path.* 17, 1-9(1934).—Pptn. of cholesterol in the gall bladder is in itself altogether inadequate to account for the formation of pure cholesterol concretions. Gallstones have been synthesized which simulate the natural concretions in both macroscopic and microscopic appearance and in properties by pouring fat supersatd. with cholesterol into Na glycocholate soln., emulsifying, allowing to stand for some time, and then sepg. the mass of fat and cholesterol from the remainder of the emulsion by centrifuging. After absorbing the excess fat with blotting paper, it was formed into a ball and dried. Particular attention should be called to the importance of fat in the synthesis of pure cholesterol stones. Not only does it serve as a collecting agent which brings together the particles of pptd. cholesterol but its solvent action is responsible for the growth of the interlacing crystals which bind the mass into a concrement.

**Melanin. I. Its mobilization and excretion in normal and in pathologic conditions.** V. C. Jacobsen and G. H. Klink. *Arch. Path.* 17, 141-51(1933).—The normal distribution of melanin is confined to the skin, to the pigment layer of the retina, the ciliary body, the choroid, certain parts of the central nervous system and the medulla and zona reticularis of the suprarenal gland. While melanin is sol. *in vitro* only in strong alkali or acid, it must be sol. or in colloidal suspension in the body fluids, because it or its precursor, melanogen, colors the urine in many cases of melanoma. The pigment has probably rarely, if ever, been detected in particulate form in the leucocytes of the blood. The mobilization of melanin from areas of

normally or pathologically pigmented cells and the paths of its excretion from the body have been studied in aged blondes and brunettes, in adult negroes, in patients with Addison's disease, in those with melanoma and in more than 400 white mice each of which had the transplantable Harding-Passey mouse melanoma. The paths of excretion of melanin appear to be from the skin by desquamation, through the intestinal tract and through the kidneys. The ingestion of melanin in foods and the synthesis of melanin in the intestines may account for much of the pigment in melanosis coli. The pigment of the zona reticularis of the suprarenal gland appears to be melanin, and it is suggested that the pigment is absorbed from the neurogenic cells of the contiguous suprarenal medulla, thus adding the epithelial cells of the suprarenal cortex to the list of possible melanophores. This explanation of the origin of melanin in the suprarenal gland is in harmony with the Soltan-Masson theory of the origin of melanotic tumors and suggests that melanin, wherever it is encountered, is always of neuro-ectodermal origin.

Harriet F. Holmes

**Experimental edema: Further experiments on the type of edema produced by a diet low in protein.** S. A. Sheldrake. *Arch. Path.* 17, 152-9 (1934).—Hypoproteinemia and edema were produced in 2 of 4 dogs fed a diet low in protein for a long time. A crit. level of plasma proteins for the formation of edema in the dog is probably 4 g. of total protein per 100 cc. and 2 g. of plasma albumin. The renal tubules of the dogs fed a diet low in protein uniformly showed a large excess of isotropic fat when compared with those of the control animals. No significant changes were noted in the blood cholesterol or fatty acids during the prolonged periods of observation.

Harriet F. Holmes

**Lipoid pneumonia.** J. Rabinovitch and M. Lederer. *Arch. Path.* 17, 160 8 (1934).—Lipoid pneumonia occurs most frequently in infants and young debilitated children from the use of oily substances administered by way of the nasopharynx. When it occurs in old persons it is usually due to laryngeal paralysis or to direct intratracheal introduction of oil, such as iodized poppy-seed oil as a diagnostic aid. The pulmonary reaction to the oily material is much the same as that to any other foreign body. The greater portion of the oil is engulfed by monocytes and is either expectorated or carried to the regional lymphatics. Part of it is encysted in granulomatous tissue. It is suggested that the diagnosis of lipoid pneumonia can be made in a certain no. of cases by the examn. of expectorated material for oily substances in the monocyte cells.

Harriet F. Holmes

**Nature and origin of the xanthoma cell.** L. W. Plewes. *Arch. Path.* 17, 177-86 (1934).—A series of 18 cases of xanthoma, in which the nodules were removed surgically, was studied from a standpoint of the origin and nature of the xanthoma cell. A study of fatty lesions of the arteries was made in relation to a fundamental similarity of atheroma and xanthoma. It is believed that the xanthoma cell and the foam cell of atheroma, of chronic suppurative reactions and of certain systemic diseases are of identical nature. Furthermore, it is believed that the origin of both of these cells is from the reticulo-endothelial system, and that the foam cell is an evidence of specific reaction of the cells of the reticulo-endothelial system to certain lipoids, especially cholesterol and its esters, when conditions favorable for their deposition in tissues are present.

Harriet F. Holmes

**Specific agglutination of bacteriophage particles.** F. M. Burnet. *Brit. J. Exptl. Path.* 14, 302-8 (1933).—One of the large particle phages (C16) can be specifically aggregated by homologous high titer antiphage serum. The aggregates when examd. by ultra-violet microphotography appear to be composed of granules whose optical properties suggest that they are of approx. uniform size and about 80 m $\mu$  in diam. The reaction can be obtained with washed phage preps. and sera freed from bacterial agglutinins and must represent a true agglutination of the phage particles.

Harriet F. Holmes

**Detection of snake venoms and the application of the**

**resulting antigens to rapid methods of antivenomous vaccination and serum production.** E. Grasset and A. Zoutendyk. *Brit. J. Exptl. Path.* 14, 308-17 (1933).—The action of a no. of possible detoxicants of venoms has been studied. Concd. solns. of both viperine and colubrine venoms are most readily detoxicated at 37° by means of formalin. In general, viperine venoms are detoxicated more readily and more satisfactorily when dissolved in saline and colubrine venoms when dissolved in broth. The atoxic derivs. are highly antigenic. Domestic animals and monkeys have been actively vaccinated by a course of 3 or 4 subcutaneous injections. By the hyperimmunization of horses, univalent and multivalent antivenins of exceptional potency are obtained in a few weeks with ease and safety.

Harriet F. Holmes

**The reaction of the arterial blood in cancer.** S. Dickinson and R. E. Havard. *Brit. J. Exptl. Path.* 14, 394-400 (1933).—From a no. of patients with and without malignant diseases, 8-10 cc. of blood was withdrawn from the radial artery of each subject into a syringe contg. 1 cc. of a soln. of 5% K oxalate and 2% NaF (neutralized) and the  $p_H$  of the blood at 37° was measured by 2 independent glass electrodes. No significant difference was found between the  $p_H$  of the arterial blood of patients with surface cancer or secondary glands, and that of patients of corresponding ages with other complaints. There is a fairly wide range of variation in the measurements from subjects of the first and second groups. The reaction of the arterial blood depends finally on the activity of the respiratory center; a momentary interference with the normal functioning of the center may possibly give rise to alterations in the reaction of the blood.

H. F. Holmes

**Further observations on the electric charge of the erythrocytes in certain protozoal diseases.** H. C. Brown. *Brit. J. Exptl. Path.* 14, 413-21 (1933); cf. *C.* A. 23, 4960.—The cause of the reduction of the elec. charge of the erythrocytes in bird malaria is due to the action of the serum on these cells. The action of the serum on the red cells is in no way specific. The charge-reducing action of the serum is due to an increase in the euglobin content of the serum. When one takes into account the protein changes in malaria, together with the charge-reducing action of euglobulin, it would seem quite conceivable that the rationale of the treatment of general paralysis by malaria might be due to phagocytosis of the spirochete induced by an increased euglobin content of the serum of the patient.

Harriet F. Holmes

**The nature of the tumors induced in fowls by injections of tar.** J. McIntosh. *Brit. J. Exptl. Path.* 14, 422-34 (1933).—Tumors of the sarcomatous type can readily be induced in the fowl by intramuscular injections of tar and lard. Four tar-induced tumors have been transmitted in series in fowls by injections of tumor emulsion, and of these, 3 have also been transmitted by means of cell-free filtrates. Tar-induced sarcomatous tumors of the fowl conform closely in morphological and biol. characteristics with the naturally occurring sarcomatous tumors of the fowl.

Harriet F. Holmes

**Changes in the esterase and fat contents of the serum induced by cancer and cancer-producing agents.** H. N. Green. *Brit. J. Exptl. Path.* 15, 1-14 (1934).—During the growth of the rat Jensen sarcoma the esterase content of the serum falls progressively, ultimately reaching a very low level. The esterase content of the liver, lung and kidney is also greatly diminished. The phosphatase content of the serum also falls, but the av. fall is less than half that of the esterase. In rats resistant to inoculation of the Jensen sarcoma the esterase content of the serum tends to rise. The fatty acid content of the serum rises in many and possibly all rats during the growth of the Jensen sarcoma. It may reach a max. level approaching 2% and then falls during the terminal stages of tumor growth. There is an assocd. rise in the cholesterol, but of a much less degree. In tar epitheliomata of mice and in localized human carcinomata the serum esterase content ranges around normal, with a tendency to rise slightly. The application of tar or the inoculation of tar produces a rise in the esterase content of the serum of rabbits in a propor-

tion of cases. The fact that a fall in the esterase content of the serum is not found in animals with tar epitheliomata, and that there is a tendency for the reverse effect to occur, is possibly due to the enormous difference in the rate of growth of these tumors as compared with that of the rat sarcoma. It is tempting to suggest that this change is an expression of the resistance of the animal to tumor growth. Appendix. The estimation of fat in blood serum. C. N. Jenkinson. *Ibid.* 13.—As it was found that the amt. of fat in serum from defibrinated or clotted blood was the same as that in plasma from blood collected with oxalate, serum was used in this work for detg. the degree of lipemia. The method used was that described by Leathes and Raper ("The Fats," Chapter 7, Longmans, Green and Co., 1925) adapted to much smaller quantities than were contemplated there. H. F. H.

**Protein-free suspensions of viruses.** V. The nature and antigenic properties of a highly purified phage. I. J. Khigler and L. Olitzki. *Brit. J. Exptl. Path.* 15, 14-23 (1934); cf. C. A. 26, 5116.—Kaolin adsorption of the coliphage from broth cultures followed by elution with 0.01 N  $\text{NH}_4\text{OH}$  yields a potent phage relatively free from protein. Successive elutions from the same kaolin adsorbate followed by dialysis yield active phage suspensions giving neg. protein and ninhydrin reactions. The residue on the kaolin after repeated elutions has a marked inhibitive effect on the phage. This effect does not appear to be specific. The purified phage retains its antigenic potency. Harriet F. Holmes

**Pressor bodies in the blood of hypertensive subjects.** O. L. V. S. de Wesselow and W. J. Griffiths. *Brit. J. Exptl. Path.* 15, 45-52 (1934).—The authors conclude that with the methods used they have not obtained any evidence of pressor bodies in the blood of hypertensive patients. These results seem to be in direct disagreement with those of Bohn (*Z. klin. Med.* 119, 100 (1931-32)). Harriet F. Holmes

**Attempts to locate the site of antibody production.** G. A. H. Buttle. *Brit. J. Exptl. Path.* 15, 64-70 (1934).—Substitution of the blood with normal blood, removal of the liver and spleen and removal of the skin do not affect the rate of production of diphtheria antitoxin in rabbits. It appears probable that all tissues take part in the production of antibodies and as these organs form a relatively small part of the total mass of the animal, the effect of their removal is not obvious. Harriet F. Holmes

**Biological and biochemical observations on cobra venom used in cancer and in malignant tumors.**

Taguet and R. Rousseau. *Néoplasmes* 12, 232-40 (1933).—Injections of cobra venom retard cancer cachexia and diminish greatly paroxysms of pain. When cobra venom acts upon yolk of egg a cryst. product may be obtained, the cobralecithin of Kyes or the lysocithin of Delezenne. This substance, a palmitophosphoglyceric ester of choline, is the result of the action of phosphatase of the venom on the egg yolk. This phosphatide has a cytolytic action while cholesterol has an anticytolytic action. On the injection of 0.5 cc. of a 1/80,000 cobra venom cholesterol is adsorbed from the cells or blood and the combination venom + cholesterol results. When this complex reaches the nerve cell it combines with the lecithin to form the complex venom + lysocithin + cholesterol which has analgesic but not cytolytic power. The retardation of the cancer cachexia is probably due to a coagulation of the  $\text{pH}$  of the blood in the direction of alk., but the chief clinical results obtained are from the action of the cobra venom on the nervous system. H. F. H.

**The importance of the phenomena of autolysis in the cancerous process.** P. Lemay. *Néoplasmes* 12, 286-90 (1933).—Cancer tissue removed aseptically autolyzes more rapidly than normal tissue and the autolysis is especially rapid in the surrounding tissue which is being cancerized. According to Carrel cells in tissue culture in order to grow and multiply require certain albuminoid substances which are very unstable. These trephones exist in large quantity in leucocytes and in embryonal tissue. The serum, on the other hand, contains an inverse factor with inhibitory power which is probably related to

the lipoids. In the normal cell these trephones and the inhibitory factor are in equilibrium. In irritation and cicatrization the cell membranes are injured, permitting the entrance of trephones and also of lipases and lipoidases which destroy the lipoids of the cell membrane. In cicatrization the influx of trephones is temporary and ceases when sepsis is completed but in cancerization there is a continual influx of trephones and in some cancers, as in sarcoma, the cancer cell itself may produce trephones. The trephones in cancer are attracted from the surrounding normal cells and these cells, deprived of the trephones which block the autolyzing enzymes, undergo autolysis. Thus the cancer cells gain both the trephones which facilitate synthesis and the materials essential for the synthesis. H. F. H.

**The iron in the bile and its dissociated retention.** R. Russev. *Wien. Arch. inn. Med.* 24, 255-8 (1933).—In 15 cases of icterus (hemolytic, hepatic and mech.) the duodenal juice was tested for Fe. After combustion the dry residue was treated with  $\text{HCl}$  and the presence of Fe was demonstrated by  $\text{NH}_4\text{CNS}$ , the merest trace of Fe giving a pale pink tint. In the same cases a Brugsch test was made, which consists of the injection of 0.1 cc. of a 1% soln. of K ferricyanide. A blue coloration at the site of injection is a pos. reaction and indicates, according to Brugsch, the presence of disso. Fe in the skin, and occurs only in cases of hepatic icterus where the function of the liver cells is impaired and not in cases of mech. icterus unless the condition had persisted long enough to bring about a secondary disturbance of liver function. R.'s findings do not wholly agree with those of Brugsch as regards the forms of icterus in which Fe retention occurs. However, the pos. Brugsch reaction is always assoc. with a disappearance of Fe from the duodenal juice and indicates a retention of Fe in the body. R.'s findings indicate that Fe retention may have a mech. as well as a biol. cause. The Brugsch test is due to disso. Fe and Fe retention does not always parallel bile pigment or bile salt retention. The Brugsch reaction is of great clinical value as it gives a convenient method of detg. whether Fe is present or absent in the bile without having recourse to a duodenal sound. Harriet F. Holmes

**The ketones of the blood and urine of the cow and ewe in health and disease.** Jesse Sampson, A. C. Gonzaga and C. E. Hayden. *Cornell Veterinarian* 23, 184-207 (1933).—In a study of approx. 25 cases of milk fever in cows a fairly large no. showed a definite ketonuria. In 19 samples of urine from cows suffering from some disease other than milk fever the total ketones as acetone did not exceed 15 mg./100 cc.; the blood from these cows did not contain more than 6 mg. acetone per 100 cc. Studies on ewes indicated that there is a definite acetoneuria in cases of so-called pregnancy disease, and that a disturbance of the Ca metabolism is not the cause of the acidosis. Thirty-six references. K. D. Jacob

**Further observations on the functional pathology of pregnancy disease of ewes.** Lee M. Roderick, G. S. Harshfield and W. R. Merchant. *Cornell Veterinarian* 23, 348-53 (1933).—Detns. of the crude fat and moisture contents of the livers of ewes with pregnancy disease showed an enormous degree of fatty metamorphosis; although the percentage moisture content of the liver as a whole decreased markedly there was no reduction in the total amt. of moisture. The glycogen content of the liver was reduced to a fraction of its normal content, and the function of the liver, as measured by the ability promptly to remove rose bengal from the blood, was seriously impaired. Significant deviations in the cholesterol and amino acid contents of the blood did not occur. K. D. Jacob

**Acetonemia, and acetonemia with parturient paresis.** C. E. Hayden, M. G. Fincher and Jesse Sampson. *Cornell Veterinarian* 23, 368-76 (1933).—Detns. of the sugar, serum Ca, total ketones and inorg. phosphate in the blood and urine of cows suffering from a disease that resembled parturient paresis gave little if any evidence that these cases were acetonemia, or acetonemia with milk fever. In most cases the concns. of ketone substances were within the normal range of the blood and urine of cows. In several

cases the Ca and inorg. phosphate contents of the blood were suggestive of milk fever. K. D. Jacob

**Chemical blood studies. III. Comparative studies on laked and unlaked blood filtrates of sheep in health and during heartwater (Rickettsia ruminantium infection) and bluetongue (catarrhal fever).** H. Graf. (*Onderstepoort J. Vet. Sci.* 1, 285-334 (1933).—In heartwater the concns. of sugar, nonprotein N and urea N in both laked and unlaked blood filtrates are higher than those in normal blood. The total creatinine N shows a tendency to decrease, with a rise in some cases just before death. The hemoglobin content varies, but is generally in the direction of a decrease. In bluetongue of sheep there is generally an increase in the sugar, nonprotein N and urea N of the blood. In severe cases a decrease in hemoglobin and a corresponding decrease in total N occur. The degree of the variations corresponds approx. to the severity of the disease. **IV. Comparative studies on laked and unlaked blood filtrates of horses in health and during horse sickness (Pestis equorum).** *Ibid.* 335-69.—No definite change in the compn. of the blood occurs during horse sickness. **V. Comparative studies on laked and unlaked blood filtrates of bovines in health and during anaplasmosis (A. marginale infection) and piroplasmiasis (P. bigemini infection).** *Ibid.* 371-401.—In anaplasmosis the hemoglobin and total N contents of the blood decrease markedly; the uric acid N also decreases. Striking increases occur in the nonprotein and urea N, with less marked though well-defined increases in the sugar level. The amino acid and rest N increase shortly before death in fatal cases. In the only case of piroplasmiasis studied, marked increases occurred in nearly all the nitrogenous constituents and the sugar of the blood, assocd. with the period of max. erythrocyte destruction. K. D. J.

**Mineral metabolism in renal disease. II. Excretion of minerals in the urine on diets high in potassium and sodium.** Hans Glatzel. *Z. ges. expil. Med.* 86, 103-29 (1933); cf. C. A. 27, 3986, 4577.—The excretion of minerals depends mainly on the anion-cation balance of the diet. In renal disease the concn. power of the kidney is somewhat limited. Milton Levy

**Iron in anemia. III. Iron in the urine.** A. Hermann Müller. *Z. ges. expil. Med.* 91, 463-70 (1933); cf. C. A. 27, 3986.—Healthy urine contains not over 2 mg. Fe in 24 hrs. Fever has no effect. In secondary and pernicious anemias a small increase above normal occurs. Normal amts. of Fe in the diet do not influence the urine Fe but 1 g. of reduced Fe per os causes a prompt increase in Fe in the urine. **IV. The effect of alimentary iron on the iron balance in untreated secondary and pernicious anemias.** *Ibid.* 579-84.—In secondary and pernicious anemias the Fe balance is pos. The retention depends on the intake but is not related to the clinical picture, hemoglobin content, erythrocyte count, color index or concn. of Fe in blood. **V. Iron balance in secondary anemia on liver therapy.** *Ibid.* 585-92.—In the treatment of secondary anemia with liver ext. less Fe is retained than in untreated cases. The Fe balance may even become neg. M. L.

**Mineral metabolism in renal disease. IV. Mineral excretion of normal people after long periods on diets containing equivalent amounts of potassium and sodium chlorides.** **V. Mineral excretion in renal disease under the same conditions.** Hans Glatzel and Walter Mecke. *Z. ges. expil. Med.* 91, 504-22, 522-38.—Cf. C. A. 27, 3986. Milton Levy

**Calcium and cholesterol in blood and in bladder bile in cholelithiasis and cholecystitis.** Mario Cattaneo. *Z. ges. expil. Med.* 91, 683-8 (1933). Milton Levy

**Gastric tetany.** Rudolf Klingner. *Z. ges. expil. Med.* 92, 129-46 (1933).—Four cases of persistent vomiting were studied. Characteristic hypochloremia, hyperazotemia and high alkali reserve were observed. In one case a 13-day balance expt. shows the restoration of the normal blood picture during parenteral absorption of water and NaCl. Milton Levy

**Renal resorptive hyperazotemia.** Giovanni Ferro-Luzzi. *Z. ges. expil. Med.* 92, 382-8 (1933).—Hyperazotemia without creatinine retention can be observed.

**The normal resistance of kidney tubules to the diffusion of urea is impaired.** Milton Levy

**Ketonemia in rabbits.** Liselotte Kallós-Defner. *Z. ges. expil. Med.* 92, 389-93 (1933).—In starvation acetone bodies appear in the blood of rabbits in considerable quantities. Low atm. pressures produce ketonemia. Milton Levy

**Acidosis: Acid intoxication or acorbia.** Y. Henderson and L. A. Greenberg. *Am. J. Physiol.* 107, 37-48 (1934).—Dogs breathing air of 7-8% O showed the same bicarbonate content of the blood and the same respiration response whether or not they had received moniodoacetic acid; hence the formation of lactic acid is not the cause of the increase of breathing and decrease of bicarbonates. The supply of O<sub>2</sub> is the principal factor influencing the sensitivity of the neuro-respiratory mechanism. A slight deficiency of O increases the sensitivity. Extreme deficiency diminishes the sensitivity so that an abnormally strong stimulus is required to excite activity. J. F. Lyman

**The respiratory quotient, oxygen consumption and glycogen content of the mammalian heart in agluemia.** B. W. H. Cruickshank and C. W. Startup. *J. Physiol.* 80, 179-92 (1933); cf. C. A. 27, 4303.—The gaseous metabolism of the isolated dog heart was detd. when perfused with sugar-free blood, kept so by the frequent addn. of insulin. The glycogen content of the heart does not change. O consumption is at about the normal rate, but the CO<sub>2</sub>/O ratio falls to 0.7, indicating purely fat metabolism. There is evidence of a brief transitional stage between the utilization of carbohydrate and that of fat, during which protein is metabolized. J. F. Lyman

**The presence of agglutinins in milk.** Antonio Colavecchio. *Boll. soc. ital. biol. sper.* 8, 1410-12 (1933).—The milk of lactating women does not react any differently from the milk of normal women toward the red corpuscles of normal or luetic individuals. Human milk, whether under physiol. or pathol. conditions, has a hemagglutinating power which follows the biol. law of blood serum in so far as it relates to blood groupings. Peter Masucci

**The antigenic power of the corneal parenchyma.** Bruno Pister. *Boll. soc. ital. biol. sper.* 8, 1407-9 (1933).—Guinea pigs were sensitized by injecting them intracorneally with a finely divided suspension of guinea pig corneal tissue. A shocking dose was administered in the same way 14 days later. A grayish disk immediately formed in the cornea as in the 1st injection which disappeared within 48 hrs. The animals showed no local or systemic symptoms of anaphylaxis. Peter Masucci

**Complement in the blood of pigeons.** Giuseppe Brotzu and Ernesto Nussbächer. *Boll. soc. ital. biol. sper.* 8, 1435-8 (1933).—By a special technic, it can be shown that certain species of pigeons contain complement in their blood serum; the titer is very low. Peter Masucci

**Curves showing the "inhibition phenomenon" in urine and spinal fluid under various febrile conditions.** A. Donaggio. *Boll. soc. ital. biol. sper.* 8, 1459-62 (1933).—After the injection of chem. substances having pyrogenic properties (S, proteins, vaccines, etc.), the reaction is not revealed by the urine or spinal fluid until 24-36 hrs. after the injection or 12-24 hrs. after the onset of fever. Phys. agents, such as general diathermy, do not show this latent period. Malarial pyrogenesis causes the reaction to appear in urine a few hrs. before the onset of fever. Urine or spinal fluid which gives a pos. "inhibition reaction" loses this property if dialyzed or if mixed with kaolin or animal charcoal and filtered. Peter Masucci

**Donaggio's "inhibition phenomenon" in the urine and in the spinal fluid of neuro and psychopathic individuals.** Gastone Canziani and Vito Longo. *Boll. soc. ital. biol. sper.* 8, 1476-8 (1933).—Normal individuals gave a neg. Donaggio reaction; a delayed pptn. of the thionine occasionally was noted. Individuals in the febrile state (malaria, suppurative processes) gave a pos. D. reaction. There was a close parallelism between the D. and Buscaino reaction. Epileptics only in convulsions gave a pos. reaction; otherwise, they gave a neg. reaction. De-

mentia precox and neuropsychopathic cases always gave a neg. D. reaction. Peter Masucci

The possibility of separating complement from serum by adsorption and elution. F. Ferranti. *Boll. soc. ital. biol. sper.* 8, 1508-10(1933).—The solns. necessary are: (1) Na borate 1%; (2) casein 2%; (3) buffer consisting of 82 g. Na acetate and 60 g. AcOH in 1 l. H<sub>2</sub>O; (4) dil. buffer obtained by dilg. soln. (3) 100 times. Place 1 cc. of fresh guinea-pig serum in a 10-cc. centrifuge tube and add 1 cc. of soln. (2). Mix and ppt. the casein by adding 0.40 cc. of soln. (3). Centrifuge, discard supernatant liquid and wash the ppt. one or more times with soln. (4); to the final ppt. add 0.50 cc. of soln. (1); make up to 1 cc. with physiol. saline. Test for complement activity. Casein added to fresh guinea-pig serum and treated as described has complement activity. Peter Masucci

Renal glutathione in toxic nephritis from uranium salts. Michele Vetri. *Boll. soc. ital. biol. sper.* 8, 1542-5 (1933).—Glutathione was detd. in the kidneys of normal albino rats which had been injected with 5-30 mg. U per kg. The av. glutathione content in the normal kidneys was 144.6 mg. per 100 g. of tissue; that of kidneys from rats treated with U was 76.42-124.3 mg. % (64-112 hrs. after the injection). Peter Masucci

Changes in the electrolyte content of blood serum during inanition. D. Torrisi. *Boll. soc. ital. biol. sper.* 8, 1546-7(1933). Peter Masucci

Relations between lipoids and immunological reactions of ophiotoxins. V. Gronchi. *Boll. soc. ital. biol. sper.* 8, 1593-6(1933).—Lyocetthin does not possess the property of producing in rabbits or guinea pigs any immunological reactions; it plays no part in the immunological reactions produced by ophiotoxins. Peter Masucci

Changes in the serum protein as an index for liver function in hepatic disturbances. Aldo Cionini. *Arch. sci. med.* 57, 341-88(1933).—The serum globulin is increased in chronic liver insufficiency, whereas the albumin is diminished. The disturbance is in parallelism with the severity of the symptoms. At a const. ratio of both, a low abs. value indicates a more progressive injury than a higher value. A. E. Meyer

Bilirubinemia I. Methods. Giorgio Dominici and Giorgio Marengo. *Arch. sci. med.* 57, 505-22(1933).—A description. II. The mechanism of the diazo reaction. *Ibid.* 523-66. III. Bilirubinemia in the first days of life and pathogenesis of the jaundice of the newborn. *Ibid.* 569-93. A. E. Meyer

Alterations of the mineral equilibrium in the blood in nephropathy with special reference to true uremia. Renato Molfese and Domenico De-Alessi. *Arch. sci. med.* 57, 594-610(1933); cf. C. A. 28, 2084.—Report of laboratory findings in a no. of cases. A. E. Meyer

Carbohydrate metabolism in cholelithiasis and its complications. Franco Molino. *Arch. sci. med.* 57, 611-40(1933).—A slight hyperglucemia is frequently found in lithiasis without symptoms. The glucemia of fasting may or may not be increased in acute cases, but the glucemic curve is almost constantly high and prolonged. Icteric cases show frequently increased blood sugar from the beginning. In colics, elevations up to glucosuria have been observed, though the fasting blood sugar is not const. A. E. Meyer

The influence of hemorrhage on some biochemical components of the blood and on the acid-base equilibrium in hypertension. R. Scotti-Douglas and R. Martinetti. *Arch. sci. med.* 57, 673-94(1933).—The acid-base equil. is influenced toward the acid side, but this is of short duration and frequently followed later on by a slight alkalosis. The urea level in the blood is lowered. A. E. Meyer

The significance of fatty substances in the kidney in pathological conditions. C. Cioni and L. Franceschi-Buchicchi. *Arch. sci. med.* 57, 705-24(1933). A. E. M.

Acid-base equilibrium in the sick infant. L. Ribadeau-Dumas, Max Lévy and Suzanne Mignon. *Bull. acad. med.* 110, 416-19(1933). A. E. Meyer

Hypochloremia and azotemia as a consequence of vomiting in pregnancy. A. Schwaab and P. Walther. *Presse méd.* 41, 874-6(1933). A. E. Meyer

Epilepsy and hypoglycemia. Ph. Pagniez. *Presse méd.* 41, 876-8(1933). A. E. Meyer

Nitrogen metabolism and acidosis in relation to vomiting in pregnancy. Marcel Labbé. *Presse méd.* 41, 921-2(1933). A. E. Meyer

Complement and snake poisons. J. Velard and M. Vianna. *Rev. med.-Chirurg. Brasil.* 41, No. 10(1933); *Rev. sud-americana endocrinol. immunol. quimioterap.* 17, 82-3(1934).—The venoms of *Lachesis* and *Trimeresurus* destroy the action of complement; however, the different species vary considerably. *Naja tripudians* is less active; *Crotalus terrificus* and *Vipera aspis* have no influence on the complement. The destructive action is developed by incubation for 15 min. The venom itself remains unchanged in every respect. A. E. Meyer

The preputiary syndrome of basophilism. Basophilia. E. B. del Castillo, N. Contreras Ortiz and J. Reforzo Membreives. *Semaná méd.* (Buenos Aires) 1934, 1, 234-9.—Description of a case. A. E. Meyer

Postoperative acidosis and ketonuria. Fredrik Roscher. *Acta Med. Scand., Suppl. XXIX*, 303 pp.(1933).—

This monograph contains a discussion of the maintenance of the acid-base balance of the organism and the origin of acidosis, also a description of the biochem. changes in carbohydrate, fat and protein metabolism assocd. with postoperative acidosis and ketonuria. A moderate ketonuria is an immediate sequel of most operations performed under narcosis but is a rare occurrence in operations under local anesthesia. Studies were made on both blood and urine in postoperative conditions after narcosis or local anesthesia. The reaction of the human organism to operations under narcosis is almost stereotyped. There is a deviation of the acid-base balance in an acidotic direction, the development of the acidosis beginning with the initiation of narcosis and gradually increasing during the operation. This is nearly completely compensated within 24 hrs. after the operation, and occasionally this compensation brings about secondarily a deviation to the alkalotic side. The urinary changes furnish corroborative evidence, the titratable acidity increasing considerably in most instances during 24 hrs. postoperatively, then gradually decreasing, accompanied by corresponding changes in the NH<sub>4</sub> excretion. The total base excretion generally decreases immediately after an operation. In operations performed under narcosis there is an increase in the blood sugar of 50-80%, but under local anesthesia there is no hyperglucemic reaction or only a very slight one. Under spinal anesthesia the blood sugar likewise rises slightly. The hyperglucemic reaction to narcosis begins even before the operation begins and gradually reaches a max. at its termination. In most cases the normal sugar level is reestablished in about 24 hrs. In expts. on rabbits, in which ether or ClHCl<sub>2</sub> narcosis is used as well as procaine-adrenaline anesthesia a decrease in liver glycogen was found which varied directly with the duration and the quantity of anesthetic administered. As similar decrease of glycogen is also observed in the heart muscle it is thought that the glycogen mobilization is general, but in addn. the carbohydrate metabolism is likewise reduced. Under narcosis there has always been an abnormally high N excretion postoperatively, which is generally not found after uncomplicated operations under local anesthesia. The high N excretion usually becomes manifest 48 hrs. after the operation, and even after 8-10 days may constitute 20-30 g. per day. In the blood the nonprotein N increases very slightly shortly after the operation. There is likewise a rise in the blood fat and lipid content, with an increased fat in the liver parenchyma, to which the postoperative ketosis is attributed. In adults, after operation under narcosis, there is always moderate and variable ketonuria, but in children this was much more pronounced and at times to a surprisingly severe degree. In children the ketosis is always accompanied by hyperglucemia, and where the condition is very alarming the use of a combination of insulin and glucose is recommended in these cases. S. Morgulis

The other number of serum. Franz Seelich. *Biochem. Z.* 268, 34-45(1934).—Serum has the property of

taking up successive quantities of ether and forming on shaking a transparent, elastic gelatinous mass. This quantity of ether which can be taken by 1 cc. serum is reproducible and limited. This constitutes the "ether no." It represents a phenomenon of emulsification similar to that observed when aq. solns. of Na oleate and glycocholate are shaken with ether. The ether no. decreases when the serum is heated to 52° and the ether-serum interfacial tension rises at the same time. With an aq. Na oleate soln. the emulsifying quantity of ether depends only on the amt. of dissolved substance but not on the concn. of the soln. whereas with Na glycocholate both quantity and concn. are determining factors. Normal horse serum shows upon diln. the same behavior as does an aq. soln. of Na glycocholate. When heated for 10 min. at 57° the ether no. of normal horse serum increases. This increase depends upon the CO<sub>2</sub> content of the dilg. fluid. The lowered ether no. of serum previously heated to 50° can be partly restored by treatment with CO<sub>2</sub> but this effect becomes progressively less and fails completely as the temp. is raised up to 55°. S. M.

**Effect of temporary bile stagnation on the bilirubin content of rabbit serum and its influence on the number of erythrocytes.** A. Vischer. *Biochem. Z.* 268, 116-20 (1934).—In normal rabbits the serum bilirubin value does not exceed 0.1 mg. %, but on clamping off the ductus choledochus this rises to 0.155 mg. % in 2 hrs., to 0.2 mg. % in 3 hrs. and in 24 hrs. reaches 0.9 mg. %. Normal bilirubin values are found again 24 hrs. after the release of the bile stagnation. The serum bilirubin concn. of 0.1 to 0.2 mg. % causes a rise in the number of red blood cells, but in concn. greater than 0.2 mg. % it brings about a decrease. S. Morgulis

**The calcium-phosphorus ratio in rickets.** G. Mouriquand and A. Leulier. *Compt. rend.* 198, 208-10 (1934).—Human milk contained 842 mg. of Ca per l. and 468 mg. of P. Cow milk contained 1599 mg. of Ca and 974 mg. of P per l. These results are obtained on ash and may not show the portions of Ca and P present in the original combinations in milk. Cow milk is apparently more rachitogenic than human milk. James C. Munch

**Hepatic complications in the treatment of syphilis. The rose bengal test as a means of detecting disturbances of liver function and its use as a guide in the therapy of syphilis.** Gerson R. Hiskind, Norman N. Epstein and Wm. J. Kerr. *Ann. Internal Med.* 7, 906-80 (1934). The test is useful. John T. Myers

**Hypoglycemia and hyperinsulinism.** Milo K. Tedstrom. *Ann. Internal Med.* 7, 1013-25 (1934). John T. Myers

**Absorption in intestinal obstruction.** R. Russel Best, Lyle A. Newton and Roy Meidinger. *Arch. Surg.* 27, 1080-6 (1933).—There was no appreciable change in the rate of absorption of methylene blue above and below intestinal obstruction in dogs, suggesting that increased absorption above an obstruction is not the cause of death. John T. Myers

**Hyperinsulinemia secondary to an adenoma of the pancreas.** Lloyd I. Ross and John M. Tomasch. *Arch. Surg.* 28, 223-31 (1934). John T. Myers

**Pathogenesis of acute pancreatitis (acute pancreatic necrosis).** Lester R. Dragstedt, H. R. Haymond and James C. Ellis. *Arch. Surg.* 28, 232-91 (1934).—The end products of the partial or complete digestion of the pancreas by active pancreatic juice are not sufficiently toxic, if placed in the peritoneal cavity, to cause death. The *in vivo* autolysis of sterile fetal pancreas and the intraperitoneal digestion of autoclaved pancreas by sterile pancreatic juice did not produce toxemia. The toxemia resulting from exptl. *in vivo* autolysis of the pancreas is chiefly due to the presence of fecal proteolytic organisms which proliferate in the pancreatic tissue, and produce amines and similar substances from protein decomposition. The toxin of *B. welchii* may contribute slightly. John T. Myers

**A new approach to the chemistry of immunity.** A. E. Stearn. *J. Bact.* 27, 88-9 (1934).—An attempt was made to apply quantum mech. considerations in calcg. the

potential energies of arbitrarily chosen configurations of certain groups. This may afford a method of studying immunochemistry. John T. Myers

**The chemo-immunological properties of the specific capsular polysaccharide of pneumococcus Type I.** Oswald T. Avery and Walther F. Goebel. *J. Bact.* 27, 89-90 (1934).—The Ac polysaccharide absorbs from Type I pneumococcus serum all type sp. precipitins, agglutinins and protective antibodies. Used as an antigen it produces Type I sp. immunity in mice, but not in rabbits. The Ac polysaccharide is readily converted into its deacetylated deriv. by treatment with dil. alkali. The deacetylated form is nonantigenic and functions solely as a hapten. John T. Myers

**The distribution of the immunizing antigen in the pneumococcus.** Lloyd D. Felton. *J. Bact.* 27, 90 (1934); cf. *C. A.* 27, 1673.—Only about 10% of the immunizing activity of the cell substance remains in the acid-insol. fraction. The sepn. of the acid-sol. fraction into alc.-sol. and alc.-insol. fractions gave fractions which varied in immunizing activity. John T. Myers

**The influence of the molecular weight of antigen on the proportion of antibody to antigen in precipitates.** Sanford B. Hooker and Wm. C. Boyd. *J. Bact.* 27, 91-2 (1934). The ratio antigen:antibody in ppt. formed at the equivalence point differs widely in different systems. To account for these differences, it is assumed that at the equivalence point the antigenic mol. is just completely covered by mols. of antibody. The mol. wt. can be calcd. from the above ratio. John T. Myers

**Serum reactions in the disimmunized state.** Reuben L. Kahn and Elizabeth B. McDermott. *J. Bact.* 27, 94 (1934).—It is likely that the difference between agglutinin and precipitin reactions in the disimmunized state is largely due to the difference between the total reacting surface of the minute colloidal particles of the protein antigen and the comparatively large surface of the bacterial antigen. The former could absorb relatively much more precipitin. John T. Myers

**The antigenic value of unprecipitated and alum-precipitated tetanus toxoid.** D. H. Hergey and S. Etris. *J. Bact.* 27, 95-6 (1934).—The alum-pptd. toxoid seems more active as an antigen. John T. Myers

**The antigenic structure of Staphylococcus aureus and its variants.** Rachel E. Hoffstadt, Guy P. Youmans and Wesley Clark. *J. Bact.* 27, 97-8 (1934). No univalent salt agglutinated any strain or variant. Bivalent salts of Pb, Cu and Fe and all trivalent salts in some concn. agglutinated all strains. High concns. of Al and Cr retarded agglutination of all forms. John T. Myers

**The adjustment of the blood volume after transfusion.** A. E. Boycott and C. L. Oakley. *J. Path. Bact.* 38, 91 (1934).—The plasma vol. returns to normal in 2 or 3 days, but the blood vol. remains too large by the vol. of the injected erythrocytes, which are not destroyed. Most of the injected plasma proteins disappear from the blood. John T. Myers

**The porphyrins in human disease.** R. Mason, Cyril Courville and E. Ziskind. *Medicine* 12, 355-430 (1933)

A general review of the chemistry of the natural and artificial porphyrins is given. Their occurrence in the urine, methods for detecting them by means of photosensitivity and fluorescence, the various clinical features accompanying hematuria, the pathol. anatomy, pathogenesis and treatment are discussed. F. B. S.

**Diphtheria toxin and antitoxin. Determination of formaldehyde and methods by which it can be removed from anatoxin.** Saburo Suzuki. *Kiobato Arch. Exptl. Med.* 10, 267-78 (1933).—The flocculation between toxin and antitoxin is a sp. reaction. Anatoxin also flocculates with antitoxin. The flocculation-product, substance can be sepd. from diphtheria toxin by pptn. with alc. or (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, the latter giving a product which retains its toxicity for over 3 years. The flocculation occurs only at a certain concn. of toxin or anatoxin and does not, therefore, follow the law of multiples. A method is given for detg. the units of low immune sera.

$\text{CH}_2\text{O}$  could not be detected in purified anatoxin by the dimedon method.

**Chloruremia in burns.** A. G. Chiariello. *Ann. ital. chir.* 12, 787(1933); *J. Am. Med. Assoc.* 101, 961.—A drop in the chloride content of the blood occurred in experimentally produced burns in dogs. This diminution in chlorides is proportional to the size and degree of the burn. Improvement following intravenous hypertonic saline is not due to replacement of the chlorides but to elimination of toxic products due to the diuresis caused by the intravenous soln.

**Halogen balance of blood, spinal fluid and urine in patients with convulsive states on bromide-chloride therapy.** J. Notkin, Teresa Garcia and John A. Killian. *Arch. Neurol. Psychiatry* 30, 114-22(1933).—Relative concns. of Br and Cl in whole blood, plasma, spinal fluid and urine were detd. in a group of epileptic patients who had been receiving bromide-chloride therapy for 1 year or more. The distribution of Br between blood cells and plasma was similar to that of Cl, and the total halogens of plasma did not exceed the normal level for Cl while in the cells the total halogen content was 15-36% above the av. normal for Cl. The concn. of Br in spinal fluid was less than that in whole blood while the Br-Cl ratio of urine as contrasted to that of blood varied between plus 4 and minus 67% of the blood ratio. These changes in halogen balance occurred within 24 hrs. after the therapy was started and Br could be detected in these fluids for 44 days after cessation of therapy. The Cl is apparently replaced by Br in plasma and in spinal fluid but in blood cells addn. as well as substitution effects may take place.

**Chemical investigations and new theories on immunity.** Felix Haurowitz. *Med. Klin.* 29, 936-9(1933).—A discussion of the recent advances in the chemistry of antigens and antibody formation and their compn.

**Carbohydrate production from fat with special reference to diabetes.** Margaret Dänm. *Yale J. Biol. Med.* 5, 359-72(1933).—From a review of the literature D. concludes that the interpretation of the R. Q. and the D. N ratio as well as fat-feeding expts. in normal animals favors the view of noncombustion of carbohydrates during diabetes.

**Lecithin in fractionation of antitoxic serum, and transformation of pseudo- to euglobulin.** I. Pirosky and F. Modern. *Anales asoc. quim. Argentina* 21, 142-8(1933). See *C. A.* 28, 818<sup>a</sup>.

**Carbohydrate metabolism in obstructive jaundice.** Sadao Nishigaki. *J. Chosen Med. Assoc.* 23, 550-63 (in English 34-6)(1933).—With rabbits and chickens with ligated common duct, sugar tolerance, glycogen content of the liver and muscle, blood bile acids and pancreatic hormones were detd. The results show that hypoglycemia in jaundice is partly due to an increase of bile acids in the blood, but chiefly due to hypersecretion of pancreatic hormones, and the decrease of the liver glycogen.

**Bile acids. I. Bile acid content of the blood of patients suffering from hepatic and biliary diseases.** Shosen Roku and Kogyoku Gon. *J. Chosen Med. Assoc.* 23, 1075-96 (in German 87-8)(1933). Analysis of the normal blood with Szirald's method gave 0.626-4.106, av. 1.298 for the corpuscle, 1.080-17.850, av. 5.080 for the plasma, and 0.517-10.629, av. 2.912 for the whole blood in mg. %. The value for non-hepatic cases, and hepatic and biliary cases without jaundice falls within the normal variations. With jaundice, bile acids increase, but later fall to normal. In fatal cases, bile acids often fall below normal. Both urine and spinal fluids of the normal human being contain bile acids. **II. Effect of food on blood bile acids.** *Ibid.* 1365-81 (in German 111-12).—Regardless of the kind of diets, food intake reduces the normal blood bile acids. This increase does not occur in the blood of hepatic and biliary cases. In obstructive jaundice, the meal may increase blood bile acids. The variation of blood bile acid is under the control of hepatic function.

**Clinical and experimental studies on xanthoproteic reaction of the blood of hepatic disorders.** H. Inoue.

*J. Chosen Med. Assoc.* 23, 1178-88 (in German 94)(1933).—With Becher's method (*C. A.* 20, 1666), the blood of the normal human being (15 cases) gave the xanthoproteic value 14-24, av. 19; and that of hepatic patients (40 cases), 12-46, av. 22, the blood of a secondary atrophic liver case and coma being the highest. The blood of the normal dog gave 12-24, av. 18, which rose when Eck fistula was produced. With Eck fistula and ligation of the hepatic artery together, still greater values were obtained. The great increase of xanthoproteic value in the case of hepatic coma is due to interference of the detoxicating function of the liver accompanied with an increased decompn. of body protein.

**Metabolism in hepatic diseases. I. Total nitrogen and nonprotein nitrogen.** Susumu Nakao, Yohitsu Kin and Shichimi Matsuzaki. *J. Chosen Med. Assoc.* 23, 1758-86 (in German 135-6)(1933).—The total N content of the blood of hepatic patients (comatose and abscess excepted) is lower than the normal average due to anemia. In these 2 exceptions, there are marked increases. The ingestion of peptone or gelatin to healthy persons or patients with hepatic disorders causes an increase in blood and urinary N, but their return to normal is more rapid in the former, probably because of the different rates of absorption. In dogs poisoned with P, or with blocked bile duct, or Eck fistula with ligated hepatic artery, blood nonprotein N greatly increases, but not in the animal with Eck fistula alone. These different N distributions in hepatic cases have some diagnostic value, but should not be attributed to the change in protein metabolism.

**III. Amino acids.** Keitaro Tsushima. *Ibid.* 1348-64 (in German 110-11).—Blood amino N of the healthy Oriental is about the same as that of the Occidental, but urinary amino N is lower (av. 11.82 mg. %). There is no change in the amt. of these in simple jaundice, a slight increase in cancer and cirrhosis of the liver, and pronounced increase in the comatose. In hepatic disorders, rate of the return of amino N to normal values after ingestion of protein is much slower than in the normal individual, probably because of the delay in amino acid absorption. When the bile duct of the dog is ligated, amino N of the blood and urine increases; and their return to normal after ingestion of protein is exceedingly slow. The ingestion of peptone to Eck fistula dogs produces a very slight increase in amino N, but when the hepatic artery is ligated in addn. there is a large increase. **IV. Uric acid.** Hideo Inoue. *Ibid.* 1410-19 (in German 117).—There is no noticeable difference in uric acid contents between healthy and hepatic cases. In leucemia and advanced cases of cancer of the liver, both blood and urinary uric acid show a decided increase. The ingestion of peptone increases both in healthy and hepatic cases, but there is in the latter case a considerable delay in this increase and its elimination.

**The  $p_H$  of horses' blood in health and disease.** A. Meyer. *Arch. wiss. prakt. Tierheilkunde* 66, 512-20 (1933).—The normal  $p_H$  ranged from 7.38 to 7.56. Deviations from this were found in gastro-intestinal disease, in chronic heart and lung disease, in acute respiratory disease, in tetanus, in myoglobinuria, in agony and in morbus maculosus.

**The etiology of grass tetany: the influence of high protein intake.** B. Sjollem and L. Seekles. *Arch. wiss. prakt. Tierheilkunde* 66, 60-9(1933).—Cows kept on a very high protein diet (earth nut, soy and meat gluten) showed toxic symptoms resulting in some cases in death. The total blood N was increased; proteins, urea and amino acids were normal. The urinary constituents were markedly changed including high sugar excretion indicating kidney damage.

**Comparative antigenic studies on egg albumin denatured by intense audible sound and by other means.** E. W. Flosdorf and L. A. Chambers. *Am. J. Med. Sci.* 187, 294; *J. Bact.* 27, 92(1934); cf. *C. A.* 27, 4151.—Antigenic studies with the washed coagulum from treated albumin indicate an altered specificity and antigenic power similar to that produced by other means such as heating in an alk. or acid soln. Long treatment with the sonic vibrator redisperses the coagulated fraction into a very

opaquecent soln. which cannot be sepd. by centrifuging at ordinary speeds. This mixt. yields a ppt. both with anti-native-albumin and with antiheat-denatured-albumin rabbit sera. After subcutaneous immunization rabbits were tested for degree of immunization both by intradermal injection and by pptn. with the serum obtained after bleeding. Excellent agreement as to degree of immunization and to antigenic specificity was observed in the results of the Arthus phenomenon, after both types of testing. R. C. Willson

Andersen, William T.: Studies on Blood Sugar and Glycosuria in Exophthalmic Goitre. Translated from Danish. Copenhagen: Levin & Munksgaard. 206 pp. Reviewed in *J. Am. Med. Assoc.* 102, 870 (1934).

Labbe, Marcel: Le traitement du diabète. 4th ed., revised and enlarged. Paris: Masson & Cie. 206 pp. F 15.

## H - PHARMACOLOGY

A. N. RICHARDS

The toxicity of aluminum with respect to the method of administration. Gabriel Bertrand and P. Serbesco. *Compt. rend.* 198, 517-20 (1934).—Intraperitoneal injection of 100 mg. Al sulfate (1% soln.)/kg. body wt. in 5 rabbits gave av. survival time of 4 hrs. 44 min.; subcutaneous injection of 100 mg. 8 hrs. 9 min.; 125 mg. 6 hrs. 12 min.; 150 mg., 4 hrs. 31 min.; 400 mg. per os, 7 hrs. 7 min. Fifty mg. introduced directly into the stomach caused death in 4 of 5 rabbits in 33-49 days. Al introduced in food from cooking utensils is harmless. Philip D. Adams

Injections of acetylcholine in ulcera cruris varicosa. B. A. Hardenberg. *Nederland. Tijdschr. Geneeskunde* 77, II, 1778 83 (1933).—Neg. results were obtained in 30 cases. R. Beutner

Treatment of pemphigus vulgaris and of pemphigus chronicus recidivans (Dühring's disease) with Bayer 205. J. J. Zoom. *Nederland. Tijdschr. Geneeskunde* 77, II, 2419-30 (1933).—Reports on successful intravenous treatment with Bayer 205 of 1 case of pemphigus vulgaris and 6 cases of Dühring's disease. R. Beutner

The application of pernocton in eclampsia attacks. M. C. Boon v. Ochsée. *Nederland. Tijdschr. Geneeskunde* 77, II, 2810-16 (1933).—Favorable case reports. R. B.

Two fatal cases of lumbar anesthesia by means of percarine (nupercaine). E. Behr and A. Zeckel. *Nederland. Tijdschr. Geneeskunde* 77, III, 3405-7 (1933).—In 2 cases nupercaine, injected intraspinally, produced fatal lesions of the membranes and nerve roots of the cord. Histological exams. indicated that next to the general toxic action of nupercaine individual factors played a role. R. Beutner

Experience with a new intravenous narcotic sodium evipan. A. J. M. Duyzings. *Nederland. Tijdschr. Geneeskunde* 77, III, 3154-7 (1933).—Na evipan (cf. C. A. 27, 2216) is recommended for surgical narcosis; it should be administered intravenously. R. Beutner

Avertin in the pain crisis of blood-vessel spasm. Bertram M. Benheim and Raymond A. Taylor. *Ann. Surgery* 99, 550-3 (1934).—Favorable use of avertin in one case of blood-vessel spasm is described. R. B.

Treatment of hypochromic anemia with soluble ferrous salts. Harold W. Fullerton. *Edinburgh Med. J.* 41, 90-107 (1934).—FeSO<sub>4</sub> in a daily dose of 9 grains is a cheap and efficient method of treatment in hypochromic anemia. Rachel Brown

Diiodotyrosine and thyroid function. A. W. Elmer. *Quant. J. Exptl. Physiol.* 24, 95-9 (1934).—Hyperfunction in the thyroid of the guinea pig produced by thyrotropic hormone can be inhibited by the administration of diiodotyrosine (I). The same effect is produced by KI in equiv. dosage. I is easily broken down in the body and its effect is probably due to the nonsp. action of the liberated I. Rachel Brown

Mercury-laden air: the toxic concentration, the proportion absorbed and the urinary excretion. A. M. Fraser, K. I. Melville and R. L. Stehle. *J. Ind. Hyg.* 16, 77-91

(1934).—Dogs were used as the exptl. animals. A concn. of 1.89 mg. of Hg vapor per cu. m. of air, inhaled 8 hrs. daily during a period of 40 days, produced no ostensible evidence of Hg poisoning. The daily excretion of Hg was about 0.5 mg. for dogs weighing 12 kg. An average of 24% of the Hg in air contg. 2.91-26.18 mg. of Hg per cu. m. of inhaled air was absorbed. A. L. Elder

The effects of the inhalation of hydrogen fluoride. I. The response following exposure to high concentrations. Willard Machle, Frederick Thamann, Karl Kitzmiller and Jacob Cholak. *J. Ind. Hyg.* 16, 129-45 (1934).—Exposure to concns. of HF above 1.5 mg. per l. for any period of time is dangerous for rabbits and guinea pigs. Concns. of 1.0 mg. per l. and less caused no deaths in rabbits and guinea pigs exposed for as long as 30 min. although evidences of injury were definite. Concns. below 0.1 mg. per l. were tolerated by rabbits and guinea pigs for 5 hrs. without injury severe enough to produce death. 0.0245 mg. per l. caused no deaths in 6 animals exposed for 41 hrs. Data on other acid gases are conflicting but in magnitude of toxicity HF appears to be of the same order as HCl and SO<sub>2</sub>. Observations on the effects of sublethal exposures in animals should be carried out for at least 6 months and preferably 8 months after the period of exposure. A. L. Elder

Elimination of iodine after ingestion of diiodotyrosine. P. Sainton, F. Kayser and E. Anschel. *Compt. rend. soc. biol.* 115, 244-7 (1934); cf. C. A. 27, 3005. In normal persons 40-60% and in Basedow's disease 35-40% of the I in diiodotyrosine was eliminated in the urine during the period 2-36 hrs. after ingestion. L. E. Gilson

Effect of insulin on the metabolism of amino acids. P. de Nayer, A. Lacquet and J. P. Bouckaert. *Compt. rend. soc. biol.* 115, 437-8 (1934). When small doses of glycine were injected into rabbits the administration of insulin increased the rate at which it disappeared from the blood, but with large doses of glycine the rate of disappearance was slower in insulinized animals than in controls. L. E. Gilson

Action of vagotonin on cardiac rhythm. L. Merklen, R. Grandpierre and M. Vidacovitch. *Compt. rend. soc. biol.* 115, 475-7 (1934); cf. C. A. 28, 531. In dogs, vagotonin completely free from insulin caused a decrease of the cardiac rhythm whereas insulin completely free from vagotonin always caused an increase. Conflicts in the results of other workers on the cardiac action of insulin are probably due to the presence of more or less vagotonin in the preps. used. L. E. Gilson

Adrenaline and its ethylamine homolog (dihydroxyphenylethylamine) can provoke hypotension and renal vasoconstriction at the same time. Raymond-Hamet. *Compt. rend. soc. biol.* 115, 512-15 (1934). L. E. Gilson

Insulin hypoglycemia tests in obesity. Marcel Labbe and R. Boulin. *Compt. rend. soc. biol.* 115, 515-16 (1934). In obese non-diabetic cases the effects of insulin were practically the same as in normal subjects. L. E. G.

A ferric derivative of adrenaline of a probable quinone nature. Chemical preparation. Cardiac-renal action in rabbits. J. Paviot, F. Arloing, A. Mord, A. Jossier and A. Badinand. *Compt. rend. soc. biol.* 115, 517-21 (1934); cf. C. A. 28, 1101. Pulped bovine adrenals were treated with FeCl<sub>3</sub> and NH<sub>4</sub>OH in such proportions that a blue, very sol. compd., *adrenoferrine*, was formed. The compd. is about 1/4 as toxic as adrenaline. In rabbits it produced cardiac dilation, without hypertrophy of the myocardium, and often inflammatory nodules in the kidneys accompanied by hyperazotemia. Anatomical study of the renal lesions observed in normal rabbits and rabbits treated with adrenoferrine or adrenaline. F. Arloing, A. Jossier and M. Levrat. *Ibid.* 521-2. L. E. Gilson

Intravenous injections of hypertonic solution of magnesium for the treatment of migraine. Auguste Lumière and Paul Meyer. *Compt. rend. soc. biol.* 115, 534-6 (1934).—Five cc. 50% MgSO<sub>4</sub> soln. in 1-cc. installments about 1 min. apart gave prompt relief. A transient in-

crease in blood Cl was produced, and followed by diuresis and increased excretion of chlorides. L. E. Gilson

**Sparteine and the vasomotor reflexes of the carotid sinus.** Fernand Mercier, J. Delphaut and C. Rizzo. *Compt. rend. soc. biol.* 115, 544-6 (1934).—Sparteine has a depressive action on the reflexes. L. E. Gilson

**The carotid sinus and the respiration-stimulating action of some nicotine-like drugs.** Fernand Mercier, C. Rizzo and J. Delphaut. *Compt. rend. soc. biol.* 115, 546-9 (1934).—"Kinkiliba de Kita" (C. A. 27, 3751), Me<sub>2</sub>N and choline did not produce their usual stimulating effect on respiration in dogs after removal of the carotid sinus. L. E. Gilson

**Antagonism of curare and pilocarpine.** Raymond-Haniet. *Compt. rend. soc. biol.* 115, 602-4 (1934). L. E. Gilson

**Vagotonin and adrenaline-chloroform syncope.** D. Santenoise, L. Merklen, R. Grandpierre and M. Vidacovitch. *Compt. rend. soc. biol.* 115, 612-14 (1934); cf. C. A. 28, 1407<sup>8</sup>.—Vagotonin prevents the syncope, insulin does not. L. E. Gilson

**Action of potassium cyanide on the respiration of the dog with reference to the respiratory nerve centers and the reflex zones of the carotid sinus.** Lucien Camus, Henri Bédard and Félix P. Merklen. *Compt. rend. soc. biol.* 115, 614-18 (1934). L. E. Gilson

**Action of some diuretics of the purine series on the functioning of the blood-spinal fluid barrier.** L. Stern and G. Kussil. *Compt. rend. soc. biol.* 115, 625-7 (1934). Rats and cats were treated with xanthine, guanine, uric acid, theobromine, theophylline and diuretin. No effect on the permeability of the blood-spinal fluid barrier to K<sub>2</sub>Fe(CN)<sub>6</sub>, trypan blue or arspenamin, could be detected. L. E. Gilson

**Further investigation of the action of vagotonin on the parasympathetic system.** D. Santenoise, L. Merklen and M. Vidacovitch. *Compt. rend. soc. biol.* 115, 697-701 (1934); cf. C. A. 27, 338. L. E. Gilson

**A comparative study of adrenaline, sympathol and ephedrine.** E. Schilling and G. Kopp. *Deut. med. Wochschr.* 58, 1399-1401 (1932).—The pharmacodynamic reactions to sympathol are much less pronounced than those of adrenaline or ephedrine. Intramuscular injection of 180-240 mg. of sympathol produces only a slight pressor action; oral doses of 1-2 g. produce no effects. Arthur Grollman

**Rotenone a new parasiticide.** Douglas B. Crane. *Cornell Veterinarian* 23, 15-31 (1933).—Rotenone was nontoxic to dogs when given in ams. up to 0.2 g./kg. of body wt. Transitory gastritis and enteritis were caused by doses of 0.1-0.2 g. Doses of 0.05-0.20 g. caused no symptoms of motor paralysis in dogs of any age. Young dogs were less apt to be depressed or nauseated by very large doses than were old animals. Rotenone, at the rate of 0.05 g./kg. of body wt., was effective against the dog hookworm, *Ankylostoma canina*, and the roundworms, *Toxascaris limbalis* and *Belascaris marginata*; it was only moderately effective against the coccidium of dogs and was ineffective against canine tapeworms. In general, rotenone caused an unusually rapid recovery from follicular mange. The best results were obtained when the drug was administered after the animal had been starved for 18-24 hrs. Fourteen references. K. D. Jacob

**Uses of some drugs acting upon the circulatory system.** H. J. Mills. *Cornell Veterinarian* 23, 152-60 (1933).—A discussion of the physiol. effects of various chem. compds. on domestic animals. K. D. Jacobs

**The campaign against liver flukes in California and the results.** Robert Jay. *Cornell Veterinarian* 23, 272-9 (1933).—Sheep that were put on cultivated crops or on hand feeding after being grazed on sparse pasture frequently became stiff and moved with difficulty when they were treated with CCl<sub>4</sub> for control of the liver fluke. The symptoms were similar to those produced experimentally in dogs by repeated treatments with CCl<sub>4</sub> while on a Ca-deficient diet. However, the same symptoms appeared in sheep after being turned into feeds rich in Ca or after a change to feeds supplemented with Ca.

1 Complete control of *Galba bulimoides* in streams, pools and marshes was obtained by treating the water with CuSO<sub>4</sub>. K. D. Jacob

**Glucose therapy in a parturient disorder atypical of milk fever and resembling acetoneuria.** A. T. Gilyard and R. T. Gilyard. *Cornell Veterinarian* 23, 377-8 (1933).—Immediate and complete recovery from the disorder was obtained by injecting 1 l. of a 12% glucose soln. into the jugular veins of the cows. K. D. Jacob

**The chemotherapy of oesophagostomiasis in sheep.** H. O. Monnig. *Onderstepoort J. Vet. Sci.* 1, 67-76 (1933).—In general liquid and H<sub>2</sub>O-sol. drugs, with or without astringents and laxatives, were ineffective against the nodular worm, *Oesophagostomum columbianum*, in sheep. The best results were obtained with relatively insol. compds., which are most likely to reach the colon and which may apparently be ingested by the parasites. 3 As<sub>2</sub>S<sub>3</sub> and Na<sub>2</sub>SiF<sub>6</sub>, in doses of 0.25-1.3 g. and 1-4 g., resp., gave fairly good control and had no toxic effect on the sheep; the efficiency of As<sub>2</sub>S<sub>3</sub> seems to be reduced when it is used in combination with other inorg. compds. Certain compds. of Cu and Hg may be useful against the worms. K. D. Jacob

**The toxicity of sodium chlorate.** D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 157-62 (1933).—NaClO<sub>3</sub> in daily ams. up to 5 g. in a 10% soln. produced no ill effects on rabbits, but 10 g. in a single dose was either fatal or produced severe symptoms of poisoning. In sheep 3 daily doses of 15 g. each produced death 20 hrs. after administration of the last dose; two 30-g doses were fatal, whereas 20 daily doses of 7.5 g. produced only transient diarrhea and inappetence. A horse developed fairly severe symptoms of poisoning after the administration of 120 and 130 g. NaClO<sub>3</sub>, resp., whereas 60 g. produced only slight methemoglobinemia. Because of its low toxicity to animals, the use of NaClO<sub>3</sub> as a weed killer on pastures offers considerable promise. K. D. Jacob

**Recent investigations into the toxicity of known and unknown poisonous plants in the Union of South Africa.** D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 173-82 (1933); cf. C. A. 27, 5121. The plants *Psilocaulon abumile* N. E. Br. and *Chironia transvaalensis* Gilg., not previously known to be poisonous, were toxic to animals. K. D. Jacob

**Fungi in relation to health in man and animal.** D. G. Steyn. *Onderstepoort J. Vet. Sci.* 1, 183-212 (1933). The chemistry and symptoms of fungus poisoning are discussed. When it was administered by means of a stomach tube, the mold skin (60 g. over a period of 3 days) of *Fusarium moniliforme* var. *sub-glutinans* grown on Raulin's medium caused the death of rabbits in 4-14 days. Sixty-nine references. K. D. Jacob

**Photosensitization of animals in South Africa I. The action of various fluorescent dyestuffs.** J. I. Quin. *Onderstepoort J. Vet. Sci.* 1, 459-68 (1933).—Intravenous injection of 1 g. eosin, erythrosine or rose bengal into sheep and goats caused marked photosensitization within a few min. when the animals were exposed to sunlight; no effects were observed in the absence of sunlight, and in no case was there any derangement of the internal organs. Dyestuffs of the anthracene group gave no pos. results of photosensitization. In the acridine group, acriflavine produced marked light sensitivity which soon passed off. In the thiazine group, methylene blue, methylene violet and thionine produced marked sensitization of short duration and accompanied by hemolysis; the nonfluorescent methyl violet had no sensitizing effect. Injections of quinine salts did not photosensitize sheep but caused hemolysis and hemoglobinuria. II. The presence of a lethal factor in certain members of the plant genus *Tribulus*. Claude Rimington and J. I. Quin. *Ibid.* 469-89. See C. A. 28, 2056<sup>8</sup>. III. The photodynamic action of *Hypericum ethiopicum* var. *glaucescens* Sond. and *Hypericum leucoptychodes* (syn. *H. lanceolatum* Lam.). J. I. Quin. *Ibid.* 491-6. Dried pulverized *H. ethiopicum*, when drenched to Merino sheep, caused intense photosensitization and edematous swelling of the exposed parts of the skin; such affected skin later be-

came necrosed and was followed by sloughing. A deep-red fluorescent pigment, sol. in acetone, alc. and water was extd. from the dried plant; this pigment when injected into sheep caused well-marked photosensitization, but the symptoms were not accompanied by icterus and resembled those produced by hematoporphyrin. *H. leucoporphodes* caused a much weaker and delayed photosensitization. IV. The toxicity of *Lopholaena coriifolia* (Harv.) Phill. and C. A. Sm. (= *L. randii* sp. Moore). *Ibid.* 497-9.—*L. coriifolia* contains an active liver poison which, however, in drenching expts. did not cause geeldikkop in sheep. When it is ground in a mill, the dry material emits a peculiar resinous odor. V. The toxicity of *Lippia rehmanni* (Pears) and *Lippia pretoriensis* (Pears). *Ibid.* 501-4.—When they were drenched to sheep, both species caused photosensitization accompanied by icterus. *L. rehmanni* was much more toxic than *L. pretoriensis*. The toxic agent of *L. rehmanni* is sol. in 75% alc. VI. The effect of surgical obstruction of the normal bile flow. *Ibid.* 505-26.—Surgical obstruction of the extra-hepatic bile tracts in sheep caused photosensitization within 1 week when animals having closely shorn heads and backs were exposed to sunlight. The effects of administering  $\text{CCl}_4$ ,  $\text{CHCl}_3$ ,  $\text{AsH}_3$ ,  $\text{MnCl}_2$  and phenylhydrazine to sheep having surgically obstructed bile tracts are discussed.

K. D. Jacob

Rotenone, the effective constituent of derris root. XVI. The relative toxicities of rotenone, deguelin and rotenone resin. Chemical behavior of deguelin. Sankichi Takei and Shikuro Miyajima. *Bull. Inst. Phys.-Chem. Research (Tokyo)* 12, 946-52 (1933), cf. C. A. 28, 1039<sup>1</sup>.—Toward the mudfish, *Cobitis fossilis*, l- and dl-deguelin in 0.02-0.002% concn. have half the toxicity of rotenone in the same concn., while the toxicity of the deguelin in 0.001-0.0001% concn. is  $1/10$  to  $1/100$  that of rotenone. In 0.005, 0.0025 and 0.00125% rotenone, rotenone resin and artificial rotenone resin soln., *Cobitis fossilis* dies in 60, 79, 86; 64, 98, 113; 60, 91, 95 min., resp. l-Deguelin from rotenone resin, m. 166°, has  $[\alpha]_D^{25} - 23.22^\circ$ , *deguelin isoxime*, colorless, m. 149°. The catalytic hydrogenation of deguelin with Pd-BaSO<sub>4</sub> gives a dihydro deriv., m. 170°, identical with isodihydrorotenone from  $\beta$ -dihydrorotenone. On sapon. of deguelin with alc. alkali, there results  $\beta$ -tubaic acid,  $\text{C}_{17}\text{H}_{16}\text{O}_4$ , m. 161°, dihydro deriv.,  $\text{C}_{17}\text{H}_{18}\text{O}_4$ , m. 170°, identical with  $\beta$ -dihydrotubaic acid. Tl  $\beta$ -tubaate m. 201°. Also in *J. Agr. Chem. Soc. Japan* 10, 81 7 (1934).

K. K.

Effects of cigaret smoking upon the blood sugar. Howard W. Haggard and Leon A. Greenberg. *Science* 79, 165-6 (1934).—When the R. Q. is above 0.85 and the blood sugar above 0.13%, neither is changed by the smoking of a cigaret. When the R. Q. and blood-sugar levels are below these values, and especially when the fasting level has been reached, the values obtained after 15 min. may be 0.85 or 0.90 and 0.12 or 0.14%, resp. During the next 30 min., the values fall to, or below, those observed before the cigaret was smoked. The effect is due to nicotine.

W. D. Langley

The absorption of iodine through the skin and its fate in the organism. H. Anthes and F. Salzmann. *Z. ges. expil. Med.* 91, 100 5 (1933).—Bathing in KI soln. produced a rise in blood I which reached its max. 1.5-3 hrs. after the bath. The I did not appear in the urine.

Milton Levy

The effects of sulfide, sulfite and sulfate compounds on metabolism. M. Kojima. *Z. ges. expil. Med.* 91, 257-66 (1933); cf. C. A. 28, 832<sup>1</sup>.—Sulfides influence the oxidative processes as indicated by urinary C, N and "vacat-oxygen" to a greater extent than sulfites or sulfates. All produced transitory hyperglucemias in rabbits but the sulfides were much more effective than the others.

Milton Levy

Production of nephrosclerosis with tyramine. Ludwig Paunz. *Z. ges. expil. Med.* 91, 424-31 (1933).—Daily injection of tyramine for a year produced in dogs the histological picture of nephrosclerosis except for the absence of fat deposition.

Milton Levy

The effects of soporifics on blood sugar. J. Lerman.

*Z. ges. expil. Med.* 85, 536-46 (1932).—Barbituric acid derivs. generally lower glucemia. Chlorotone produces a rise and then a fall. Chloralose requires large doses to produce a lowering. Chloral, Formamidol and Dionin have no characteristic action.

Milton Levy

Phenol and indole metabolism. VI. Latent phenol and indole intoxication and adrenal hypertrophy. M. Biebl. *Z. ges. expil. Med.* 91, 822-37 (1933); cf. C. A. 27, 5422.

Milton Levy

Anterior hypophysis extracts and abnormal glycogen storage. H. Fasold. *Z. ges. expil. Med.* 92, 68-5 (1933).—A patient with disturbed glycogen storage was given praphyson. The blood sugar did not rise. Praphyson acts through adrenaline and these subjects are not sensitive to adrenaline. The result is expected. The excretion of ketone bodies increased. Praphyson has no value as a therapeutic agent in this disease.

Milton Levy

The effects of phenylhydrazine, phosphorus and arsenic poisonings on the lipoids and amino acids of blood. Sándor Láng and J. Starker. *Z. ges. expil. Med.* 92, 98-101 (1933); cf. C. A. 27, 3006, 5114.—In dogs phenylhydrazine poisoning was accompanied by a fall of amino acidemia and a rise of cholesterolemia. In chronic P poisoning the opposite is true. Arsenic has no regular effect.

Milton Levy

The effects of thyroid and bone marrow on plasma proteins. Sándor Láng. *Z. ges. expil. Med.* 92, 102-7 (1933).—Thyroid ext. and thyroxine do not produce changes in the plasma proteins except as they affect water content. Bone marrow ext. increases the albumin and globulin contents of plasma. Bone marrow is perhaps involved in the formation of plasma proteins.

Milton Levy

The effects of cholesterol and phlorizin on fat metabolism. The fat contents of the livers of cats and rabbits after injection of these substances. Hsienli Tseng. *Z. ges. expil. Med.* 92, 108 28 (1933).

Milton Levy

Physiology of creatine-creatinine metabolism. The treatment of muscular disease with glycine. A. Mader, E. Selter and R. Schellenberg. *Z. ges. expil. Med.* 92, 151-64 (1933).—In progressive muscular dystrophy the creatinine coeff. is low and creatine excretion above normal. Glycine had therapeutic effects in 2 cases.

Milton Levy

The pharmacology of lead. IX. The distribution of lead by the method of autohistodiagraphy. Behrend Behrens and Anny Baumann. *Z. ges. expil. Med.* 92, 241-50 (1933); cf. C. A. 26, 3272.—Radioactive Pb (Th B) was injected. The distribution could be followed by the radioactivity. Pb storage occurred particularly in the bones. Large quantities led to storage in the liver and spleen. X. The relation of lead storage to calcium metabolism. *Ibid.* 251-64.—Pb is always stored where mobilizable Ca exists.

Milton Levy

The effect of anti-prothrombin on erythrocyte resistance. Hans W. Schmidt. *Z. ges. expil. Med.* 92, 351-60 (1933). Anti-prothrombin prepps. increase the resistance of red cells to hypotonic NaCl.

Milton Levy

The fate of intravenous sodium chloride in normal and nephrotic men. Aldo Gandellini. *Z. ges. expil. Med.* 92, 361 6 (1933).—Injected NaCl is excreted by normal people but is partially stored in the tissues in nephrotic.

Milton Levy

The effect of carbon monoxide on tissue respiration. F. O. Schmitt and Mary G. Scott. *Am. J. Physiol.* 107, 85 93 (1934).—CO contg. 21% O has little effect on the consumption of skin, nerve, kidney or intestine, but produces definite accelerations with skeletal muscle, stomach, liver, spleen and particularly with heart muscle. Illumination causes partial, and in some cases complete, recovery of the CO-poisoned tissues, with some indication that the catalyst of CO combustion is also light-sensitive.

J. F. Lyman

Physiological effects of high-frequency current. V. The non-protein nitrogen partition and the secretion of urine in anesthetized dogs. J. W. Karr and E. S. Nassif. *Am. J. Physiol.* 107, 170-7 (1934); cf. C. A. 26, 4101. In fever caused by high-frequency current the urea, amino acid, creatinine and uric acid N fractions of the blood

maintain essentially the same relative concns. up to a rectal temp. of 42–44°. There is some evidence that protein metabolism, as judged by urea production, may be doubled, with no disturbance to the endogenous protein metabolism. Probably dehydration and damage to the kidneys are important factors in the loss of kidney function.

J. F. Lyman

The excretion of cyanol by the mammalian kidney. C. L. Cope. *J. Physiol.* 80, 253–60 (1933).—The dye "Cyanol extra" has the same clearance value in the normal mammalian kidney as does xylose. Under the action of phlorizin the cyanol clearance falls to about 42% of the xylose clearance.

J. F. Lyman

The behavior of liver glycogen during decerebration hyperglucemia and the influence of atropine and of ergotamine on this condition. M. Louisa Long. *J. Physiol.* 80, 206–204 (1933).—When liver glycogen is high in rabbits, atropine has only a slight retarding effect on the development of decerebration hyperglucemia. With both high- and low-liver glycogen ergotamine almost completely prevents the hyperglucemia without increasing blood lactic acid. There is no parallelism between the rate of glycogen disappearance from the liver and the rise in blood sugar after decerebration.

J. F. Lyman

The correlation between the action of insulin and adrenaline upon the muscle and liver glycogen. K. M. Daoud and H. A. F. Gohar. *J. Physiol.* 80, 314–22 (1933).

With intact rats, injection of insulin in convulsive doses causes an almost complete disappearance of liver glycogen and a considerable fall in muscle glycogen. In rats whose adrenals have been removed, insulin causes a similar loss of liver glycogen but has no effect upon the muscle glycogen. The depletion of muscle glycogen therefore can be brought about by insulin only indirectly through an increased activity of the adrenals.

J. F. Lyman

The effect of splanchnotomy and of phlorizin on decerebration hyperglucemia. M. G. Foster. *J. Physiol.* 80, 323–8 (1933).—Pontine decerebration in fasted rabbits, in which the splanchnic nerves have been cut several days previously, is not followed by an increase in blood sugar. Injection of phlorizin does not prevent decerebration hyperglucemia when the renal vessels are ligated, but does so when these are intact.

J. F. Lyman

Calcium tolerance in cats. J. L. D'Silva. *Proc. Physiol. Soc., J. Physiol.* 80, 6P (1933). Intravenous injection of  $\text{CaCl}_2$  into cats was highly toxic in some individuals while others showed a remarkable tolerance. Blood Ca was raised in one case to 53.5 mg. per 100 cc. plasma without fatal effects, suggesting that the Ca is in an inactive form in the blood.

J. F. Lyman

The influence of adrenaline on the blood potassium. J. L. D'Silva. *Proc. Physiol. Soc., J. Physiol.* 80, 7P (1933).—Intravenous injection of 0.5 cc.  $1/10,000$  adrenaline into cats caused a 65% increase in serum K which returned to normal within 15 min.

J. F. Lyman

Acclimatization of animals to 0.3% carbon monoxide in the inspired air. J. A. Campbell. *Proc. Physiol. Soc., J. Physiol.* 80, 11P (1933).—Young mice and rabbits exposed to CO in the air in gradually increasing concns. maintained body growth when inhaling as much as 0.3%. The CO tension in the tissues of these animals was 0.15%.

J. F. Lyman

The sensitization of leech muscle to barium by eserine. A. Vartiainen. *Proc. Physiol. Soc., J. Physiol.* 80, 21P (1933).—Eserine has some sensitizing action on the response of leech muscle to Ba, but this sensitization was not comparable with that to acetylcholine.

J. F. L.

The hemopoietic disturbances induced in the albino rat by administration of thyroxine. J. S. Latta and M. C. Renner. *Am. J. Anatomy* 54, 115–42 (1934).—The injection of thyroxine into rats changes the differential count probably because of the increased basal metabolism. Reticulated erythrocytes tend to increase as the injections progress. There is also an increase of about 10% in the neutrophilic leucocytes. The initial injection of thyroxine is followed by a decrease in the total no. of erythrocytes. More hemoglobin is found in the spleen in these cases.

C. M. McCoy

Diuresis caused by hyper-, iso- and hypotonic solutions of glucose in animals rendered nephritic by potassium dichromate. G. Ravasini and R. Da Prato. *Boll. soc. ital. biol. sper.* 8, 1371–2 (1933).—Rabbits were rendered nephritic with  $\text{K}_2\text{Cr}_2\text{O}_7$  and treated with various concns. of glucose. With a hypertonic soln. 4 N, diuresis was little or none; with a 3 N soln. about 90% of the vol. introduced was eliminated; with a 2 N soln. diuresis was abundant, being equal to about double the vol. of the soln. injected. With less concd. solns. the vol. of urine eliminated decreased in relation to the vol. of soln. introduced so that with 0.5 N soln. about 90% of the vol. introduced was eliminated. With iso- or hypotonic solns. only a few drops of urine were eliminated. The glucose eliminated was almost zero with the 4 N soln.; 5% with the 3 N; and with diminishing hypertonicity the amt. of glucose eliminated increased and reached 80% of the amt. introduced when the soln. was 0.5 N. With iso- and hypotonic solns. there was no elimination of glucose.

Peter Masucci

The diuresis caused by hyper-, iso- and hypotonic solutions of glucose in animals rendered nephritic by cantharidin. G. Ravasini and R. Da Prato. *Boll. soc. ital. biol. sper.* 8, 1372–3 (1933). Max. diuresis was obtained with a 4 N soln. of glucose; the vol. of urine eliminated was about triple that of the soln. injected. By diminishing the hypertonicity, the diuresis decreased proportionately so that with 0.5 N soln. the vol. of urine eliminated equaled the vol. of soln. introduced. With an isotonic soln. the vol. of urine eliminated was 70% and with hypotonic solns. it was 50–70% of the vol. injected. The amt. of glucose eliminated was about 20% of that introduced with a 4 N soln. and increased progressively with diminishing hypertonicity reaching 70% with 0.5 N soln. With an isotonic soln. the glucose eliminated was 37%, and with hypotonic solns. the amt. eliminated gradually decreased to almost zero.

P. M.

The action of acid and alkaline liquids on the movements and tone of the bladder. Giorgio Ravasini. *Boll. soc. ital. biol. sper.* 8, 1374–5 (1933).—Strips of isolated bladder of the rabbit and cat were subjected to solns. of varying pH values. Up to pH 9.4 the rabbit bladder maintained unchanged its tone and the frequency and amplitude of its movements; at pH 9.4–10.3 there was a distinct increase in the tone but the movements remained the same; at pH 10.4 there was an increase in the tone and a diminution of the amplitude and frequency of the movements. On the acid side, the tone and movements remained the same down to pH 5.8; below this (pH 4.4) the tone diminished and the movements disappeared completely. With alk. solns. the behavior of the cat bladder was the same as the rabbit but in acid solns. it was much more resistant than the rabbit.

Peter Masucci

Action of benzene in pregnancy. Gemma Barzilai. *Boll. soc. ital. biol. sper.* 8, 1388–92 (1933). Pregnant white mice showed a decreased resistance of their nervous system toward the narcotic effects of benzene; narcosis was reached in less time than the controls and recovery took longer time. The diminished resistance of the pregnant mice was especially evident when they were exposed to a benzene-air mixt. of 35–43 mg. per l.

Peter Masucci

Cause of the toxicity of methanol. Italo Samou. *Boll. soc. ital. biol. sper.* 8, 1376–9 (1933).—Exptl. data fail to support the view that the toxicity of MeOH is due to its products of oxidation ( $\text{HCOOH}$  and  $\text{HCOOH}$ ) in the animal body; instead, the toxicity is probably due to the unchanged MeOH mol. The action of MeOH on blood serum is distinctly different from that of EtOH or PrOH. The former ppt. the proteins fractionally, the latter in mass. EtOH and PrOH if left in contact with serum for some time and in doses which do not cause a pptn. of the proteins produce an increase in the viscosity of the serum, while MeOH does not produce this effect because it has the power of combining with the proteins and transforming them into a precipitable form.

P. M.

Variations in the chloremia of normal and thymectomized animals after intravenous injections of sodium chloride. P. Masucci. *Boll. soc. ital. biol. sper.* 8, 1379–

80(1933).—In thymectomized animals the chloremic curve showed higher values than in the normal animals. Max. values were found in animals that had been thymectomized 20 days.

**A positive Wassermann test after the injection of cinchophen preparations.** Dario Tuchten. *Boll. soc. ital. biol. sper.* 8, 1396-7(1933).—In certain individuals injected with Atophanil or Urosol, intravenously or intramuscularly, the Wassermann reaction of the blood became pos. and a few days after interrupting the treatment became neg. again. Five out of 100 patients treated with cinchophen gave this pos. reaction. In each case repeated serological tests before and after cinchophen treatment failed to show lues.

**The action of sympathetic and parasympathetic mimetic drugs on gaseous exchange.** VII. The action of nicotine. Alberto Cirimigna. *Boll. soc. ital. biol. sper.* 8, 1471-3 (1933); cf. C. A. 28, 1104<sup>a</sup>.—Nicotine does not modify appreciably the gaseous exchange in albino rats. It exerts no influence against the excitometabolic action of adrenaline or pilocarpine. The simultaneous injection of ergotamine and nicotine into normal rats causes a diminution in the gaseous metabolism identical to that caused by ergotamine alone. The simultaneous injection of ergotamine and nicotine into rats followed immediately by the injection of adrenaline causes a diminution of the excitometabolic action of the adrenaline but no different from that caused by ergotamine alone. Neither ergotamine nor nicotine nor both those substances, therefore, can block the excitometabolic action of adrenaline.

**The influence of acetylcholine on accommodation.** A. Santonastaso. *Boll. soc. ital. biol. sper.* 8, 1513-17(1933).—Studies were made on the refractive and accommodative state of the eye before and after the injection or instillation of acetylcholine with or without the addn. of atropine. The results lead to the conclusion that after the injection of acetylcholine there is a widening of the proximate point (P. P.) which is greater in individuals who make a continual use of their accommodation; the shifting of the P. P. is very likely to be attributed to various factors and especially to the action on the ciliary muscle and more particularly on the Brücke portion.

**The action of ricin on the isolated heart of the rabbit.** Riccardo Attimonelli. *Boll. soc. ital. biol. sper.* 8, 1525-8 (1933).—Ricin in doses of 0.5-3 g. per 100 cc. (in Locke-Lewis soln.) inhibits the activity of the isolated heart of the rabbit diminishing gradually the height of the contractions while the frequency remains practically unchanged except at the end of the cardiac activity. If the heart is then perfused with Locke-Lewis soln. alone, cardiac activity is not resumed; the heart stops.

**Experimental notes on poisoning by uranium salts.** Alberto Cannava. *Boll. soc. ital. biol. sper.* 8, 1551-5 (1933).—U poisoning was studied in relation to various doses and different routes of administration. The M. L. D. per kg. of rabbit was: hypodermically 4-10 mg.; intravenously, little difference was noted between the various doses; orally, 100 mg. was inactive, 200 mg. was barely active but 500 mg. was lethal. The course of the poisoning was the same regardless of the route of administration.

**The anti-oxygen-inhibiting action of thyroxine.** L. De Caro. *Boll. soc. ital. biol. sper.* 8, 1555-8(1933); cf. C. A. 27, 4727.—That the anti-oxygen-inhibiting action *in vitro* of thyroxine toward suspensions of carotene is independent of its hormone action has been confirmed experimentally. Three cc. of a benzene soln. of carotene contg. in all 0.0135 g. is mixed with 15 cc. linoleic acid; the benzene is removed by a warm current of O-free N and 5 cc. of this soln. is mixed with 50 cc. N NaOH and diluted to 125 cc. with water. To 20 cc. portions of this are added, resp.: (a) 20 cc. 0.04 N NaOH (control); (b) 20 cc. 0.01 M thyroxine in 0.04 N NaOH; (c) 20 cc. 0.01 M thyroxine in 0.04 N NaOH; (d) 20 cc. 0.01 M monomethylhydroquinone in 0.04 N NaOH. The color intensity of each soln. is detd. by a Pulfrich photometer

with an S 47 filter wave length 470 m. From the degree of decolorization of the solns. the degree of oxidation of the carotene is deduced. The results show not only the protective action of thyroxine, but even more pronounced that of thyronine and of monomethylhydroquinone on maintaining the coloration of carotene. This anti-oxygen capacity of thyroxine is probably due to the suppression of oxidizing catalysts such as Fe or Cu.

**The autoglucolytic, autolipolytic and glucolytic power of adipose tissue from thyroxinized dogs.** G. Scoz. *Boll. soc. ital. biol. sper.* 8, 1567-70(1933).—The expts. were made on dogs, before, during and after treatment with thyroxine. The methods used were those previously described by S. The results seem to affirm that the autoglucolytic power of adipose tissue increases in the animal treated with thyroxine during and after the treatment; the glucolytic power increases during the treatment; and the autolipolytic power probably decreases during the treatment and increases afterward.

**Antidotism between sodium thiosulfate, mercuric and mercurous salts.** E. Menghetti. *Boll. soc. ital. biol. sper.* 8, 1589-91(1933).—HgCl<sub>2</sub> and HgNO<sub>3</sub> were used. In the animal organism HgCl<sub>2</sub> circulates mostly as chlorinated Hg; HgNO<sub>3</sub> is transformed immediately into HgCl; Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> is oxidized mostly into sulfate, passing through the polythionate phase. Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and HgCl<sub>2</sub>: No antidote action may be expected because HgS or Hg polythionates do not form. Instead, the following reactions may take place: (1) HgCl<sub>2</sub> + Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> = HgS<sub>2</sub>O<sub>4</sub> + 2NaCl (formation of a slightly sol. Hg salt); (2) HgCl<sub>2</sub> + 3Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> = Hg(S<sub>2</sub>O<sub>4</sub>)<sub>2</sub>Na<sub>4</sub> + 2NaCl (formation of a complex sol. Hg salt). In both reactions a decrease of Hg<sup>++</sup> ions is obtained compared to HgCl<sub>2</sub>. When HgCl<sub>2</sub> is still in the digestive tract, the 1st reaction may bring good results; the 2nd would prove harmful because Hg is extd. from the Hg-protein complexes and thus facilitates absorption. Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and HgNO<sub>3</sub>: The 2 react to form metallic Hg, HgS and a complex sol. Hg<sub>2</sub>-Na salt. Since in every case HgNO<sub>3</sub> is transformed into HgCl, the following possibilities arise: (a) when HgNO<sub>3</sub> is in the subcutaneous or muscle tissues or in the gastro-intestic tube the above-mentioned reaction is harmful because it transforms the slightly sol. HgCl into a sol. compd. easily absorbed such as the complex salt; (b) when HgNO<sub>3</sub> is injected intravenously, the reaction mentioned is useful because the HgCl formed in the circulation is highly dispersed and therefore the concn. of Hg ions is greater than that resulting from the products of interaction between HgCl and Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> (Hg and HgS, insol.; complex Hg<sub>2</sub>-Na salt little dissociated).

**The action of ammonium chloride on cardiac function.** B. Bassani. *Boll. soc. ital. biol. sper.* 8, 1591-3(1933).—The action of NH<sub>4</sub>Cl was studied on the cardiac function of the heart-lung prepn. The substance was injected in various doses and at different velocities. The results show that NH<sub>4</sub>Cl, in the heart-lung prepn., is either lethal or its action is very transitory even in doses approaching the lethal. If the velocity of injection is decreased, the prepn. resists doses greater than the lethal. Therefore, the detoxicating mechanism against NH<sub>4</sub>Cl is very active even in the heart-lung prepn.

**The action of opium alkaloids on the glucemic titer.** I. The action of morphine. Giovanni Rizzotti. *Boll. soc. ital. biol. sper.* 8, 1603-5(1933).—The mechanism by which morphine alone produces hyperglucemia is entirely different from that by which in assocn. with insulin it produces hypoglucemia. In the assocn. morphine-insulin the hypoglucemic action diminishes rapidly with diminishing dose of insulin but is hardly influenced by marked variations in the dose of morphine.

**The behavior of certain digestive enzymes in experimental intoxication by sodium fluoride.** Aldo Costantini. *Boll. soc. ital. biol. sper.* 8, 1605-8(1933); cf. C. A. 28, 210<sup>r</sup>.—There was a marked diminution in the digestive activity of the exts. of organs of guinea pigs which had received orally daily doses of 4 cg. NaF per kg. body wt. The diminution was not only marked compared to the controls but also greater than that of guinea pigs which

had received an equiv. dosage of NaF intraperitoneally.

**Peter Masucci**  
The stability of blood in relation to dilution and anticoagulants. Luigi Robuschi. *Boll. soc. ital. biol. sper.* 8, 1608-11(1933).—Neohirudin increases the sedimentation velocity (S. V.) of human blood; diln. with NaCl 40% decreases the S. V. of both citrated blood and of blood rendered incoagulable with neohirudin. Neohirudin also accelerates the sedimentation of red corpuscles of blood from tuberculous individuals; the S. V. may be twice that observed in citrated blood. P. M.

The behavior of the sedimentation velocity of blood by the action of anticoagulants and suspensions. Luigi Robuschi. *Boll. soc. ital. biol. sper.* 8, 1612-16(1933).—The anticoagulant (neohirudin) decreases the sedimentation velocity (S. V.) whether injected by itself or assocd. with the suspension (India ink); the suspension alone also produces a decrease in the S. V. but not so marked. The effect of the anticoagulant and suspension is not one of summation but of a semi-summation. The addn. of the anti-coagulant, or of the suspension, or of both, *in vitro* gives results similar to those obtained *in vivo*. Diln. increases almost proportionally the S. V. both *in vivo* or *in vitro* and at a concn. of 20% of blood the effects of the anticoagulant and suspension are nullified. P. M.

**Pharmacologic studies on thallium sulfide and iodide.** Salvatore Sapienza. *Boll. soc. ital. biol. sper.* 8, 1616-18 (1933).—That the transformation of TlCl in the organism into TlI or Tl<sub>2</sub>S would be of little or no advantage as an antidote measure is proved experimentally. The M. L. D. (intravenously) of colloidal TlI is about 0.00014 g.-equiv. per kg. of rabbit; that of colloidal Tl<sub>2</sub>S is similar to that of TlOAc, 0.0001 g.-equiv. per kg. When injected subcutaneously and the animals are sacrificed at various intervals, the following observations may be made: Tl<sub>2</sub>S produces a black stain which is transformed to a reddish color and then disappears. TlI produces a stain which disappears rapidly without undergoing any color transformation. Injected intravenously Tl<sub>2</sub>S is gradually oxidized to Tl<sub>2</sub>SO<sub>4</sub> and eventually transformed into TlCl like the acetate. Hence, the similarity of the pharmacol. action of the 2 compds. Injected subcutaneously, the transformation is: colloidal Tl<sub>2</sub>S → pptd. Tl<sub>2</sub>S → sol. Tl<sub>2</sub>SO<sub>4</sub>. Injected intravenously, colloidal TlI is transformed into sol. TlI; injected subcutaneously, the transformation is: colloidal TlI → pptd. TlI → sol. TlI. TlCl is about 70 times more sol. *in vitro* than TlI; *in vivo* the soly. of TlCl is much less. This may account for the fact that the 2 compds. behave quite similarly in their pharmacol. action. Peter Masucci

The action of sympathetic-parasympatheticomimetic drugs on the estrus. M. Maino. *Boll. soc. ital. biol. sper.* 8, 1626-8(1933).—The injection of adrenaline + follicular hormone or pilocarpine + follicular hormone does not in any way influence the estral reaction in spayed female rats. Estrus is, therefore, not disturbed by drugs which act on the sympathetic and parasympathetic endings of the vessels and of the muscles of the uterus and vagina. Peter Masucci

**Pharmacology of phosphorus.** The elimination after introduction of phosphates. Emilio Trabucchi. *Arch. fisiol.* 33, 1-32(1933).—The quantity of P eliminated by rabbits in the urine is inferior to the elimination in the feces. Large doses of NaH<sub>2</sub>PO<sub>4</sub> and Na<sub>2</sub>HPO<sub>4</sub> given by mouth or intramuscularly increase the urinary output only slightly; the initial increase is followed by a drop to subnormal values. Even intravenous injection has little influence on the urinary P in comparison with the elimination through the intestine. A. E. Meyer

**Diuresis.** V. The influence of intravenous injections of glucose solutions of different concentrations. G. Ravasini and A. Cossio. *Arch. fisiol.* 33, 33-66(1933); cf. C. A. 27, 340.—The quantity of urine, eliminated by the rabbit after intravenous injections of hypertonic glucose soln., is higher than the amt. injected. Iso- or hypotonic solns. cause an output of urine inferior to the liquid injected. VI. Diuresis after intravenous administration of sodium sulfate solutions. G. Ravasini and L.

1 Martini. *Ibid.* 67-91; cf. C. A. 27, 341.—Hypertonic solns. cause a urine flow exceeding the vol. of liquid injected, but part of the Na<sub>2</sub>SO<sub>4</sub> is retained. Isotonic solns. cause an elimination of salt and fluid at the same ratio, as injected, but the quantities are slightly smaller. Hypotonic solns. show a retention of fluid and of salt; this retention is the more marked, the more hypotonic the soln. is. A. E. Meyer

2 The excitability of the nervous system and sodium perchlorate. G. Spagnol. *Arch. fisiol.* 33, 219-30(1934).—See C. A. 27, 1945. A. E. Meyer

The action of ephedrine on the cardiac vagus excitability. Emilio Beccari. *Arch. fisiol.* 33, 247-60(1934).—Doses of 0.3-0.5 mg. per kg. cause first an increase, later a decrease, of excitability. A. E. Meyer

The lipid composition of the cerebrospinal centers as influenced by neurotropic substances. Giselda Biancalani. *Arch. fisiol.* 33, 261-73(1934); cf. C. A. 28, 1774.—The free cholesterol and its esters increase in ether and veronal narcosis. A. E. Meyer

The action of veratrine, eserine and nicotine on the neuromuscular activity studied by sound reflexes. R. De Marco and G. Boccia. *Arch. fisiol.* 33, 300-6(1934); *Boll. soc. ital. biol. sper.* 8, 1491-3(1933).—All 3 alkaloids produce an increase of the reflex activity. Nicotine and veratrine have a longer action than eserine. Nicotine first produces an inhibition of the reflexes for a certain period. A. E. Meyer

The influence of uric acid on the diffusion of dyes in the tissues and on inflammation. Wally Beltrami. *Arch. sci. med.* 57, 221-44(1933).—The injection of a soln. of uric acid into the peritoneal cavity of rats causes an increased diffusion when a dye soln. is injected into the tissues. The degree of diffusion varies with the nature of the dye. Some inflammations, such as produced by croton oil, are activated by uric acid. Inflammations produced by serum or casein are not greatly influenced. A. E. M.

The mechanism of diuresis and antidiuresis by mercury. Francisco Bua. *Arch. sci. med.* 57, 389-434(1933); cf. C. A. 27, 4300.—The influence of salyrgan in different types of disturbances is investigated. A. E. Meyer

Experimental production of hepatitis and cirrhosis. Vittorio Pennati and Luigi Telatin. *Arch. sci. med.* 57, 457-504(1933).—Blood and ascites liquid from animals with hepatic cirrhosis and ext. from human cirrhotic livers, when injected intravenously, produce liver cirrhosis in rabbits. A. E. Meyer

Intoxication with carbon tetrachloride and its treatment with calcium. A. Ravina. *Presse med.* 41, 809-10 (1933).—Treatment with CaCl<sub>2</sub> is successful. A. E. M.

Postoperative azotemia with chlorine deficiency cured with chloride medication. H. Chabanier, C. Lobo-Onell and E. Lelu. *Presse med.* 41, 987-90(1933).—A case is described and discussed. A. E. Meyer

Treatment with cod-liver oil by rectal administration. Robert Clément. *Presse med.* 41, 1001-2(1933).—Doses of 120 cc. for adults and 60 cc. for children given by rectum gave good results. A. E. Meyer

The action of monosodium phosphate in nervous depression of diabetic patients. Alberto Lacroze. *Semana med.* (Buenos Aires) 1934, I, 201-2.—Favorable results were obtained with doses of 2 g. 1 or 2 times daily 30 min. after meals. Undesirable effects on the elimination of ketonic compds. or on the gastric acidity were not observed. A. E. Meyer

Hyperthyroidism and Lugol treatment. III. J. Tillgren and Nils Sundgren. *Acta Med. Scand.* 81, 133-212(1934).—A study of 120 patients with very complete records. S. Morgallis

Behavior of 5-vanillalbarbituric acid in the rabbit organism. Eisci Kataoka. *J. Biochem.* (Japan) 19, 11-13(1934).—5-Vanillalbarbituric acid is synthesized by dissolving vanillin and barbituric acid in hot water, digesting the cryst. mass in H<sub>2</sub>O and recrystg. from hot MeOH. It is insol. in H<sub>2</sub>O, Et<sub>2</sub>O or benzene, sol. in EtOH or in hot Me<sub>2</sub>CO and MeOH. When 2-3 g. was fed to rabbits vanillic acid was found in the urine. The oxidation of

vanilla in the animal organism proceeds similarly whether it is administered free or in combination with barbituric acid.

S. Morgulis

**Effect of lead and zinc sulfides.** C. G. Santesson. *Skand. Arch. Physiol.* 67, 177-95(1934).—Injections of PbS into rabbits produce only slight effects at the site of the injection and a few insignificant bleedings or necroses in the liver but not typical Pb effects otherwise. Subcutaneous injections of ZnS cause more serious local irritation with inflammation but not to the same severe degree as HgS does. The bleedings and necroses in the liver are more extensive and numerous but not nearly as much as with CuS. In the kidney necroses of the epithelium with Ca infarcts were not very common.

S. Morgulis

**Effect of potassium and calcium on the heart.** C. E. Raha, M. Merikoski and A. Nyman. *Skand. Arch. Physiol.* 67, 211-20(1934).—K promotes the synthesis while Ca promotes the hydrolysis of creatinephosphoric acid. Furthermore, K may inhibit the hydrolysis and Ca the resynthesis of creatinephosphoric acid. K promotes lactic acid formation in so far as the energy set free in this reaction is utilized in the increased creatinephosphoric acid resynthesis. Ca promotes an increased lactic acid formation in the heart muscle which, however, is not sufficient to compensate for the creatinephosphoric acid hydrolysis, which proceeds far ahead of the lactic acid formation.

S. Morgulis

**The alteration of the electrical excitability of the heart vagus by various means. I. The action of heart remedies.** Chyutaro Saito. *Acta Schol. Med. Univ. Imp. Kioto* 16, 146-51(1933).—Digitalis bodies first increased and then decreased the excitability of the vagus and always increased the frequency and amplitude of the auricle while the amplitude of the ventricular beat may either be increased or decreased. Strophanthin decreased the amplitude of both auricle and ventricle, increased frequency and first increased and then decreased vagus excitability. Caffeine Na benzoate decreased frequency and amplitude of the auricle while the amplitude of the ventricle may be increased or decreased. Vagus excitability was first increased and then decreased. Vitacamphor and Coramine decreased frequency and amplitude of the auricle; they always increased the amplitude of the ventricle and always decreased vagus excitability. II. The action of salts.

*Ibid.* 152-8.—K decreased frequency and amplitude of auricular beat, had a variable effect on ventricular amplitude and first increased and then decreased vagus excitability. Ca usually decreased frequency, decreased both auricular and ventricular amplitude and usually increased vagus excitability. Mg increased frequency slightly, always increased the amplitude of the auricular beat and usually that of the ventricular. MgSO<sub>4</sub> first increased and then decreased vagus excitability, while MgCl<sub>2</sub> either increased frequency and vagus excitability or decreased both. NH<sub>4</sub> and Ba decreased all phases.

III. The action of pilocarpine, atropine, morphine, cocaine and chloral hydrate. *Ibid.* 159-64.—Pilocarpine seldom affected frequency, usually decreased amplitude of both auricle and ventricle and first increased and then decreased vagus excitability. Atropine seldom affected frequency, increased both amplitudes and had a variable effect in vagus excitability. Morphine decreased all phases. Cocaine increased frequency and decreased other phases. Chloral hydrate decreased frequency, amplitude of auricular beat and vagus excitability and had a varying effect on the amplitude of the ventricular beat. IV. The action of hormones. *Ibid.* 165-9.—Adrenaline produced a momentary increase, then a decrease of frequency, an increase in auricular amplitude, a decrease in ventricular amplitude and a variable effect on vagus excitability. Insulin produced slight decreases in frequency and auricular amplitude, a slight increase in ventricular amplitude and a decrease in vagus excitability. Thyroxine decreased all phases except ventricular amplitude which was increased after a preliminary decrease. Pituitrin decreased frequency, auricular amplitude and vagus excitability and increased ventricular amplitude.

T. H. Rider

**The chemotherapy of acetarsone (stovarsol) by intravenous and subcutaneous administration.** John A. Kolmer and Anna M. Rule. *J. Chemotherapy* 10, 37-42 (1933).—Acetarsone, Na salt (I), is well born by human beings in intravenous doses of 0.5-1 g. per week and when administered in conjunction with iodide and intramuscular Bi is of value in the treatment of neurosyphilis. The max. tolerated dose (rats) is 0.3 g. per kg. The min. trypanocidal dose (rats, intravenous) is 0.120 g. per kg., the chemotherapeutic index being 2.5 approx.

T. H. Rider

**The point of action of pilocarpine, tested on isolated toad heart-nerve preparations.** Kosuke Furuta. *Japan J. Med. Sci. IV. Pharmacol.* 7, 113-31(1933).—Detailed expts. are described leading to the conclusion that the effects of pilocarpine are complex and not directed to a single point of action.

T. H. Rider

**The reaction to fine- and medium-sized quartz and aluminum oxide particles. Silicotic cirrhosis of the liver.** Leroy U. Gardner and D. E. Cummings. *Am. J. Path.* 9 (Suppl.) 751-63(1933).—Of silica particles of 6-12 or 1-3 microns in diam., injected intravenously into rabbits, the largest particles were caught in the pulmonary capillaries, those of intermediate size in the spleen and hepatic lymph node, and the finest ones in the liver. Fine silica particles are most active and produce a progressive, coarsely nodular cirrhosis of the liver attended by extensive destruction of the parenchyma, followed later by regeneration in certain areas. Coarse silica particles, 10-12 microns in diam., are much less irritating and excite a simple foreign body type of reaction. The injury produced by silica is specific, since fine Al<sub>2</sub>O<sub>3</sub> particles of the same size produce no fibrosis in the stroma of any organ.

F. B. Seibert

**The effect of cesium chloride on transplanted tumors of mice.** Arthur W. Wright and Clarence F. Graham. *Am. J. Path.* 9 (Suppl.) 789-99(1933).—CsCl injected into mice which have Twort carcinoma does not affect in any way the capacity of the tumor cells to divide and multiply. On the contrary, the necrosis of the neoplastic tissue may be more extensive. If the CsCl is injected into mice before the tumor is implanted, then there is some evidence of its deterrent effect upon the growth of the neoplasm. There were 41.6 and 53.8% of takes in mice who had received Cs injections and 83.3 and 84.6% in the controls. When individual tumors appeared in the treated animals they were smaller and more firm in consistency than the control growths.

F. B. Seibert

**Benzene poisoning with hyperplasia of the bone marrow.** Dorothy H. Anderson. *Am. J. Path.* 10, 101-11(1934).—One patient with the complaint of weakness and bleeding from the nose and gums had progressive diminution of the cellular elements of the blood and the bone marrow was extremely hyperplastic. He had had considerable exposure to benzene.

F. B. Seibert

**Anthelmintic power of some chlorinated butanes in the cyclostomosis of the horse.** Marrenac. *Compt. rend.* 198, 510-12(1934).—To be active against the nematode worm responsible for the disease, a compd. must combine toxicity to all the developmental stages of the worm with relative insolub., so that it is not easily lost from the intestine. These conditions are fulfilled by 2,2-dichlorobutane and its unsatd. deriv., 2-chlorobutene, MeCCl:CHMe. In a dose of 0.2 cc. per kg. body wt. the effectiveness of these compds. is 4-6 times as great as that of other, classical, anthelmintics. The solubilities are so low that about 6 days is required for complete removal from the alimentary canal.

K. V. Thimann

**Association of the cinnamic (acid) radical and copper in the treatment of the leper.** Feron and André Lancien. *Compt. rend.* 198, 683-4(1934).—Intravenous injections of a colloidal soln. of Cu and the complex "cin-ethyl-formine" (Simionescu and Lancien, C. A. 19, 134) were administered to a large group of lepers. The results indicate that this treatment attacks the cause of the disease and alleviates the symptoms.

Julius White

On the reactions of reticulo-endothelial system follow-

ing the repeated injections of foreign materials. Yosimi Harada. *Trans. Japan. Path. Soc.* 22, 480-83 (1932).—The author found that in the repeated intravenous injections of foreign materials, lithium carmine, collargol and vaccines into the rabbits, there occurred generally severe hyperplasia of the reticulo-endothelial system in the spleen, liver, bone marrow, adrenals and lymph nodes, and also the proliferation of the alveolar epithelial cells were shown. I. S. Yun

Cinchona and civilization (Howard) 17. Pyrazolones derived from the carbethoxypiperidones (Englert, McElvain) 10. Furan compds. of barbituric acid (Iseki) 10.

Cattaneo, Cesare: Le cure salsodioidiche nelle malattie dei bambini. Fidenza: A. Mattioli. 25 pp. L. 1.20.

## 12—FOODS

F. C. BLANCK AND H. A. LEPFER

**Foods.** Walter H. Eddy, et al. *Am. Pub. Health Assoc. Year Book 1933* 34, 59-62. Rept. of the comm. reviewing the year 1933.

**Examination of fermented foods by laboratory methods.** Carl S. Pederson. *Am. J. Pub. Health* 24, 229-34 (1934); cf. C. A. 27, 349. —The quality of sauerkraut bears a definite relation to its chem. compn. Defects in fermentation or in canning can often be detected by careful analyses and proper interpretation of the results supplemented by a microscopic examn. J. A. Kennedy

**The colloid chemistry of wheat gluten.** Th. Ruemele. *Z. Untersuch. Lebensm.* 67, 41-50 (1934). —A study of the swelling phenomena of 12 different types of wheat gluten in oxalic acid of different normalities. 0.1 N oxalic acid is especially serviceable for showing the swelling capacity of gluten. For a quant. study of this phenomenon of swelling of gluten, oxalic acid is preferable to lactic acid, but the reverse is true with the flour itself. F. L. D.

**Tempering factors affecting the quantity and quality of wheat flours.** R. O. Pence and C. O. Swanson. *Kans. Agr. Expt. Sta., Director's 6th Biennial Rept. 1932*, 4950. The rate of evapn. from wheat and mill stocks does not primarily depend on the length of the tempering period nor upon the temp. of the tempering water, provided that the conditions are such that the tempering water is completely absorbed. The rate of evapn. is influenced by the character, moisture content, and temp. of the stocks. Relative humidity is the most important factor influencing evapn.; a relative humidity of slightly above 50% is the optimum. The length of the tempering time had no effect on the percentage of extn. or its distribution. That is, wheat tempered a short time ground as easily as that tempered a long time. Shriveled and extremely dry wheats required a considerably longer tempering period than plump wheats in good condition. The amt. of water absorbed by wheat during washing depends upon the original moisture content of the grain, its phys. condition and the speed of the revolving agitator. Wheat washing improves color of the flour, but does not consistently lower the ash content. C. R. Tellers

**Effect of certain salts on fermentation in dough.** R. H. Callow. *Analyst* 59, 156-60 (1934). —Practically all Ca compds. have an activating effect on yeast, and the effect on gas production is relatively larger on a weak yeast than on a strong one. Ca compds. also affect the gluten of dough so that it retains gas better, and apparently Ca also increases the rate of reproduction of the yeast. By adding 0.25 lb. of  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ , 0.1 lb. of  $\text{NH}_4\text{Cl}$  and 0.003 lb. of  $\text{K}_2\text{HPO}_4$  to a dough made from 280 lb. of flour, the fermentation losses are reduced at least 50%. W. T. H.

**A comparison of the leucocyte count, the bromothymol blue reaction and the catalase content of freshly drawn milk.** C. C. Prouty. *J. Dairy Sci.* 17, 75-81 (1934).

A total of 1019 samples of freshly drawn milk from the individual udder quarters of 40 cows in the early stages of lactation were tested. An av. leucocyte count of 225,000 was obtained for 870 samples from 31 cows free from pos. evidence of mastitis. As the leucocyte count increased, there was a deviation from normal which was more pronounced by the catalase test than by the bromothymol blue test. The percentage of animals producing milk normal by the bromothymol blue and catalase tests from all quarters and at all times is low. Fifteen references. James C. Munch

**Special milks.** Wm. B. Palmer, et al. *Am. Pub. Health Assoc. Year Book 1933* 34, 63-6; cf. C. A. 27, 3990. A committee report reviewing papers published in 1933 on vitamin D milk and homogenized milk.

**Bacteriological, chemical and biological studies of reconstituted milk.** Raymond Randall. *Philippine J. Sci.* 52, 219-33 (1933). A reconstituted fluid milk can be made in a properly equipped reconstituting plant from skim-milk powder, sweet (unsalted) butter and water, that closely agrees in compn. with pasteurized cow milk. The vitamin A requirement for rats was satisfied by 10 cc. per day and the requirements for vitamins B<sub>1</sub> and B<sub>2</sub> were satisfied by 20-30 cc. daily. James C. Munch

**Milk of unpleasant odor or taste; the influence of the feeding of the cows and of some industrial treatment.** A. Nevot. *Bull. acad. m'd.* 110, 50-1 (1933). —Feeding of preserved turnips or oil cakes causes only a slight odor in the raw milk. But when such milk is pasteurized and air is excluded during the whole process, a rancid or soapy taste is developed. This does not happen, if air has access during the cooling period after heating. A. E. M.

**Examination of one thousand milks by the Hortvet freezing-point process.** J. R. Stubbs. *Analyst* 59, 146-52 (1934). —Nine tables are given and explained. The av. f.-p. depression was 0.544°; individual results varied from 0.529 to 0.563°. No material difference was found between morning and evening milk nor between milk of different seasons. There was no apparent correlation between the f.-p. depression and the content of "solids not fat." W. T. H.

**Nitrates in milk.** W. F. Elvidge. *Analyst* 59, 170-2 (1934). —The danger of reporting nitrate when hypochlorite is present is pointed out. W. T. H.

**Quality of milk stored in containers of different metals.** E. Caserio. *Ind. ital. conserve aliment.* 9, 65-74 (1934). —The best results were obtained with Al of 98% purity. G. A. Bravo

**Protein, minerals and vitamins of evaporated milk.** Frank E. Rice. *Am. J. Pub. Health* 24, 194-8 (1934). Review with 33 references. J. A. Kennedy

**Manufacture of low-lactose skim milk for use in ice cream.** B. H. Webb and O. E. Williams. *J. Dairy Sci.* 17, 103-14 (1934). —Fresh skim milk contg. 5.9 lb. cane sugar per 100 lb., concd. in a vacuum, ppts. about 65% of the lactose, without altering dispersion of the milk proteins. Use of low-lactose milk for the manuf. of ice cream increases the milk solids-not-fat to 11-13%, this producing ice cream mixes with an improved body and texture, which may be handled without developing sandiness. James C. Munch

**Ice cream investigations.** W. H. Martin and W. J. Caulfield. *Kans. Agr. Expt. Sta., Director's Sixth Biennial Rept. 1932*, 68-71. —Whole fresh eggs in amts. up to 4% of the ice cream mix and egg yolks up to 2% improved whipping properties of the mix and the texture of the ice cream. Egg yolks for ice cream manuf. may be suitably preserved and stabilized by the addn. of 5% corn sugar, 1% glycerol, and 0.5% gelatin, and stored at 0-10° F. The ice cream made from the stabilized frozen yolks whipped approx. 2 min. faster than that made from a check mix contg. the unstabilized yolks. C. R. F.

**Manufacture of ice cream mixes in a vacuum pan.** W. J. Caulfield. *Kans. Agr. Expt. Sta., Director's*

**5th Biennial Rept. 1930, 80.**—In every case superheating the ice cream mix. to 180°F. or higher resulted in a cooked flavor in the finished ice cream. However, the body and texture and viscosity of the heated mixes and resulting ice creams were improved. The process reduces materially the bacteria present but cannot be recommended for com. use.

C. R. Fellers  
**Layer cheese.** G. Stamm. *Z. Untersuch. Lebensm.* 66, 593 (1933). Analyses are given and the general subject of this type of cheese is discussed. F. L. Dunlap

**Coloring of cheese by tin foil.** J. Gangl and F. Becker. *Milchwirtschaft. Forsch.* 15, 281-93 (1933).—Pasteurized cheese of sufficient acidity ( $pH < 5.0$ ), if a suitable oxidizing medium is present, will dissolve Sn from Sn foil whether it is pure or contains Sb or Pb. The black stain on such cheese is due to finely divided Sb or Pb, the gray stain to Sn. A method is described for detg. Sb in Sn foil.

B. C. A.

**Variable composition of casein and its role in the manufacture of cheese.** E. Cherbuliez. *Compt. rend. soc. phys. hist. nat. Genève* 50, 156 (1933); in *Arch. sci. phys. nat.* 15, (July-Aug.).—Of two cow milks, that contg. the higher proportion of the  $\alpha_2$  constituent (cf. C. A. 27, 4548) of casein coagulated the more readily. B. C. A.

**Effect of washing on the keeping quality of hen eggs.** Reece L. Bryant and Paul F. Sharp. *J. Agr. Research* 48, 67-89 (1934).—Eggs washed with a no. of different solns. did not lose wt. during storage at 35° more rapidly than unwashed eggs, but oil-dipped eggs showed a smaller loss in wt. than eggs that were not oil-dipped. A significant pos. correlation was found between the no. of pores in the eggshell and the loss in wt. of the egg. Washing in itself does not cause eggs to deteriorate if they are properly handled after washing. The deterioration of washed eggs is caused by bacterial infection of the egg from the dirt that was on the shell. W. H. Ross

**The choline factor of egg yolk and the phosphatide-lecithin number of egg lecithin.** F. R. Nottbohm and F. Mayer. *Z. Untersuch. Lebensm.* 66, 585-92 (1933).—A method is proposed for the detn. of choline in egg yolk. For the detn. of the egg content of foods a "choline factor" is serviceable. This factor corresponds to the amt. of choline found in 100 g. egg yolk. The proposed choline factor for the yolk from the eggs of hens and ducks is 1.000. The method of Brodrick-Pittard for obtaining egg-yolk lecithin is satisfactory. In the egg yolk of hens, practically all of the choline is in the form of choline-lecithin. Duck egg yolk seps., on mixing with H<sub>2</sub>O, a non-emulsifiable ingredient, but there is no reason to believe that the sepd. substance carries significant amts. of undetd. choline. As an expression of the ratio of the total phosphatide to the choline-lecithin, a "phosphatide-lecithin no." is proposed. This no. gives a significant view into the building up of those phosphatides which in the main consist of choline-lecithin and cephalin. The phosphatide-lecithin no. for hen egg-yolk lecithin is, in round nos., 1.4 and for that from ducks 1.5. The dried mass yields the following:

	Total phosphatide	Choline-lecithin	Cephalin
Hen egg yolk	19.99	14.27	5.72%
Duck egg yolk	16.48	10.90	5.58%

Calcd. to liquid egg yolk, hen egg yolk contains 8.53-10.90% phosphatide and duck egg yolk 7.96-9.77%.

F. L. Dunlap

**Meat extracts.** Giulio Buogo. *Ind. ital. conserve aliment.* 9, 75-7 (1934).—The methods for the detn. of H<sub>2</sub>O, Cl (as NaCl), amino acids and creatinine are given. The method of Baur and Barschall for the detn. of creatinine (cf. C. A. 6, 1180) does not give exact results. Analyses of typical com. meat exts. are reported.

G. A. Bravo

**Chemical and spectrophotometrical detection of gelatin in bouillon cubes.** H. Mohler, E. Helberg and F. Almasy. *Z. Untersuch. Lebensm.* 66, 602-6 (1933).—A discussion of methods.

F. L. Dunlap

**Antagonism of univalent and multivalent metals in bio-**

**logical processes.** H. H. King and J. L. Hall. *Kans. Agr. Expt. Sta., Director's Sixth Biennial Rept. 1932, 62-3.*—The hydrophilic antagonism of minerals in the lipin fraction of meat was applied to a study of the keeping quality of the meat. Bone meat improved the condition of the beef when the cattle were on P-deficient pasture. The cuts from the animals receiving the P supplement withstood decompn. better and were edible after a 30-day ripening period, whereas cuts from other animals were so decompd. that they were unfit for food. The elec. resistance of the fresh meat was outstandingly high. There was a significantly high Na:Ca ratio where shrinkage losses were high and spoilage was most pronounced. This is explained on the basis of the hydrophilic antagonism of Na and Ca. Elec. cond. has possibilities of being developed into an indicator of meat quality. The ripening process nearly reduces the elec. resistance of all samples to a common level. C. R. Fellers

**The examination of the edibility of [canned] tunny and sardines.** M. Pergola. *Boll. soc. intern. microbiol., Sez. ital.* 5, 283-7 (1933). The methods used in the Italian labs. for the systematic examn., prepn. of cultures, bacteriol. and bio-toxicological investigations are reviewed.

G. A. Bravo

**Rice in British Guiana, 1927-1932.** I. Varietal and industrial investigations. L. E. W. Codd and E. M. Peterkin. *British Guiana Dept. Agr., Rice Bull.* 1, 1-38 (1933). Six samples of paripiled rice prepd. from gram grown in British Guiana contained H<sub>2</sub>O 40.84-41.38, fat 0.43-0.58, protein 6.33-8.76, carbohydrates 78.79-81.19, fiber 0.17-0.34, ash 0.65-0.77 and P<sub>2</sub>O<sub>5</sub> 0.391-0.525%. The polished rice contained H<sub>2</sub>O 11.49, fat 0.34, protein 7.16, carbohydrates 80.21, fiber 0.34, ash 0.45 and P<sub>2</sub>O<sub>5</sub> 0.134%. The coarse and fine grades of the husks and embryos (contg. small amts. of broken rice from the sheller) contained H<sub>2</sub>O 10.72, 10.02; fat 4.56, 6.00; protein 8.40, 11.82; carbohydrates 60.01, 57.96; fiber 8.18, 5.13; ash 8.04, 9.07; and P<sub>2</sub>O<sub>5</sub> 0.390, 0.565%, resp. The bran from the 1st and 2nd cones, resp., contained H<sub>2</sub>O 9.85, 9.98; fat 18.42, 9.20; protein 12.99, 11.49; carbohydrates 44.73, 62.07; fiber 4.85, 1.42; ash 9.10, 5.24; and P<sub>2</sub>O<sub>5</sub> 0.769, 0.552. K. D. Jacob

**The soy bean as human food.** Frances L. Dittles. *J. Tenn. Acad. Sci.* 8, 323-5 (1933).—Chem. analysis of meal from *Glycine max* gave: moisture 9.9, protein 36.5, fat 17.5, N-free ext. 26.5, fiber 4.3 and ash 5.3%. The chief protein is glycinin, similar to the amino acids of beef but more available to the human organism.

A. Lloyd Taylor

[Report of] department of chemistry [on the protein content of bean varieties]. S. D. F. Harwood, L. W. Cole and I. B. Prowse. *J. South-Eastern Agr. Coll. Wye, Kept 1943, No. 33, 81-3.*—The Windsor, Long Pod, Maragan and Tick varieties contained 24.8, 27.9, 21.3 and 20.3% protein, resp. The starch equiv. was practically the same for each variety. K. D. Jacob

**Effect of preserving agents and spices on the digestion of proteins.** H. Amelung. *Chem.-Ztg.* 57, 614 (1933). Digestion of albumin is retarded slightly by 0.1% of H<sub>2</sub>SO<sub>4</sub>, H<sub>2</sub>BO<sub>3</sub>, salicylic acid, and various condiments and spices, but the retardation is less than with 0.5-2% NaCl, which is a normal constituent of prepared foods.

B. C. A.

**Pectin studies. II. Sugar-acid-pectin relationships and their bearings upon routine evaluation of apple pectin.** R. Stuewer, N. M. Beach and A. G. Olsen. *Ind. Eng. Chem., Anal. Ed.* 6, 143-6 (1934); cf. C. A. 27, 3536. The optimum pH of apple pectin jellies varies with the age of the sample, method of prepn. and concn. of pectin. For routine comparisons of pectins the jelly mixt. is prepd. without acid and is poured into a glass contg. an excess of acid. Amy LeVesconte

**The maturity test for grapes.** V. A. Putterill. *Farming S. Africa* 8, 427-9 (1933).—In 48 samples representing 14 varieties of grapes that had been packed for export, the sugar content ranged from 10.8 to 22.9% and the acid from 0.45 to 1.04%. In sweet grapes the sugar:acid ratios ranged from 15.9:1 to 32.5:1 and in sour grapes

from 9.1:1 to 10.8:1. Methods for detg. sugar and acids in grapes are outlined.

**Storage pit (bitterpit) of apples.** Len Verwoerd. *Farming S. Africa* 8, 418, 430(1933).—Development of bitterpit in apples during storage is due to a deficiency of water for the normal ripening processes in fruits of those varieties in which starch changes occur in an irregular manner; the deficiency of water is the result of harvesting maturing fruit in an immature condition. In the York Imperial and other varieties where starch hydrolysis takes place evenly and regularly throughout the fruit, no bitterpit occurs. Where starch hydrolysis is uneven and irregular, the cells maturing first draw their full water requirements from their neighboring cells, and these in turn from their neighbors; this procedure continues until eventually a no. of cells lack the required water for their starch hydrolysis, and these cells eventually die and through further chem. changes become brown and give rise to the characteristic lesions. The proper time for picking apples is shown by the presence of small spots of starch scattered through the pulp outside the core line but none within the core line, as indicated by testing with 1-KI soln.

**Apple flour.** F. Zago. *Ind. ital. conserve aliment.* 9, 19-21(1934). Apples are washed and broken in small pieces, dried at 55° and then milled. The chem. analysis of the flour gave:  $H_2O$  6.29, dry matter 93.71, pectin 7.04, cellulose 8.10, malic acid 1.44, tannic acid 0.45, reducing sugars 42.46 and sucrose 7.81%. G. A. B.

**The behavior of the coloring matter of the raspberry toward mineral water.** W. Diemair and J. Schormüller. *Z. Untersuch. Lebensm.* 67, 59-64(1934). The  $pH$  of fresh raspberry juice and raspberry sirup has been detd., also the color nuances after diln. of the juice with buffers. The  $pH$  of a no. of mineral waters was detd. as well as of admixts. of these with raspberry juice and raspberry sirup, the color nuances also being noted. The color and  $pH$  with increasing mineral water diln. were studied, and the stability of these mixts. at 100° was detd. In the study of the system raspberry juice-mineral water consideration was given to those factors responsible for its stability, of the optimal  $pH$  and the limiting values for fine color.

**Microscopic diagnosis of vegetables. II. Legume hulls, root and tuber vegetables, leaf and stem vegetables.** H. Volger. *Z. Untersuch. Lebensm.* 67, 1-41(1934).—Forty references.

**Composition of eggplant fruit at different stages of maturity in relation to its preparation and use as food.** C. W. Culpepper and H. H. Moon. *J. Agr. Research* 47, 705-17(1933).—The total solids are low at all stages of maturity and range from 7 to 9% of the fresh green wt. The total sugars vary from 2.0 to 3.5% of the fresh green wt. The starch, or other material converted into sugar by acid hydrolysis, and the titratable acidity are low and vary but little with stage of maturity. The differences in the compn. of the varieties studied are too small to be of any practical significance. Chem. and cooking tests indicate that the failure of the eggplant fruit to hold its form during cooking is due to the high moisture content of the material and to the change of a considerable part of the protopectin into pectin as a result of heating.

**Results of experimental cultures with some varieties of tomatoes in the Parma Province, in the year 1933.** F. Emanuele, A. A. Mazzotta, M. Guastalla and G. Mauri. *Ind. ital. conserve aliment.* 8, 283-91(1933); cf. *C. A.* 27, 3537.—Two varieties of English tomatoes and 21 of Italian, resp., averaged dry residue 4.10-6.00, 4.40-6.90; reducing sugars 1.95-4.54, 2.17-4.50; acid 0.40-0.55, 0.30-0.78; NaCl 0.045-0.059, 0.028-0.060%. G. A. B.

**Change in canned anchovies.** Rolando Cultrera. *Ind. ital. conserve aliment.* 9, 31-2(1934). A crystd. substance formed on the surface of canned anchovies was identified as tyrosine; to eliminate this, treatment with NaOH soln. before canning is recommended. G. A. B.

**The possibility of determining glucose in sirups and beverages.** Giulio Buogo. *Ind. ital. conserve aliment.* 9, 35-8(1934).—Formulas are given for the detn. of su-

crose, glucose and fructose in sirups and beverages; if they contain dextrans, the detn. becomes impossible.

G. A. Bravo

**Sirups from natural fruits, and beverages.** Giovanni Mauri. *Ind. ital. conserve aliment.* 9, 61-4(1934). Suggestions are given to avoid fermentation of beverages made with natural fruits sirups.

G. A. Bravo

**Reactions during the fermentation of honey.** G. Borries. *Z. Untersuch. Lebensm.* 67, 65-75(1934).—The fermentation of honey is a slow and weakly alc. one. The  $CO_2$  developed is partly given off and partly retained in the honey. The  $CO_2$  was detd. and from it, the amt. of fermented sugar was detd. This fermented sugar is but a small proportion of the total sugar. The  $CO_2$  remaining in the honey was detd. by the vol. increase in the honey when it was subjected to lowered pressures. No detn. was made of the increase in the amt. of free acid and volatile acids accompanying the formation of  $CO_2$ . Conclusion: In the fermentation of honey, it is not accompanied by AcOH and lactic acid fermentations. During fermentation, there is no loss in diastase.

F. L. Dunlap

**Determination of benzoic, salicylic, cinnamic and saccharic acids, and of the esters of *p*-hydroxybenzoic acid.** Rolando Cultrera. *Ind. ital. conserve aliment.* 8, 298-301(1933).—The method of Fischer and Stauder (*C. A.* 26, 4409) for the detection of these compds. in wines is applied to alimentary conserves; it is possible to obtain the sublimation of 0.01 g. of the antifermentive compd. from 10 g. sample.

G. A. Bravo

**Means of processing and packaging pecans for an extended use.** Genie F. Cameron. Texas Pecan Growers' Assoc., *Proc. 13th Ann. Meeting 1933*, 37-41.—When shelled pecans were stored in an O-free atm. of  $CO_2$  in hermetically sealed cans for 4-6 weeks the nuts developed a taste somewhat similar to that of coconuts or Brazil-nuts. The best results were obtained by sealing the nuts in cans with no further treatment.

K. D. Jacob

**The determination of chlorogenic acid in roasted coffee.** C. Massatsch. *Z. Untersuch. Lebensm.* 67, 88-91(1934). A brief discussion of various methods and polemical against the work of Plucker and Keilholz (cf. *C. A.* 27, 5838).

F. L. Dunlap

**Examination of coffee and coffee substitutes.** R. Strohacker. *Z. anal. Chem.* 96, 229-36(1934). A review of 18 papers.

W. T. H.

**Tea manufacture in Ceylon.** D. I. Evans. Tea Research Inst. Ceylon, *Bull.* 9, 70 pp.(1932?). The changes occurring during the processing of tea are discussed, with particular reference to moisture. The compn. and the degree of oxidation of the nontannin fraction of tea fermented under dry conditions were practically the same as in tea fermented under moist atm. conditions. The infusions of tea made under dry conditions were greener, and fermentation seemed to be slower.

K. D. Jacob

**Capsanthin determination in ground paprika products.** Laszlo Benedek. *Z. Untersuch. Lebensm.* 66, 600-2(1933). The colorimetric method of Zechmeister and Chelnoky (cf. *C. A.* 25, 4887-8) for the detn. of the coloring matter in paprika has been simplified. Results based on this simplified method are given.

F. L. Dunlap

**Inspection of commercial feedstuffs. Water-soluble protein in meat scraps and fish meal.** Philip H. Smith. Mass. Agr. Expt. Sta. *Control Series Bull.* 70, 50-2(1933); cf. *C. A.* 26, 5616.—In an effort to see whether water-insol. protein might not be a more accurate index to protein quality than total protein, 45 samples of meat scraps and 22 samples of fish meals were examd. The amt. of water-sol. protein in meat scraps was dependent upon the character of the material rendered. Samples which were high in connective tissue were also high in sol. protein. The fish meals contg. the lowest percentages of sol. proteins are probably glue residues. Fish meals show greater variability in sol. protein content than do meat scraps. In meat scraps the percentage of sol. protein of the total, varied from 17.3-54.9; and in the fish meals from 6.1-40.1%. No conclusions are deduced.

C. R. Fellers

**Results of silage making by the A. I. V. method.** L.

Spildo. *Tids. Norske Landbruk* 40, 84-6 (1933).—Silage made by the A. I. V. method from meadow grass, first-cut and aftermath, and from leaves of root crops is high in digestible protein and low in  $\text{PrCO}_2\text{H}$  and  $\text{AcOH}$ .

B. C. A.

Influence of feed on the color, chemical composition and cooking quality of the meat of grass-fat cattle. G. W. McCampbell, D. L. Mackintosh, W. L. Latshaw, J. I. Hall, Martha S. Pittman and Martha M. Kramer. *Kans. Agr. Expt. Sta., Director's Fifth Biennial Rept.* 1930, 70-2; *Sixth Biennial Rept.* 1932, 60-2; cf. *C. A.* 27, 1414.—The color of beef brightens very materially for a few min. after cutting. The color of the raw meat, muscle, has no correlation to the color, quality or palatability of the cooked beef. Blood analyses showed no significant variations among cattle kept on different feeds. The degree of unsat. of the fat (I no.) is inversely proportional to the moisture content of the original fat. The moisture content of the original fat is directly proportional to the m. p., i. e., the greater the moisture, the higher the m. p. The collagen content of meat ripened 30 days is approx. 60% that found in fresh meat. The av. muscle hemoglobin content was highest in animals fed on blue-grass alone; namely 0.458% as compared with 0.416 for those on corn and grass, and 0.396% for those in a dry lot. A moderate ripening period for grass-fat beef was satisfactory, but on prolonged ripening, the fat took on objectionable flavors. Without the addn. of water during cooking, the shrinkage varied 16-25%. The lean meat was much more const. in compn. than the fat among different cattle. In human subjects, balance studies showed that the protein and P of ground meat from very tender and from very tough cuts were utilized with the same ease. A high collagen and elastin content in meat did not affect the utilization of the meat by human beings. C. R. Fellers

Detrn. of the rancidity of fats (Korpácy) 27. Behavior of fruit juices and wines in their spectrographic examn. (Heiduschka, Muller) 16. Pecan oil (Simis) 27. Direct crystn. of citric acid from lemon juice (Ajon) 16. Preservation of cosmetics [and food products] (Bohm) 17. Starchless potato (Suit, Hihbert) 11D. Food product. Hubert C. Meyers. *Fr.* 757,454, Dec. 27, 1933. A product rich in proteins, mineral salts and vitamins is made by applying heat to the germ of grain, without carbonizing it, for a sufficient time to prevent rancidity and to remove bitterness without destroying the nutritive value.

Apparatus for mechanically preparing gluten from flour. Pierre Barbade (to Établissements Tripette & Renaud Fils). U. S. 1,948,453, Feb. 20. Various mech. and operative details are described.

Dough. Tritikum A.-G. *Ger.* 591,932, Jan. 29,

1934 (Cl. 53a. 2.01). Dough is formed by mixing rye meal to a paste with concd.  $\text{H}_2\text{O}_2$  soln.

Bread making. Willy Gätlin. *Fr.* 757,637, Dec. 29, 1933. A product favoring fermentation and cooking is made by introducing into a sirup of lactic acid, nutritive substances for yeast, i. e., saccharose and dextrose, and absorbing substances such as reduced flour (flour transformed to a paste and dried), and drying the mixt, which should contain at least 20% of lactic acid when dry.

Filter for milk, etc. Horace Cousins. *Brit.* 401,715, Nov. 20, 1933. A filtering element comprises 2 pieces of woven fabric with wadding secured between them by stretching and adhesive.

Tubular heat-exchange apparatus for cooling milk, etc. Albert T. Light (to York Ice Machinery Corp.). U. S. 1,949,126-7, Feb. 27. Structural features.

Reducing the acidity of butter, cream, fats, oils, etc. Otto Karpeles. *Austrian* 136,322, Jan. 25, 1934 (Cl. 53a). The material is washed with milk or skim milk, the acidity of which has been reduced by electrochem. treatment in known manner.

Junket powders. Crosse & Blackwell, Ltd., and Wm. Clayton. *Brit.* 401,395, Nov. 16, 1933. In making junket powders, which consist of sugar, rennet or pepsin and flavoring and coloring substances, a small amt., i. e., 0.1-1%, of an edible salt, i. e., Ca lactate, Mg citrate, which restores to heated milk the properties destroyed by pptn. of the Ca content due to heating, is added to the powder.

Preserving meat. Fernand Nieninek. *Brit.* 393,803, June 2, 1933. Divided on 393,935. Meat, except beef, is preserved by a single-stage process in a gaseous atm. at a suitable temp. by simultaneously withdrawing or displacing air from the storage chamber and replacing it by  $\text{CO}_2$  (mixed with N) so that the atm. contains more  $\text{CO}_2$  than O. In 393,935, June 2, 1933, beef is so preserved.

Pectin-sugar composition suitable for use in cakes, confectionery, jellies, etc. Robert M. Preston. U. S. 1,949,657, March 6. See *Brit.* 377,084 (*C. A.* 27, 3262).

Stable mayonnaise emulsion. Albert K. Epstein and Marvin C. Reynolds. U. S. 1,949,791, March 6. App. and various details of use in mayonnaise-emulsion manuf. are described. An inert gas such as N or  $\text{CO}_2$  may be used.

Preserving alimentary oils and fats. Swift & Co. *Ger.* 592,392, Feb. 6, 1934 (Cl. 53a. 1.01). See *Brit.* 399,639 (*C. A.* 28, 1883\*).

Emulsions. Ivo Deiglmayr. *Ger.* 575,922, Feb. 8, 1934 (Cl. 23c. 2). \*High percentage stable aq. emulsions of oil, fats or waxes are prepd. by the aid of pectin, the emulsifying being carried out in the presence of milk sugar.

Emulsions. Ivo Deiglmayr. *Ger.* 585,586, Feb. 8, 1934 (Cl. 23c. 2). Addn. to 575,922 (preceding abstr.). The method of 575,922 for making high percentage stable aq. emulsions of oils, fats and waxes by the aid of pectin and in the presence of milk sugar, is modified by replacing the latter by fruit sugar, invertose, grape or manna sugar.

Cocoa product. John H. Kellog, George L. Teller and Wm. K. Teller (to Battle Creek Food Co.). U. S. 1,947,717, Feb. 20. To remove theobromine selectively, material such as cocoa powder is treated with a reagent including an alc. such as  $\text{MeOH}$ , an alkali such as  $\text{KOH}$  and water, the liquid is sepd. and the sepd. solids are washed with 90%  $\text{MeOH}$ . Cf. *C. A.* 27, 5483.

Caffeine-free coffee. Wilhelmus H. Levelt. *Ger.* 592,355, Feb. 5, 1934 (Cl. 53d. 5). See *Brit.* 362,313 (*C. A.* 27, 1063).

Tannins, fatty acids, caffeine, theobromine and glycerol from coffee, cacao or maté. Franz Köck and Franz Messner. *Austrian* 136,388, Jan. 25, 1934 (Cl. 12c). These substances are recovered from the liquid by-product obtained in the process of *Austrian* 132,410 (*C. A.* 27, 3540). Methods of procedure are indicated.

## 13-GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

The importance of chemistry to planned industry. Wilhelm Krumbhaar. *Ind. Eng. Chem., News. Ed.* 12, 68-9(1934).

The future of the chemist in industry. S. Reginald Price. *Paper Maker & Brit. Paper Trade J.* 87, 121, 126, 128(1934).—An address. A. Papineau-Couture. *Some principles of industrial research.* H. A. Schwartz. *Metals & Alloys* 5, 49-53(1934).

Coordinating research with practical mill operation. K. A. Taylor. *Chem. & Metal Eng.* 41, 124 6(1934); cf. *C. A.* 28, 2527.

Transporting and handling bulk chemicals. R. F. Bergmann. *Chem. & Met. Eng.* 40, 474 7(1933).

Isothermal flow of liquid layers. C. M. Cooper, T. B. Drew and W. H. McAdams. *Ind. Eng. Chem.* 26, 428-31(1934).—See *C. A.* 28, 5436.

Glycerol ethers as solvents. Otto Merz. *Farben-Chem.* 5, 91-5(1934).—The b. ps., sp. grs., ns and solubilities in  $H_2O$  of a no. of glycerol ethers are tabulated. Glycerol dimethyl ether, glycerol diethyl ether, epithylin and -piphenylin are compared with ethylene glycol in their miscibility, solvency, evapn. rates. In general, they are miscible in all proportions with alcs., ethers, ketones, and esters; have good solvency for cellulose esters and resins; and are almost odorless.

Alignment chart for plant dilution problems. Norman M. Wickstand. *Chem. & Met. Eng.* 40, 487(1933).

Determining the efficiency of the radiant surface. A. G. Korenevskii and M. V. Meiklyar. *Izvestiya Isplokh. Inst.* 1933, No. 9, 23 6.—Calcs. are made of heat transfer.

Modern methods of attacking heat-transmission problems. C. H. Lander. *Trans. Inst. Chem. Engrs.* (London), Advance copy, Feb. 16, 1934, 10 pp.—Measurements of gas radiation, free convection from a horizontal wire in air at pressures up to 650 atm., and free convection from various surfaces by optical means are discussed.

Heat liberation and transmission in large steam-generating plants. E. W. Robey and W. P. Harlow. *Proc. Inst. Mech. Engrs.* (London) 125, 201-89; *Engineer* 136, 586-8, 611; *Engineer* 156, 524(1933).—Data from the literature are described with respect to mech. work, secondary air, heat release per unit vol. and the effect of thicker fuel beds, and principles are evolved which point to a reduction in boiler size. New exptl. data are reported for heat transfer and draft loss for gas flowing between parallel plates. Higher gas velocities in boilers are justified economically. Delayed heat release in flue gases and air-heater corrosion as affected by high gas dew points are discussed. Cf. Johnstone, *C. A.* 25, 1509.

Friction and heat transmission in moving fluids. Vladimir Margoulis. *Chaleur & ind.* 14, 347-56, 531 6, 591 6(1933); 15, 30-8(1934). A math. treatment of fluid flow with examples of exptl. verifications of the theories by various investigators.

New media for heat transfer in industry. Organic liquids as heat-transfer agents. Freitag. *Apparaturbau* 46, 11-12(1934).—A review of the development of the use of biphenyl and diphenyl oxide in the U. S.

Heat transfer in fire boxes. V. N. Timofeev. *Izvestiya Isplokh. Inst.* 1933, No. 9, 10 19. Calcs. are made of heat transfer in fire boxes.

Heat transfer between metal pipes and a stream of air. Edgar Griffiths and J. H. Awbery. *Ice and Cold Storage* 37, 14-16(1934).

Steam-film heat-transfer coefficients for vertical tubes. M. Hebbard and W. L. Badger. *Ind. Eng. Chem.* 26, 420-4(1934).—See *C. A.* 28, 544.

The absorption capacity of respiratory filters and their

limitations. Gerhard Stampe. *Angew. Chem.* 47, 95-9 (1934).—The filter action and absorption capacity are discussed and exptl. results are reported on the effects of gas velocity, gas concn., construction of air path, rest periods of the used filter before re-use and mutual influences of different gases in a filter. Thirteen references.

Consideration of the insulating properties of plastics. Marcel Belin. *Rev. gén. mat. plastiques* 9, 322-6(1933).—A brief discussion of the merits of plastics as elec. insulators.

Thermal insulation with aluminum foil. J. F. O. Strutton. *Paper, Trade J.* 98, No. 9, 37 9(1934).—Thermal insulation with a metal is obtained by taking advantage of the low thermal emissivity of Al foil and the low cond. of air. Al foil when applied is usually crumpled so that 3 layers take up an in. thickness of space. The advantages of Alfol, an Al-foil insulator, are discussed.

Polystyrene as an insulating material. N. P. Bogoroditzkii, G. F. Duletzkii and V. N. Malishev. *J. Tech. Phys.* (U. S. S. R.) 3, 831-39(1933).—Pure polystyrene at room temp. and relative moisture content of 60% had a specific vol. resistivity of  $\rho = 3 \cdot 10^{17}$  ohm/cc., and specific surface resistivity of  $\rho = 1.2 \cdot 10^{10}$  ohm/sq. cm. Pure polystyrene shows no variation of dielec. loss with temp. at high or low frequencies. Plasticized polystyrene shows no variation at high frequencies, but at low frequencies rises to a max. at 66.5° and then decreases.

Styrene-coated marble as an insulating material under high frequencies. N. P. Bogoroditzkii and G. F. Duletzkii. *J. Tech. Phys.* (U. S. S. R.) 3, 1200-2(1933).—Marble dried and then given a coating of polymerized styrene was found suitable for adoption as a radio insulator.

Heat content of mixts. of  $NH_3$  and  $H_2O$  as a function of the compn. and temp. (Zinner) 2. Heat conductivities of various liquids (Kardos) 2. Interferometer in air protection (Gorlach) 7.

Effecting endothermic reactions. Metallges. A.-G. (Helmuth Wendeborn, inventor). Ger. 577,103, Feb. 7, 1934 (Cl. 80c. 11). In effecting endothermic reactions such as the manuf. of cement and the thermal decompn. of sulfates, chlorides and alk. earth carbonates, a mixt. of the starting material with fuel and a substantial proportion of an inert material is supported on a grate through

which air is blown so as to effect combustion of the fuel. The presence of the inert material facilitates the completion of the reaction and the formation of a uniform product. The inert material may be, e. g., blast-furnace slag or the final product of a preceding operation. Examples and exptl. results are given.

**Magnetic separation of materials.** Bartel Granigg. U. S. 1,948,419, Feb. 20. Various app. and operative details are described.

**Mechanical separation of dust from gases.** Soc. d'électricité de la région de Valenciennes-Anzin. Fr. 757,541, Dec. 28, 1933.

**Removing condensable material from gaseous mixtures by adsorption.** Cornelius F. Abbott and Charles A. Conklin, 3rd (to the receiver of the Silica Gel Corp.). U. S. 1,948,779, Feb. 27. A gaseous mixt. such as an contg. moisture to be removed is successively contacted with 2 batches of adsorbent such as silica gel one of which is partially satd. with the condensable material and is under reduced pressure for enrichment of the mixt. and activation of the adsorbent, the mixt. being then cooled and condensate formed removed before passing the mixt. into contact with active adsorbent (an app. for periodical reversal of flow being described). Cf. C. A. 27, 5223.

**Separating mixtures of gases and vapors.** I. G. Farbenind. A.-G. (Fritz Stöwener, inventor). Ger. 592,417, Feb. 7, 1934 (Cl. 12e. 3.02). Addn. to 573,400 (C. A. 27, 3017). Mixts. contg. water vapor as well as other easily adsorbed components are treated with 2 or more adsorbents in series, as described in Ger. 573,400, under such conditions that water and one or more of the other easily adsorbed components are recovered together.

**Detecting the presence of gases.** Otto Schmidt. Ger. 591,710, Jan. 30, 1934 (Cl. 42l. 4.16). The presence of H, CO and NH<sub>3</sub> is detected by mixing powd. ZnO with a catalyst and noting changes of the dielec. const. of the mixt.

**Means for producing compressed gas from liquefied gas.** Leo I. Dana. Ger. 592,298, Feb. 6, 1934 (Cl. 17g. 5.02).

**Apparatus for freezing out water from compressed gases or gas mixtures to be liquefied.** Adolf Messer. U. S. 1,949,616, March 6. Various details of a compression and heat-exchange system are described.

**Apparatus for liquefying gases.** Sebastian Haller. Ger. 595,462, Feb. 9, 1934 (Cl. 17g. 1).

**Apparatus for liquefying solid carbon dioxide.** Philipp Stapp. Ger. 592,118, Feb. 1, 1934 (Cl. 12i. 35).

**Solid carbon dioxide.** Raymond C. Pierce (to York Ice Machinery Corp.). U. S. 1,949,179, Feb. 27. Various structural and mech. details are described of app. for manuf. of solid CO<sub>2</sub>.

**Apparatus for solid carbon dioxide production and compression.** Mark Shoeld (to Koppers Co. of Del.). U. S. 1,949,730, March 6. Various structural, mech. and operative details are described.

**Purifying liquids.** Éliée C. Duhamel and Compagnie générale des industries textiles. Fr. 757,503, Dec. 28, 1933. The sepn. from liquids of solids in suspension is facilitated by causing a modification of the compn. of the suspended particles, e. g., by adding an emulsion of fat to the liquid or by removing gas from the particles to cause them to sink or by increasing the vol. of the gas to cause the particles to float. Fr. 757,504. Removal or change of vol. of the gas attached to solid particles is used to purify liquids used for washing textiles, etc.

**Cleaning organic liquids.** Terlinden & Co. Swiss 163,269, Oct. 2, 1933 (Cl. 36d). Org. liquids contg. fat and dirt are cleaned by circulation in app. in which the

water and suspended particles are first removed. The fats are then removed by an adsorbent filter.

**Fusing inorganic substances.** Deutsch-englische Quarzschmelze G. m. b. H. Ger. 592,378, Feb. 5, 1934 (Cl. 80b. 8.17). Inorg. conductors of the 2nd class, e. g., bauxite, rutile, monazite sand and Cr<sub>2</sub>O<sub>3</sub>, are fused by electromagnetic high-frequency heating after they have been preheated, by another source of heat, to the temp. at which they become conductive.

**Crushing or milling gelatinous materials.** Carl Nachtigall. Ger. 591,536, Jan. 23, 1934, and 591,537, Jan. 24, 1934 (Cl. 22a. 8).

**Separating emulsions such as those of petroleum by the combined action of magnetic and electric fields.** Claudius H. M. Roberts (to Petroleum Rectifying Co. of Calif.). U. S. 1,949,660, March 6. Various details of app. and operation are described.

**Separating mixed material such as "run-of-mine" coal.** Richard Peale and Rembrandt Peale, Jr. (to Peale-Davis Co.). U. S. 1,949,729, March 6. Various structural and operative details of an air-pervious table app. are described. Cf. C. A. 28, 51.

**Freezing agent.** Hermann Geppert. Ger. 591,819, Jan. 30, 1934 (Cl. 12a. 7). Solid CO<sub>2</sub> hydrate is used as freezing agent.

**Warning of hydrocyanic acid fumigation.** Ludwig Gassner (to Deutsche Ges. für Schadlings-Bekämpfung m. b. H.). U. S. 1,949,466, March 6. There is added to a HCN fumigating compn. a warning agent having a higher vapor pressure than HCN, such as cyanogen chloride or bromide, and another warning substance having a lower vapor pressure than HCN, such as bromoacetophenone so that warning will be given throughout the period in which a toxic concn. of HCN exists.

**Mask for absorbing poisonous gases.** Modesto B. Seijo. U. S. 1,948,945, Feb. 27.

**Heat-insulating material suitable for use in building and refrigerator construction.** Merrill D. Squiers. U. S. 1,919,087, Feb. 27. Asphalt emulsion 10 is stirred into a mixt. of mineral 100 and soft water 1500 parts and the material is molded to desired shape.

**Apparatus for baking insulation on wire, etc.** Henry M. Larsen (to Western Elec. Co.). U. S. 1,947,993, Feb. 20. Various structural and operative details are described.

**Extrusion machine and method for sheathing electric conductors, etc., with two differently colored layers of rubber, bitumen, etc.** The Liverpool Electric Cable Co. Ltd. and Thomas H. Tweedle. Brit. 401,529, Nov. 16, 1933.

**Insulators.** Emil Schmalz. Swiss 163,900, Dec. 1, 1933 (Cl. 37g). A protective agent for the insulation of cables, etc., comprises water, CH<sub>2</sub>O, dextrin, a filling agent and linseed oil.

**Binder suitable for securing mica plates together.** George F. Hadley (to Westinghouse Elec. & Mfg. Co.). U. S. 1,948,756, Feb. 27. A mixt. of a vegetable drying oil such as China wood oil, a natural hydrocarbon pitch or stearin pitch, glycerol and a resin such as rosin is heated to 250-300° until the oil polymerizes, the resin reacts with the glycerol and all excess volatile matter is driven off, leaving a thermoplastic compn. suitable for use with mica in making high-voltage insulation.

**Sound-absorbing material.** Brouwer D. McIntyre (to Insulation Development Corp.). U. S. 1,947,788, Feb. 20. A sound-absorbing panel comprises an outer covering of vulcanized sheet rubber and a filler contg. about 60% of fibrous material such as waste jute and about 40% of powd. rubber.

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

**Rijkman's test on water supplies in the Madras Presidency.** W. J. Webster and T. N. S. Raghavachari. *Indian J. Med. Research* 21, 525-34 (1934).—In a series

of comparative tests with MacConkey's bile salt lactose broth on waters from a variety of sources, the Rijkman test (fermentation of glucose at 46°) was found to be an

reliable, samples showing true coli in 0.1 cc. giving, in some instances, a neg. Bijkman test in amts. up to 50 cc. Bijkman tubes which showed turbidity and occasionally acidity but no gas frequently yielded lactose fermenters on sub-culture. *Aerobacter aerogenes* is inhibited in Bijkman medium to a greater extent than *Es. coli*. Streptococci were noted far more frequently in the Bijkman than in the MacConkey tubes. R. E. Thompson

**Water supplies—mechanical filtration.** Ernest Minors. *Water and Water Eng.* 36, 79(1934).—Pressure filters and double coagulation with Na aluminate and Al sulfate are used. The bacterial count is thus reduced from 14,000/cc. in the raw river water to 65/cc. in the filtered water. Post-chlorination is used to lower the *Es. coli* tier.

**Principles of water purification.** W. C. Miller. *Eng. Contract Record* 48, 19 22, 80-81, 187 90(1934).—Water-purification practice is discussed. R. E. Thompson

**Purification of water. A practical method of purifying water for an army on the march.** M. Garret. *Tribuna farm.* 2, 56 8(1934); cf. C. A. 26, 1997, 4118.—Four light compact canvas filters will supply a squad of 25 men for 10 days on the march. For each man is supplied 2.1 l. of clean palatable water per day. The filter consists of a layer of  $KMnO_4$ , talc and alum, and one of  $Na_2S_2O_4$ , talc and  $Na_2CO_3$ , sepd. and covered with pressed cotton batting and flannel. G. H. Conant

**Recent developments in the field of water-works practice.** Henry A. Mentz. *Proc. Am. Soc. Munic. Engrs.* 39, 157-76(1933).—A rept. of the Comm. on Water Works of the Society. Applications of activated C, aeration, taste and odor control, the  $NH_4$ -Cl treatment, etc., are briefly mentioned. W. H. Boynton

**Determination of fluorides in natural waters.** J. M. Sanchis. *Ind. Eng. Chem., Anal. Ed.* 6, 134 5(1934). Slight modification of the Thompson-Taylor procedure (C. A. 27, 2072) to adapt it to routine detns. A. L. H.

**Chlamydomonas in storage reservoirs.** Stanley Thomas and J. W. Burger. *J. Am. Water Works Assoc.* 25, 991 2(1933); *U. S. Pub. Health Eng. Abstracts* 13, W, 100(Oct. 21, 1933).—Studies conducted at the Easton, Pa., water-works plant showed that *Chlamydomonas* may cause serious unpleasant odors and tastes in water. Their presence greatly increases the Cl demand of water. The organism may assume a variety of forms, some of which resist treatment with  $CuSO_4$  when used up to 8 lb. per million gals. C. R. Fellers

**Determination of the hardness of water with the potassium salts of acids from cottonseed oil.** E. A. Nikiforov. *Izvestiya Teplotekh. Inst.* 1933, No. 10, 42-4.—The natural cottonseed oil contains 22.26% of the glyceride of palmitic acid, 26.90% of that of oleic acid and 46.50% of that of linoleic acid, in addn. to 1.85% unsaponifiable matter. This oil was heated (for the prepn. of acids) on a water bath with a concd. soln. of KOH and the lumps, which were formed in the course of the process were dissolved in a large vol. of distd.  $H_2O$  and the soln. was filtered. The soap obtained was split with HCl and the excess of the latter was washed off with warm water. A 0.1 N soln. of the above acids, corresponding to 0.28° (German hardness degrees), was then prepd. in a manner similar to the C. Blacher, P. Grunberg, M. Kissa soln. (C. A. 7, 1938). The detn. of the hardness was carried out by the C. Blacher, *et al.*, method. The procedure is described and a few illustrations are given. A. A. Bochtlingk

**Lowering the residual hardness of the water during filtration.** Yu. M. Kostrikin. *Izvestiya Teplotekh. Inst.* 1933, No. 10, 44-5.—Expts. carried out with softening of water by the permute method indicate that a preliminary treatment of the water with lime, which should be pptd. after treatment; produces a water which is more suitable for boiler feed water than water which has received only a permute treatment. A. A. Bochtlingk

**Influence of the marble filter on the residual hardness of water softened by the soda-lime method.** N. E. Koshlyanskii. *Izvestiya Teplotekh. Inst.* 1933, No. 10, 47.—The procedure is reported in detail (results are

tabulated) and the following conclusions are derived: Filtration through crushed marble or other crushed stone lowers the residual hardness of water softened by the soda-lime method or preliminary lime treatment. The degree of the lowering of the residual hardness is in direct relation to the temp. of the water to be filtered and it is inversely proportional to the velocity of filtration. Crushed marble is 50% more efficient than sand-quartz filters. A. A. Bochtlingk

**Determination of the total hardness of boiler feed water.** E. V. Khalapsin. *Izvestiya Teplotekh. Inst.* 1933, No. 10, 40 2.—A crit. review of various methods is given. A. A. Bochtlingk

**Coagulation of organic substances in the Shatura power plant.** R. B. Grinberg. *Izvestiya Teplotekh. Inst.* 1933, No. 10, 40 50.—The boiler feed water derived from "Chernoe Ozero" was treated with  $Al_2(SO_4)_3$  and it was found that 20 mg. per l. does not effect a complete coagulation at 20° and even a treating temp. of 40° does not show an improvement, while 40 mg. produces better results at both temps. A further increase of the substance decreases the coagulation. The best conditions are: 40 mg. per l. of  $Al_2(SO_4)_3$  at 40° and a filtration velocity of 5 m. per hr. The method is discussed and the results are tabulated. A. A. Bochtlingk

**Solid matter in boiler-water foaming. II. Loss of foam-stabilizing properties at higher pressures.** C. W. Foulk and S. F. Whirl. *Ind. Eng. Chem.* 26, 263 7 (1934); cf. C. A. 26, 1997.—Studies made in an exptl. boiler similar to that of Joseph and Hancock showed that the rate of loss of foam-stabilizing power of solids (e. g., limestone) increases with the pressure (temp.) of the soln. At pressures of 7.0-10.6 kg. per sq. cm., the foam-stabilizing properties were lost in 5-10 min. "Solids that have lost their foam-stabilizing effects not only no longer promote foaming and priming in a boiler but actually reduce it because of the greater smoothness of boiling induced." Oscar T. Quimby

**Deposits caused by impurities of boiler water.** W. Reicher. *Gaz. Cukrownicza* 72, 280 302(1933). Deposits in boilers of a sugar plant consisting mainly of  $CaSO_4$  and humic acids were formed from so-called cold-water feeding. The humic substances may have had their origin in small amts. of sugar entering the boiler. Im proper lubrication was also a factor in the formation of deposits. J. Wiertelak

**Chlorinated copperas as a coagulant.** L. C. Billings. *Water Works and Sewerage* 81, 73-7(1934).—The use of chlorinated copperas ( $FeSO_4$ ) at the Dallas, Texas, municipal water works has resulted in marked savings and increased efficiency of coagulation of then highly turbid water. G. H. Young

**Reduction of corrosion in water pipe.** Edward S. Hopkins. *Ind. Eng. Chem.* 25, 1050(1933).—The  $pH$  of water is an indication of its corrosive action. Detailed analytical data show that water with a  $pH$  value at the satn. point of  $CaCO_3$  deposits a coating that retards corrosion. With bright Fe surfaces  $pH$  values between 5.0 and 9.0 are of equal merit in retarding corrosion by waters that do not form protective coatings. Lime treatment of water to give pipe protection is described, with cost data. R. R. Shaw

**Well water causes sewer stoppages.** M'Kean Maffitt. *Eng. News-Record* 112, 226(1934).—A sewer stoppage in an office building in Wilmington, N. C., was found to be due to a deposit consisting of 80-90%  $CaCO_3$ . The private well supply to the building contained 267 p. p. m. free  $CO_2$  and 196 p. p. m. Ca. R. E. Thompson

**New experiences with small sewage-treatment plants.** Paul Wiese. *Tech. Gemeindeblatt.* 35, 275-6(1932); *U. S. Pub. Health Eng. Abstracts* 13, S, 71(Nov. 4, 1933).—The disadvantages of Emischer tanks and Siedler tanks with Hoffman sepg. app. for treatment of sewage from sep. houses are pointed out. In an improved design the sludge and sewage are sepd. in a channel corresponding to the Hoffman sepg. app. and the sludge is carried by a sludge channel to a point beneath the scum layer in the digestion chamber. The object of the design is to prevent

access of septic sludge or liquid to the fresh clarified sewage.

C. R. Fellers

Performance of Dearborn's chemical sewage-treatment plant. A. M. Buswell. *Water Works and Sewerage* 81, 87-91(1934).—B. presents the results of a 30-day intensive study of the treatment at the Dearborn sewage works. The process tested consists of: (1) coagulation by use of lime, ferric salts and paper pulp (made from waste-paper collected from the city schools and municipal bldgs.), (2) sedimentation, followed by (3) rapid filtration through a Laughlin magnetite sand screen. Complete operating data and analytical results are included.

G. H. Young

Six months' operation of a chemical sewage-purification plant. G. H. Gleason and A. C. Loomis. *Public Works* 65, No. 3, 9-10(1934); cf. *C. A.* 27, 2510.—An exptl. sewage-treatment plant at Chicago, Ill., uses ferric sulfate for coagulation, followed by liming. Zeolite reaction filters are used for final treatment of the effluent. Solid sludge is collected on an Oliver vacuum filter and incinerated. The incinerator ash contains 30-32% Fe oxide, and is treated with 66°Bé.  $H_2SO_4$  at 150°; it is then leached with water in a rubber-lined steel tank. This gives an iron soln. which after diln. is applied to the raw sewage in the first dosing tank. The process has proved consistently more efficient and gives a better effluent than the activated-sludge process.

G. H. Young

Operation of Prüss pump at Baltimore sewage works. C. E. Kiefer. *Water Works and Sewerage* 81, 78-83; *Gesundh.-Ing.* 57, 54-7, 65-8(1934).—Comparison of a digestion tank having Prüss circulating equipment with a tank in which the sludge was not circulated showed that: (1) sludge digestion was not accelerated; (2) the solid content in the ripe sludge was much lower; (3) the liquefaction of solids was one half as great; (4) more digested sludge and less supernatant liquor were withdrawn; (5) less scum formation resulted; (6) heat losses from the tank were no greater; (7) there was no increase in the percentage of volatile solids in the ripe sludge withdrawn; (8) there was only a slight increase in the  $CO_2$  content of the gas; (9) the total gas production was increased 21%. Some operating difficulties were encountered.

G. H. Young

Notes on operation of sewage-treatment plants. LeRoy W. Van Kleeck. *Sewage Works J.* 5, 625-44(1933). The common methods of sewage treatment in New England are described. Plain settling, sep. sludge digestion, Imhoff tanks, septic tanks, sand filters and sludge drying are discussed.

E. Hurwitz

History of chemical precipitation. Leon B. Reynolds. *Sewage Works J.* 5, 595-9(1933).—A history of the chem. pptn. method of sewage treatment is presented, describing early English, French, German and American experiences as well as plants built and chemicals used. Results indicate that under favorable conditions the chem. pptn. treatment removed 80-90% suspended org. solids, 20-30% dissolved org. solids, 50-60% total org. matter and 80-90% bacteria. Chemicals used were 0.25-0.75 ton per million gallons. The remaining suspended and dissolved org. matter caused the effluent to be putrescible, and cost difficulties finally resulted in the abandonment of all plants except a few treating sewage high in certain industrial wastes.

E. Hurwitz

How sewage is purified. I. H. H. Bach. *Chem.-Ztg.* 58, 33-5, 46-8(1934). The various processes of sewage treatment and their applicability are discussed, including both mech. and biol. processes—both aerobic and anaerobic. For unknown reasons some sewages cannot be satisfactorily treated by the activated-sludge process. This process, when functioning properly, produces an effluent of very good quality.

M. G. Moore

Chlorination in sewage treatment. A. M. Ruwn. *Water Works and Sewerage* 81, 96-8(1934).—R. discusses briefly the general role of Cl in sterilization, in odor control, as an aid in coagulation, in reducing the  $O_2$  demand, in stabilization, structure protection, etc., in sewage treatment. Seventeen references.

G. H. Young

The selection and maintenance of mechanical sewage

equipment. John Lewis. *Sewage Works J.* 5, 652-4(1933).—Mech. sewage equipment should be selected on the basis of 3 important factors: (1) simplification which will reduce the no. of moving parts to a minimum; (2) durability and resistance to conditions of erosion and corrosion; (3) accessibility in order to insure proper maintenance. These factors are discussed in detail with information on maintenance and lubrication.

The Zentri-Sieb (centrifugal screen). Wilhelm Seeger. *Gesundh.-Ing.* 57, 68-70(1934).—A drum-shaped screen revolves on a vertical axis in the path of the sewage flow. Because of centrifugal force the heavier sewage solids are thrown away from the revolving screen and the sewage thus concd. leaves by one outlet; while another outlet carries the more dil. effluent which passes through the screen. The device is particularly useful in an emergency outlet as it enables the plant operator in times of high flow after heavy rains, etc., to deliver a large percentage of the sewage solids to the plant, while the more dil., partially purified fraction is by-passed. The screen is self-cleaning, since any deposit would be dislodged by centrifugal force.

M. G. Moore

The "population equivalent" in the estimation of the degree of pollution of sewage. H. Rohde. *Gesundh.-Ing.* 57, 45-6(1934).—Formulas are given for calc. biochem.  $O$  demand values for given temps. and time intervals from biochem.  $O$  demand  $\Delta$  obtained at 20° for either 5 or 20 days. Since av. German domestic sewage requires 45 g.  $O_2$  per contributing inhabitant per day, this value is taken as a measure of 1 unit population equiv. The population equivs. per 1000 kg. for various materials found in industrial sewage are given. The convenience of the unit in calc. plant dimensions, permissible load on a receiving stream, etc., is discussed.

M. G. Moore

The effect of sewage on cast-iron Venturi meters. C. I. Kiefer. *Eng. News-Record* 112, 44(1934).—Examn. of five 42 X 21-in. cast-iron Venturi meters installed at Baltimore, Md., in 1911 indicated that domestic sewage has little, if any, disintegrating effect on cast iron, provided it is free of  $O_2$  and grit and is not flowing at excessive velocities.

R. F. Thompson

Present trends in sludge disposal. Robert A. Allison. Ohio Conference Sewage Treatment, 6th Ann. Rept. 1932 35-7.

E. H.

Operation of activated-sludge plants practically considered. R. J. Spode. *Surveyor* 83, 391-2(1933). *U. S. Pub. Health Eng. Abstracts* 13, S, 58(Sept. 1933).—The fundamental requirements of a successful activated-sludge process are: (1) intimate mixing of the sludge and sewage during the aeration period; (2) preservation of aerobic conditions in the plant; (3) storage capacity in the plant to deal with the peak load flow; (4) provisions made for the regular and systematic discharge of surplus sludge under controlled conditions. The reactivation of sludge and activated-sludge disposal are also discussed.

C. R. Fellers

Circulation of sewage sludge. W. Husmann. *Techn. Gemeindeblatt* 37, 21-2(1934).—The practical significance of the lab. expts. of Herb (cf. *C. A.* 28, 239<sup>6</sup>) is discussed. The fact that  $CH_4$  production begins later in stirred than in unstirred sewage is explained as follows: Fresh domestic sewage is usually acid. Alk. reaction favors the development of  $CH_4$ -producing bacteria. In unstirred sludge, the sludge itself may acquire an alk. reaction, favoring  $CH_4$  fermentation, while the supernatant liquid is still acid. During stirring the acid liquid would be mixed with the sludge, keeping the whole acid for a longer period. In practice, stirring should not begin until  $CH_4$  fermentation has been established. In Herb's expts. the total amt. of gas evolved up to complete digestion is practically the same in the stirred and unstirred samples. The fact that the digested sludge shows the same compn. in both cases indicates the same type of fermentation took place in both cases.

M. G. Moore

Sludge digestion at Peoria, Illinois. Leon S. Kraus. *Sewage Works J.* 5, 623-34(1933).—The sewage-treatment plant of the Greater Peoria Sanitary and Sewage Disposal District is of the activated-sludge, sep. sludge-

digestion type. The sludge-disposal equipment is described. The method of operation of single- and two-stage sludge-digestion systems at 90°F., and the digestion of beer slops are also given. The sludge-digestion tanks were started by providing temporary heating app., filling tanks with water until heating coils were submerged and maintaining a temp. of 85-90° after sludge was introduced. The  $p_H$  was kept at 6.5 by addn. of lime until normal digestion brought this value above 6.5. The load is increased in such a way as not to increase greatly the percentage of volatile acids. Cost data and general conclusions based on 2 years of plant operation are also given.

E. Hurwitz

**Incineration of skimmings.** A. P. Banta. *Sewage Works J.* 5, 659-61(1933).—The practice of digesting the screenings and skimmings in the same tank with raw and activated sludge resulted in drying difficulties with the sludge from the main digestors. Incineration of skimmings at high temps. (1700°F.) with gas from the digestion tanks as fuel resulted in normal sludge-drying conditions and an efficient method of disposing of skimmings.

E. Hurwitz

**Detection and measurement of certain types of gases.** S. H. Ash. *Sewage Works J.* 5, 662-73(1933).—A general description is given of the phys. properties, physiol. action, measurement and detection of gases that may be encountered in the field of sewage treatment. After inspection of many types of sewer and sewage gases the following were found to be most common:  $CO_2$ , illuminants, O, H, CO,  $CH_4$ ,  $C_2H_6$ , gasoline vapor and N.

E. Hurwitz

**Sewerage system utilized for disposal of garbage.** C. E. Keefe. *Eng. News-Record* 112, 227-9(1934).—Equipment was installed in Baltimore, Md., in 1933, at a cost of \$8585, for grinding a portion of the garbage during periods of peak production, the pulp being discharged into the outfall sewer 2.1 miles from the sewage-treatment works. The equipment was operated for 24 days, during which period 1693 tons of garbage were disposed of in this manner. The av. sewage flow during the period was 83 million gals. per day. The power consumed in grinding was 4.35 kw.-hrs. per ton of garbage. The only effect on the operation of the sewage-treatment plant, which consists of settling tanks, trickling filters, humus tanks, digestion tanks, and sludge-drying beds, was an increased amt. of screenings, due to imperfectly ground corn husks, and appreciably increased scum formation in the primary settling tanks. Tabulated data are given showing the variations in the compn. of the raw sewage due to addn. of the garbage. Lab. expts. showed that garbage may be readily digested with sewage sludge in 30-40 days.

R. E. Thompson

**Report of the Water Pollution Research Board, for the year ended June 30, 1932.** Robert Robertson and H. T. Calvert. Dept. Sci. Ind. Research, *Rept.* 1932, 53 pp.—No improvement was noted in the treatment of beet-sugar-factory effluents in a percolating filter by inoculating the filter with organisms specially efficient in sugar oxidation. Lab. expts. to det. the effect upon biol. filtration of the addn. of N-compds. to pure substances such as sucrose, lactic acid and AcOH indicated that a ratio of C to N of 15 to 1 gave the best results.  $NH_4$  salts,  $NaNO_2$  and  $NaNO_3$  were equally effective as N sources. The presence of phosphate and K was found to be essential but optimum amts. were not detd. Errors in the biochem. O demand test on beet-sugar-factory wastes are as high as 1%. Dissolved salts and nitrogenous substances in diln. water effect O absorption. In 5 days the O taken up rarely exceeds  $\frac{1}{2}$  of the amt. required for complete combustion of sucrose to  $CO_2$  and  $H_2O$ . The biol. filtration of milk-factory effluents was similar to the treatment of beet-sugar-factory wastes. Aeration of the milk wastes reduced difficulties due to "ponding." In a survey of the River Tees cyanides in coke-oven wastes were found to be killing large nos. of fish. The cyanides could be rendered harmless by mixing with spent pickle liquor ( $FeCl_3$ ) or by aeration at 60°. A variation in the time of regeneration in a base-exchange water softener affects the exchange

value, which increases as the time of contact with the brine is increased from 2 to 90 min. NaCl in the water to be softened caused marked decreases in the softening powers of both synthetic and natural materials. With synthetic material complete softening did not occur in the presence of 0.2% NaCl. Water contg. 100 p. p. m. Al destroyed the exchange power of both synthetic and natural materials. Righty p. p. m. of Mn greatly decreased the exchange value but repeated brine treatment restored it. The activated-sludge process of sewage treatment was studied with the biochem. O demand test. No O absorption took place after sterilization of sewage in an autoclave or filtration through a Seitz disk or after treatment with chem. sterilizing agents if sterility was maintained. The time required for the methylene blue stability test was shortened by use of mixts. of sewage and sludge. The colloids in sewage form only a small part of the domestic sewage studied. The major portion of the dispersed matter will sep. by simple sedimentation or centrifuging. Gas-works effluents contain polluting substances known as crude  $NH_3$  liquor. Expts. have indicated that phenols and higher tar acids in  $NH_3$  liquor can be extd. by benzene, tritoyl phosphate and certain tar oils. Biol. purification of the wastes is accomplished at one plant. The process is expensive but av. purification of 80-90% is obtained as measured by the O consumed test.

G. L. Kelso

To what extent can the relation between permanganate consumption and chlorine number be taken to indicate pollution of waters? Alfons Kaess. *Gesund.-Ing.* 57, 30 2, 41 5(1934).—Investigations were carried out on a dil. sewage, a drinking (ground) water and river water. Permanganate consumption was detd. by the method of Kubel-Tiemann,  $Cl_2$  no. by Frohse's modification (cf. C. A. 15, 913) of the method of Ilmanowitsch and Zaleski except that the reaction mixt. was heated 30 min. in a rapidly boiling water bath. Data presented in tables and graphs indicate that the ratio (permanganate consumption)/( $Cl_2$  no.) cannot be taken as an index of fecal pollution and that this value shows no definite relation to the coli titer. In cases where pollution is slight (as it would be in drinking waters) the org. matter is readily oxidized although optimum conditions of temp.,  $p_H$ , etc., may favor multiplication of *Es. coli*. The permanganate consumption and  $Cl_2$  no. were parallel in samples of the same river water taken on various days.

M. G. Moore

**Treating a badly polluted supply.** Horace A. Brown. *Water Works Eng.* 87, 204-7(1934).—A discussion of the treatment of a water in which the bacterial count ranges from a few thousand per cc. to several hundred thousand. Sufficient lime is added in an aeromix to maintain a  $p_H$  of 10.5. The water then passes to the flocculator from which it flows through a baffle system to a primary settling basin. Soda ash is added in the basin to reduce non-carbonate hardness to 10-15 p.p.m.  $Al_2(SO_4)_3$  is also added to bring the  $p_H$  to 9.8. From the primary basin the water passes over a second baffle system to the secondary settling basin which is equipped with a clarifier. It then passes to an aeromix where sufficient  $CO_2$  is added to maintain a residual of 0.88-1.0 p. p. m. of free  $CO_2$  and a  $p_H$  of 7.7 in the influent to the filters.

W. A. Moore

**Observations on changes in numbers of bacteria in polluted water.** C. T. Butterfield. *Sewage Works J.* 5, 601-22(1933).—The av. results of intensive observations made on bacterial changes occurring in 166 samples of polluted water collected from 4 sources (2 points on the Ohio River, a small stream draining a densely populated area, and a city sewer) and held at 10°, 20°, 37° indicate that at all 3 temps. the bacteria increased to a maximum and then decreased. The rate of increase in no. of bacteria varied with the temp. of storage, the rate being most rapid at the higher temps. A study of the following factors was made to det. which might affect the tendency of the bacteria in the samples to increase and decrease in nos. on storage: the nature of the containing vessel, size of sample, exposure to light, the presence or absence of an air surface and occasional agitation of the sample. Centrifuging or filtering a sample very materially increased

the tendency of the bacteria to multiply on storage. As waters in a polluted stream, after max. bacterial concn. has been reached, tend to a consistent and rapid decrease, the results show that the more extensive the interference with normal conditions, the greater the increase in bacterial nos.

E. Hurwitz

**Impurities in water and their elimination.** A Taibo. *Quim. e ind.* 10, 305-9(1933).—A general review.

O. W. Willcox

**Purification of cyanide-containing waste waters.** Friedrich Neuwirth. *Berg- und Hüttenmannisches Jahrb.* 81, 126-31(1933).—Two methods are described to free waste waters of cyanides in solu.: (1) By action of  $\text{CO}_2$ -contg. waste gases which liberate  $\text{HCN}$ . The latter can eventually be recovered. This method has been successfully used in actual operation. (2) By action of ozonized air. This reaction is somewhat slow but can be accelerated by addn. of Fe and Mg salts as carriers of O; this can be simply done by using Fe ores for filling the reaction towers. The latter method also destroys the phenols in phenol-contg. waste waters.

M. Hartenhiem

**The harmful effect of ammonia liquor and still waste of coke plants on the fish in public waters.** G. A. Brendler & Brandis and W. Keeman. *Helv. Gas* 54, 2-13(1934).—A review. Data (15 tables) are given on the compn. and quantity of ammonia liquor and of still waste of various types of plants, on the toxicity of  $\text{PhOH}$ ,  $\text{Ca}$ ,  $\text{CNS}$ ,  $\text{CN}$ ,  $\text{NH}_3$ ,  $\text{NH}_4$ ,  $\text{H}_2\text{S}$ ,  $\text{PhNH}_2$ , pyridine, tar,  $\text{CO}_2$  and  $\text{SO}_2$  for fish; methods for improvement of the waste liquors are discussed. An extensive reference list is given.

B. J. C. van der Hoeven

**Effect of sunlight on dissolved oxygen in the White River.** C. K. Calvert. *Sewage Works J.* 5, 685-94(1933).—Although the measure of dissolved O in a polluted stream is of value in detg. the condition of the water, expts. made on samples of polluted water from the White River, Indiana, indicate that conditions of temp. and light and darkness affect these values; consequently they must be used with care and in full knowledge of conditions. By comparing chloride concns. with dissolved O values under varying conditions, the following conclusions were reached. The org. load in the White River below Indianapolis is frequently such that in bright sunlight the biologic activity of the river is able to maintain considerable O concn., but in the absence of sunlight the O content may be zero.

E. Hurwitz

**Use of copper and silver for the elimination of micro- and macroorganisms from swimming-bath water.** H. Ivekovic. *Z. Gesundheitsleh. Statist.* 24, 251-4, 314-20(1932).

E. H

**Experimental application of chloropicrin and carbon disulfide in the control of mosquito larvae and pupae.** A. Politov. *Med. Parasitology and Parasitic Diseases* (Moscow) 1, No. 1, 32-6(1932); *Trop. Diseases Bull.* 30, 606-7(1933); *U. S. Pub. Health Eng. Abstracts* 13, Ma, 31 (Nov. 25, 1933).—Unless atomized or used as a fine spray chloropicrin sinks to the bottom of pools or streams. In both lab. and field expts. a concn. of 1.0% in 5-6 min. killed all larvae, pupae and immature mosquitoes; at 0.1% concn. up to 90% were killed during the first 30 min.; at 0.01% concn., nearly all larvae were killed after 22 hrs. The action of chloropicrin upon larvae is much more rapid than upon pupae. The action of the poison is both phys. and chem.; it poisons and acts as an adhesive. It destroys tadpoles, fish and other animals in the water as well as mosquitoes. However, the drinking of water contg. 0.1% chloropicrin had no harmful effect upon larger animals. By spraying the chemical on the surface, the max. larva destruction occurred. The rate for swamps was 0.01-0.02 g. per l. and was very effective. The use of chloropicrin is independent of atm. conditions.  $\text{CS}_2$  was tested in the same way as chloropicrin but was less toxic.

C. R. Fellers

**Smoke of cities and industrial centers.** N. P. Danilov. *Vsesoyuzniy Nauch.-Issledmatel. Inst. Vodostokhneniya i Sanitarnoi Tekh. (All-Union Sci. Research Inst. Water*

*Supply Sanit. Tech.*) 1932, 24 pp. (Separate).—The discussion of the smoke and soot nuisance of the city and industrial centers and of the measures for its abatement is based on the practice of Europe and America. Recommendations are made to follow the findings and legislation of America in combating the smoke evil by tech. improvements.

**Fertilizer from activated sludge** (Hincks) 15. Rept. on Bur. of Standards pipe-coating investigation (Wood) 9.

**Ashworth, J. R.:** Smoke and the Atmosphere; Studies from a Factory Town. London: Manchester Univ. Press. 143 pp. 7s. 6d. Reviewed in *Nature* 133, 362 (1934).

**Water purifying.** Carbo-Norit-Union Verwaltungs-G. m. b. H. (Max Jaenicke, inventor). Ger. 591,527, Jan. 23, 1934 (Cl. 85b. 1.01). The effective life of water-purifying masses contg. active C, coke, wood charcoal, etc., is prolonged by treating the water with  $\text{CO}_2$  before purification.

**Apparatus for electroosmotic purification of water or other liquids.** Oswald Gerth (to Siemens-Elektro-Osmose G. m. b. H.). U. S. 1,949,467, March 6. Structural features.

**Treatment of water.** Minami Manshū Tetsudō K. K. (Inosuke Watanabe and Kitarō Sagada, inventors). Japan. 100,177, March 20, 1933. Addn. to 94,848 (C. A. 27, 2747). Water contg. free  $\text{CO}_2$  and bicarbonate is mixed with  $\text{Ca(OH)}_2$  more than twice the equiv. of the  $\text{CO}_2$  and the bicarbonate in the water; thus the bicarbonates of Ca and Mg are pptd. The treated water is then mixed with fresh water in such amt. that a small amt. of  $\text{Ca(OH)}_2$  remains after pptn. of  $\text{CO}_2$  and bicarbonate in the added water. The remaining  $\text{Ca(OH)}_2$  is pptd. by adding  $\text{NaHCO}_3$ .

**Apparatus for softening water by use of zeolitic material** Andrew J. Dotterweich (to Automatic Water Softener Co.). U. S. 1,919,044, Feb. 27. An electrically controlled valve system, etc., is described.

**Artificial zeolites.** Arlie W. Schorger (to C. F. Burgess Laboratories, Inc.). U. S. 1,949,360, Feb. 27. An aq. gel is formed of a compd. of base-exchanging character and the gel is then frozen, in order to obtain a product of high base-exchange capacity.

**Apparatus for treating water for boilers, etc.** Minami Manshū Tetsudō K. K. (Inosuke Watanabe, Masuzo Isokane and Kitarō Sagada, inventors). Japan. 100,178, March 20, 1933. Diagrammatical.

**Prevention of fur and rust in water containers.** Akt.-Ges. für Hydrologie. Swiss 163,557, Nov. 1, 1933 (Cl. 43). The formation of fur and rust in vessels contg. water which is not heated to boiling is prevented by adding a neutral  $\text{NH}_4$  salt such as  $(\text{NH}_4)_2\text{SO}_4$  to the water.

**Sewage disposal.** Champlain L. Riley (to Industrial Associates, Inc.). U. S. 1,949,181, Feb. 27. Sewage is concd. to form sludge and the sludge is centrifugally atomized in a current of hot gases to convert the sludge into dry comminuted solid form of uniform moisture content suitable for use as a fertilizer.

**Apparatus for treating sewage water with purifying slurry.** Barnag-Meguain A.-G. Ger. 591,528, Jan. 23, 1934 (Cl. 85c. 3.02).

**Mechanism for collecting and removing sludge or grit from sewage and other sedimentation chambers.** The Dorr Co., Inc. Brit. 401,804, Nov. 23, 1933.

**Polluted-water purification.** Oliver M. Urbain (to Charles H. Lewis). U. S. 1,947,747, Feb. 20. A polluted water contg. alcs. and amines such as the waste water from packing houses, canneries, etc., is treated with a mono acid halide of a "dibasic" acid such as succinic acid in at least gram-mol. equiv. proportion to the alcs. and amines present, and  $\text{Ca(OH)}_2$  or  $\text{Ba(OH)}_2$  is added to form insol. products. Cf. C. A. 28, 846<sup>a</sup>.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

**The American system of soil surveying and mapping.** Charles F. Shaw. *Arch. Suikerind.* 42, 53-9(1934).—Reply to criticisms by Koningsberger et al. (*C. A.* 27, 515). Postscript. V. J. Koningsberger. *Ibid.* 59-61. Rebuttal. F. W. Zerbe.

**Studies in Malayan soils. III.** R. G. H. Wilshaw. *Malayan Agr. J.* 22, 4-24(1934).—Large quantities of N may be lost from nitrogenous fertilizers in the form of  $\text{NH}_4$  ion under fallow conditions on some soils in this country within a very short time, apparently on account of heavy leaching combined with a slow rate of nitrification and a low absorption or retaining capacity of the soil colloids. Malayan conditions are practically ideal for the rapid and complete destruction of org. matter to  $\text{CO}_2$  and  $\text{H}_2\text{O}$  and unsuitable for the formation of humus on the plains of Malaya, on free-draining soils. Where covers have been turned into the soil, the amt. of humus subsequently extd. shows no real increase. Immediately after turning in green manures, rapid production of ammoniacal and nitrate N occurs, and this production is absorbed by growing plants. J. R. Adams

**Report of the assistant director and agricultural chemist.** A. J. W. Hornby. Nyasaland Protectorate Dept. Agr., *Ann. Rept.* 1932, 36-47(1933).—*Soil investigations.* The qualities of Nyasaland soils progressively increase to maxima at depths ranging from approx. 10 to 90 in., depending on the soil type, and then decrease more or less rapidly at further depths. The  $\text{SiO}_2\text{-Al}_2\text{O}_3$  ratio in the clay fraction of the soils increases in inverse proportion to the av. annual rainfall. For soil work in Nyasaland analysis of the clay fraction gives useful information for characterizing series and types. *Chlorides in Nyasaland macco.* Data are given on the amts. of K, Cl, Ca and Mg in numerous samples of the dried leaves. The  $\text{K}_2\text{O-Cl}$  ratio varies within wide limits according to the rainfall during growth, the form in which K is supplied, the type of soil on which the tobacco is grown, the length of time required for ripening, and the variety of the tobacco. As compared with other tobaccos, Nyasaland tobacco is low in Mg, Ca and Cl, and the  $\text{K}_2\text{O:Cl}$  ratio is usually high. K. D. Jacob

**Report of the mycologist for 1932.** R. Leach. Nyasaland Protectorate Dept. Agr., *Ann. Rept.* 1932, 53-4(1933).—*S deficiency in soils.* Cowpeas grown on soil affected with tea yellows and not fertilized with S produced very few root nodules. Addn. of S to the soil caused ten-fold increase in the no. of root nodules, and also increased the size and no. of leaves per plant. K. D. J.

**The composition of the soils used in the Potterne transplant experiments and of portions of Centaurea and Silene grown thereon.** C. G. T. Morison. *J. Ecology* 21, 475-8(1933).—Data are given on the phys. and chem. compns. of the soils and on the N, Ca, P, K and ash contents of the leaves of *Centaurea nemoralis* and of the roots of *Silene vulgaris* grown thereon. K. D. Jacob

**Physical and chemical properties of the soils of the Hulton and Morton areas, Monroe County, and their relation to orchard performance. III.** J. Oskamp and L. P. Batjer. Cornell Univ. Agr. Expt. Sta., *Bull.* No. 575, 34 pp.(1933).—Soils in which the colloid fraction of the  $B_1$  horizon is not greater than that of  $A_1$  possess satisfactory internal drainage for orchards. Where the rate of  $\text{H}_2\text{O}$ -percolation through  $A_1$  is more than 2.5 times that through  $B_1$ , injurious water-logging is to be anticipated. High satn. with bages is assocd. with poor drainage of soils and low productivity, and vice versa. The limiting factor in orchard production in this area is slow drainage rather than fertility. B. C. A.

**Studies of West Indian soils. III. The cacao soils of Tobago.** F. Hardy, C. G. Akhurst and G. Griffith. *Trin. Coll. Trop. Agr.*, Trinidad, 23 pp., Suppl. to *Trop. Agr.* (Trinidad) 8, No. 2(1931); cf. *C. A.* 26, 2002.—Samples (334) were collected from 35 profiles and examd. for reaction, index of texture, org. matter, N, readily

available plant nutrients and rate of soln. of plant nutrients. The cacao soils are immature, shallow, nearly neutral, sandy and fairly well supplied with org. matter. Nearly all soils yielding over 8 bags of cacao beans per 1000 pickets had high C/N ratios with an av. of 8.7; all those yielding under 8 bags averaged 6.6. High pos. correlations were found between yielding capacity and rate of soln. of soil nutrients and org. matter content of the top soil. These soils are frequently deficient in  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$ . The soil types, rock weathering and soil formation in Tobago are discussed. A. L. Mehring

**A new apparatus for measuring soil shrinkage.** A. N. Puri, E. M. Taylor and A. G. Asghar. *Soil Sci.* 37, 59-63(1934).—An app. is described for measuring pore space, apparent density and shrinkage of moist soil on drying. Typical shrinkage curves are given. Soils satd. with Na, K, Ca and Ba show little difference in the characteristics of their shrinkage curves. M. S. A.

**The settling volume of soils.** H. E. Middleton and H. G. Byers. *Soil Sci.* 37, 15-27(1934).—The settling vol. of soils and soil colloids is measured on a group of 10 soils of widely differing character, taken from soil-erosion expt. stations. This is a new soil- $\text{H}_2\text{O}$  and soil colloid- $\text{H}_2\text{O}$  relation. The detn. is made as follows: Place the air-dry equiv. of 50 g. of dry soil in a beaker, add about 40 cc. of  $\text{H}_2\text{O}$  and thoroughly agitate, place in a vacuum desiccator and evacuate, boiling at room temp. Transfer to a 100-cc. graduated cylinder, shake, make up to a total vol. of 100 cc., allow to settle 24 hrs. and note the vol. Shake the graduate again and allow to stand 24 hrs. Repeat the process until const. vol. is reached. The vols. vary from 41 cc. for Kurvin fine sandy loam, A horizon, to 68 cc. for Marshall silt loam, B horizon. There is some relation between the settling vol. of soils and their erosion ratio (*C. A.* 26, 5306). The sp. grs. of the suspensions of 9 soil colloids vary from 0.38 to 0.63. The vol. wt. at the settling vol. is the lower limit to which the field vol. wt. may approach. The term "water saturation capacity" is used to define the percentage  $\text{H}_2\text{O}$  content of soils at their settling vol. A comparison is made of this value, the  $\text{H}_2\text{O}$  absorption and the moisture equiv. of soils. All of these values are affected by the soil colloid compn. as well as by soil texture. The settling vol. of soil colloids is affected by the character of the acids and oxides present, the org. matter and the kind and quantity of bases. M. S. Anderson

**Mechanical properties of disperse systems. II. The deformation of soils by pull.** G. I. Pokrovskii and V. G. Bulnichev. *Kolloid-Z.* 66, 137-9(1934); cf. *C. A.* 26, 5684; 27, 5608.—The equation, previously deduced, applies to both pressure and pull strains. There is no step-wise change in the elasticity modulus on passing from a pressure to a pull force. Arthur Meischer

**Variation in the composition of the displaced soil solution.** A. M. Smith. *Proc. 2nd. Intern. Congr. Soil Sci., Leningrad 1930* 2, 175-8(1933)(in English); cf. *C. A.* 22, 1206.—A silt loam and a sandy loam, 6 and 3% ignition loss, resp., were mixed with ground dolomite equiv. to  $1/2$ , 1 and 2 times the Truog line requirement of 3 tons/acre. The mixts. were made to optimum  $\text{H}_2\text{O}$  content, stored and sampled at the end of 3, 11 and 31 days. The samples were percolated with 0.5%  $\text{NH}_4\text{CNS}$  to displace the soil soln., which was examd. Increasing addns. of dolomite and time before sampling increased Mg and Ca, but the latter showed a tendency toward satn.; Ca in the soln. appeared to depend upon the amt. of biol. action rather than upon the size of the addn. The  $pH$  of soil suspensions also increased with amt. of dolomite added; in every case, max.  $pH$  was at 11 days and decreased slightly at 31 days. Soil from unlimed and limed plots was examd. in a similar manner;  $pH$  was the same at the end of 3 and 11 days; Ca and Mg increased with time of storage; Ca was highest in the limed soil but Mg was

lower. Evidently the changes in soil stored moist are very rapid, and the soil soln. in the field is variable; the results of small pot expts. are dependent to a great extent upon aeration and preliminary treatment of the sample.

C. J. Schollenberger

**Oxidation-reduction potentials in soils. I. Principles and electrometric determination.** Lindsey A. Brown. *Soil Sci.* 37, 65-76(1934).—A 7-g. soil sample is ground with a rubber pestle, sieved and mixed with 4 cc. of  $H_2O$  in a 30-cc. vial. A well-cleaned  $pH$  electrode is inserted and left in contact 30 min. The vial and contents are then centrifuged and the potential of the suspension half cell is measured as soon as the centrifuge is stopped. Potentials obtained by this method are comparative, and have a deviation from the mean of not more than 0.003 v. A study is made of the influence of various factors, such as time of contact, soil-water ratio and a wide variety of other factors. Water-logging for 12 hrs. or more causes a decided negative shift in the potential of a soil. Very long and very short soil water contacts are apparently highly variable.

M. S. Anderson

**Dynamics of the oxidation-reduction potential in podzolized soils.** N. P. Remezov. *Proc. 2nd. Intern. Congr. Soil Sci., Leningrad 1930* 2, 212-26(1933)(in German); cf. *C. A.* 26, 547; 24, 3850.—Factors operating in the podzolization of grass soils and their degeneration with respect to drainage and aeration are discussed. As the latter decline, reduction processes predominate. The theory of oxidation-reduction potential is outlined; at a particular time,  $r_H$  is an index to soil processes, of special importance to plants and microorganisms, and can be detd. electrometrically. Expts. with podzols poor in humus showed no difference in  $E_h$  on standing for this period, whether or not the suspensions were sterile. Electrode potential in the chain with a satd. KCl-HgCl electrode is  $E_h$ , and at  $18^\circ$   $r_H = (E_h/0.020) \div 2p_H$ . A detn. of  $p_H$  with the quinhydrone electrode is therefore made on the sample after  $E_h$  is detd. Data obtained by examn. of a no. of soils variously treated are discussed. The higher the value for  $E_h$ , the greater the oxidation potential, and consequently the smaller the reducing tendency.  $E_h$  is affected by weather, supply of org. matter, biol. action and variation in  $p_H$ .

C. J. Schollenberger

**Comparison of methods of treatment of soil samples before mechanical analysis.** V. Novák and P. Hrubec. *Věstník Českoslov. Akad. Zemědělské* 9, 19-25(1933).

B. C. A.

**An examination of the Degtjareff method for determining soil org. matter, and a proposed modification of the chromic acid titration method.** A. Walkley and J. Armstrong Black. *Soil Sci.* 37, 29-38(1934); cf. *C. A.* 24, 2823.—The Degtjareff method for org. soil carbon gives excessively high values when the C contents are small. The errors decrease progressively with increasing amts. of C. When 4% or more of C is present, the results agree fairly well with those by the dry combustion method. The modified method proposed is as follows: A sample of finely divided soil contg. 10-25 mg. of C is placed in a 350-cc. conical flask. About 10 cc. of  $N K_2Cr_2O_7$  is added from a buret, then 20 cc. of strong  $H_2SO_4$ . The mixt. is shaken 1 min. When cool it is dild. to 150 cc. and 5 g. NaF added. The excess of chromic acid is titrated with 0.4 N  $(NH_4)_2Fe(SO_4)_2$ , with diphenylamine as an indicator. One cc. of N  $K_2Cr_2O_7$  equals 4 mg. of C. The procedure is rapid and may prove useful for comparative purposes where no very exact detn. is required.

M. S. Anderson

**The carbon-nitrogen ratio of soil organic matter.** W. McLean. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 181(1933)(in English).—The C:N ratio for 50 varied British soils was 6.5-13.5:1, averaging  $10.2 \pm 0.3$ ; by plotting to a normal frequency curve with a well-defined max. corresponding to the av., the C:N ratio for 16 foreign soils varied 2.0-23.0:1. Whether high or low, the C:N ratio of a particular region and climate seems to be nearly a specific figure; cultivated soils do not differ much from grasslands, although soils in high fertility have higher ratios than poor soils. It is suggested that

total org. matter or N might be useful as an index of fertility for a region, if differences due to altitude or  $H_2O$  relations are excluded.

C. J. Schollenberger

**Soil respiration and the carbon dioxide content of the soil air of cultivated soils.** Helmut Wurmbech. *Arch. Pflanzbau* 10, 424-532(1934).—The  $CO_2$  content of the soil air and soil respiration increase after a period of warm, wet weather. Legumes caused the greatest production of  $CO_2$ , increasing the percentage in the soil air in a loam from 0.2 in April to 1.0 in June. At the time of the max. growth the cereals produce large quantities of  $CO_2$ , but sugar beets increased the  $CO_2$  content only about fourth as much as did alfalfa. The 2 soil types studied a loam and a humus soil, showed an appreciable difference only at the peak production of  $CO_2$  where the humus soil showed a  $CO_2$  content in the soil air of 4.7% in contrast to a max. of 1.0% for the loam. The excessive content of  $CO_2$  does not seem to be harmful unless high moisture causes crusts to form which prevent the proper diffusion of the air through the soil. A higher soil respiration was found in fertilized than in unfertilized plot but the  $CO_2$  content of the soil air of unfertilized plot was the higher of the 2.

K. C. Bresson

**Soil acidity in relation to vegetational succession in Calthorpe Broad, Norfolk.** H. Godwin and J. S. Turner. *J. Ecology* 21, 235-62(1933).—The water of the Broad is alk. ( $p_H$  7.30-7.43) and the general character of the vegetation conforms to that of low-moor soils. Throughout the vegetational succession the soil acidity increases as the ground-level rises and the distance from the Broad increases; the communities lowest and nearest the Broad have approx. neutral soil, and those away from it have  $p_H$  values as low as 5.0. The progressive soil acidification and the corresponding establishment of acidophilous species is regarded as the normal result of vegetational succession.

K. D. Jacob

**Influence of soil acidity upon the decompn. of organic matter in soils.** J. W. White, F. J. Holben and C. D. Jeffries. *Soil Sci.* 37, 1-15(1934).—A stock soil is prepd. consisting of 5 parts Hagerstown silt loam with one part each of sewage sludge and fine sand. This is divided into 10 portions and 9 of these are treated with different amts. of S and incubated in small field plots for 2 years. The  $p_H$  values then range from 7.4 to 3.2. These soils are treated with various nutrients and org. matter and their respiration capacities studied by detns. of the  $CO_2$  evolved. There is a close correlation among the  $p_H$  value of a soil, its respiratory capacity and its power to decompose org. matter. Addns. of sol. N to soils treated with org. matter cause an increase in  $CO_2$  production. Addns. of  $K_2HPO_4$  to soil treated with cellulose and various forms of N have little effect upon  $CO_2$  production. Lime applied to the acid soils treated with cellulose and N greatly stimulates  $CO_2$  production. Air-dry soils produce  $CO_2$  more rapidly than does freshly screened moist soil with similar org. and nutrient addns. Corn-starch added to soil is decompd. at about the same rate in acid as in alk. soils, while cellulose, manure and cottonseed meal are greatly influenced by soil reaction. Respiratory capacity and power to decompose org. matter run parallel with the nbs. of microorganisms present.

M. S. Anderson

**The acidity of tea soils of northeast India. III. The effect of fertilizers on soil acidity.** C. J. Harrison. *Indian Tea Assoc., Sci. Dept., Quart. J.* 1932, 189-90 (cf. *C. A.* 28, 554).— $NH_4Cl$  and  $(NH_4)_2SO_4$  increased, and  $CaCN_2$  and basic phosphates decreased, the acidity of tea soils. K salts, superphosphate, org. manures and  $NaNO_3$  tended to decrease the acidity slightly when they were applied in large amts. over an extended period. Cattle manure temporarily decreased the acidity to some extent, but the effect was transient and due to liberation of free  $NH_3$  in the soil.

K. D. Jacob

**The application of differential titration of the chloride ion to the analysis of soil extracts.** P. A. Kryukov. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 141 (1933)(in German).— $Cl^-$  in soil exts. colored by humus and contg. some suspended soil was accurately titrated with  $AgNO_3$  by an electrometric method.

C. J. S.

**Reversal of charge on soils by acids and anion fixation.** I. N. Antipov-Karatayev and A. I. Rabinerson. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 108-33 (1933) (in German).—The nature of the charge on the entire soil mass was detd. by electrobiosis expts. The reversal of charge on representative Russian soil types by common inorg. and org. acids was investigated. The most pronounced effects were observed with the 60-65 cm. horizon of a red earth (I); podzol soils were less affected. The charge on solonetz and chernozem soils (II) was not reversed by acids. Most of the soils were affected by HCl and HNO<sub>3</sub>, but only I by other acids. No connection with SiO<sub>2</sub>:R<sub>2</sub>O<sub>3</sub> in the fraction < 1  $\mu$  was noted, but there was marked correlation of charge reversal with the content of "immobile" R<sub>2</sub>O<sub>3</sub>, i. e., that extd. by oxalate or KOH. Charge reversal is attributed to a soln. effect; R<sub>2</sub>O<sub>3</sub> is partially dissolved in the acid, then adsorbed upon particles, whence the latter become pos. The anion-fixing property does not closely parallel the ability to reverse charge; for sulfate and phosphate, it was strongly developed in soils not exhibiting the latter phenomenon. Nevertheless, both depend upon the content of active R<sub>2</sub>O<sub>3</sub>, the former also upon the soly. of salt-like combinations formed, buffering the soln. at an optimum not below pH 2.2. Max. fixation of phosphate and sulfate was observed with I, min. with II. Fixation of nitrate was not observed; Cl<sup>-</sup> was fixed by some soils irrespective of ability to reverse the charge, and with one podzol and II was neg. for the lower consns. of HCl. The max. was with I, likewise the only soil showing adsorption of carbonate from satd. CO<sub>2</sub> in H<sub>2</sub>O. There are numerous references.

Vine growth and soil reaction. K. Müller and H. Sleumer. *Weinbau u. Kellerwirtsch* 12, 11-14 (1933).—With a soil mixture and with sand + nutrient solution optimum growth occurred at pH 6.1.

B. C. A.  
Rapid determination of small quantities of calcium in soil extracts. H. Rentelspacher. *Z. anal. Chem.* 96, 161-72 (1934).—To 1 cc. of freshly centrifuged ext. or to a dil. Ca<sup>++</sup> soln., contg. not more than 0.16 mg. of CaO, add 1 cc. of Na<sub>2</sub>WO<sub>4</sub> soln. prepd. by dissolving 5.241 g. of Na<sub>2</sub>WO<sub>4</sub>·2H<sub>2</sub>O in 1 l. of water and adjusting the concn. so that 1 cc. = exactly 0.200 mg. Ca. Evap. to dryness on the water bath and to the residue add exactly 2 cc. of distd. water. Rub well with a rubber-tipped stirring rod and transfer to the point of a centrifuge tube. Rotate for 5-10 min. at 3000 r. p. m. Pipet off 1 cc. of the supernatant soln. and det. the excess W colorimetrically by adding 0.2 cc. of N HCl and 1 cc. of TiCl<sub>3</sub> soln. which is exactly equiv. to 2 mg. of Fe, and comparing with a set of standards prepd. similarly in the analysis of synthetic samples contg. 0.02, 0.04, 0.06, 0.08 and 0.10 mg. CaO.

W. T. H.  
A critical examination of analytical methods used in the determination of exchangeable potassium and sodium of soils. M. L. M. Salgado. *Soil Sci.* 37, 39-48 (1934).—NH<sub>4</sub>OAc soln. is a satisfactory reagent for the extn. of exchangeable Na and K from soils. Analytical technic is described which is rapid and gives reliable results. A 25-g. sample of soil is leached with 500 cc. of NH<sub>4</sub>OAc soln. The soln. is evapd. to dryness, dried at 110° and finally ignited at a low temp. to burn off org. matter and to convert acetates to carbonates. The residue is extd. with hot H<sub>2</sub>O and filtered, the soln. contg. Na<sub>2</sub>CO<sub>3</sub> and K<sub>2</sub>CO<sub>3</sub>. The K detn. is made by the volumetric cobaltinitrite-permanganate method (C. A. 23, 5535). Na is detd. by the direct uranyl Zn acetate gravimetric method (C. A. 24, 5060). When definite amts. of K are added to the acetate ext. about 98% is recovered by the method described.

M. S. Anderson  
Experiments on the movement of iron and aluminum in the soil. J. S. Joffe. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 135-45 (1933) (in English).—

1 Review and discussion of the movement of Fe and Al in the soil in the light of colloid reactions. Expts. show that the removal of electrolytes from soil decreases the rate of movement. Fe(NO<sub>3</sub>)<sub>3</sub> treatment exts. Al, a substitution or replacement; repeated expts. indicated this goes on for a long time at a decreasing rate. The reverse exchange does not take place. Some Al can be percolated from Al-treated soil by H<sub>2</sub>O. Hence Fe is fixed mainly in the upper soil, while Al tends to reach lower depths prior to fixation.

Adaptability and accuracy of the Emerson lime analyzer for testing the neutralizing value of various liming materials in Virginia. N. A. Pettinger and R. L. Selby. *J. Am. Soc. Agron.* 26, 240-8 (1934).—The Emerson portable CaO analyzer, as sold by the manufacturer, is not suitable for testing fluffy limes, such as burnt, hydrated and air-slaked, but is well adapted to testing ground 3 CaCO<sub>3</sub>, marls and oyster shells. Modifications have been suggested for making the equipment usable for testing the fluffy limes. The accuracy of the values obtained by the Emerson equipment gave very good agreement with those obtained by the tentative Assoc. Official Agr. Chem. method. The values obtained by the 2 methods differed by less than 1% CaCO<sub>3</sub> equiv. in 64% of the total no. of samples tested and by less than 4% CaCO<sub>3</sub> equiv. in all the tests. The Emerson method is usually more rapid than the official method when single detns. only are made or for materials which have a CaCO<sub>3</sub> equiv. of more than 100%. Materials with a CaCO<sub>3</sub> equiv. less than 100% may be tested more quickly by the official method.

J. R. Adams  
The influence of liming upon the structure of podzol soils. N. P. Remezov and O. I. Izmailovich. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 162-74 (1933) (in German).—See C. A. 26, 287.

C. J. S.  
Effect of hydrogen peroxide on soil organic matter. W. McLean. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930 2*, 182-3 (1933) (in English); cf. C. A. 26, 3595.—While pure cellulose from filter paper is not attacked by 6% H<sub>2</sub>O<sub>2</sub> alone, in the presence of soil it is considerably attacked, the action varying with soils. Hence it is not possible to det. "degree of humification" of soil org. matter accurately by means of H<sub>2</sub>O<sub>2</sub>. M. would distinguish by this means "readily oxidizable org. matter" and "residual org. matter." Residual C and N are detd. as follows: Place 4 g. soil in a 400-ml. beaker with 60 ml. H<sub>2</sub>O<sub>2</sub>, boil 20 min., add 40 ml. H<sub>2</sub>O and boil to small vol. Filter through hardened paper and wash with boiling H<sub>2</sub>O. Dry and grind the residue and det. C and N. The results obtained with 6 soils treated with 1-6% H<sub>2</sub>O<sub>2</sub> or repeatedly with 6% H<sub>2</sub>O<sub>2</sub>, without and with 0.15 g. added cellulose, are summarized: Residual C decreased with increasing percentage of H<sub>2</sub>O<sub>2</sub> or repetition of treatment to a const. figure of 4-5% of the original C in the sample. Residual N decreased with strength of H<sub>2</sub>O<sub>2</sub> up to 2-3% but was const. with more severe treatment. From 7 to 47% of the added cellulose was oxidized by 2 treatments with 40 ml. 6% H<sub>2</sub>O<sub>2</sub>. The C:N ratio of the residue increased with decreasing percentage of H<sub>2</sub>O<sub>2</sub> to a max. at 1-3% H<sub>2</sub>O<sub>2</sub>, then decreased. These max. values for the C:N ratio varied 11.2-19.7, and are considered to indicate the ratios in the original added plant material for each soil. The condition of the org. matter is, therefore, indicated by the C:N ratio in the "residual org. matter"—if high, the org. matter is capable of further oxidation in the soil, if low, a stable condition has already been reached.

C. J. Schollenberger  
Influence of irrigation on the soil microflora. N. N. Sushkina. *Trans. Irrigation Comm., Acad. Sci. U. S. S. R.* 1, 87-94 (1933).—Saline soils on irrigation can support a microflora of the kind required for agricultural plants. The application of CaCO<sub>3</sub> + (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> to irrigated land gave rise to intense nitrification. B. C. A.

Relation of the absolute reaction of the soil solution to the quantity of nitrogen fixed by Azotobacter. P. L. Chisney. *Kans. Agr. Expt. Sta., Director's 5th Biennial Rept. 1930*, 25-8; cf. C. A. 25, 4077.—A series of cylinders inoculated with *Azotobacter* in 1923 showed no

living bacteria of this group in 1930 except in cylinders to which lime had been added. Soil samples from fertile-appearing spots in wheat fields showed 2-3 times the nitrate content of normal soils; similarly plant growth and percentage of N in the plants grown on these spots were greatly increased. P was no higher in the fertile spots. The relationships of *Asotobacter* to these N-rich spots are being investigated. C. R. Fellers

**Determination of the fertilizer requirement of soil. I. Mitscherlich and Neubauer methods for estimating available phosphorus and potash vs. field fertilizers experiments.** G. Sundelin, O. Franck and C. Larson. *Agl. Landbruks-Akad. Handl. Tid.* 71, 974-1001 (in English 1001-3) (1932).—Comparative tests on various Swedish soils show that Mitscherlich's method gives a quantitative measure of the requirement. Neubauer's method is less satisfactory. B. C. A.

**Commercial fertilizers and soil reaction.** S. Tørvhøj Jensen. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 154-61 (in English) (1933).—Tests on plot soils long fertilized with superphosphate, KCl,  $\text{NaNO}_3$  and  $(\text{NH}_4)_2\text{SO}_4$  indicated inconsiderable effects except from the last, which greatly increased soil acidity and buffer effects toward  $\text{Ca}(\text{OH})_2$ . C. J. Schollenberger

**The influence of fertilizers and lime on the exchangeable bases and soil reaction of a light acid soil after 50 years of continuous barley and wheat.** E. M. Crowther and J. K. Basu. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 146-51 (in English) (1933); cf. C. A. 26, 3594.—Examination of soil samples from plots at Rothamstead indicates that exchangeable Ca of unfertilized soil has decreased from 9.2 to 4.2 mg. equivs. %.  $(\text{NH}_4)_2\text{SO}_4$  fertilization has strongly acidified the soil and caused Ca to fall to 1.16, of which 0.54 is  $\text{H}_2\text{O}$ -sol., leaving only 0.62 mg. equivs. % exchangeable Ca. There was no conclusive evidence that bases other than Ca had been reduced. On the limed part of the  $(\text{NH}_4)_2\text{SO}_4$  plots, exchangeable Ca was increased and K consistently reduced; the latter was possibly due to increased draft by the larger crops. The use of  $\text{NaNO}_3$  as the source of N has probably conserved exchangeable Ca. The data indicate a difference in the effects with crop; apparently the mineral fertilizers have displaced H from surface to subsoil by an ionic exchange process in the barley plots only. Superphosphate with  $\text{K}_2\text{SO}_4$  is shown to have no permanent or cumulative acidifying effect upon the soil. The evidence indicates that loss by leaching of Ca from soil tends to decrease with the amt. remaining, until it falls to a permanent level balanced by new supplies from weathering and upward movement. A practically permanent agriculture is therefore possible without liming, if only crops of low Ca requirement are grown, and the superior economy of min.  $\text{CaO}$  dressings is indicated. C. J. Schollenberger

**An electrometric-titration method of finding the  $p_H$  value and lime requirement of soils.** A. N. Puri and B. Anand. *Soil Sci.* 37, 49-58 (1934).—Two antimony electrodes are used, one dipping into soil suspension and the other into a universal buffer soln., the  $p_H$  of which is continuously varied until a galvanometer through which the 2 electrodes are joined shows no deflection. The universal buffer mixt. contains 5.445 g.  $\text{KH}_2\text{PO}_4$ , 5.44 g.  $\text{PhCH}_2\text{CO}_2\text{H}$  and 2.406 g. boric acid per l. The buffer solns. are prepd. by adding 5, 10, 15 and 20 cc. of 0.2 N NaOH to 25 cc. of the universal buffer. These are used to locate the  $p_H$  range within which the soil suspension may lie. After the buffers between which the true  $p_H$  value lies have been located, 0.2 N NaOH is added to 25 cc. of the universal buffer in amt. equal to that corresponding to the buffer having the lower  $p_H$  value. The Sb rod is then dipped in it and connected to one in the soil suspension. More NaOH soln. is then added from a buret to the buffer soln. until there is a balance in the galvanometer. The true  $p_H$  is read from a graph prepd. by titration of the universal buffer with NaOH. Lime requirements are detd. by titrating a soil to  $p_H$  6.5 or any desired value and balancing an Sb electrode in this against a universal buffer of known  $p_H$  value. M. S. Anderson

**Report on results of research work carried out in connection with soil acidity and the use of ammonium sulfate as a fertilizer for putting greens and fairways.** R. B. Dawson and Robert Greig. *J. Board Greenkeeping Research* 3, 65-78 (1933).—When turf plots composed of a pure stand of New Zealand bent grass received 4-6 applications of  $\text{NH}_4$  phosphate or  $(\text{NH}_4)_2\text{SO}_4$  annually (32.3 lb. N per application) over a period of 3 yrs., the plots remained free from foreign grasses, weeds and earthworms; plots treated with equiv. amts. of N as  $\text{NaNO}_3$  became extremely weedy and were gradually invaded by *Poa annua*. The plots treated with  $\text{NH}_4$  salts were distinctly acid. When  $(\text{NH}_4)_2\text{SO}_4$  is applied to turf contg. *Poa annua* this species spreads very rapidly in the initial stages until the soil becomes too acid to permit germination of the seeds. The fungus *Fusarium nivale* frequently appears on bent plots that have been treated with  $\text{NaNO}_3$  or lime, but it was not observed on plots that had received regular applications of  $(\text{NH}_4)_2\text{SO}_4$  over a period of 3 yrs. On turf plots that had been treated with Fe sulfate exclusively for 4 yrs. fescue was the predominating herbage, whereas on plots receiving  $(\text{NH}_4)_2\text{SO}_4$  in addn. bent grass predominated. Fe sulfate had a marked effect in preventing the invasion of weeds into plots treated with nitro-chalk, dried blood,  $\text{NaNO}_3$ , etc. In general, plots receiving  $(\text{NH}_4)_2\text{SO}_4$  and Fe sulfate withstood drought far better if treated with lime in the winter. Twenty-two references. K. D. Jacob

**The relation of the carbon-nitrogen ratio of a mulch to the accumulation of nitrates in soil.** W. J. Moore, Jr. and A. B. Beaumont. *J. Am. Soc. Agron.* 26, 252 (1934).—Data are given supporting the hypothesis that nitrification occurs mainly in the lower layers of a mulch of waste hay and straw rather than in the soil and only after the C:N ratio of the mulch has been considerably narrowed through processes of decay. It appears that under the exptl. conditions a period of about 3 years is necessary to reduce the C:N ratio of the mulch to the point where nitrates are produced in excess of the needs of the decay organisms. The upper limit of this ratio appears to be about 15:1. J. R. Adams

**Are superphosphate and plaster capable of lowering the  $p_H$  of the soil?** Georges Joret. *Engrais* 49, 119 (1934).—The intimate incorporation of either superphosphate or  $\text{CaSO}_4$  in a soil of  $p_H$  6.6 in the proportion of 1 g. of fertilizer to 1000 g. of soil did not cause a decrease in the  $p_H$  of the soil over a period of 6 months. In fact, the  $p_H$  increased slightly with  $\text{CaSO}_4$ . J. R. A.

**Growth peculiarities of hemp as a result of a lack of nutritive substances in the soils.** L. G. Dobrunov. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 281 (in English 285-6) (1934).—In a poor soil flax uses up most N,  $\text{P}_2\text{O}_5$  and  $\text{K}_2\text{O}$ ; oats are second for  $\text{K}_2\text{O}$ , and hemp for N and  $\text{P}_2\text{O}_5$ . In a rich fertilized soil hemp uses up relatively most N and  $\text{K}_2\text{O}$  but least  $\text{P}_2\text{O}_5$ . F. H. Rathmann

**Meadows and meadow grasses in middle Germany. IV. Classification and distribution of varieties in relation to the soil reaction.** E. Klapp, A. Stahlin and F. W. Wacker. *Arch. Pflanzenern.* 10, 533-57 (1934); cf. C. A. 25, 161.—About 200 grasses are classified in 9 groups according to their observed frequency on soils of varying reactions from a  $p_H$  of 3.4 to 8.5. About 25% were grouped in the class ranging in  $p_H$  from 5.5 to 6.0, and about 20% each were grouped in the classes 4.5-5.4 and 6.7-7.2. In most cases the reaction of the top soil was characteristic for the class of the meadow. In 4 cases where there were extreme differences of  $p_H$  between the top soil and the sub soil, 6.4-4.4, 5.9-4.5, 5.1-3.5 and 5.1-4.1, the reaction of the sub soil influenced the type of grass. The absorption of quantities of moisture appeared to influence extreme reactions whether acid or basic. Fertilization had little effect on the frequency of any grass on a particular soil class. In general the best yields of grass were obtained on soils having a reaction range between  $p_H$  5.5 and 7.5. K. C. Beeson

**Reactions of some pecan soils and the effect of fertilizers on soil reaction.** A. O. Alben and Hugh M. Boggs

Texas Pecan Growers' Assoc., *Proc. 15th Ann. Meeting* 1933, 59-64.—Soils from several districts in La. and Texas were studied. In most soils the  $pH$  values ranged from 4.45-7.70 in the 1st 12 in. to 5.83-9.08 at a depth of 5-6 ft. With 1 exception, the acidity of the soils decreased with increase in the depth at which the sample was taken. Annual applications of com.  $CaCN_2$  caused a significant decrease in the acidity of the 1st 6-in. layer of pecan soils in 2-3 yrs. but had little or no effect on the 2nd 6-in. layer;  $NaNO_3$  caused a significant decrease in acidity to a depth of 12 in.;  $(NH_4)_2SO_4$  increased the acidity of the 1st 12 in. of soil. K. D. Jacob

The relative growth rate, the carbohydrate contents and the yield of the rice plant (*Oryza sativa* L.) under different treatments. R. H. Dastur and A. R. Pirzada. *Indian J. Agr. Sci.* 3, 993-1012 (1933).—The fresh and dry wts. of rice plants, their leaf areas, the vols. of the roots and the carbohydrate contents when fertilized about Aug. 15th, the period at which the relative growth rate of the plants was highest, with a nitrate or  $(NH_4)_2SO_4$  or both together on equal total-N basis, were higher than when the plants were fertilized at any other period. A mixt. of  $NH_4$  salts and nitrates had a more beneficial effect on the growth, yield and carbohydrate contents of grain of the rice plant than either form of N used singly in equiv. amt. A greater production of grain as compared to the vegetative growth was obtained by the use of mixts. of the 2 forms of N than by the use of either alone. As compared with the unfertilized plants, application of nitrates at the flowering stage caused no increase in the carbohydrate contents or in the yields of grain or straw. The effects of superphosphate on the production of carbohydrates and on the yields and dry wts. of the plants were greatest when the fertilizer was applied in Aug.; superphosphate caused a proportionately greater vegetative growth than reproductive growth.  $KNO_3$  and  $NaNO_3$  were equally effective as sources of N for the rice plant. Data are given on the sucrose, starch and total carbohydrate contents of rice plants at various stages and conditions of growth. K. D. Jacob

Harmful effects upon young rice and corn plants of rice straw when added to clay loam soil in pots. R. B. Espino and F. T. Pantaleon. *Philippine Agr.* 22, 534-56 (1934).—Rice straw and rice straw ash greatly injured the development of young rice and corn plants in clay loam soil, and the effect increased with the quantity present. The effect was not due to increase of acidity, nor was it corrected by additions of  $CaO$ . After the straw had decomposed 75 days in the soil it proved beneficial. The chemistry underlying these effects is discussed at length. Twenty references. A. L. Mehring

Queensland tobacco soils. E. H. Gurney and J. I. F. Foran. *Queensland Agr. J.* 40, 495-503 (1933).—In general, the soils are sands deficient in mineral plant foods and humus; the  $pH$  values of the aq. suspensions of several samples ranged from 5.0 to 6.4. Mech. analyses are given. K. D. Jacob

Soil treatment for Brassica. I. The effect of sterilization of the soil by mercuric chloride on the seedling growth of Brussels sprouts. R. M. Woodman, G. H. Brenchley and F. Hanley. *J. Soc. Chem. Ind.* 53, 35-67 (1934).—The use of 0.05-0.2% solns. of  $HgCl_2$  to sterilize seed beds infected with *Plasmodiophora brassicae* previous to sowing reduces the dry wts. of the tops, roots and total seedlings of Brussels sprouts. J. R. H.

Tree roots and the field layer. A. S. Watt and G. K. Fraser. *J. Ecology* 21, 404-14 (1933).—Application of  $NH_4NO_3$  at the rate of 21 lb. N per acre, to plots of pine-wood (*Pinus silvestris*) forest soil had a beneficial effect on the growth of *Deschampsia flexuosa*; larger amts. of N, either as  $NH_4NO_3$  or  $(NH_4)_2SO_4$ , had an adverse effect.  $NH_4NO_3$ , applied at the rate of 21-42 lb. N per acre, had no stimulating effect on the growth of *Oxalis acetosella*; 84 lb. N as  $NH_4NO_3$  or 42 lb. as  $(NH_4)_2SO_4$  completely eliminated *O. acetosella* from the plots. Trenching the plots to a depth of 8-18 in. into the mineral-soil layer caused a marked increase in the N content of *D. flexuosa*. K. D. Jacob

Growing cotton in solution cultures of a higher salt concentration. A. F. Pankrat'eva-Glagoleva. *Nauch. Issledovatel. Inst. Khlopkovodstva (Sci. Research Inst. Cotton Culture)* (Tashkent), Sept. 1932, 24 pp.—A concn of 0.0625 M and 0.125 M NaCl in a Hellriegel medium prevented the normal growth of cotton. The introduction of antagonistic salts, KCl and  $CaCl_2$ , did not have favorable effect. Similar results were obtained in sand cultures, but the antagonistic effects of K and Ca were more marked. In sand cultures an osmotic concn. up to 3 atms. was tolerated by cotton. In soil cultures the concns. mentioned did not decrease the yields as much as in soln. cultures, 83% against 58.4%, resp. An increase of the Cl content to 0.250 M NaCl caused a complete failure of the crop. In the soil cultures the antagonistic effects of K and Ca were extremely favorable. In soil cultures cotton withstood an osmotic concn. of 5 atms. With an increase in concn. of salts the transpiration coeff. was lowered. The presence of NaCl in soln. seems to cause an increase of N in the seed and a lowering of the crude fat. J. S. Joffe

Exchange adsorption in root systems. Influence of the technic and time of introduction of fertilizers on the nature of plants. D. A. Sabinin. *Compt. rend. acad. sci. U. R. S. S. [N. S.]*, 1, 136-8 (in English 138-40) (1934).—Daily "breathing" and nitrate and phosphate absorption curves run parallel. Absorption is preceded by adsorption of the ions. Placing and mixing of fertilizer phosphate may raise (100%) or lower (30%) the yield. N fertilizers introduced  $1/3$ ,  $1/3$ ,  $1/3$  (at times of planting, budding, flowering) to unnaive cause excess female inflorescence while K fertilizers cause excess male inflorescence. F. H. Rathmann

Fertilizer experiments carried out in Burma by the agricultural department from 1912-13 to 1930-31. R. Watson and V. V. Subramanian. *Burma Dept. Agr., Bull.* 29, 72 pp. (1933).—When they were applied at the rate of 50 lb. N per acre, synthetic farmyard manures prep'd. from straw, ordinary farmyard manure and straw increased the yields of paddy grain 34.67, 35.1 and 18.9%, resp., as compared with an increase of 26.47% from  $(NH_4)_2SO_4$  and  $CaCO_3$ . Coarse rice bran, contg. 1.93% N and applied at the rate of 20 lb. N per acre, increased the yield 1.7-28.9% in 3 seasons. A compost prep'd. from the water hyacinth (*Eichhornia crassipes*) contained N 0.260,  $P_2O_5$  0.208 and  $K_2O$  0.759% and gave good results when it was applied at the rate of 10 tons/acre. Ammophos, Nicfos, Leunaphos, Diammophos and other  $NH_4$  phosphate fertilizers increased the yields of paddy in some instances but had little or no effect in others. Superphosphate and basic slag increased the yield approx. 7-32% in different years and on different soils; basic slag seemed to have a beneficial effect on paddy soils apart from its fertilizer value. Urea and com.  $CaCN_2$  were not as effective as  $(NH_4)_2SO_4$  as sources of N for paddy. Detailed chem. and mech. analyses of the soils used in the expts. are given. K. D. Jacob

The influence of various calcium and magnesium ratios upon plant crops. D. V. Druzhinin. *Proc. 2nd Intern. Congr. Soil Sci., Leningrad 1930* 2, 152 (1933) (in English); cf. C. A. 28, 2103<sup>a</sup>.—A very brief note to the effect that Loew's "lime factor" (cf. C. A. 3, 1505) is incorrect because only the total  $CaO$ /total  $MgO$  ratio is taken into account, whereas "moving" forms should be considered. The optimum for barley and oats has been observed to be 1. C. J. Schollenberger

Agricultural importance of potash salts containing magnesium salts. H. Kappen. *Zuckerrübenbau* 16, 1-7 (1934).—Kainite and other K salts contg. Mg and Ca chlorides tend to increase the acidity of sour soils. Much better results on such soils follow the use of K fertilizers contg.  $MgSO_4$ . K. suggests that the fertilizer manufacturers supply the existing lack of physiologically alk. K fertilizer by treating carnallite with steam at 400-500° to expel Cl and leave a residue of  $MgO$ . O. W. W.

Recovery of phosphorus from prairie grasses growing on central Oklahoma soils treated with superphosphate. H. F. Murphy. *J. Agr. Research* 47, 911-17 (1933).—

The use of superphosphate on 2 common pasture and grassland soils in central Okla. increased the yield of native prairie grasses and raised the P content of the hay produced. When N as well as P was applied in the fertilizer, the yield of hay was increased, but the percentage of P in the hay was of the same order as when superphosphate only was applied. The percentage of P in hay from plots that received N alone was essentially the same as that in hay produced on unfertilized soil. The recovery of P from the applied superphosphate was very small. The P applied did not penetrate to any great distance in the soil, being confined largely to the surface 3 in.

W. H. Ross

The effect of nitrogenous fertilizers on the growth of lawn grasses. J. W. Zahuley and P. L. Duley. *J. Am. Soc. Agron.* 26, 231 4(1934).—Tests on Kentucky bluegrass, Washington bent and German mixed bent grasses showed that  $(\text{NH}_4)_2\text{SO}_4$ ,  $\text{NaNO}_3$ , and  $\text{CO}(\text{NH}_2)_2$  were about equally effective when used at such rates that equiv. amts. of N were supplied.  $\text{CO}(\text{NH}_2)_2$  had a slight advantage with each grass. Combined treatment of  $(\text{NH}_4)_2\text{SO}_4$  and compost gave a slight increase over  $\text{CO}(\text{NH}_2)_2$ . Applications as high as 1633 lb. of  $(\text{NH}_4)_2\text{SO}_4$  or 2156 lb. of  $\text{NaNO}_3$  per acre, supplied in 6 applications during the season, were used without injury to the grasses. Heavy applications of  $(\text{NH}_4)_2\text{SO}_4$  greatly reduced the no. of dandelions. The  $p_H$  value of this soil has not been greatly affected even by these heavy fertilizer treatments.  $(\text{NH}_4)_2\text{SO}_4$ , however, has tended to make the soil slightly acid.

J. R. Adams

The influence of nitrogen and phosphoric acid on the speed of growth and yield under conditions of pot experiments. O. F. Tueva. *Lenin Acad. Agr. Sci. U. S. S. R., Central Asia Sci. Research Cotton Inst., Ak-Kavak Central Expt. Sta. (Tashkent), Fertilizers for Cotton*. Pt. 1, 52-9(in English 60)(1933).—The higher the ratio of  $\text{P}_2\text{O}_5$  to N in the fertilizer mixt. the earlier the blooming period arrives and the quicker the plants mature. N alone retards the maturity of cotton.

J. S. Joffe

The influence of nitrogen and phosphoric acid fertilizers on the yield of cotton in pot experiments. D. A. Sabinin, G. A. Bogdanovskiy, G. D. Panfilova and M. I. Popova. *Proc. All-Union Sci. Research Inst. Cotton Culture and Ind. (Tashkent)*, No. 37, 36 pp.(1931).—Pot expts indicate that high applications of N retard germination, formation of bolls, flowering and maturity. Addns. of superphosphate counteract the inhibitory effect of N. The relation of the yield increases to the application of mixts. of N and  $\text{P}_2\text{O}_5$  appears to be more complicated, as indicated by the Mitscherlich-Baule equation.

J. S. Joffe

Potassium fertilization of cotton. D. V. Kharkov and L. N. Pershakova. *Lenin Acad. Agr. Sci. U. S. S. R., Central Asia Sci. Research Cotton Inst., Ak-Kavak Central Expt. Sta. (Tashkent), Fertilizers for Cotton* Pt. 1, 38-47 (in English 47)(1933).—A series of expts. with K fertilizers shows that it is effective on cotton only in combination with N and  $\text{P}_2\text{O}_5$  on the soils in central Asia.

J. S. Joffe

The influence of potassium on cotton. O. F. Tueva. *Lenin Acad. Agr. Sci. U. S. S. R., Central Asia Sci. Research Cotton Inst., Ak-Kavak Central Expt. Sta. (Tashkent), Fertilizers for Cotton* Pt. 1, 48-51(1933).—K alone extends the period of the flowering of cotton. It is effective on the yield primarily in combination with N and  $\text{P}_2\text{O}_5$ . It increases the total leaf surface when applied in moderate quantities. Increased applications of KCl decrease the total leaf surface.

J. S. Joffe

Field experiments with sugar cane. II. C. Holman B. Williams and R. R. Follett-Smith. *British Guiana Dept. Agr., Sugar Bull.* 2, 48 pp.(1933); cf. *C. A.* 27, 3355.—Application of 400 lb.  $(\text{NH}_4)_2\text{SO}_4$  per acre of flood-fallowed front-land clay gave the heaviest yields of 1st ratoon cane but decreased the sucrose quality and the juice purity. Heavy applications of  $(\text{NH}_4)_2\text{SO}_4$  (300-600 lb./acre) to the plants and 1st ratoons of Diamond 10 cane grown on unflooded front-land soil did not impair the sucrose quality and had no residual effect on the 2nd

ratoon crop. There were definite indications that different cane varieties have different N requirements. On pegassy clay soil, application of either ground limestone or agricultural slaked lime in the row at planting increased the yield, sugar content and juice purity of the cane. Application of  $\text{K}_2\text{SO}_4$  to 1st ratoons grown on pegassy clay soil had a favorable effect on the yield of cane, sucrose quality and juice purity. Chem. analyses of the soils used in the expts. are given. K. D. Jacob

Physiology of nutrition of the sugar cane. II. Experiments on phosphate absorption. T. H. van den Honert. *Arch. Suikerind.* 41, III, *Mededeel. Proefsta. Java-Suikerind.* 1119-56(1933); cf. *C. A.* 27, 1705.—The results of previous investigations are critically discussed. An app. and method for making water culture expts. on sugar cane under const. replacement of the nutrient soln., and with  $p_H$  control, are described, and the results are presented in tables and graphs. The effect of light and temp. on the expts. was excluded as far as possible by taking samples at the same time of day. Sugar cane is able to take up  $\text{P}_2\text{O}_5$  from very dil. solns. At  $p_H$  6 and a concn. of 0.03-0.05 mg.  $\text{P}_2\text{O}_5$  per l., 15-20% of the max. amt. is absorbed per hr.; at a concn. of 1 mg. per l., nearly 100%. These are approx. the concns. found in the soil soln. Other conditions being equal, even the 20% absorption appears sufficient for normal growth, because sugar cane is able to absorb several times the  $\text{P}_2\text{O}_5$  actually required. At  $p_H$  7 the absorption of  $\text{P}_2\text{O}_5$  is only 1/2 of that at  $p_H$  6. The plant evidently utilizes the  $\text{H}_2\text{PO}_4^-$  ion, but not the  $\text{HPO}_4^{--}$  ion. When the  $\text{P}_2\text{O}_5$  concn. in the nutrient soln. is extremely small, the plants may release  $\text{P}_2\text{O}_5$ , and then show symptoms of phosphate hunger. The results of this study confirm the conclusions of von Wrangell (*C. A.* 23, 3006; 25, 1019) that the  $\text{P}_2\text{O}_5$  concn. in the soil soln. is an essential factor in the  $\text{P}_2\text{O}_5$  absorption by the plant, and that the influence of the roots and the contact with the soil particles play a less important part. F. W. Z.

Importance of potash for the nutrition of the sugar beet. O. Engels. *Zuckerrubensbau* 16, 7 20(1934).

O. W. Willcox

Earliness in northern corn as affected by phosphate fertilizers, manure and other soil treatments. P. J. Olson and H. L. Walster. *J. Am. Soc. Agron.* 26, 205 13(1934).—P advanced the silking date of corn 2 days and combined with manure advanced it 3 days. Manure alone advanced maturity somewhat. Neither CaO nor  $\text{K}_2\text{O}$  influenced maturity consistently. The increased yield of corn, wheat and oats, the rotation crops, was apparently sufficient to cover the cost of the  $\text{P}_2\text{O}_5$  application, and thus the enhanced maturity essentially represented the margin of profit from the soil treatment.

J. R. Adams

Rice in British Guiana, 1927-1932. II. Fertilizer investigations. R. R. Follett-Smith. *Brit. Guiana Dept. Agr., Rice Bull.* 1, 39 50(1933); cf. Codd and Peterkin, *C. A.* 28, 2804<sup>3</sup>.—Analyses of the soil and of the rice straw and other org. material used as fertilizers are given. Applications of limestone depressed the yield of rice straw; small increases were obtained with superphosphate,  $(\text{NH}_4)_2\text{SO}_4$  and  $\text{K}_2\text{SO}_4$ . Application of limestone at the rate of 1 ton per acre tended to increase the incidence of "man rice." N and P fertilizers and rice straw decreased lodging. None of the treatments affected the flowering date. III. Insect pests of rice and padi. F. A. Squire. *Ibid.* 51 7. —Addn. of 1/4 lb.  $\text{Na}_2\text{SiF}_6$  per bag gave good control of the rice weevil (*Calandra oryzae* L.) in stored rice. Naphthalene gave good results when the rice was stored for a short time in closed containers. K. D. J.

The composition and mixing of commercial fertilizers. F. T. Adriano. *Philippine J. Agr.* 3, 289-309(1932).

A general review with annexed tables showing (1) the amt. of plant food elements removed from the soil by crops such as bananas, cacao, coconuts, coffee and rice, (2) the value of com. fertilizers imported into the Philippines from 1920 to 1930, (3) the compn. and price of com. fertilizers sold in Manila in Aug., 1931, (4) the analysis of some com. fertilizers and Philippine bat guanos used in the Philippines, (5) comparison of the fertilization values of some Philippine seed cakes with that of cottonseed meal, and

(6) the analysis of some possible Philippine fertilizer fillers. Fourteen references. John O. Hardesty

Making fertilizer from activated sludge. Harvey W. Hincks. *Am. City* 49, No. 3, 45-8 (1934).—Excess sludge resulting from the activated sludge treatment at the Tri-City disposal plant, Pasadena, Calif., is converted into "nitrogeanic" fertilizer. The excess sludge is drawn from the re-aerating tanks, coagulated with  $\text{FeCl}_3$ , filtered off, dried in revolving cylindrical driers, ground to size, and sacked for distribution. The annual production is approx. 3000 tons or 1 ton of dried com. fertilizer per million gals. of sewage processed. The fertilizer analyzes approx. 70% org. matter, 3% total P as phosphoric acid and 6% total N.

Inspection of commercial fertilizers. H. D. Haskins. Mass. Agr. Expt. Sta., *Control Series Bull.* 69, 46 pp. (1933).—Chem. analyses for N, P and K are given for 495 brands of fertilizers sold and registered in Mass. The N fraction is differentiated by reporting as ammonia N, nitrate N or as org. N.

Inspection of agricultural lime products. H. D. Haskins. Mass. Agr. Expt. Sta., *Control Series Bull.* 71, 8 pp. (1933).—The chem. compns. of 39 samples of lime products and 1 sample of gypsum are tabulated.

Photonitrication of some compounds. Ram Singh Sarkaria and Faqal-Ud-Din. *Indian J. Agr. Sci.* 3, 1057-63 (1933).—When 1% solns. of urea and  $\text{NH}_4$  oxalate were exposed to the sunlight for 14 days in the presence of ZnO, 13.48 and 10.16%, resp., of the N was converted into nitrite and nitrate. Under similar conditions, appreciable oxidation of the N was also obtained in 1% solns. of uric acid, hippuric acid, acetamide, glycocoll,  $\text{NH}_4\text{OAc}$ , dicyanodiamide, monoethylamine and diethylamine; sterile soil was much less efficient than ZnO as a catalyst for the photo-oxidation of these compds., but was more efficient for the oxidation of aniline. Animal charcoal was more efficient than ZnO as a catalyst for the oxidation of  $(\text{NH}_4)_2\text{SO}_4$ , but sterile soil had no effect.  $\text{NaNO}_2$  was oxidized to  $\text{NaNO}_3$  in the presence of ZnO and sunlight. The presence of the  $\text{NH}_4$  radical in the nitrifying solns. indicated that org. compds. were first converted into  $\text{NH}_4$  compds. and subsequently into nitrite and nitrate.

Composts and fertilizers in relation to greenkeeping. II. Nitrogenous fertilizers. T. W. Evans. *J. Board Greenkeeping Research* 3, 99-103 (1933); cf. *C. A.* 28, 2152.—The use and effects of soot, dried blood, hoof and horn meals, leather, shoddy, sewage sludge, oil cakes, malt culms and spent hops on golf greens are discussed.

Turf diseases and their control. John Monteith, Jr., and Arnold S. Dahl. *Bull. U. S. Golf Assoc., Green Sect.* 12, 85-186 (1932).—Formalin, S and various Cu compds. were ineffective in controlling turf diseases caused by *Rhizoctonia*; metallic Hg and various org. and inorg. Hg compds. gave good results and were almost equally effective when applied on the basis of equiv. Hg content, but there were slight differences in the rapidity with which the diseases were checked, in the length of time that a recurrence of the diseases was prevented, and in the danger of burning the turf. Repeated use of Bordeaux mixt. resulted in serious injury to turf owing to Cu poisoning. None of the Hg compds. caused permanent injury to turf, but  $\text{HgCl}_2$  caused less burning of the grass than did other Hg compds. when they were applied at comparable rates; when turf had been treated year after year less Hg was required to check the diseases than on turf where no treatments had ever been applied.  $\text{HgCl}_2$  and  $\text{HgCl}_2$ , used at the rate of 2-5 oz./1000 sq. ft., effectively controlled the snow-mold disease caused by *Fusarium nivale*. A discussion is given of the injuries to turf caused by chem. deficiencies in the soil, excessive coupons. of salts and unfavorable soil acidity.

*Fusarium* patch disease of bowling and golf greens. F. J. Bennett. *J. Board Greenkeeping Research* 3, 79-86 (1933).—The disease, known as "snow mold," is caused

by the fungus *Fusarium nivale*. Growth of the fungus on wheat-meal agar substratum was completely inhibited by the addn. of 1 part of malachite green to 20,000 parts of the medium; a 10-fold concn. of  $\text{CuSO}_4$  had no effect, and  $\text{KMnO}_4$  (1:1000) was not toxic but induced earlier production of the dark growth assoc. with the calometria stage of the fungus. Because of its soly. in water, malachite green when used alone did not effectively control the fungus on grass swards; excellent results were obtained by the use of malachite green-Bordeaux mixt. sprays (1 qt. 1:20,000 malachite green plus 3 gal. Bordeaux mixt.) applied at the rate of  $3\frac{1}{4}$  gal. to 150 sq. yd. of sward at approx. weekly intervals.

Susceptibility of treated and untreated turf to brown-patch and dollarspot. H. F. A. North and L. E. Erwin. *Phytopathology* 24, 15 (1934).—Good control of the diseases was obtained with a mixt. of  $\text{HgCl}_2$   $\frac{1}{2}$  and calomel  $\frac{1}{2}$ , but much depends on the weather conditions.

Control of crabgrass and other turf weeds with chemicals. Fred V. Grau. *Bull. U. S. Golf Assoc., Green Sect.* 13, 47-52 (1933).— $\text{NaClO}_2$  gave excellent control of crabgrass, milk purslane and chickweed in turf and markedly increased the stand of Kentucky bluegrass; the treatment had practically no effect on the nutritive elements in the soil or on the soil reaction.  $\text{NH}_4\text{CNS}$  gave promising control of crabgrass, but it stimulated the growth of plantain, dandelion and other perennial weeds, as well as that of the grass.  $\text{As}_2\text{O}_3$ ,  $\text{Na}_2\text{AsO}_4$  and  $\text{NaAsO}_4$  were ineffective against crabgrass, but gave a high percentage control of plantain, white clover, chickweed, ground ivy, knotweed and pennywort; they were not injurious to either the grass or the soil. Pb arsenate had no effect on crabgrass but was of some value in controlling chickweed.  $\text{FeSO}_4$  alone and in mixt. with  $(\text{NH}_4)_2\text{SO}_4$  stimulated the growth of crabgrass.

Further experiments on the root-gall nematode, *Heterodera marioni* (Cornu) Goodey, in South India. P. N. Krishna Ayyar. *Indian J. Agr. Sci.* 3, 1064-71 (1933); cf. *C. A.* 27, 3244.—Treating the soil with com.  $\text{CaCN}_2$  (1000 lb./acre) or with a mixt. of  $\text{KCN}$  (800 lb.) and  $(\text{NH}_4)_2\text{SO}_4$  (1000 lb.) 5 weeks before sowing the seed, gave practically complete control of the root-gall nematode on *Hibiscus esculentus* plants. Moderate control was obtained with  $\text{Ca}(\text{CN})_2$ , but S and  $(\text{NH}_4)_2\text{CO}_3$  had little or no effect. None of the treatments was injurious to the plants.

Codling-moth control. W. S. Hough. Va. State Hort. Soc., *Proc. 38th Ann. Meeting; Va. Fruit* 22, No. 1, 165-71 (1934); cf. *C. A.* 28, 2114.—In heavily infested orchards, 4 applications of Pb arsenate were more effective than 6 applications of either Ca arsenate or Mn arsenate in preventing the entrance of codling-moth larvae into apples; Paris green was ineffective. Addn. of Bordeaux mixt. (1:3:50),  $\text{Zn}(\text{OH})_2$  or  $\text{ZnSO}_4$ -lime mixts. to Ca arsenate sprays more or less completely prevented the foliage injury resulting when Ca arsenate was used alone; the Zn compds. caused severe russetting of the Winesap, Stayman, Delicious, Grimes Golden and York apple varieties. The efficiency of Ca arsenate-Bordeaux mixt. sprays in controlling the codling moth was increased by the addn. of summer-oil emulsion. None of the As sprays could be used sufficiently late in the season to control late worms without the necessity for washing the fruit to remove As residue; Mn arsenate seemed to adhere to the fruit to a greater extent than Pb arsenate. Addn. of oil to the sprays increased the As residue and made its removal more difficult. Summer-oil emulsion, 1 gal., and nicotine sulfate, 1 pint per 100 gal., gave about the same control of codling moth as did Pb arsenate, and the fruit did not require washing to remove objectionable residues. Combinations of  $\text{Na}_2\text{AlF}_6$  and fish oil gave results almost equal to those obtained with Pb arsenate, but when the spray was used in July it was necessary to wash the fruit in order to reduce the F residue to the tolerance of 0.01 grain per lb.

The entrance of codling-moth larvae into fruit, with special reference to the ingestion of poison. Paul M.

Gilmer. *J. Kansas Entomol. Soc.* 6, 19-25 (1933).—Most of the *As* ingested by the larvae is probably obtained by the taking into the buccal cavity of bits of skin and pulp cut from the sprayed fruit during the process of entering. These bits are afterward expelled, but a considerable portion of the foreign material remains within the mouth cavity. When fruit was sprayed with carmine, varying amts. of the dye were present in  $\frac{3}{4}$  of the larvae within 24 hrs. after entrance into the fruit; the amt. ingested indicated that 25-33% of the larvae would survive were the material Pb arsenate. The larvae pick up considerable foreign matter on the setae, legs and other appendages, some of which is carried into the fruit at entrance.

K. D. Jacob

The control of insects boring in ornamental shrubs and shade trees. Clyde C. Hamilton. Natl. Shade Tree Conf., *Proc. 9th Ann. Meeting* 1933, 59-73. —Good control of several species of cambium bark borers on pin-oak trees was obtained by painting the trunks, limbs and twigs of the trees with refined pine oil contg. 5% of 95% free nicotine, with or without the addn. of 5-10% of paraffin; good results were also obtained when solns. of resin in McOH or isopropyl alc. were substituted for the pine oil. Mixts. of pine oil and 5% of nicotine with resins, corn oil or cottonseed oil also gave effective control of the insects. The treatments caused no injury to pin oaks, except where they were applied to twigs of smaller diam. than a lead pencil; hard maples showed bark injury about 6-8 weeks after the materials were applied, and in some instances the trees were killed. Oil sprays and tree paints of all kinds were injurious to the sugar maple, black walnut, butternut and beech. Eighteen references.

K. D. Jacob

Top-dressing corn for the control of stalk-borer. Geo. C. Haines. *Farming in S. Africa* 8, 434, 436 (1933).—Good control of *Calamistis fusca* grubs on corn plants was obtained by applying approx. 10 cc. of a 1:1000 aq. soln. of Derrisol (a proprietary deriv. prepn.) to the crowns of the plants at the peak period of moth emergence.

K. D. Jacob

Stimulation of potatoes by magnesium Bordeaux spray. Reimer Honde. *Phytopathology* 24, 3 (1934).—Spraying potatoes with Bordeaux mixt. prepd. from hydrated lime high in Mg (30%) stimulated growth in the absence of insects and diseases; while spraying with Bordeaux mixt. prepd. from a high-Ca hydrated lime failed to stimulate growth or increase yield. The stimulation is apparent only on soils deficient in Mg, and the beneficial effect of the spray is probably due to the Mg supplied.

R. C. Burrell

Tar-oil distillates (tar creosotes) as dormant spray materials for the control of aphids and other insect pests. R. H. Hurt. Va. State Hort. Soc., *Proc. 38th Ann. Meeting; Va. Fruit* 22, No. 1, 149-60 (1934).—The compn., properties and uses of tar-distillate sprays are discussed. Emulsions contg. tar oil 3% and petroleum oil 3% gave excellent control of rosy aphids and scale on apple trees and caused little or no twig injury. Cresylic acid 1% in combination with petroleum oil 6% gave good control of aphids and caused no injury to buds and twigs. Combinations of cresylic acid 0.5%, water-gas creosote 1% and petroleum oil 2.5% gave good results but produced considerable bud burning, which was caused by the water-gas creosote.

K. D. Jacob

Lime-sulfur substitutes and their role in the Virginia spray program. A. B. Grove. Va. State Hort. Soc., *Proc. 38th Ann. Meeting; Va. Fruit* 22, No. 1, 116-26 (1934).—The compn., properties and uses of S-spray materials are discussed.

K. D. Jacob

Pecan roset—a nutritional disease. J. R. Cole, A. O. Alben, C. L. Smith and B. G. Sittin. Texas Pecan Growers' Assoc., *Proc. 13th Ann. Meeting* 1933, 52-6; cf. *C. A.* 27, 3771.—Pecan roset was prevented or largely controlled by spraying the trees with 0.25%  $ZnSO_4$  soln. at intervals of 3-4 weeks during the growing season. Results with Zn-lime or Zn-Bordeaux mixt. sprays were inconclusive. Promising results were obtained by injecting  $ZnSO_4$  into the trunks of pecan trees at the rate of 0.36

g. per sq. in. of cross section of trunk. Addn. of 100 lb.  $ZnSO_4$  to the ton of fertilizer used on pecan trees gave more or less complete control of roset on trees growing in acid soils but had little or no effect on those growing in neutral and basic soils.

K. D. Jacob

Notes on pear psylla and San José scale control. W. A. Ross, T. Armstrong and D. F. Patterson. *Entomol. Soc. Ontario, 63rd Ann. Rept.* 1932, 21 4 (1933).—In lab. expts., oil-lime-S sprays (lubricating oil 3 gal., water 3 gal. and Ca caseinate 6 oz., dild. in 100 gal. lime-S, 1:9) and 3% lubricating oil emulsion alone effectively prevented the deposition of gravid psylla eggs on the sprayed wood; eggs at different stages of incubation were very susceptible to the combination spray, but were resistant to the oil emulsion. Effective control of San José scale was obtained by spraying with 3 and 4% oil emulsions, and the oil sprays killed more quickly than lime-S.

K. D. Jacob

Additional recommendations for the control of blue mold of tobacco. L. F. Mandelson. *Queensland J. Agr.* 40, 465-9 (1933).—An efficient colloidal Cu spray soln. is prepd. as follows: Dissolve 1 lb.  $CuSO_4 \cdot 5H_2O$  in 2 qts. water; add 1 pint of molasses and then make slightly alk. by slowly adding a soln. of 5 oz. NaOH in 1 qt. water. This stock soln. should be stored for at least 1 week before use. For spraying purposes, 1 part of the stock soln. is dild. with 30 parts q<sup>r</sup> water, and 0.5% by wt. of potash soft soap is added as a spreader.

K. D. Jacob

Fungicidal experiments for the control of blue mold of tobacco. L. F. Mandelson. *Queensland Agr. J.* 40, 470-94 (1933). In general, sprays were more effective than dusts in controlling blue mold (*Peronospora tabacina* Adam.) of tobacco. A home-made colloidal Cu spray, contg. 0.4%  $CuSO_4$  and 0.5% soft soap as spreader, was most suitable as a fungicide for tobacco seedlings. Bordeaux mixt. without a spreading agent was not effective, addn. of 0.25% of Agral No. 1 or 2% of soft soap as spreading agents caused some spray injury to the plants. Colloidal Cu spray prepd. from a stock soln. that was at least 6 weeks old gave better results than that made from a freshly prepd. stock.

K. D. Jacob

Experiments on the control of downy mildew of tobacco. R. G. Henderson. *Phytopathology* 24, 11 (1934). A sulfide (Cal-Mo-Sul) alone, of all fungicides tested, gave results approaching com. control.

R. C. Burrell

Fungicidal control of *Gymnosporangium juniperi virginianae* and related species. Ivan H. Crowell. *Phytopathology* 24, 5 6 (1934).—A special form of colloidal S was effective in controlling cedar-apple rust. If the method proves satisfactory on a large scale, it will make unnecessary the eradication of the red cedar to control apple rust.

R. C. Burrell

Soil treatment with mercurials for control of potato scab. C. W. Frutchey and J. H. Muncie. *Phytopathology* 24, 9 (1934).— $HgCl$ ,  $HgO$  and an org. Hg prepn. failed to control potato scab when applied at the rate of 20, 10 and 10 lb. per acre to soils of a pH of 6.8-7.2. Several strains of *Actinomyces scab* grew well in acid solns. of  $HgO$  and  $HgCl$  in tyrosinate media.

R. C. Burrell

Promising fungicides. M. C. Goldsworthy and F. I. Green. *Phytopathology* 23, 561-2 (1933).—Copper oxide, Cu silicate or Cu phosphate when finely ground and combined with bentonite flocculated by lime show promise as fungicides.

R. C. Burrell

Comparing soil fungicides with special reference to *Phymatotrichum omnivorum*, root rot. W. N. Eckel and J. J. Taubenhaus. *Phytopathology* 24, 8 (1934).

Of a large no. of chemicals examined, direct toxicity tests showed pentachloroethane, tetrachloroethane, xylene and  $NH_3$  most toxic to *Phymatotrichum*. In soil tests tetrachloroethane injected 6 in. into the soil had within 15 days killed *Phymatotrichum* on infected cotton roots to a depth of at least 24 in.

R. C. Burrell

The effect of sulfur fungicides, applied during the bloom, on the set of apple fruits. L. H. MacDaniels and A. B. Burrell. *Phytopathology* 24, 144-50 (1934).—Data are

presented which confirms the view that S applied as dust or lime-sulfur spray, either before pollination takes place or shortly after, reduces the set of fruit. R. C. Burrell

**Toxic action of *Trichoderma* on *Rhizoctonia* and other soil fungi.** C. Mc Haenseler and M. C. Allen. *Phytopathology* 24, 10(1934).—A liquid nutrient medium in which *Trichoderma* had grown for 5 days, sterilized by passing through a Seitz filter, proved to be lethal to *Rhizoctonia* and *Pythium*. The occurrence of *Trichoderma* in soils may have an antagonistic effect on *Rhizoctonia* and other soil-borne pathogens. R. C. Burrell

**Purification of the virus of tobacco mosaic.** Carl G. Vinson. *Phytopathology* 24, 20(1934). Juice from diseased plants may be increased in infective power more consistently by the addn. of activated C after the addn of Lloyd's reagent in the usual procedure. R. C. B.

**Zinc oxide as a seed and soil treatment for damping off.** J. G. Horsfall. *Phytopathology* 24, 12(1934). ZnO may be more effective than the usual red Cu oxide treatment, especially for control of post-emergence damping off. R. C. Burrell

**Seed-treatment studies of spinach.** L. E. Fwim and F. K. Crandall. *Phytopathology* 24, 8(1934).—Of 10 fungicides tested, red oxide of Cu, and to a lesser degree, CuSO<sub>4</sub> (sol.), gave the best control of the damping-off fungus with spinach. R. C. Burrell

**The stimulation of fungus spore germination by aqueous plant extracts.** Frank Wilcoxson and S. E. A. McCallan. *Phytopathology* 24, 20(1934). Spores which failed to germinate readily in H<sub>2</sub>O would often show 100% germination when small quantities of yeast, tuber or fruit juices were added. R. C. Burrell

**Further studies on a non-infectious leaf-deforming principle from mosaic tomato plants.** M. H. Thornton and H. R. Graybill. *Phytopathology* 24, 19(1934). After the expressed juice of mosaic tomato plants was autolyzed and the virus inactivated by boiling, the juice still contained a noninfectious, leaf-deforming principle. R. C. Burrell

**The action of trypsin on tobacco mosaic virus.** W. M. Stanley. *Phytopathology* 24, 18(1934). Addn. of a soln. of cryst. trypsin to the juice of mosaic-diseased tobacco plants rendered the juice practically noninfectious, although no protein digestion could be demonstrated. R. C. Burrell

**A study of the potato eelworm (*Heterodera schachtii*) in the Irish Free State.** J. Carroll. *J. Helminthol.* 11, 137-56(1933).—No relation between the pH of the soil and eelworm abundance was found. It was definitely shown that soils having a pH above 7.0 are not unfavorable to eelworm. Of a no. of compds. tested CaCN<sub>2</sub> was the only one that decreased the occurrence of eelworms in soil and the attack on the roots of potatoes. K. D. Jacob

**Sodium fluoride as a control for cattle lice.** R. W. Thompson. *Entomol. Soc. Ontario, 63rd Ann. Rept.* 1932, 54-6(1933).—When they were applied in the powd. form, NaF, Na<sub>2</sub>SiF<sub>6</sub>, CaSiF<sub>6</sub> and BaSiF<sub>6</sub> were equally effective in controlling the cattle lice *Trichodectes scalaris*, *Iaemalopinus euryternus* and *H. vituli*. NaF killed biting lice more quickly than did derris. Sprays contg. NaF were very effective. K. D. Jacob

**The sheep blowfly problem in Australia.** I. R. J. Lillyard and H. R. Seddon. *Australia Council Sci. Ind. Research, Pamphlet No. 37*; N. S. Wales Dept. Agr., *Sci. Bull.* 40, 136 pp.(1933).—A review of investigations on the use of chemicals for jetting, swabbing and dipping sheep for blowfly control, for dressing blowfly wounds, for the treatment of harts in blowfly traps and for the control of blowfly larvae in sheep carcasses. Numerous references. K. D. Jacob

**Derris in fly sprays.** I. Kerosene extracts of derris root as house-fly sprays. F. L. Campbell, W. N. Sullivan and Howard A. Jones. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 3, 81-3, 85, 87, 103, 105, 107(1934).—Kerosene exts. of *derris* root, cubé root and haiari stems were all effective against house flies varying in effectiveness in that order. A modified lab. method of testing such insecticides was used with the mortality of flies as an index.

<sup>1</sup> The toxic action of kerosene exts. of *derris* extends over a period of 3 days or more during which mortality of flies increases. Rotenone is an important but not the only toxic constituent of such exts. The methoxy content may be a better chem. index of insecticidal value than the rotenone content of such plants. Eleven references. Henry H. Richardson

**Colloidal bentonite-sulfur.** A. S. McDaniel. *Ind. Eng. Chem.* 26, 340-5(1934).—The fungicide is made by adsorbing molten S into dry, finely ground bentonite clay and permitting the S to solidify. After grinding, the mixt. will absorb H<sub>2</sub>O to form a gel, the bentonite-S being the continuous phase. The toxicity of this product is much greater than mech. mixts. of bentonite and S. H. E. Messmore

**Removing spray residue.** Arthur J. Farley. *Va. State Hort. Soc., Proc. 35th Ann. Meeting; Va. Fruit* 22, No. 1, 133-41(1934).—A HCl wash that was effective in removing As and Pb from apples which had been sprayed with combination oil-Pb arsenate sprays consisted of 20" B6. HCl 5-5.5 gal., water 100 gal. and Vatsol, a proprietary wetting agent, 8 lb. Apples originally contg. 0.17 grain Pb per lb. showed 0.000 grain per lb. after immersion in the HCl-Vatsol bath for 1.5-2.5 min., whereas fruit washed with HCl alone showed 0.50 grain Pb per lb. Degras, a crude wool-grease product, has been developed for the prevention of excessive foaming when HCl-Vatsol washes are used in the spray or flood types of washers. K. D. Jacob

**[Report of] department of advisory chemistry [Effect of Bordeaux mixture on galvanized iron wire].** W. Goodwin. *J. South-Eastern Agri. Coll., Wye, Kent* 1934, No. 33, 31-7.—When galvanized Fe wires of various thickness and ages were dipped in Bordeaux mixt. and then immersed in rain water in open containers for several months the amt. of corrosion (as shown by the Fe and Zn contents of the water) was, in general, somewhat less than that of wire which had not been dipped in Bordeaux mixt. K. D. Jacob

**A review of Derris patents.** R. C. Roark. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 3, 91, 95, 97, 99(1934); cf. *C. A.* 25, 4081, 27, 2244. —Patents issued in the U. S. and foreign countries since 1930 are reviewed. Henry H. Richardson

**Corrosion troubles with cast-Fe pipes laid in Groninger soil (Wichers) 9. Soil-corrosion studies (Logan, Taylor) 9. Thiocyanogenation of aromatic compds. [production of insecticides] (Likhoshershtov, Petrov) 10.**

**Jahresbericht für Agrikultur-Chemie.** Folge 4. Jg. 73. Edited by F. Mach. Berlin: P. Parcy. 608 pp. M. 92.

**Fertilizer.** Christian J. Hansen (to Koppers Co. of Del.). U. S. 1,949,715, March 6. A dry dusty fertilizer salt, consists principally of originally dry (NH<sub>4</sub>)<sub>2</sub>H<sub>2</sub>PO<sub>4</sub> dry (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and a damp clotting K salt such as "technical" KCl contg. a small proportion of hygroscopic Mg salts.

**Fertilizer.** Charlotte Wilberg. *Gér.* 574,743, Feb. 10, 1934 (Cl. 16.4). A radioactive fertilizer is prep'd. by treating monazite sand or similar radioactive material, with excess of concd. H<sub>2</sub>SO<sub>4</sub>, removing the solid residue, neutralizing the filtrate with NH<sub>4</sub>OH or KOH and crystg the resulting NH<sub>4</sub>-K-phosphate-sulfate mixt.

**Fertilizer.** F. L. Schmidt. *Ger* 591,758, Jan. 26, 1934 (Cl. 16.3). Slag, e. g., from Thomas or Martin furnaces, is heated with *m*- or *p*-phosphates of alkali metals, especially with the reaction product of H<sub>2</sub>PO<sub>4</sub> and KCl, to form a fertilizer.

**Fertilizers.** Kali-Forschungs-Anstalt G. m. b. H. *Fr.* 757,610, Dec. 29, 1933. Mixed fertilizers are obtained by treating (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> or (NH<sub>4</sub>)<sub>2</sub>P<sub>2</sub>O<sub>5</sub> or both with HNO<sub>3</sub> in amt. corresponding to one or 2 atoms of NH<sub>3</sub>. Mixts. of di- and tri-phosphates in which the H<sub>2</sub>PO<sub>4</sub> is joined on the one hand to K and on the other to NH<sub>4</sub> may be used.

**Fertilizers.** Bamag-Meguain A.-G. Fr. 757,657, Dec. 30, 1938. Fertilizers contg.  $\text{NH}_4\text{NO}_3$  are colored a distinctive color by org. dyestuffs which are added to the limestone or other ingredients to be mixed with the  $\text{NH}_4\text{NO}_3$ .

**Mixed fertilizers containing ammonium nitrate.** Carl Krauch, Carl Eyer, Gottwald Baetz and Friedrich Korn (to I. G. Farbenind. A.-G.). U. S. 1,947,601, Feb. 20. A melt of mixed fertilizer material contg.  $\text{NH}_4\text{NO}_3$  and which also may contain  $\text{CaCO}_3$  is treated with up to 10% of  $\text{Ca}(\text{NO}_3)_2$ ,  $\text{CaCl}_2$  or mono-Ca phosphate, in order to produce a final product in the form of globular granules. Cf. C. A. 27, 1082.

**Fertilizer from superphosphate and ammonia.** Charles I. Burdick (to E. I. du Pont de Nemours & Co.). U. S. 1,948,454, Feb. 20. A superphosphate is treated with anhyd.  $\text{NH}_3$  to the extent of about 4% N incorporation, and the material is then treated with aq.  $\text{NH}_3$ . Cf. C. A. 27, 2526.

**Fertilizer from superphosphate and ammonia.** Edward W. Harvey (to Barrett Co.). U. S. 1,948,520, Feb. 27.  $\text{NH}_3$  is incorporated with a mixt. of superphosphate material and a "represser salt" such as  $(\text{NH}_4)_2\text{SO}_4$  in the proportion of not substantially less than 23 lb.  $\text{NH}_3$  per 1000 lb. superphosphate, so that reversion of available  $\text{P}_2\text{O}_5$  in the superphosphate to an unavailable form is inhibited by the represser salt.

**Converting the calcium sulfate in superphosphate into ammonium sulfate.** Hermann Oehme (to Chemische Fabrik Kalk, G. m. b. H.). U. S. 1,949,129, Feb. 27. Superphosphate is neutralized with  $\text{NH}_3$ , the neutralized

product is thoroughly mixed with  $\text{NH}_4$  carbonate and only a little water; the  $\text{NH}_4$  carbonate is then removed by blowing off (the quantity of water used being so small that a product is obtained in a dry comminuted condition ready for use as a fertilizer without preliminary drying or pulverization).

**Insecticide and fungicide.** Dehne & Co. Orbono-Ges. Fr. 757,450, Dec. 26, 1938. A mixt. is used contg. soft soap 33, a 2% soln. of cresol soap 11, 10% aq. ext. of tobacco 17, N<sub>2</sub> soln. of  $\text{KMnO}_4$  22, gliadine (vegetable glue) 17 and alc. 0.5-2 parts.

**Insecticide suitable for use on plant foliage.** Hugh Knight (to Emulsoids, Inc.). U. S. 1,949,722, March 6. A mineral oil having a viscosity of about 30-50 sec. Saybolt at 38° is compounded with an oil-sol. ester such as stearyl (suitable in a proportion about 20% the quantity of the oil).

**Seed disinfectant.** Vartkes Migrdichian and John L. Horsfall (to American Cyanamid Co.). U. S. 1,949,485, March 6. Pb, Zn, Hg, Cd, Bi and Fe salts of aromatic hydrocarbon-substituted cyanamids such as the phenyl cyanamides are used for treating seeds.

**Treating seed grains such as wheat to combat smut, etc.** Adolf Steindorff, Kaspar Pfaff and Michael Erlenbach (to Winthrop Chemical Co.). U. S. 1,947,926, Feb. 20. A tetrahalobenzene or the like such as 1,2,4,6-tetrachloro-3,5-dinitrobenzene is used as an active treating agent and may be mixed with tcl.

**Weed killer.** Säurefabrik Schweizerhall, Swiss 164,406, Dec. 16, 1933 (Cl. 2e). A weed killer contains  $\text{H}_3\text{PO}_4$  mixed optionally with fertilizer salts.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Biological action of short electromagnetic waves. I. Alcoholic fermentation of sugar by malt under the influence of the Lakhovski oscillator** Francesco Pirrone. *Industria chimica* 9, 16 21(1934). Exposure to radiation  $\lambda$  1885 accelerates the fermentation of sucrose soln. by malt slightly, as measured by the amt. of  $\text{CO}_2$  evolved.

**The determination of methanol in ethyl alcohol and potable spirits.** Olli Ant-Wuorinen. *Teknillinen Aikakauslehti* 24, 69-75(1934); cf. C. A. 27, 2755.—The alc. soln. to be analyzed is dild. to a concn. of 10% total alc. To 5 ml. of the soln. is added 2 ml. of 5 N  $\text{H}_3\text{PO}_4$ , and the soln. is placed in a thermostat at 15°. After 15 min. 2 ml. of  $\text{KMnO}_4$  (3 g. in 100 ml. of  $\text{H}_2\text{O}$ ) and 1 ml. of  $(\text{COOH})_2$  (10 g. in 100 ml. of  $\text{H}_2\text{O}$ ) are added, both being brought to 15° in a thermostat before addn. After 5 min. the soln. is shaken, and 10 min. after the  $(\text{COOH})_2$  has been added, 1 ml. of concd.  $\text{H}_2\text{SO}_4$  (sp. gr. 1.84) is added, followed by 3 ml. of fuchsin soln. (200 mg. fuchsin, 2 g.  $\text{Na}_2\text{SO}_3$  and 10 ml. of 2 N HCl, diluted to 200 ml.). Exactly 1 hr. after the addn. of the fuchsin a portion of the soln. is placed in a cuvette and the color intensity detd. in a Pulfrich photometer. All phases of the operation are standardized, and no parallel tests are required with known solns. The accuracy of the new method is  $\pm 0.01-0.02$  mg. MeOH in 1 ml. test soln. contg. 10% by wt. of total alc.

**New studies in the direct crystallization of citric acid from lemon juice.** Guido Ajon. *Ann. merceologia siciliana* 1, 33 pp.(1933).—With the increasingly sharp competition of fermentation citric acid, the old Scheele method for producing the acid from lemon juice is ceasing to be profitable and a more efficient method is required. A. treats the fresh juice with a few dg. per l. of tannic acid in aq. soln., heats slowly with const. stirring to 70-75°, adds 4 g. decolorizing C per l., maintains the temp. 1 hr., stirs while cooling to room temp., filters, adds suitable organisms for complete fermentation (8-15 days) of the sugars, filters, evaps. to about 1/3 the initial vol., adds aq.  $(\text{NH}_4)_2\text{C}_2\text{O}_4$  to the hot residue to ppt. all Ca and Mg, stirs while cooling, filters after 24 hrs., adds 7-8 g. tartaric

acid per l., lets stand 24 hrs., filters and finally ppts. citric acid by cong. the liquid. A little  $\text{H}_2\text{SO}_4$  accelerates the final crystn. Equipment for com. production by this method is described, and costs are discussed. Analytical data are given for Sicilian lemon juice and analytical methods are described. The new method, as yet hardly beyond the lab. stage, is expected to compete successfully with the fermentation method in which cheap carbohydrate raw materials are used.

**Citric acid fermentation.** Antonio Angeletti. *Ann. Schnapparelli* 7, 72-5(1933). The fermentative capacities of the various species of *Aspergillus niger* vary greatly, but the dark-colored or black colonies of the fungus seem to be the most active. The fermentation may be carried out at the surface of the liquid (sucrose, molasses) or solid substrate (wheat meal, horse chestnuts, lupine seeds) or even within the liquid. These methods can be of use in the natural citric acid industry.

**Influence of oxygen on fermentation.** K. Bengtson. *Svensk Bryggareforen. Månadsbl. Svensk Bryggmästare Tidn.* 47, 331-7(1932).—Small addns. of  $\text{O}_2$  enhance the fermenting power of yeast, but large addns. adversely affect it.

**The tartaric acid contents of the 1932 Mosel musts.** J. Seiler. *Z. Untersuch. Lebensm.* 66, 609-15(1933). Many analytical data are presented on both the fermented and unfermented musts.

**Inhibition of fermentation of maceration juice by oxygen in the presence of positive-oxidation-reduction systems.** Fritz Lipmann. *Biochem. Z.* 268, 205-13(1934). 1. inhibits the fermentative activity of maceration juice when it exceeds the quantity of SH in the juice. Not sensitive to  $\text{O}_2$ , the fermentation is, however, inhibited by it in the presence of pos. oxidation reduction systems. In the presence of a very small amt. of thionine as sensitizer maceration juice has a fairly const. potential of 60 mv. with a blank Pt electrode, and when this is raised to 160 mv. by the addn. of naphtholsulfonate-indophenol the fermentation is very greatly diminished.

**Rapid commercial analysis of crude potash from beet vinasses.** K. Dömötör. *Z. Spiritusind.* 56, 195(1933).

In the crude residue ("Schlempekohle"), total carbonate is detd. directly as  $\text{CO}_2$ , total K as  $\text{KClO}_4$ , and K + Na as chloride, or Na may be detd. directly. B. C. A.

Turbidities in colored wine vinegar. Heinrich Kreipe. *Deut. Essigind.* 38, 41-2(1934).—The turbidities or ppts. often observed when certain wine vinegars are colored with com. caramel products result from the formation of protein-tannin compds. W. O. E.

Spectrographic examination of fruit juices and wines. A. Heiduschka and H. Müller. *Pharm. Zentralhalle* 75, 141-3(1934).—The feasibility of examg. fruit juices and wines spectrographically is demonstrated, notably by the photographic method, since the absorption thereby may be readily detd.; this cannot be accomplished by purely ocular observation. While the photographic method does not at present permit conclusions respecting the detection of berry wines in grape wines, its utility in this respect shows hopeful possibilities, sufficient in fact to warrant further investigations. W. O. E.

Fermentation of red wine. W. V. Cruess. *Fruit Products J.* 13, 199-204, 207, 212, 214, 217(1934).

E. H.  
Volatile acidity of wines containing sulfurous acid. Alberto A. Perazzo and Armando C. Arbecchi. *Anal. asoc. quim. Argentina* 21, 156-8(1933).—Detn. of volatile acids in wines by the official method (decree of Aug. 19, 1910) can be in error because of  $\text{SO}_2$ . To avoid the influence of  $\text{SO}_2$ , place in a Cazenave volatimetric tube 10 cc. of wine, add 4-5 drops of starch soln., add drop by drop 0.2 N I soln. until a blue color is obtained, add 1-0.3 cc. more 0.2 N I soln., add a few drops of paraffin oil and proceed with the Cazenave detn. Tests show that the  $\text{H}_2\text{SO}_4$  formed from the  $\text{SO}_2$  by the I soln. does not break up org. esters and set free org. acids.

R. M. Symmes  
Effect of refrigerants on brewery apparatus. H. Schulze. *Allgem. Brauer-Hopfen-Ztg.* 72, 1112(1932).— $\text{NH}_3$  attacks Cu and its alloys, but not Fe. Explosions in  $\text{NH}_3$  compressors are frequently due to decompn. owing to superheating and entry of explosive oil vapors.  $\text{CO}_2$  does not attack Fe or Cu.  $\text{SO}_2$  does not attack Fe or Cu at  $< 100^\circ$ . B. C. A.

Color of beer. T. Hajek. *Z. ges. Brauw.* 55, 115-18(1932).—The effect of differences in the  $\text{H}_2\text{O}$ , hops and malt and of treatment on the color of beer has been studied. B. C. A.

The influence of phosphates and bromates as catalysts for the growth of *Saccharomyces cerevisiae*. E. Caserio. *boll. ist. sieroterap. milan.* 12, 742-51(1933).—Small quantities of bromates (optimum 0.04%) and phosphates (optimum 0.2%) added to the culture media favor the growth of *S. cerevisiae*, but when bromates are  $> 0.1\%$  and phosphates  $> 0.5\%$ , the growth ceases. G. A. B.

Staining of yeast cells with methylene blue and studies on the permeability of the cell membrane. IV. H. Fink and R. Kühles. *Wochschr. Brau.* 50, 185(1933); cf. *A.* 27, 4021.—Some earlier investigation (*C. A.* 24, 104; 26, 251) showed that living yeast cells are stained blue in the absence of electrolyte. To obviate this source of error the authors suggest the incorporation of phosphate in the staining soln. S. Józsa

The effect of age on the nitrogen content of yeast. Niels Nielsen. *Compt. rend. trav. lab. Carlsberg* 19, No. 10, 11 pp.(1933).—Inoculations were made with a const.

amt. of a yeast suspension of const. age (9 days) into 100 ml. wort, and the total dry wt. and N followed for 48 hrs. Growth, plotted as dry matter, followed a sigmoid course, the increase beginning after a 10 hrs. lag and the max. being reached in 96 hrs., after which autolysis caused a slight decrease in dry matter. However, the percentage of N in the dry matter increased about 30% during the last 12 hrs., i. e., while growth was only starting; it fell to a min. in 70-80 hrs., i. e., while growth was slowing down, and it increased slightly during autolysis. A high

concn. of N thus precedes the period of rapid growth. The decrease is not due to a decrease in the N content of the wort, which is insignificant, but to internal conditions in the cells. K. V. Thimann

Acid formation in yeast autolysis. Hugo Haehn and Heinrich Leopold. *Z. Untersuch. Lebensm.* 67, 50-8(1934).—In an alk. medium, the increase in amino acids is less than in an acid one. This holds at  $30^\circ$ ,  $45^\circ$  and  $55^\circ$ . On the other hand, alk. autolysis develops more acid than the acid autolysis. It is possible that this is due to an energetic deaminating breaking down to N-free acids. While asparaginase acts strongly in an alk. medium, these expts. do not offer a complete insight into this. An important practical result of these expts. is that in the normal yeast autolysis at higher temp. the acids which result in a purely enzymic way keep down the albumin-putrefying bacteria. F. L. Dunlap

Heteroxanthine, isolated from yeast. P. W. Wiardi and B. C. P. Jansen. *Roc. trav. chim.* 53, 205-8(1934). Forty kg. of dried brewer's yeast, extd. with water contg. 0.1%  $\text{H}_2\text{O}_2$  and adjusted with HCl to pH 4.5, gave 100 l. of ext., which was stirred with 6 kg. of fuller's earth. After sepn. the earth was extd. with baryta and ice, and filtered. The alk. filtrate was brought to pH 4.8 and a soln. of Na silicotungstate was added to complete pptn. The ppt., decompd. with baryta and ice, gave an alk. soln. which was acidified with  $\text{HNO}_3$  to pH 2 and then treated with excess  $\text{AgNO}_3$ . The ppt., which contained no vitamin  $\text{B}_1$ , was decompd. with HCl and filtered; the filtrate was evapd. to dryness and the residue extd. with dil.  $\text{H}_2\text{SO}_4$ . By repeating the  $\text{AgNO}_3$  purification, concg. the soln. and recrystg. from 0.5 N HCl, 1.2 g. of the HCl salt of heteroxanthine (7-methylxanthine), pale yellow, was obtained. When  $(\text{AcO})_2\text{Pb}$  and silicotungstic acid were used before the treatment with fuller's earth, the Ag ppt. contained not heteroxanthine but adenine. L. K.

Fermentation of honey (Borries) 12. Partial oxidation products of hydrocarbons (for denaturing alc.) (U. S. pat. 1,948,161) 10.

Tables to Be Used with Sikes's A. and B. Hydrometers. Part I. For Ascertaining the Strength of Spirits at Temperatures Ranging from  $30^\circ$  to  $100^\circ$  F. Part II. For Determining the Weight per Gallon of Spirits by Sikes's A. and B. Hydrometers. London: H. M. Stationery Office. 68 pp. 2s. 6d.

Denatured alcohol and ester. Wm. N. Davis and John T. Rutherford (to Standard Oil Co. of Calif.). U. S. 1,940,244, Feb. 27. The extd. oils derived by the  $\text{SO}_2$  extrn. treatment of petroleum oils and which contain org. S compds. and a relatively large amt. of unsatd. and aromatic constituents are used for denaturing alcs. or esters.

Vinegar from alcoholic solutions. Charles S. Ash (to Calif. Packing Corp.). U. S. 1,948,836, Feb. 27. For conversion by a plurality of intermittent fermenting steps, a porous bed of substantially insol. material such as pumice or wood shavings is inoculated with vinegar enzymes, a film of the alc. soln. is formed upon the surfaces of the bed and acetic fermentation is conducted on the surfaces, an excess of alc. soln. from storage being passed through the bed, drained off and recirculated. App. is described.

Beverage of low alcohol content. Erich Mertens and Bernhard Hanack. *Ger.* 543,777, Jan. 2, 1934 (Cl. 6b. 21). Cooled pasteurized skim milk is fermented in closed vessels with yeast, sugar and honey.

Filter for wine, etc. Gustave Gessner. *Swiss* 163,530, Oct. 16, 1933 (Cl. 36d).

Separating drums for yeast. Aktiebolaget-Separator. *Fr.* 757,294, Dec. 22, 1933.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**South American rose-wood oil and its original plants.** F. W. Freise. *Perfumery Essent. Oil Record* 24, 307-8 (1933).—Distn. of the wood or bark of the genuine rose-wood oil tree, *Aniba rosaeodora*, var. *amazonica*, gives oil having the following av. const.:  $d_{20}^{20}$  0.9055-0.9220,  $[\alpha]_D^{20} + 5$  45' to 6" 10',  $n_D^{20}$  1.4585-1.4020, soly. in 70% EtOH 3.5 vols. Seven other species of *Lauraceae*, the oils from which are used as substitutes, are described. The following are also frequently found in adulterated rose-wood oils: oil from *Hedwigia balsamifera*, Swartz, having  $d_{20}^{20}$  0.885-0.920,  $[\alpha]_D^{20} - 4$  30' to  $+6$  10',  $n_D^{20}$  1.550, and contg. *l*-linalool, terpineol and cineole; oil from *Bursera balsamifera*, Pois., having  $d_{20}^{20}$  0.8975,  $[\alpha]_D^{20} - 3$  50',  $n_D^{20}$  1.448, and sol. in 5 vols. of 70% EtOH; *Swietenia* oil (from *S. mahagoni*, L.) ( $d_{20}^{20}$  0.965-1.055), detected by its cedar-wood odor; and oil from a species of *Piper* having an odor of *Me salicylate*. B. C. A.

**Hop oil.** G. Louveau. *Rev. marques parfums. savonn.* 10, 420-1, 456 8 (1932).—The steam distillate afforded an insol. and a sol. oil; characteristics of oils from Bavarian, Bohemian and Burgundian hops are recorded. For Bavarian hops (insol. and sol. oils, respectively) the oils have:  $d_4$  0.8617, 0.9101;  $n_D$  1.4850, 1.4910;  $[\alpha]_D + 0$  18', —; acid value 9.1, 25.6; ester value 21.0, 45.5. B. C. A.

**A new preparation of colloidal mercuric sulfide, Mercol, in the therapy of syphilis.** Ettore Soscia. *Ann. Schiapparelli* 7, 87-93 (1933).

**Locust oil as a therapeutic agency** F. G. Cawston. *J. Trop. Med. Hyg.* 37, 49 (1934).

**Microsublimation of asafetida in the Swiss Pharmacopeia V.** L. Kofler and A. Kutnak. *Pharm. Monatsh.* 15, 7-9 (1931). The following test is described: "Pon the Et<sub>2</sub>O ext. from 1 g. asafetida into petr. ether (A). A ppt. is obtained; wash with A, dry, subject to fractional microsublimation and in the 1st fraction is obtained *vanillin*, in the 2nd fraction, *ferulic acid* and in the 3rd, *umbelliferone*." The authors show that the 1st crystals obtained are not *vanillin* but *ferulic acid*. H. M. B.

**Sixty years of the Austrian Pharmaceutical Society.** Hans Heeger. *Pharm. Monatsh.* 15, 11-18 (1934).

**Remedies for leprosy in Mexico.** Victor A. Reko. *Pharm. Post* 67, 49-55 (1934).—A discussion.

**Wallflower and stock.** Alfons M. Burger. *Riechstoff Ind.* 9, 1-2 (1934).—Use of the wallflower (*Cheiranthus cheiri*, L.) and the stock (*Matthiola annua*, Sweet.) in perfumery and formulas is described. H. M. Burlage

**Skin-cream bases.** K. Pfaff. *Riechstoff Ind.* 9, 2 5 (1934).—A discussion of skin-cream bases sold under the following trade names: (1) *Tegin*, a glycol ester of stearic acid, (2) *Protegin*, a petrolatum-like substance, (3) *Protegin X*, (4) *Tegacid*, (5) *Emulsifier 157*, (6) *Lanette Wax SX* (a mixt. of palmitin and stearin alcs.), (7) *Ivorit*, (8) *Thoreps* and *Vaneps*, (9) *Paremulsol*, (10) *Noremulsol*, (11) *Kleblatt Cream Base* and *Emulsifier* and (12) *Aquaphil*. Formulas illustrating their uses are given. H. M. Burlage

**A portable distillation apparatus for the recovery of essential oils.** Paolo Rovesti. *Industria chimica* 9, 6 11 (1934).—A portable app. for the steam distn. of essential oils is described. It is carried around the country so that the essences may be distd. as soon as possible. There is an optimum period when yields are best.

**Identification of *p*-phenylenediamine in the presence of other diamines in hair dyes.** C. Griebel and F. Weiss. *Z. Untersuch. Lebensm.* 67, 86-8 (1934); cf. C. A. 27, 4626.—Methods for the identification of *p*-phenylenediamine in the presence of 2,5-diaminoanisole are discussed. F. L. Dunlap

**Eryngium planum.** W. Peyer. *Apoth. Ztg.* 49, 253-4 (1934).—The histology of this drug has been studied in

connection with its saponin constituent and probable occurrence of an alkaloid. W. O. E.

**New Pharmacopoeia Helvetica (Ed. quinta).** H. Harms. *Apoth. Ztg.* 49, 256-65 (1934).—A commentary. W. O. E.

**Saponins as emulsifiers in practical pharmacy.** Wolfgang Brandrup. *Pharm. Zentralhalle* 75, 129-30 (1934) W. O. E.

**Investigations of homeopathic iron preparations.** A. Kuhn. *Pharm. Zentralhalle* 75, 131-4 (1934).—Triturations of FeCl<sub>3</sub> decomp., especially when exposed to light, into bivalent biologically active Fe, the amt. of which was detd. according to Simon with benzidine sulfate. The demonstrable limits of peroxidative action were detd. by means of benzidine, while those for ferrous ions were detd. by means of  $\alpha,\alpha'$ -bipyridyl and isonitrosoacetophenone. Dilns. of ferr. muriat. are unaffected in this respect. The importance of biologically active Fe is emphasized. Other typical homeopathic preps., as Fe sulfate, carbonate and lactate, contain biologically active Fe. The detection of active Fe in ferr. iodat. was scarcely possible. W. O. E.

**Reactions of eucalyptole.** Lad. Ekkert. *Pharm. Zentralhalle* 75, 145 (1934).—The color reactions arising from the action of aldehydes and concd. H<sub>2</sub>SO<sub>4</sub> on an alc. soln. of eucalyptole are: With furfural, the ring is dark garnet; it becomes green to deep indigo blue on gentle agitation; it changes to deep violet-red when shaken; it becomes blue with a green cast on diln. with alc. With anisaldehyde the ring is carmine-red; when gently agitated the upper liquid becomes green followed by deep blue and finally violet; on shaking it changes from cochineal to cherry red; when dild. with alc. it changes from blue-violet to blue. With salicylaldehyde, the ring is deep garnet; it changes from green to blue and violet on gentle agitation; on shaking it becomes deep bluish red; when dild. with alc. it becomes brown-violet. With *vanillin*, the ring is garnet; on gentle agitation it changes from violet-rose to violet; it cyclamen to cochineal-red when shaken; it is bright rose-violet to violet-blue on diln. with alc. With cinnamaldehyde, the ring is garnet; when gently agitated or shaken it is garnet; when dild. with alc. it is brown-rose. With piperonal, the ring is garnet with violet cast; when gently agitated it is violet-rose to rose-violet; when shaken it is cyclamen to cochineal-red; when dild. with alc. it is violet-rose. With *p*-dimethylaminobenzaldehyde, the ring is garnet; when gently agitated it is violet-rose, when shaken it is brown to bluish red. Coloration with  $\alpha$ - and  $\beta$ -naphthol are also recorded. W. O. E.

**Specific rotation of alkaloid and alkaloid salt solutions.** R. Lillig. *Pharm. Ztg.* 79, 198-200 (1934).—The [α]<sub>D</sub> values for various cinchona and opium alkaloids, as also for cocaine, gelsemine, retamine, chelidonium, corydine, lupinine, etc., are recorded. W. O. E.

**Steam sterilization in apothecaries and hospitals.** Reinold Kummer. *Pharm. Ztg.* 79, 205-8 (1934).

**Detection and estimation of copper in pharmaceutical preparations.** F. Feigl and P. Krumholz. *Scientia Pharm.* 5, 19-20 (1934).—In the case of exts. ignite 0.2 g. of the sample in a 5-cc. porcelain crucible, fume with 2 drops of HNO<sub>3</sub> to disappearance of C, warm with 1 drop concd. HCl after prior evapn. with 1 drop concd. HCl, add 2 cc. H<sub>2</sub>O, transfer to a cylinder, then after addn. of about 50 mg. NH<sub>4</sub>F to mask the Fe always present treat with 1 drop 5% ZnSO<sub>4</sub> soln. and 0.5 cc. NH<sub>4</sub> Hg thiocyanate (8 HgCl<sub>2</sub> and 9 NH<sub>4</sub>CNS in 100 cc. H<sub>2</sub>O). The presence of Cu is indicated by an intense violet color, which on comparison with standards may serve for quant. results. In the case of essential oils, shake 1 cc. in a separatory funnel with 2 cc. 0.1 N HCl, add a granule of NH<sub>4</sub>F to the aq. layer, and proceed as above. W. O. E.

**Histochemical detection of the active glucosides in folia**

**digitalis and in semen strophanthi.** Gundis Rotter and A. Pünkel. *Scientia Pharm.* 5, 9-15(1934).—The glucosides digitoxin, gitoxin and gitalin, the saponin digitonin, the leaves from the fresh plants of *Digitalis purpurea* and *D. lanata*, and finally the seeds of *Strophanthus kombe*, *S. hispidus* and *S. gratus* were treated with the following reagents: Na nitroprusside, concd.  $H_2SO_4$ , 80%  $H_2SO_4$ ,  $FeCl_3$ - $H_2SO_4$ ,  $EtOH$ - $H_2SO_4$ ,  $EtOH$ - $H_2SO_4$ - $Ac_2O$ ,  $EtOH$ - $H_2SO_4$ - $FeCl_3$ ,  $H_2SO_4$ - $Ac_2O$ , Wasicky's reagent (with and without  $H_2O$ ),  $H_2SO_4$ -glycerol,  $Br$ - $H_2O$ ,  $KBr$  and tannin, some of which yield characteristic colors (with tannin fine-grained ppts.). Of value in this connection are for digitalis, tannin, Wasicky's reagent and  $EtOH$ - $H_2SO_4$ - $Ac_2O$  mixt.; for strophanthus, Wasicky's reagent, concd.  $H_2SO_4$  and glycerol,  $H_2SO_4$ - $Ac_2O$  and  $EtOH$ - $H_2SO_4$ - $Ac_2O$  mixt. W. O. E.

**Improvement of drugs through chemical intervention.** C. Rohmann. *Sueddeut. Apoth.-Ztg.* 74, 132 5(1934).—An address. W. O. E.

**Sterilizing action of carveol, dihydrocarveol and their ozonization products.** A. Morel, A. Rochaix, J. Dœuvre and F. Dénard. *Compt. rend. soc. biol.* 115, 536-8(1934), cf. C. A. 28, 1138<sup>4</sup>. L. E. Gilson

**Arsenic in tobacco smoke.** C. R. Gross and O. A. Nelson. *Am. J. Pub. Health* 24, 36-42(1934).—An app. is described for detg. volatile As and other substances evolved during the smoking of cigars, cigarettes and pipe tobacco. The range of  $As_2O_3$  found in popular domestic brands of cigars, cigarettes and smoking tobaccos ranged from 8.3 to 50 p. p. m. On the basis of av. figures the As inhaled in smoking 1.35 lb. of cigars, 0.57 lb. of cigarettes or 0.16 lb. of pipe tobacco is calcd. to be equiv. to that present in 1 lb. of food contg. 1.43 p. p. m. of  $As_2O_3$ —the max. permitted by law for food products. The proportion of total As volatilized during smoking ranges for cigars from 15.1 to 34.7%, for cigarettes from 32.2 to 41.3% and for pipe tobaccos from 26.1 to 32.8%. J. A. K.

**The assay of insulin and the blood-sugar level.** M. Caroline Hrubetz. *Am. J. Physiol.* 107, 284-32(1934).—In fasting rats, after the administration of insulin in doses less than 0.5 units per kg., the % drop in blood sugar is a logarithmic function of the dosage. The fall in blood sugar 0.5 hr. after the injection of less than 0.5 unit of insulin per kg., therefore, can serve as a basis for insulin assay. J. F. Lyman

**Colobot essential oil from Citrus hystrix dc. var. Torosa.** Simona Santiago Tanchico and Augustus P. West. *Philippine J. Sci.* 52, 263-7(1933).—The colobot grows wild and is cultivated to some extent in the Philippine Islands. The crushed fruit is used in shampoos and crushed rind is added to flavor and scent coconut oil. Steam distn. of the peel gave 2.15% of an essential oil which contained 26% of citronellal. The oil contains double bonds, gives a test for aldehydes and with  $NaHSO_3$  produces a cryst. addn product. The unaltered material sepd. from crystals had an odor resembling pinene and appeared to consist of a mixt. of terpenes.

James C. Munch

**Simple and rapid micro methods for tobacco analysis.** V. Microtitrimetric determination of ammonia in tobacco.

J. Budnár, Vitéz L. Nagy and Ladislaus Barta. *Biochem. Z.* 268, 174-7(1934); cf. C. A. 25, 558.—Heat for 15 min. on a boiling water bath and with const. shaking 0.25 g. finely ground tobacco with about 15 cc. 1/2%  $HCl$  in a 50-cc. volumetric flask. Add to this acid tobacco suspension 2-3 cc. 10% silicotungstic acid, then more reagent drop by drop until no further ppt. or opalescence appears. Cool, dil. with  $H_2O$  to the mark, and after an hr. filter through a small paper. Transfer 20 cc. filtrate + 0.1 g. tobacco to a Parnas-Wagner distn. app., add about 0.1 g.  $MgO$  and drive off the liberated  $NH_3$  with steam into 10 cc. 0.01 N  $HCl$  until about 50 cc. distillate is obtained. Titrate excess 0.01 N  $HCl$  with 0.01 N  $NaOH$  with methyl red. Analysis of 15 samples of tobacco gives  $NH_3$  content ranging from 0.46 to 1.07%. S. M.

**Violet perfumes.** R. M. Gattefossé. *Parfumerie moderne* 27, 313 19(1933).—A discussion of synthetic products. A. Papineau-Couture

**Preservation of cosmetics.** Bohm. *Parfumerie moderne* 27, 373 83, 487(1933).—A discussion of the merits of esters of  $p$ - $C_6H_4(OH)CO_2H$  (nipagin, nipasol, nipabenzyl and nipakombin) as preservatives, particularly for cosmetics, and also for pharmaceuticals and food products.

A. Papineau-Couture

**Note on an insecticidal ointment.** R. Louis Joly. *Parfumerie moderne* 27, 577, 579(1933).—Ointment that soothes the burning of mosquito bites and drives away mosquitoes and similar insects contains as essential constituents citral and camphor. A. P.-C.

**Quinine iodobismuthate.** Picon. *Compt. rend.* 198, 926 8(1934).—Detn. of the heat evolved on addn. of increasing amts. of  $Me_2CO$  to  $C_{20}H_{24}N_2O_7 \cdot 2HI \cdot 2BiI_3$  (I) shows that the viscous fluid product obtained with 20%  $Me_2CO$  is  $C_{20}H_{24}N_2O_7 \cdot 2HI \cdot 2BiI_3 \cdot 6Me_2CO$  (II). I with > 60%  $Me_2CO$  forms a clear soln.; with > 60% two layers form, the heavier (a) being II satd. with  $Me_2CO$ , the lighter (b) a soln. of II in  $Me_2CO$ , contg. resp. at 19° 104.9 and 1.97, and at 49° 130.2 and 0.7793 g. of I per 100 cc. soln.  $H_2O$  increases the amt. of I in b and decreases it in a until with 4%  $H_2O$  no sepn. occurs; with 10%  $H_2O$   $BiOI$  is pptd. I is sol. in all proportions in cyclohexanone, to form an increasingly viscous red soln. with which small amts. of Bi or quinine can be detd. colorimetrically. In diethylene glycol a limpid soln. is formed (cf. C. A. 17, 3508). C. A. Silberiad

**Fluorescence analysis of pharmaceutical products.** J. A. Radley. *Chemist and Druggist* 119, 612 3, 708 (1933); cf. C. A. 28, 1130<sup>4</sup>.—A review is given of the studies of Metzner (C. A. 24, 5335; 25, 1122), Wasicky (C. A. 23, 2244) and others on seeds, of Dummer (C. A. 24, 1934) on tinctures, Wimmer and Kennedy (C. A. 24, 3319) on essential oils, Mushet and Willoughby (C. A. 23, 1585; 24, 1532), Loew (C. A. 25, 2316), Pierce (C. A. 24, 5175) and others on fixed oils. R. reports detection of mineral oil in a sample of "genuine" seal oil, confirmed by chem. detn. which revealed the presence of 60% mineral oil. S. Waldbott

**The essential oils of the Swiss Pharmacopoeia.** Ernest J. Parry. *Chemist and Druggist* 120, 95 6(1934).—A crit. discussion of the 27 essential oils of the pharmacopoeia. The absence of values for  $n$  is noted. S. W.

**New perfume compounds and synthetics.** H. S. R. Pharm. J. 131, 605, 715(1933).—Many new com. perfumes are named; the formula for a built-up gardenia odor contains 14 different perfumes in alc. soln. Addn. of certain synthetics, e. g., methylheptim carbonate (for violet odors), phenylacetaldehyde dimethyl acetal (for lilacs, etc.) and phenylpropyl dimethyl ether (e. g., in rose compns.) gives a "fresh leafy note" to perfumes. Eugenyl formate (a), terpinyl cinnamate (b) and valerate (c) are recommended as fixatives in face powder perfumes (a and b); c is a tobacco perfume. *Longue oil* from the root or whole plant of *Levisticum officinale* Koch is not well known; the root oil combines the odors of angelica root, oakmoss and celery seed. S. Waldbott

**Cinchona and civilization.** Bernard P. Howard. *Pharm. J.* 131, 707 8, 709, 742 3, 765-6; *Chemist and Druggist* 119, 734-6(1933).—A lecture. The part played by cinchona and its alkaloids in combating malarial fever is emphasized. Close collaboration between the pharmacologist, clinician, research chemist and manufacturer is still desirable. S. Waldbott

**The new Swiss Pharmacopoeia, 5th ed.** P. Casparis. *Schweiz. Apoth.-Ztg.* 71, 437-9, 470, 473-7, 485-9, 497 9, 577-9, 593 4, 625-6, 637-41, 653-5(1933); 72, 13-15, 25 7, 41-3(1934).—A review of its history and detailed discussion of its contents. S. Waldbott

**History of medicine and pharmacy in St. Gall.** R. G. Maeder. *Schweiz. Apoth.-Ztg.* 71, 453-7(1933).—An illustrated review, with an unusual portrait of Paracelsus from the Historical Museum. S. Waldbott

**Origin and early history of the Swiss Apothecaries' union.** A. Tschirch. *Schweiz. Apoth.-Ztg.* 71, 457-65 (1933). S. Waldbott

**Assay methods for some N. F. VI preparations containing bromides.** Donald C. Grove and Edward M.

Hoshall. *J. Am. Pharm. Assoc.* 22, 545-8 (1933).—Six preps. contg. bromides are proposed for N. F. VI. These are elixir of  $\text{NH}_4\text{Br}$ , elixir of  $\text{KBr}$ , elixir of  $\text{NaBr}$ , elixir of 3 bromides ( $\text{NH}_4\text{Br}$ ,  $\text{KBr}$  and  $\text{NaBr}$ ), elixir of 5 bromides ( $\text{NH}_4\text{Br}$ ,  $\text{KBr}$ ,  $\text{NaBr}$ ,  $\text{CaBr}_2$  and  $\text{LiBr}$ ) and sirup of 5 bromides ( $\text{NH}_4\text{Br}$ ,  $\text{KBr}$ ,  $\text{NaBr}$ ,  $\text{CaBr}_2$  and  $\text{LiBr}$ ). The Volhard method is satisfactory for the assay of these preps. Factors were calcd. for the titration of each of the mixed salt preps. after due allowance is made for the purity of the U. S. P. salts. One cc. of 0.1 N  $\text{AgNO}_3$  = 0.01059 g. of the mixed salts in the elixir of 3 bromides. One cc. of 0.1 N  $\text{AgNO}_3$  = 0.01037 g. of the mixed salts in the elixir of 5 bromides. One cc. of 0.1 N  $\text{AgNO}_3$  = 0.01058 g. of the mixed salts in the sirup of 5 bromides. L. E. Warren

Licorice fern and wild licorice as substitutes for licorice. Louis Fischer and E. V. Lynn. *J. Am. Pharm. Assoc.* 22, 1225-30 (1933).—This is a continuation of studies on licorice fern *Polypodium vulgare* L. var. *occidentalis* Hook. (C. A. 25, 4087) and a new study of wild licorice *Glycyrrhiza lepidota* (Nutt) Pursh. Material was identified by G. N. Jones. Licorice fern rhizomes (A) and leaves (B) were collected near Seattle, Wash. and wild licorice rhizome (C) near The Dalles, O. in June, 1929. Loss in air was (A) 75.6, (B) 74.4 and (C) 59.0%. Loss at 110° was (A) 79.2, (B) 77.1 and (C) 59.0%. The cleaned and air-dried material was used. Total ash was (A) 2.7, (B) 6.2 and (C) 5.2%. Acid-insol. ash was (A) 0.27, (B) 0.08 and (C) 0.55%.  $\text{Et}_2\text{O}$ -sol. ext. was (A) 7.3 and (C) 1.67%.  $\text{CHCl}_3$ -sol. ext. was (A) 7.7 and (C) 1.75%.  $\text{EtOAc}$ -sol. ext. was (A) 15.6 and (C) 3.7%.  $\text{EtOH}$ -sol. ext. was (A) 35.8 and (C) 14.3%.  $\text{H}_2\text{O}$ -sol. ext. was (A) 41.2 and (C) 27.9%. Reducing sugars were (A) 4.2, (B) 17.0 and (C) 2.3%. Sucrose was (A) 15.5, (B) 0.66 and (C) 3.64%. Starch was (A) 6.3 and (C) 3.5%. Pentosans (A. O. A. C.) were (A) 7.75 and (C) 14.0%.  $\text{N} \times 0.25$  was (A) 9%. Tannin was (A) 2.5%. Alkaloids were absent in each. Glycyrrhizin, Housemann's method (C. J. 15, 2959) (real licorice), was 7.89 and (C) 8.39%. The residues from (A) and (C) were not sweet. The Tschirch and Cedarberg method gave the characteristic sweet acid from genuine licorice but not for (A) and (C). Hence it was concluded that neither of the plants contained genuine glycyrrhizin. Benzoic and salicylic acids were obtained from (B); also a phytosterol m. 132.3° and an unidentified substance m. 74°. A new glucoside *polydin* was isolated from (A). It had no effect when fed to a rat. If previously extd. with  $\text{CHCl}_3$  preps. of (A) might be used in medicine in place of genuine licorice. Licorice fern may be cultivated. L. E. Warren

A reaction for phenobarbital. G. D. Beal and C. R. Szalkowski. *J. Am. Pharm. Assoc.* 23, 18-19 (1934). The Ph group is converted into *m*-dinitrobenzoic acid by heating with  $\text{H}_2\text{SO}_4$  and  $\text{KNO}_3$ . The reaction mixt. is made alk. with  $\text{NH}_4\text{OH}$  and reduced with  $(\text{NH}_4)_2\text{S}$ . The *m*-diamino compd. is formed with the production of a red-brown color. In a large, hard-glass test tube mix 0.2 g. of the unknown with 0.5 g. of  $\text{KNO}_3$  and 2 cc. of  $\text{H}_2\text{SO}_4$ . Heat the mixt. in a water bath for 20 min., cool and add 3 cc. of  $\text{H}_2\text{O}$ . Make alk. with  $\text{NH}_4\text{OH}$  and boil gently. Cool and add without mixing 2-3 drops of  $(\text{NH}_4)_2\text{S}$ . A reddish brown ring forms which diffuses through the liquid to an orange color. L. E. Warren

Isolation of a glucoside from *Gnidia polyccephala* (Januaris bossie). M. Kindl. *Trans. Roy. Soc. S. Africa* 21, 239-44 (1933).—From the aerial portions of the plant collected in S. Africa a new glucoside (I) of daphnetin was isolated. It probably has the same empirical formula as daphnetin (II), and has the same content of aglucone (daphnetin). I differs from II, however, as follows: (1) I m. 197-8°, II m. 223.4°; (2) I, dextro rotatory, II, levo; (3) I, much less sol. in  $\text{EtOH}$  and  $\text{MeOH}$ ; (4) m. p. is depressed when mixed with II. J. J. W.

Chem. compn. of "St. John's root" (Almeida Costa, Dias da Silva) 25. Thiocyanogenation of aromatic

compds. [production of medicinal preps.] (Iakhushevstov, Petrov) 10. Peroxide of tetrahydronaphthalene (Swiss pat. 162,066) 10.

Therapeutic basic ethers containing halogen. Max Hartmann and Hans Iskt (to Soc. pour l'ind. chim. Bâle). U. S. 1,949,046, Feb. 27. 1-Diethylamino ethoxy-4-bromonaphthalene, the hydrochloride of which m. 179-80°, is obtained from diethylaminoethoxy naphthalene and Br by boiling in acetone. The free base is a yellowish oil and the hydrobromide m. 174.5°. The production of the following compds. also is described: 1-diethylaminoethoxy-2-isopropyl-4-chloro-5-methylbenzene, b<sub>p</sub> 142-3°; 1-bromoethoxy-2-isopropyl-4-chloro-5-methylbenzene, b<sub>p</sub> 154-5°; 2,4,6-tribromo-1-diethylaminoethoxybenzene, b<sub>p</sub> 170-1° and hydrochloride m. 163-4°; 1-diethylaminoethoxy-2-amino-4-chlorobenzene, b<sub>p</sub> 158-60°; 5-chloro-7-iodo-8-diethylaminoethoxyquinoline, a yellow viscous oil forming a mono hydrochloride, m. 187.8°, and a dihydrochloride, m. 153-4°; 5,6,7-trichloro-8-diethylaminoethoxyquinoline, an oil, dihydrochloride, m. 134-5°; 2-diethylaminoethoxy-4-methyl-7-chloroquinoline, an oil forming a dihydrochloride, m. 154-5°, and a methane sulfonate, m. 133.5°; 5-chloro-8-diethylaminoethoxyquinoline, an oil, hydrochloride, m. 191-3°; mention also being made of 1-dicyclohexylaminoethoxy-4-chlorobenzene-HCl, m. 198.0°; 5-bromo-8-diethylaminoethoxyquinoline-di-HCl, m. 178.0°; 5-chloro-8-dicyclohexylaminoethoxyquinoline-di-HCl, m. 239.40°; 5-chloro-7-bromo-8-diethylaminoethoxyquinoline-di-HCl, m. 142-3°; 5,7-dibromo-8-diethylaminoethoxyquinoline-di-HCl, m. 165.6°; 5-bromo-7-iodo-8-diethylaminoethoxyquinoline-di-HCl, m. 142.3°; 5,7-diiodo-8-diethylaminoethoxyquinoline-di-HCl, m. 168-9°; and 4-methyl-7-chloro-9-piperidinoethoxyquinoline-di-HCl, m. 150-1°. The products are therapeutic antiseptics, and may be made by various described methods. Cf. C. A. 27, 1994.

Curative specifics containing sulfonated santalene or cyclophyllylene derivatives. Joao da Veiga Soares and Nicanor B. Gonçalves da Silva. Brit. 395,007, July 1, 1933. Sulfonates of the sesquiterpenes, santalene or cyclophyllylene, are prepd. by adding concd.  $\text{H}_2\text{SO}_4$  to a mixt. of the hydrocarbon with  $\text{Ac}_2\text{O}$ . After addn. of  $\text{H}_2\text{O}$  and neutralization with alkali, the oil layer is removed. The alk. sulfonate is extd. from the aq. soln. with  $\text{CHCl}_3$ , the  $\text{CHCl}_3$  evapd., the residue dissolved in  $\text{H}_2\text{O}$  and extd. with  $\text{Et}_2\text{O}$  to remove any remaining oil and the aq. soln. evapd. to dryness. The products are used medicinally.

Stable salt of primula-saponin. Chemische Fabrik Pilot A.-G. Swiss 163,890, Nov. 16, 1933 (Cl. 36). A stable salt m. 212-13° and useful in pharmacy is obtained by treating primula-saponin with  $\text{NH}_3$ .

Racemic 1-hydroxyphenyl-2-amino-1-alkanol. I. G. Farberind. A.-G. (Max Bodmann, Gustav Bernhart and Leonhard Stein, inventors). Ger. 591,939, Jan. 29, 1934 (Cl. 12g. 32.21). 1-1-Hydroxyphenyl-2-amino-1-alkanol is subjected to a catalytic reduction with metals of the Ni group or with noble metals, at high temps. and in the

presence of  $\text{NH}_3$  or primary amines. The products are used in medicine. Examples describe the prepn. of *dl*-*m*-hydroxyphenylpropanolamine-HCl, m.  $178^\circ$ , *dl*-*m*-hydroxyphenylbenzylaminopropanol-HCl, m.  $168^\circ$ , and *dl*-3,4-dihydroxyphenylaminopropanol-HCl, m.  $178-80^\circ$ .  
**Magnesium lactobionate.** Chemische Fabrik vorm. Sandoz... Swiss 103,398, Nov. 16, 1933 (Cl. 116k).  $\text{Mg}$  lactobionate is prepd. by treating lactobionic acid with  $\text{MgCO}_3$  in the presence of water. The salt is used in therapy.

**Piperazine salt.** Chemische Fabrik Tempelhof A.-G. (Josef Zeltner, inventor). Ger. 591,808, Jan. 27, 1934 (Cl. 30k. 2). Solns. of the above salt suitable for injection purposes are prepd. by dissolving the substance in a mixt. of water and  $(\text{CH}_3)_4\text{N}_4$ .

**Tetraiodophenolphthalein composition.** Henry W. Wendt, Jr., administrator of the estate of Isco F. Ellzey, deceased (to The National Aniline and Chemical Co. Inc.). Can. 339,390, Feb. 13, 1934. A compn. for oral administration is produced by mixing together the di-Na salt of tetraiodophenolphthalein, water, gelatin, Na citrate and Na acid citrate in such amts. that the molar ratio of the total Na in the citrates to the di-Na tetraiodophenolphthalein employed is about 0.7 to 0.9 and about 2 to 7% of the tetraiodophenolphthalein is in the form of the mono-Na salt and the remainder is in the form of the di-Na salt.

**Compounds of the 1-phenyl-2-amino-1-alkanol series hydroxylated in the phenyl nucleus.** Max Bockmühl, Gustav Ehrhart and Leonhard Stein (to Winthrop Chemical Co.). U. S. 1,948,162, Feb. 20. Compds. of this series of the general formula  $\text{RCH}(\text{OH})\text{CH}(\text{NH}_2)\text{Y}$  in which R stands for a phenyl nucleus substituted by at least one hydroxyl group and Y for an alkyl group, are obtained by causing  $\text{HNO}_2$  to act upon a compd. of the general formula  $\text{R}'\text{COCH}_2\text{Y}$  in which R' stands for a phenyl nucleus substituted by at least one radical of the group comprising alkoxy, aralkoxy and acyloxy and Y for an alkyl group and subjecting the isonitroso compd. thus obtained to reduction. The introduction of the nitroso group is preferably carried out in the presence of a diluent, as by dissolving the aliphatic-aromatic ketone, in which the hydroxy groups of the phenyl nucleus are esterified or etherified, in an org. solvent, as ether or benzene. The  $\text{HNO}_2$  is preferably produced in the reaction mixt., for instance, by causing an inorg. acid, preferably gaseous  $\text{HCl}$ , to act upon a salt or another deriv. of  $\text{HNO}_2$ , such as  $\text{NaNO}_2$  or Pr nitrite. The isonitroso compds. are preferably reduced by a catalytic process to which they may be subjected in the form of their salts or as free bases, preferably dissolved in an org. solvent, such as alc. As catalysts may be used precious metal or other hydrogenation metal catalysts, for instance, those of the iron group. When using a precious metal catalyst, for instance, Pd catalyst, the isonitroso group is reduced by the hydrogenation to the amino group and the keto group is reduced to the  $\text{CHOH}$  group and when the hydroxy groups of the phenyl nucleus are substituted by aralkyl radicals these are simultaneously split off. When using as a catalyst a metal of the iron group, for instance, a Ni catalyst, the hydrogenation only causes reduction of the isonitroso and the keto group and when the parent compds. are substituted by aralkyl oxy groups in the phenyl nucleus, the reduction products are further treated in order to split off the said aralkyl radicals from the O atom attached to the phenyl nucleus, for instance, by subjecting them to a further catalytic hydrogenation in the presence of a precious metal catalyst. When the compds. are substituted by acyl radicals in the hydroxy groups of the phenyl nucleus, the acyl radical or radicals may be split off after the introduction of the isonitroso group at any stage of the process, for instance, before the reduction of the isonitroso compd., by heating with an inorg. acid, for instance,  $\text{HCl}$ . The 1-phenyl-2-amino-1-alkanols hydroxylated in the phenyl nucleus as obtained according to this process are therapeutics and can be utilized as remedies for treating diseases of the circulation of blood. Examples are given of the production of *o*-hydroxyphenylpropanolamine-HCl,

*m*-benzyloxyphenylpropanolamine, m.  $125^\circ$ , *p*-hydroxyphenylpropanolamine-HCl, 3,4-dihydroxyphenylpropanolamine-HCl, m.  $178^\circ$ , and some related and intermediate compds.

**Arsenic compounds of quinoline, etc.** I. G. Farbenind. A.-G. (Karl Streitwolf and Friedrich Hampe, inventors). Ger. 591,987, Jan. 20, 1934 (Cl. 12p. 1.10). 2-Methylquinoline compds. in which the Ph nucleus contains an arsenic acid residue are treated with aromatic aldehydes or their substitution products. Thus, quinaldine-6-arsonic acid is heated with  $\text{BzH}$ . The products are used as intermediates for the prepn. of drugs.

**Mercury-containing purine compounds.** Carl L. Lantenschlager, Max Bockmühl and Walther Persch (to Winthrop Chemical Co.). U. S. 1,948,179, Feb. 20. Therapeutic, strongly diuretic compds. are obtained by causing  $\text{Hg}$  salts, such as mercury acetate, to act upon purine derivs. contg. an unsatd. side chain, such as allyltheobromine or butenyltheobromine, allyltheophylline or butenyltheophylline or the like. The mercury in these new compds. is fixed in the side chain, the double bond being split by the reaction. Several examples with details of procedure are given.

**Derivative of phenylethylhydantoin.** Chemische Fabrik vorm. Sandoz. Swiss 166,004, Feb. 10, 1934 (Cl. 116k). The substance 3-methyl-5,5-phenylethylhydantoin is obtained by the action of 1 mol. of  $\text{Me}_2\text{SO}_4$  on 1 mol. of 5,5-phenylethylhydantoin. The substance m.  $136-7^\circ$  and is used in therapy.

**Alkylolamine derivatives.** Otto Eisleb (to Winthrop Chemical Co.). U. S. 1,949,247, Feb. 27. Compds. of the general formula  $\text{XCH}(\text{OH})\text{CH}_2\text{N}(\text{CH}_2\text{Ar})_2$  in which each Ar stands for a benzene or naphthalene radical which may be substituted by Cl and X stands for H or a lower alkyl are obtained by causing a 1-amino-2-alkanol to react with an arylmethyl chloride the aryl radical of which may be substituted by Cl (suitably at temps. of about  $60-110^\circ$  and in the presence of an acid-binding substance, with addn. of ether to sep. the reaction product from the resulting soln.). The products may be used as intermediates for prep. therapeutic compds. and dyes. *N,N*-Dibenzylaminoethanol, m.  $40-7^\circ$  and b.  $170-5^\circ$ ; *N,N*-dibenzylaminoethyl chloride-HCl, m.  $192^\circ$ ; *N,N*-bis(4-chlorobenzyl)aminoethanol, b.  $212^\circ$  and forms a colorless cryst. hydrochloride only sparingly sol. in water; *N,N*-bis(1-naphthylmethyl)aminoethanol, b.  $283^\circ$  and forms a hydrochloride m.  $211-12^\circ$ , 1-*N,N*-dibenzylamino-2-propanol, b. about  $168^\circ$ .

**Barbituric acid derivatives.** I. G. Farbenind. A.-G. Brit. 401,693, Nov. 17, 1933. *N*-Mono- or di-alkylated 5-cyclohexenyl- or cyclopentenyl-5-alkylbarbituric acids and their salts are prepd. by known processes for the manuf. of barbituric acid derivs., e. g., by introducing a substituent group into the corresponding barbituric acid compd. or by condensing alkylureas, guanidines, thioureas and isourea ethers with 5-cyclohexenyl- or cyclopentenyl-5-alkylmalonic acids, cyanoacetic acids or their derivs., with subsequent treatment if necessary. The products are useful as soporifics. Among examples (1) 5,5- $\Delta^1$ -cyclohexenylmethyl-*N*-methylbarbituric acid is prepd. by condensing Et  $\Delta^1$ -cyclohexenylmethylcyanoacetate with monomethylurea in alc. soln. contg. dissolved Na, and (2) monomethylurea is treated with Et  $\Delta^1$ -cyclopentenylmethylcyanoacetate and the product heated with dil.  $\text{H}_2\text{SO}_4$ . Cf. C. A. 27, 3947.

**Barbituric acid derivative.** F. Hoffmann-La Roche & Co. A.-G. Swiss 163,608, Nov. 1, 1933 (Cl. 116k). The compd. 5-isopropyl-5-methylolbarbituric acid, m.  $195-9^\circ$ , is obtained by the action of  $\text{CH}_3\text{O}$  on isopropylbarbituric acid. The compd. is used in medicine. Cf. C. A. 28, 1140<sup>2</sup>.

***N*-Alkylated derivatives of barbituric acid.** Walter Kropp and Ludwig Taub (to Winthrop Chemical Co.). U. S. 1,947,944, Feb. 20. By methods customary for the manuf. of substitution products of barbituric acid (I), generally tasteless, whitish cryst. hypnotic products are obtained such as the following derivs. of I: 5- $\Delta^1$ -cyclohexenyl-*N*,5-dimethyl, m.  $140^\circ$  and forming Na, Li and

- Ca salts; *N*-ethyl homolog, m. 134-5°; the corresponding *N*-allyl deriv., m. 127-8°; 5- $\Delta^1$ -cyclohexenyl-5-allyl-*N,N'*-dimethyl, m. 58-60°; the corresponding *N,N'*-diallyl compd., b<sub>1</sub> 158-60°; 5-methyl-5-(4-methyl- $\Delta^1$ -cyclohexenyl)-*N*-methyl, m. 133-4°; 5-ethyl homolog, m. 119°; 5-ethyl-5- $\Delta^1$ -cyclopentenyl-*N*-methyl, m. 127-8°; 5-methyl-5-(methyl- $\Delta^1$ -cyclopentenyl)-*N*-methyl, m. 116°; the corresponding 5-ethyl homolog, m. 73-4°; 5- $\Delta^2$ -cyclohexenyl-*N*,5-dimethyl, m. 127°; 5- $\Delta^2$ -cyclopentenyl-5-allyl-*N*-methyl, m. 98°; 5- $\Delta^1$ -cyclohexenyl-5-ethyl-*N*-methyl, m. 111-12°; 5- $\Delta^1$ -cyclohexenyl-5-ethyl-*N,N'*-dimethyl, m. 146°; 5- $\Delta^1$ -cyclohexenyl-5-ethyl-*N*-allyl, m. 84°. Various details of procedure are given for making some of these compds.
- Veratric acid derivative.** F. Hoffmann La-Roche & Co. A.-G. Swiss 163,700, Nov. 1, 1933 (Cl. 116k). A deriv. useful in medicine is obtained by the action of HNEt<sub>3</sub> on halide of veratric acid. The resulting veratric acid diethylamide b<sub>1</sub> 201-5°.
- Adenosinephosphoric acid.** I. G. Farbenind. A.-G. (Carl L. Lautenschlager and Fritz Lindner, inventors). Ger. 591,920, Jan. 20, 1934 (Cl. 12p. 7.01). See Brit. 396,135 (C. A. 28, 578<sup>9</sup>).
- Surgical sutures.** George M. Randall (to Plastic Products, Inc.). U. S. 1,949,111, Feb. 27. A "synthetic" surgical suture comprises a thread of absorbable animal tissue such as that of bovine ligamentum nuchae in its original chemical state homogeneously distributed through a cellulose base material such as regenerated cellulose.
- Wax of the tubercle bacillus.** I. G. Farbenind. A.-G. (Carl Ludwig, inventor). Ger. 473,846, Jan. 20, 1934 (Cl. 30k. 6). See Brit. 287,041 (C. A. 23, 483).
- Lyzed bacterial protein preparation suitable for topical treatment of local infections.** Frank G. Jones (to Eli Lilly and Co.). U. S. 1,949,375, Feb. 27. Lyzed bacterial proteins such as those from staphylococci are mixed with a germicide comprising a water-sol. Hg compd. such as Na ethyl mercurithiosalicylate.
- Hormones.** Soc. pour l'ind. chim. à Bâle. Swiss 163,140, Oct. 2, 1933 (Cl. 116k). See Brit. 401,574 (C. A. 28, 2469<sup>9</sup>).
- Hormones.** C. F. Boehringer & Soehne G. m. b. H. (Fritz Johannessohn and Erich Rabald, inventors). Ger. 592,200, Feb. 3, 1934 (Cl. 12p. 17.10). Sexual hormones are pptd. from aq. soln. by means of water-insol. or sparingly sol. alkaloids. The ppt. may be worked up by treatment with HCl followed by extn. with an org. solvent. Examples are given.
- Hormone preparations.** Soc. pour l'ind. chim. à Bâle. Swiss 163,699, Nov. 1, 1933 (Cl. 116k). A growth-promoting prepn. is obtained by extg. a thymus gland
- ext. with a 70% water-sol. aliphatic alc. The solvent is evapd. *in vacuo*. The residue is dissolved in water and treated with concd. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln. The resulting ppt. is washed with satd. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln., dried and washed with 70% alc. The dried product is probably pure thymus hormone, and has strong growth-promoting properties.
- Sexual hormones.** Soc. pour l'ind. chim. à Bâle. Swiss 163,139, Oct. 2, 1933 (Cl. 116k). See Brit. 400,520 (C. A. 28, 2129<sup>9</sup>).
- Enzyme.** Francis J. W. Roughton and Norma U. Meldrum. Brit. 403,096, Dec. 1, 1933. An enzyme which catalyzes reactions in which CO<sub>2</sub> or carbonates are involved is obtained by centrifuging slaughterhouse blood, sepg. the red corpuscles, washing them by centrifuging with isotonic saline (if desired), pptg. the hemoglobin with CHCl<sub>3</sub>, and sepg. the enzyme from the supernatant liquid by evapn., preceded, if desired, by ultrafiltration. Various applications of the product are described.
- Antiseptics and disinfectants.** Lehn & Fink, Inc. Fr. 757,580, Dec. 28, 1933. Diphenylalkyl compds. contg. an OH group and a halogen element, e. g., 3-chloro-4-hydroxydiphenylmethane, 5-chloro-3-methyl-2-hydroxydiphenylmethane, 4'-chloro-3-methyl-4-hydroxydiphenylmethane and 4'-bromo-4,6-dimethyl-2-hydroxydiphenylmethane.
- Stable antiseptic cream containing carron oil.** Harry Noonan (to Drug Products Co.). U. S. 1,947,568, Feb. 20. Unctuous bases are incorporated with carron oil, lime water, triethanolamine and chloramine, producing a "carron oil" in a solid colloidal state so dispersed that it is not reactive with the Cl slowly evolved from the chloramine.
- Intestinal absorbent comprising kaolin and aluminum hydroxide gel.** John C. Bird (to John Wyeth & Brother) U. S. 1,949,266, Feb. 27.
- Alkyl phenols.** Hyvm E. Buc and Reuben Schuler (to Standard Oil Development Co.). U. S. 1,948,287, Feb. 20. See Fr. 731,556 (C. A. 27, 731).
- Acid tooth paste.** Einar Bergve. U. S. 1,947,635, Feb. 20. A tooth paste is prepd. contg. silica-water-glycerol gel and an acid constituent such as tartaric acid, boric acid or benzoic acid rendering the colloids liquid at an increased grinding temp. without preventing re-coagulation upon cooling, the mixt. thus formed being peptized by subjecting it to a colloidgrinding at an increased temp. not higher than 70°.
- Removing nicotine from tobacco.** Leonhard Frank (to Generaldirektion der Österreichischen Tabak-Regie.). U. S. 1,949,012, Feb. 27. See Brit. 392,336 (C. A. 27, 4882).

## 18-ACIDS, ALKALIES, SALTS AND SUNDRIES

F. M. SYMMES

- Production of sulfuric acid by the tower process.** V. N. Shultz. *J. Chem. Ind. (Moscow)* 1933, No. 9, 14-20.—A detailed criticism of the work of S. D. Stupnikov (*Khimstroj* 1932, No. 7) is given. H. M. Leicester
- The technology of the process and the value of a one-tower system for sulfuric acid production.** P. V. Samarskii and E. K. Zefberlikh. *J. Chem. Ind. (Moscow)* 1933, No. 9, 20-4.—One tower composed of 3 zones is described. In the first zone, SO<sub>2</sub> is oxidized by nitrosyl-sulfuric acid, in the second NO is oxidized and in the third it is absorbed by pure H<sub>2</sub>SO<sub>4</sub>, which is returned to the first zone. H. M. Leicester
- Obtaining sulfuric acid by purifying smoke gases.** B. D. Shnererson. *J. Chem. Ind. (Moscow)* 1933, No. 9, 24-8.—The smoke is passed over Fe rings through a descending stream of H<sub>2</sub>O. Most of the SO<sub>2</sub> forms FeSO<sub>4</sub> and can be recovered. After a month the Fe must be washed with HCl to remove FeS. H. M. Leicester
- The corrosion of andesite in the tower process for the production of sulfuric acid.** I. E. Adadurov and E. A. Hauman. *J. Chem. Ind. (Moscow)* 1933, No. 9, 33 5.—
- The soly. in H<sub>2</sub>SO<sub>4</sub> of Fe and Al in andesite shows a max. in 60% acid and a min. in 80% acid. The soly. of Ca decreases regularly with increasing acid concn., while Mg is not dissolved at all. HNO<sub>3</sub> and HNO<sub>2</sub> have little action on andesite. Increasing temp. and degree of porosity of the andesite cause increased corrosion. H. M. L.
- The oxidation of sulfur dioxide by nitrosylsulfuric acid in the liquid phase.** E. K. Lopatto and A. M. Savinaev. *J. Chem. Ind. (Moscow)* 1933, No. 9, 28 33.—A hydraulic compressor, or a SO<sub>2</sub> injector, gives a degree of dispersion of the gas in acid higher than previously obtained. In this intimate mixt. reaction is practically instantaneous at 20-50°, and is a function of the concn. of the acid. The production rate is greater than in the tower process. H. M. Leicester
- The formation of ammonia on highly dispersed metals.** D. P. Dobuchin and A. V. Frost. *Z. Elektrochem.* 40, 89-91 (1934).—The synthesis of NH<sub>3</sub> on Fe, which, together with NaCl, was vaporized in a H<sub>2</sub>-N<sub>2</sub> mixt. at 0.04 mm. Hg pressure at the temp. of liquid air, was investigated. No NH<sub>3</sub> was formed. This substantiates the work

of Frankenger, Mayrhofer and Schwamberger (*C. A.* 24, 2026; 26, 60) and refutes that of Müller and Schwabe (*C. A.* 27, 881). Frick Müller and Kurt Schwabe. *Ibid.* 91-2.—The authors defend their previous results (*C. A.* 27, 881) and criticize those of Dobinichin and Frost.

**Absorption of nitric oxide.** Carlo Toniolo and Giuseppe Giammarco. *Atti IV Congr. naz. chim. pura applicata* 1933, 828-43.—Many graphs of the course of oxidation of NO and absorption of NO<sub>2</sub> under various conditions are given. From these, under plant conditions, the exact course of the reactions at any stage of the operations can be detd. The use of the graphs is explained by examples from actual plant operations.

**Catalytic oxidation of ammonia.** Carlo Toniolo and Giuseppe Giammarco. *Atti IV Congr. naz. chim. pura applicata* 1933, 843-59; cf. preceding abstr. The literature and com. operations are reviewed. Preheaters made of Al, higher oxidation temps., multiple gauze catalysts are favored. Addn. of O<sub>2</sub> to the NH<sub>3</sub> gas mixt. and operation under superatm. pressure have the most favorable effects in absorption of NO<sub>2</sub>.

**Physicochemical investigation on the preparation of ammonium phosphates.** II. The solubility isotherm of the system: H<sub>2</sub>O-NH<sub>3</sub>-P<sub>2</sub>O<sub>5</sub>-SO<sub>3</sub> at 25°. L. E. Berlin and B. M. Mantzev. *J. Applied Chem.* (U. S. S. R.) 6, 85 9(1933).—The following detns. are given: (1) the isotherm of the system H<sub>2</sub>O-NH<sub>3</sub>-P<sub>2</sub>O<sub>5</sub>-SO<sub>3</sub>; (2) the crystn. surface of NH<sub>4</sub> phosphates, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>H(SO<sub>4</sub>)<sub>2</sub>; (3) the boundary curves of the crystn. surface of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> with the surfaces of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub>, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>H(SO<sub>4</sub>)<sub>2</sub> and the soly. of NH<sub>4</sub> thiophosphate. The satd. solns. corresponding to the crystn. surfaces of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub>, NH<sub>4</sub>HSO<sub>4</sub> and (NH<sub>4</sub>)<sub>2</sub>H(SO<sub>4</sub>)<sub>2</sub> and the acidic part of the crystn. surface of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> contain an approx. const. amt. of NH<sub>3</sub> (10-11%). In the soln. corresponding to the alk. part of the crystn. surface of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> there is originally a slight decrease in the NH<sub>3</sub> content and it increases rapidly with a simultaneous slow decrease in the P<sub>2</sub>O<sub>5</sub> and SO<sub>3</sub> contents. The satd. solns. which correspond to the acidic part of the crystn. surface of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> contain, depending upon the decrease of the acidity (P<sub>2</sub>O<sub>5</sub> content), from 4% (in the soly. curve of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> in phosphoric acid) up to 11% (boundary curve of NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub>-NH<sub>4</sub>HSO<sub>4</sub>) of NH<sub>3</sub>. In the solns. corresponding to the crystn. surface of (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> the fluctuation of the NH<sub>3</sub> content is insignificant (11-13%). Depending upon the increase of the alk. of the solns. which correspond to the crystn. surfaces of (NH<sub>4</sub>)<sub>2</sub>PO<sub>4</sub>·3H<sub>2</sub>O, the NH<sub>3</sub> content originally decreases (up to 5% in the solvation point (NH<sub>4</sub>)<sub>2</sub>PO<sub>4</sub>·3H<sub>2</sub>O) and increases then sharply with a simultaneous rapid decrease in the P<sub>2</sub>O<sub>5</sub> content. The split procedure is described and numerical data are tabulated.

**Isolation of helium and the utilization of the gases at Larderello.** Piero Ginori-Conti. *Industria chimica* 8, 1561 7(1933).—See *C. A.* 28, 2131.

**The synthetic nitrogen industry during the world crisis.** Carlo Toniolo. *Atti IV congresso naz. chim. pura applicata* 1933, 127-70.—A review of the present status; largely statistical.

**Mining sulfur under water in Louisiana.** Lawrence O. Donnell. *Chem. & Met. Eng.* 40, 454-8(1933).

**Grande Ecaille sulfur development overcomes marsh conditions.** Wilson T. Lundy. *Chem. & Met. Eng.* 41, 110 20(1934).

**The question of purification of sulfur-burner gases containing arsenious oxide by absorbing it in sulfuric acid.** V. E. Postnikov, L. L. Kuzmin and N. K. Vorob'ev. *J. Chem. Ind.* (Moscow) 1933, No. 9, 55-9. The hot gases are passed through 77-79% H<sub>2</sub>SO<sub>4</sub> and then through 100% acid. H<sub>2</sub>O is an unsatisfactory solvent. The mixt. of As<sub>2</sub>O<sub>3</sub> and SO<sub>2</sub> recovered from the acid is washed rapidly with H<sub>2</sub>O and gives practically pure As<sub>2</sub>O<sub>3</sub>.

**Incomplete oxidation of methane with oxygen and air.** Padovani and P. Franchetti. *Giorn. chim. ind.*

*applicata* 15, 429-32(1933).—The reaction CH<sub>4</sub> + 1/2 O<sub>2</sub> → CO + 2H<sub>2</sub> + 8 Cal. is influenced markedly by the presence of catalysts such as Ni, e. g., at 850-950° with a space velocity of 500, practically equil. conditions were obtained. At 900° less than 1% CH<sub>4</sub> remained in the reaction product. CH<sub>4</sub>, from petroleum cracking as well as from illuminating gas, was used. With reduced cost of O, the above reaction may become of interest in the prepn. of H, NH<sub>3</sub> and alcs.

**Effect of shape and size of pieces of contact mass on the catalytic [sulfuric acid] process.** I. E. Adadurov and D. V. Gernet. *J. Applied Chem.* (U. S. S. R.) 6, 450-68 (in German 469) (1933).—Expts. were made with a Sn-Ba-V catalyst from which pieces of various configurations were prepd. and the effects of their shape, etc., on the prepn. of SO<sub>3</sub> investigated. A catalyst characterized by permanent shape and size of contact pieces is not more efficient the less SO<sub>3</sub> in the gas mixt. and the lower the vol. velocity. The shape of the catalyst does not directly affect its activity but there is an effect exerted by the area of the surface, which depends upon the free space unit, the sp. surface and the effective and unscreened surface. Size of the contact pieces is of the utmost importance because it governs the sp. surface as well as the unscreened surface. Duration of contact is the dominant factor in catalysis. The amt. of heat generated, removal of the SO<sub>3</sub> from the reaction sphere because of its poisonous effect on the catalyst and the difference in the temp. between the catalyst surface and the gas mixt. must also be considered. The higher the percentage of the SO<sub>2</sub> gas in the gas mixt. and the higher the vol. velocity, the higher the magnitude of contacting in catalysts that have relatively low effective surface per unit of free vol. On the other hand, in catalysts with a larger surface this effect is either absent in case it is equalized by the total increase in no. of active centers, or it is reversed when the no. of active centers available is insufficient to handle the quantity of gas to be converted. For each catalyst with its peculiar shape and magnitude of contact mass there is a max. vol. velocity, a concn. of gas and a duration of contact that assure max. efficiency and max. transformation.

**Experiments on the work on vanadium catalysts in the Vladimir Works.** A. G. Ameln. *J. Chem. Ind.* (Moscow) 1933, No. 9, 40 3.—The development of the plant is described.

**The regeneration of vanadium catalysts.** I. E. Adadurov and P. P. Pershin. *J. Chem. Ind.* (Moscow) 1933, No. 9, 38-40.—Finely ground Sn-V catalyst on a zeolite base is extd. with 89% H<sub>2</sub>SO<sub>4</sub>; 22% acid may be used, but extn. is then less efficient. Not more than 76% of the V is dissolved. About 22% more can be recovered by converting the residual SiO<sub>2</sub> to water glass. The catalyst must be freshly prepd. from the V thus recovered.

**The action of poisons on a vanadium contact substance and the fight against poisoning.** M. O. Kharmandar'yan and K. I. Brodovich. *J. Chem. Ind.* (Moscow) 1933, No. 9, 35-8.—H<sub>2</sub>O, H<sub>2</sub>S and HCl do not poison Si-Pb-V catalysts. As<sub>2</sub>O<sub>3</sub> and CO do, but in the presence of CO<sub>2</sub> their poisonous action is prevented.

**Highly adsorptive substances prepared by the action of sulfuric acid on sugars, starches, etc.** G. Sollazzo. *Industria chimica* 8, 1554 61(1933).—Activated charcoals were prepd. by the action of H<sub>2</sub>SO<sub>4</sub> on sucrose, natural and artificial mannitol, glucose, lactose and rice starch, both at ordinary pressure and *in vacuo*. They adsorb the color from a 0.1% soln. of methylene blue more rapidly than do com. activated charcoals, e. g., if the adsorption of Merck's is 100, that of C from glucose is 134, from gum arabic 210, from lactose 163, mannitol 85, rice starch 153, sucrose 95. Prepd. *in vacuo*, the last six show the adsorptions: 172, 179, 156, —, 164 and 153.

**Adsorptive properties of volcanic minerals of Armenia.** S. M. Veller and A. Kh. Arutyunyan. *J. Applied Chem.* (U. S. S. R.) 6, 571 3(1933).—The Anii pumice stone found in Armenia possesses adsorptive power, approx.

equiv. to that of diatomite. The adsorptive power of pumice stone for kerosene and cottonseed oil is lower than that of diatomite. Exptl. results are reported.

**Velocity of calcination of chalk.** K. Smoleński and H. Iwanik. *Prace Centr. Lab. Cukrownic. Łódź.* 1928-31, 145-50.—A study of marble and 15 other varieties of  $\text{CaCO}_3$  is reported.

**Installations for purifying and cooling of furnace gases.** S. A. Fotiev. *Bumashnaya Prom.* 12, No. 10, 23-9 (1933).—Various Russian and foreign installations and methods of purifying and cooling of pyrite burner gases are discussed.

**Drying and burning flotation pyrite (tailings).** I. L. Pelsakhov, V. M. Ramm and N. P. Sosnovskii. *J. (Chem. Ind. (Moscow))* 1933, No. 9, 43-55.—Various methods for the treatment of such pyrites are discussed and compared.

**Control of house ants.** Alfred Weed. *Soap (Insecticide and Disinfectant Sect.)* 10, No. 3, 89, 101, 103 (1934).—A review with 13 references. In addn. to other methods W. states that household fly sprays may also be used for house-ant control.

**Equipment in the inorg. chem. industry [manuf. of  $\text{Na}_2\text{CO}_3$ ,  $\text{NaOH}$ ,  $\text{Cl}_2$ ,  $\text{HCl}$ ,  $\text{Na}_2\text{S}$ ,  $\text{H}_2\text{SO}_4$  and  $\text{NH}_3$ ].** (Waeser) 1.  $\text{CaC}_2$  and  $\text{Ca cyanamide}$  (Nordlander) 2. Formic acid and  $\text{NaNO}_2$  (Ger. pat. 592,054) 10. Effecting endothermic reactions [thermal decompn. of sulfates, chlorides and alk. earth carbonates] (Ger. pat. 577,103) 13.

**Hydrochloric acid.** Chemische Fabrik Hugo Stoltzenberg. Fr. 757,361, Dec. 26, 1933.  $\text{HCl}$  is obtained by combustion of  $\text{H}$  and  $\text{Cl}$  under high pressure. The  $\text{HCl}$  may be liquefied directly. An app. is described.

**Nitric acid by oxidation of ammonia.** Louis J. A. Marmier. U. S. 1,947,804, Feb. 20. A catalyst is used comprising lumps of material such as pozzuolana capable of withstanding temps. above  $900^\circ$  without substantial modification, each lump having its peripheral portion impregnated with a finely divided  $\text{Cr}$  oxide. Cf. C. A. 26, 3078.

**Phosphoric acid.** Toragorô Tanabashi. Japan. 99-102, Jan. 18, 1933. After oxidation with  $\text{HNO}_3$ , crude  $\text{H}_3\text{PO}_4$  is purified by passing an electric current into the acid at  $90-100^\circ$ , with a  $\text{Pt}$  plate as an anode and a graphite plate as a cathode. The c. d. at the cathode is 12-35 amp. per sq. dm.

**Sulfuric acid.** G. Schuy Nachf. A.-G. Ger. 591,925, Jan. 29, 1934 (Cl. 12i. 25).  $\text{As}$  is removed from concd.  $\text{H}_2\text{SO}_4$  by converting the  $\text{As}$  into  $\text{AsCl}_3$  by the aid of  $\text{HCl}$  and a reducing agent such as  $\text{H}_2\text{S}$ , thionate or polythionate, and then driving off the  $\text{AsCl}_3$ .

**Ammonia.** I. G. Farbenind. A.-G. (Fritz Stowener, Emil Keunecke and Josef König, inventors). Ger. 591,531, Jan. 23, 1934 (Cl. 12k. 3).  $\text{NH}_3$  is prep'd. synthetically from a mixt. of  $\text{N}$  and  $\text{H}$  by the aid of a catalyst comprising a  $\text{Fe}$  or  $\text{Mo}$  basis (obtained by reducing their oxides) in which  $\text{CN}$  compds. are pp'd. Thus, fused  $\text{Fe}$  contg. a small amt. of  $\text{Al}$  and  $\text{KNO}_3$  is oxidized. The mass is then reduced by  $\text{H}$  at  $500^\circ$ . The resulting mass is treated with a cold satd. soln. of  $\text{K}_2\text{FeC}_2\text{N}_4$  and dried *in vacuo*.

**Aqua ammonia.** Wm. L. Spalding (to National Aniline & Chemical Co.). U. S. 1,948,948, Feb. 27.  $\text{NH}_3$  is introduced into a flowing stream of recirculating aq. liquid (in a described app.).

**Nitrogenous products from ammonia oxidation.** Gustav A. Kramer and Ludwig Rosenstein (to Shell Development Co.). U. S. 1,948,968, Feb. 27. Water is sep'd. from products such as are formed by the combustion of  $\text{NH}_3$  and the oxides of  $\text{N}$  are removed from elemental  $\text{N}$  by fractionating in the presence of  $\text{NO}$  more than sufficient to react with substantially all the free  $\text{O}$  present, liquid oxides of  $\text{N}$  being produced as one end product and substantially pure  $\text{N}$  as the other.

**Alkali salts.** I. G. Farbenind. A.-G. (Robert Griessbach and Karl Neundlinger, inventors). Ger. 589,270,

Dec. 5, 1933 (Cl. 12i. 15). Addn. to 588,506 (C. A. 28, 1477\*). Alkali salt hydrates are converted to globular form by stirring the dehydrated or partly hydrated salt with a satd. salt soln., allowing to congeal, and drying in a rotary drum.

**Alkali cyanides.** N. V. Stikstofbindingsindustrie "Nederland." Brit. 401,827, Nov. 16, 1933. See Ger. 588,823 (C. A. 28, 2132\*).

**Alkali nitrates.** I. G. Farbenind. A.-G. (Christoph Beck and Helmut Weissbach, inventors). Ger. 591,874, Jan. 29, 1934 (Cl. 12i. 6). In forming the above nitrates by treating alkali chlorides or sulfates with  $\text{HNO}_3$ , the mother liquor, after sepn. of the nitrates by cooling, is treated with  $\text{SO}_2$ . The  $\text{N}$  oxides thus driven out are led into  $\text{HNO}_3$ , which is used for treating further alkali chloride or sulfate.

**Alkali metal phosphates from ferrophosphorus.** Victor Chemical Works. Brit. 401,950, Nov. 23, 1933. See U. S. 1,909,996 (C. A. 27, 4035).

**Alkali and ammonium compounds.** Friedrich Bartling (to Alterum Kredit-A.-G.). U. S. 1,947,671, Feb. 20. An alkali sulfate such as  $\text{Na}_2\text{SO}_4$  is heated with lime and carbon in an atm. of  $\text{N}$ ; the resulting product is treated with steam to produce an alkali compd. such as  $\text{NaOH}$ , a  $\text{S}$  compd. and  $\text{NH}_3$ ; the  $\text{S}$  compd. is converted into  $\text{H}_2\text{SO}_4$  and the  $\text{NH}_3$  is absorbed in the  $\text{H}_2\text{SO}_4$  to produce  $\text{NH}_4$  sulfate. Cf. C. A. 27, 670.

**Alkaline earth metal oxides.** Oswin Nitzschke (to I. G. Farbenind. A.-G.). U. S. 1,947,952, Feb. 20. See Ger. 567,605 (C. A. 27, 2786\*).

**Chromates.** Omar F. Tarr (to Mutual Chemical Co. of America). U. S. 1,948,143, Feb. 20. Chrome ore (100 is roasted in admixture with basic refractory material such as burned lime about 50 parts and with about 50-70% of the amt. of alkali base such as  $\text{Na}_2\text{CO}_3$ , theoretically required to combine with the  $\text{Cr}$  present in the ore, and about 90 parts of the leached residue from the previous roasting of a similar charge (details of roasting being regulated so as to maintain the charge in a porous condition without fusing it or forming balls or lumps).

**Thiocyanates of quaternary ammonium bases.** Kah Chemie A.-G. Brit. 401,954, Nov. 23, 1933. See Ger. 589,331 (C. A. 28, 1472\*).

**Finely divided metal compounds.** Chemische Werke Schuster & Wilhelmy Patentverwertungs-Ges. m. b. H. Fr. 757,604, Dec. 29, 1933. See Ger. 590,481 (C. A. 28, 2133\*).

**Removing water of crystallization from crystals such as those of potash alum.** Wilfrid C. Powelson. U. 1,948,313, Feb. 20. Various details of operation are described involving heating the material to a temp. for liberation of water of crystn. and carrying particles of the material in a current of a gas such as air having a greater avidity for moisture than the particles possess.

**Aluminum chloride.** A. P. Khorki. Russ. 31,426, Oct. 31, 1933. A mixt. of kaolin and coal is chlorinated in a kiln subdivided by baffles permitting a downward movement of the mass. In the upper section the mixt. is heated to about  $850^\circ$ , while the chlorination is carried out in the lower section of the furnace.

**Aluminum oxide or aluminum chloride.** M. E. Mandenov and A. M. Monoszon. Russ. 31,424, Oct. 31, 1933. The material contg.  $\text{Al}$  is mixed with acid sludge or a similar waste from acid-refined petroleum, etc., and heated to the disappearance of  $\text{SO}_2$  or  $\text{S}$ . The mass is then reworked for  $\text{Al}_2\text{O}_3$  or it is chlorinated.

**Alumina.** Walter M. Sanders (to Kalumite Co.). U. S. 1,948,887, Feb. 27. See Brit. 397,409-411 (C. A. 28, 1152\*).

**Aluminum sulfate.** Robert S. Perry (to Paper Makers Chemical Corp.). U. S. 1,948,004, Feb. 20. Bauxite ore is ground in the presence of water and the resulting mixt. is then treated with  $\text{H}_2\text{SO}_4$  and heated at atm. pressure.

**Sulfated ammonium nitrate.** Gewerkschaft Vichy. Fr. 757,342, Dec. 23, 1933. See Brit. 397,532 (C. A. 28, 1148\*).

**Ammonium sulfate.** Frederic M. Pysal (to The Shell

Development Co.). Can. 889,400, Feb. 13, 1934.  $(\text{NH}_4)_2\text{SO}_4$  is formed by injecting  $\text{NH}_3$  and  $\text{H}_2\text{SO}_4$  into a liquid stream of narrow cross section in a cyclic system at the lowest point in the system. The stream is circulated through the system, part of the stream is withdrawn at each circulation and the crystals are removed from the part of the stream withdrawn. Cf. C. A. 28, 586<sup>3</sup>.

**Ammonium sulfate.** Ges. für Kohlentechnik m. b. H. (Walter Klempt, inventor). Ger. 591,754, Jan. 26, 1934 (Cl. 12k. 2). Addn. to 563,552 (C. A. 27, 1151). The method of 563,552 for producing  $(\text{NH}_4)_2\text{SO}_4$  is modified by treating synthetic  $\text{NH}_3$  with  $\text{H}_2\text{SO}_4$ .

**Ammonium sulfate.** Alfred Mentzel. Ger. 592,108, Feb. 3, 1934 (Cl. 12k. 7). Briquets prepd. from a mixt. of an alkali hydroxide or carbonate and coal of high S content are heated in steam to 800-500°, and the  $\text{H}_2\text{S}$  evolved is converted in known manner into  $\text{H}_2\text{SO}_4$ . The briquets are then heated to 950-1000° in N to form alkali cyanide, which is heated to 350° in steam to yield  $\text{NH}_3$ . The latter is combined with the  $\text{H}_2\text{SO}_4$ .

**Saturator for making ammonium sulfate.** F. J. Collin A.-G. Ger. 592,051, Jan. 31, 1934 (Cl. 12k. 2).

**Beryllium hydroxide.** Emil Baggi and Edwin Burger (Walter Plau and Paul Cipán, inventors). Ger. 592,418, Feb. 7, 1934 (Cl. 12m. 4). An aq. soln. of  $\text{BeF}_2 \cdot 2\text{NaF}$  is warmed with HCl to form a soln. contg.  $\text{BeCl}_2$ , which is treated with  $\text{NH}_3$  to ppt.  $\text{Be}(\text{OH})_2$ .

**Purifying calcium chlorate.** Sheldon B. Heath (to Dow Chemical Co.). U. S. 1,949,204, Feb. 27. For removing a small proportion of associated  $\text{CaCl}_2$ , the impure chlorate is dissolved to form a soln. satd. with respect to  $\text{Ca}(\text{ClO}_3)_2 \cdot 2\text{H}_2\text{O}$  at a temp. below 60°, and the purified chlorate dihydrate is cryd. on cooling and sepd. Cf. C. A. 27, 2256.

**Calcium cyanamide.** George E. Cox (to American Cyanamid Co.). Brit. 401,788, Nov. 23, 1933. See Fr. 728,685 (C. A. 27, 1998).

**Granulating calcium cyanamide.** George E. Cox (to American Cyanamid Co.). U. S. 1,947,971, Feb. 20. The cyanamide is completely hydrated, cooled, treated with a soln. of an alk. earth metal salt such as  $\text{Ca}(\text{NO}_3)_2$ , and granulated, and the granules are quickly dried until their free water content is below 5%.

**Material containing calcium cyanamide.** Hans H. Franck. U. S. 1,948,106, Feb. 20.  $\text{NH}_3$  gas is caused to react on  $\text{CaCO}_3$  at about the disson. temp. of the latter at ordinary pressure. Cf. C. A. 27, 2767.

**Decomposition of calcium alkali sulfates.** Chem. Fab. Buckan (Erich Wiedbrauck, Hans Schrader and Karl Buche, inventors). Ger. 592,496, Feb. 9, 1934 (Cl. 12l. 5). Calcium alkali sulfates are heated under pressure with water or an aq. soln. until decomn. into alkali sulfate soln. and insol.  $\text{CaSO}_4$  is complete. The process may be applied to the isolated double sulfates or to crude reaction mixts. contg. a double sulfate as an undesired by-product, e. g., to the reaction product of aq.  $\text{K}_2\text{SO}_4$  and  $\text{Ca}(\text{NO}_3)_2$ . Details are given. Cf. C. A. 27, 4634.

**Nitric oxide.** Thaddeus Hobler and Hydro-Nitro Soc. anon. Swiss 168,880, Dec. 1, 1933 (Cl. 36r). Conc'd. NO, especially for making  $\text{HNO}_3$ , is prepd. by bringing hot gases contg. NO into contact with  $\text{HNO}_3$  so that the gases are enriched in NO by the resulting decomn. of the  $\text{HNO}_3$ . The NO gases may be obtained by the burning of  $\text{NH}_3$ . App. is indicated.

**Utilizing nitrogen oxide gases for producing nitrate, etc.** Mayor F. Fogler (to Atmospheric Nitrogen Corp.). U. S. 1,949,462, March 6. A soln. contg. a nitrite such as  $\text{NaNO}_2$  is treated with a gas contg.  $\text{N}_2\text{O}$ , dild. with other gases to convert the nitrite to nitrate; unabsorbed gases and the resulting nitrate soln. are sepd. from each other, and N oxides in the unabsorbed gases are absorbed in an alk. soln. such as  $\text{Na}_2\text{CO}_3$ .  $\text{HNO}_3$  may be produced by reaction of O, water and an excess of liquid  $\text{N}_2\text{O}$ , which is insufficient to form 2 liquid phases in the reaction product. App. is described.

**Nitrosyl chloride.** Kali-Forschungs-Anstalt G. m. b. H. Fr. 757,387, Dec. 28, 1933. The N in  $\text{NOCl}$  is utilized by transforming the  $\text{NOCl}$  with O or gas contg. it into a

mixt. of  $\text{NO}_2$  and Cl and causing the mixt. of  $\text{NO}_2$  and Cl to react with acid alkali chlorides or their mixts. Cf. C. A. 27, 814.

**Caustic soda.** I. G. Farbenind. A.-G. (Walter Schmid, inventor). Ger. 585,951, Jan. 10, 1934 (Cl. 12l. 15). See Fr. 718,040 (C. A. 26, 2931).

**Sodium bromide.** A. I. Chertak and S. L. Rakhmievich. Russ. 31,419, Oct. 31, 1933. The interaction of Na formate and Br is effected in the presence of NaOH.

**Sodium cyanide from sodium calcium cyanide.** Edward J. Franke (to Grangers Mfg. Co.). U. S. 1,947,570, Feb. 20. Na Ca cyanide is mixed with liquid anhyd.  $\text{NH}_3$ , the soln. thus formed is sepd. from insol. matter and NaCN is obtained from the soln. Cf. C. A. 27, 3567.

**Sodium silicate.** Henkel & Cie. G. m. b. H. (Franz Albertshausen, inventor). Ger. 592,202, Feb. 5, 1934 (Cl. 12i. 38). A soln. or melt of Na metasilicate is caused to crystallize, and as soon as crystn. has begun a solid hydrated Na water glass contg. more  $\text{SiO}_2$  than  $\text{Na}_2\text{O}$  is added. The mixt. is allowed to set and the product is ground. A water-sol. product stable to storage is obtained. The Na metasilicate soln. may be prepd. in the process from com. Na water glass and NaOH. Details are given.

**Sodium sesquisilicate.** George W. Morey (to Philadelphia Quartz Co.). U. S. 1,948,730, Feb. 27. For producing  $3\text{Na}_2\text{O} \cdot 2\text{SiO}_2 \cdot 11\text{H}_2\text{O}$ , a soln. is prepd. composed of  $\text{Na}_2\text{SiO}_3 \cdot 9\text{H}_2\text{O}$  together with equal proportions of NaOH and water, and crystn. is effected.

**Thorium oxide and salts.** Chemische Fabrik von Heyden A.-G. Brit. 402,040, Nov. 23, 1933; Fr. 757,246, Dec. 22, 1933. A  $\text{ThO}_2$  which dissolves readily to form salts when heated with acids is made by heating Th oxalate at below 500° under normal or reduced pressure. The time of heating is such that "aging" of the oxide is prevented. In examples the oxalate is heated at 300° 24 hrs., resp., in *vacuo* and at normal pressure, and  $\text{Th}(\text{NO}_3)_4$  and  $\text{ThCl}_4$  are produced by dissolving the oxide in  $\text{HNO}_3$  and HCl. Cf. C. A. 28, 1481<sup>4</sup>.

**Zirconia.** Frederick L. Clark and Imperial Chemical Industries, Ltd. Brit. 401,756, Nov. 23, 1933. In the production of Fe-free  $\text{ZrO}_2$ , impure  $\text{ZrO}_2$  or Zr-contg. material is brought into soln. and the Fe pptd. by adding an alkali ferrocyanide or ferricyanide. Prior to treatment with ferrocyanide, the soln. is, if necessary, treated with an oxidizing agent, e. g.,  $\text{HNO}_3$ ; with ferrocyanide a preliminary reducing treatment, e. g., with  $\text{SO}_2$ , may be advisable.

**Extraction of aluminum from the ash from Moscow coals.** V. I. Gusev, M. K. Stebbe and heirs of P. A. Solodovnikov. Russ. 31,425, Oct. 31, 1933. The ash is mixed with  $(\text{NH}_4)_2\text{SO}_4$  and  $\text{NH}_4\text{F}$  and burned at temps. exceeding 400° until  $\text{Al}_2(\text{SO}_4)_3$  is formed.

**Argon.** Bayerische Stickstoffwerke A.-G. (Rudolf Wendlandt, inventor). Ger. 577,919, Jan. 13, 1934 (Cl. 12i. 27). A or gases rich in A are obtained from air by removing the N by liquefaction and converting the O into water and oxides of N by treatment with  $\text{NH}_3$ .

**Hydrogen.** Otto Emersleben. Ger. 591,753, Feb. 2, 1934 (Cl. 12i. 1). The prepn. of H by the decomn. of water by the aid of Ca, Sr or Ba in the presence of water-sol. halides such as  $\text{CaCl}_2$  or  $\text{MgCl}_2$  is described.

**Sulfur.** I. G. Farbenind. A.-G. (Fritz Giller, inventor). Ger. 590,173, Dec. 27, 1933 (Cl. 12i. 17). Addn. to 565,538 (C. A. 27, 2541). The method of 565,538 for producing pure S by treating org. solns. of S contg. impurities with fuming  $\text{H}_2\text{SO}_4$ ,  $\text{ClHSO}_4$  or  $\text{SO}_3$ , to remove the impurities, is modified by removing suspended impurities by treatment with moistened burned lime. In the example a soln. of S in  $\text{CS}_2$  is treated with slaked and granular burned lime.

**Sulfur.** Metallgesellschaft A.-G. (Conway Freiherr v. Gerswald and Hans Weidmann, inventors). Ger. 591,924, Jan. 29, 1934 (Cl. 12i. 17). S is obtained from gases contg.  $\text{SO}_2$  and O, especially gases obtained by roasting pyrite, etc., by the following steps: (a) the gases are treated with water at high pressure and low temp. to dissolve the  $\text{SO}_2$ ; (b) the  $\text{SO}_2$  is driven from the soln. ob-

tained as in (a) by raising the temp. to above 40° and decreasing the pressure; SO<sub>2</sub> free from O is so obtained; (c) this SO<sub>2</sub> is reduced to S by treatment with a carboniferous reducing agent, in optional presence of a catalyst.

**Colloidal sulfur.** A. G. Bosin. Russ. 31,420, Oct. 31, 1933. A soln. of K polysulfide is treated with an amt. of tartaric acid equiv. to the K ion. The reaction is carried out in the presence of gelatose and a protective albumin and the soln. is then filtered to sep. K tartrate, neutralized with chalk, filtered and evapd. *in vacuo*.

**Air preheater for use with sulfur burners in acid manufacture.** Thomas J. Ellis and Edwin F. Burns. U. S. 1,949,605, March 6. Structural features.

**Sulfate furnace.** S. P. Kovalev. Russ. 31,423, Oct. 31, 1933. The furnace is equipped with a rotating agitator and a ladle attached to the agitator shaft for the distribution of the H<sub>2</sub>SO<sub>4</sub>.

**Solar evaporation of salt solutions.** A. V. Nikolaev. Russ. 31,422, Oct. 31, 1933. The mother liquor is dyed black so as to increase the absorption of the sun's energy by the water.

**Kiln for carbonizing sea weeds.** M. F. Smirnov. Russ. 31,418, Oct. 31, 1933. Construction details.

**Catalyst.** Herrick R. Arnold and Wilbur A. Lazier (to The Canadian Industries, Ltd.). Can. 339,435, Feb. 20, 1934. SiO<sub>2</sub> gel is heated at 400° under a pressure of less than 1 mm. for 4 hrs., cooled to room temp. and impregnated with a soln. of Al(NO<sub>3</sub>)<sub>3</sub> still under a vacuum. The impregnated gel is dried and ignited at 400-450° for 4 hrs. Cf. C. A. 28, 1483<sup>3</sup>.

**Reworking hydrogenation catalysts.** Rhea N. Watts (to Standard-I. G. Co.). U. S. 1,948,407, Feb. 20. A spent hydrogenation catalyst contg. Mo which may have been used in hydrogenating oil, tar or coal is roasted, the roasted material is digested with an acid soln. such as 6 N HCl capable of dissolving molybdc oxide, the soln. is sepd. from the residue and is treated with an amount of alkali such as NH<sub>3</sub>, insufficient for neutralization, whereby the molybdc oxide is pptd., and the recovered molybdc oxide is reincorporated with suitable materials such as alk. earth and rare earth oxides, carbonates, alumina, clay or asbestos, for further use as a hydrogenation catalyst.

**Hydrogenation catalysts.** Rhea N. Watts and Wm. E. Spicer (to Standard-I. G. Co.). U. S. 1,948,408, Feb. 20. A catalyst suitable for use in hydrogenating comprises a compd. of the heavier metals of the 6th periodic group such as U or W oxide prepd. by pptn. from an acid soln. contg. 1-4% excess acid such as HF or H<sub>3</sub>PO<sub>4</sub> which serves to produce an active acidic oxide.

**Apparatus for catalytic oxidation of gases such as sulfur dioxide to trioxide.** Robert C. Jeffcott (to Calco Chemical Co.). U. S. 1,949,122, Feb. 27. Various structural and operative details are described of an app. having a converter with a plurality of spaced foraminous trays on which the catalyst is carried, with bases and a heat-regulating system.

**Complex polymerization products.** I. G. Farhenind. A.-G. (Arthur Voss, Ewald Dickhäuser, and Werner Starck, inventors). Ger. 592,231, Feb. 3, 1934 (Cl. 39b. 4.02). See U. S. 1,939,422 (C. A. 28, 1484<sup>7</sup>).

**Plastic compositions.** Helmut Fritz and Emil Glaser. Austrian 136,422, Feb. 10, 1934 (Cl. 80e). See Fr. 752,452 (C. A. 28, 1154<sup>9</sup>).

**Plastic materials.** Soc. anon. des pneumatiques Dunlop. Fr. 757,432, Dec. 26, 1933. Compns. and articles are made from at least 2 plastic materials practically insol. in each other. One plastic material is dispersed in another which will form the continuous phase, the 2 being mutually insol., and the dispersion thus prepd. is mixed with a 3rd practically insol. plastic material under such conditions that the 1st dispersion will itself disperse in this 3rd plastic material. Thus, rubber factice and plastified casein are incorporated in a mill and the dispersion is incorporated in rubber. Other examples are given.

**Plastic materials.** Paul Fisch. Fr. 757,485, Dec. 27, 1933. Graphite (1-10%) is added to plastic materials in

general, but rubber and its derivs. in particular, to increase resistance to wear by friction and to the attack of chem. agents.

**Machines for extruding thermo-setting plastic materials.** Rockhard Resins, Ltd., and Frederick W. Jones. Brit. 401,428, Nov. 16, 1933.

**Plastic masses.** Röhm & Haas A.-G. Brit. 401,653, Nov. 30, 1933<sup>1</sup>. Plastic masses are prepd. by incorporating (partially) polymerized methacrylic acid Me or Et ester with 1 or more addnl. substances at any stage in the polymerization, which may be effected, if desired, in soln. or in aq. emulsion and with the aid of catalysts. Addnl. substances are softeners, e. g., phthalic, tartaric, H<sub>2</sub>PO<sub>4</sub>, and stearic acid esters, drying oils, camphor, hardeners, e. g., paraformaldehyde, plastifiers, cellulose derivs., resins, fillers, etc. The products may be used for the manuf. of rayon, films, lacquers, varnishes, glass substitutes, and in the production of knife and umbrella handles, elec. insulating materials, tiles, billiard balls, rayon, leather, bandaging material, etc. Among examples polymerized methacrylic acid Et ester, which may be polymerized by heat or light or with Bz peroxide, is mixed with di-Bu tartrate and dissolved in AcOEt. By evapn. of the solvent from the soln. on bands, films or plates are obtained suitable for use as boiler linings, protective coatings and gas-tight materials.

**Plastic masses.** Soc. pour l'ind. chim. à Bâle. Swiss 163,020, Sept. 16, 1933 (Cl. 41). Masses obtained by condensing primary amines and CH<sub>2</sub>O in the proportions 1:2, in the presence of at least 1/2 equivalent of strong mineral acid, are hot-pressed.

**Plastic masses.** Soc. pour l'ind. chim. à Bâle. Swiss 163,552, Nov. 1, 1933 (Cl. 41). Polynuclear aromatic amine bases, whose nuclei are bound with -NH-CH<sub>2</sub>- and -CH<sub>2</sub>- groups, are treated with aldehydic hardening agents and the products hot-pressed to form infusible insol. objects. Thus, 1 mol. of diaminodiphenylmethane in alc. is heated with 2 mols. of CH<sub>2</sub>O. The product is treated with PhNH<sub>2</sub> and glacial AcOH to give NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>-NH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>NHCH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>NH<sub>2</sub>, which is kneaded with wood meal, salicylic acid and CH<sub>2</sub>O. The product is dried, molded and heated. Several other examples are given.

**Artificial masses.** "Kolloidchemie" Studiengesellschaft m. b. H., Johannes B. Carpzw, Martin March and Robert Lenzmann. Ger. 591,540, Jan. 23, 1934 (Cl. 39f. 26). Albuminous substances, such as blood, casein, keratin or resins, gums or oxidizable oils, are used as binding agent with sea- or fresh-water slime. The mixt. is hot-pressed and hardened by treatment with aq. or gaseous CH<sub>2</sub>O. Material such as cellulose, cellulose derivs., B compds., S, soot or heavy metals may be added. Many examples are given.

**Hardening mass.** Josef Schafer. Swiss 163,283, Oct. 2, 1933 (Cl. 41). A hardening mass consists of a mixt. of fiber, size, glue, wax and gypsum.

**Molding powders.** Soc. pour l'ind. chim. à Bâle. Brit. 401,905, Nov. 23, 1933. The powders are prepd. from a mixt. of a filling material and an acid soln. of an aromatic amine and an aldehyde, which has a tendency to gelatinize, by disintegrating the gel during or after its formation but before complete solidification. Among examples (1) a soln. of PhNH<sub>2</sub>·HCl in H<sub>2</sub>O is treated with CH<sub>2</sub>O and mixed with wood meal with stirring, the product being treated with NaOH, washed and dried to yield the molding powder.

**Molding materials.** Soc. parisienne artistique de moulage (S. à r. l.). Fr. 757,592, Dec. 28, 1933. A glue having a basis of gelatin is used as binder for molding articles from sandstone, etc. Glucose may be added to prevent breakage on drying and a little dichromate is added to the glucose if the articles are exposed to weather.

**Molded objects.** Soc. pour l'ind. chim. à Bâle. Swiss 163,902, Nov. 16, 1933 (Cl. 41). Carbamide-aldehyde condensation products are mixed with fiber, dried and hot-pressed.

**Casein.** Soc. pour l'ind. chim. à Bâle. Swiss 163,550, Nov. 1, 1933 (Cl. 41). Benzoylated casein is obtained by

treating a soln. of casein in a liquid mixt. of a quaternary  $\text{NH}_4$  salt and a tertiary base with  $\text{BzCl}$ . The dried product is completely insol. in all solvents and useful for making fibers, films, articles, etc.

**Casein products.** Hugo Wilcken. Ger. 501,550, Jan. 23, 1934 (Cl. 22i. 2). Adhesive sheets of casein are produced by hot-pressing a mixt. of casein, a hygroscopic substance such as glycerol, and rubber latex.

**Apparatus for making vegetable glue in powdered form.** Soc. H. Gouthière et Cie. Fr. 757,525, Dec. 28, 1933.

**Adhesives.** Amelie T. Arnot and Michael Stenier (legal representatives of Robert Arnot, deceased). Brit. 401,674, Nov. 2, 1933. Films or sheets of materials adapted to act as adhesives in the presence of moisture in the materials to be joined or in the films or sheets themselves are manufd. by mixing adhesives, *e. g.*, casein or aluminous substances, glues, gums, with solns. or pastes of cellulose (derivs.) and drying so as to furnish an adhesive film or sheet. Thus viscose solns. may be mixed with a soln. of casein, hydrolyzed glue or gum arabic, or a cellulose acetate or celluloid solp. may be mixed with a non-aq. soln. of an adhesive or gum obtained, *e. g.*, by dissolving casein in dil. pyridine and diluting with a solvent, *e. g.*,  $\text{Me}_2\text{CO}$ .

**Adhesive.** Katsuji Uchiume (Jitsutarō Konishi and Katsuji Uchiume, inventors). Japan 100,295, March 27, 1933. An adhesive is made by mixing waste vulcanized rubber (boiled with  $\text{NaOH}$  soln. in a closed vessel), heated pitch, asphaltic substances, resin, solvent naphtha, etc.

**Adhesive suitable for use with materials such as cellophane.** John E. Clegg (to Aralcol Mfg. Co.). U. S. 1,948,334, Feb. 20. Various details are described for producing adhesives as by heating G rosin with Venetian turpentine at about  $120^\circ$ , cooling to about  $100^\circ$  and adding diethylene glycol monobutyl ether or a similar compd.

**Adhesive coating.** Richard G. Drew (to The Minnesota Mining and Manufacturing Co.). Can. 339,517, Feb. 20, 1934. An adhesive coating contains glue, glycerol,  $\text{CaCl}_2$ , alum and water, in proportions to maintain the coating normally tacky and sensitive to pressure, and a quantity of  $\beta$ -naphthol to inhibit the formation of mold.

**Water-repelling impregnating preparations.** H. Schenk Swiss 164,203, Dec. 1, 1933 (Cl. 38c). A prepn. for impregnating plaster, wood, stone, bricks, etc., to render these impervious to water consists of an emulsion of mineral oil of sp. gr. 0.8–0.9 and of viscosity 2–6° Engler at  $50^\circ$ , in a substance in which the oil is insol., *e. g.*, in an aq. emulsion.

**Waterproofing agents.** I. G. Farbenind. A.-G. Brit. 401,712, Nov. 13, 1933. Porous materials, *e. g.*, wool, cotton and rayon fibers, yarns and fabrics, paper, leather, wood, bricks, concrete, are waterproofed by impregnation with aq. media contg. (1) open-chain or cycloaliphatic acids contg. at least 8 C atoms, *e. g.*, stearic, ricinoleic, myristic, abietic, naphthenic or their  $\text{H}_2\text{O}$ -sol. salts, *e. g.*,  $\text{NaI}$ , alkali metal and hydroxyalkylamine salts, (2)  $\text{H}_2\text{O}$ -sol. salts of multivalent metals, *e. g.*, Al, Cu, Zn, Cd, Ca, Ba, Sr, Co, La, Pr formates, acetates, chlorides or sulfonates, and (3)  $\text{H}_2\text{O}$ -sol. protective colloids having the formula  $\text{RY}(\text{C}_2\text{H}_4\text{O})_x\text{H}$ , in which  $x$  is 2 or more, R is an org. radical contg. at least 6 C atoms and Y is O, NH or  $\text{NR}'$  ( $\text{R}'$  being an org. radical which may be the same as R), and obtained by treating  $\text{H}_2\text{O}$ -insol. or difficultly sol. org. compds., contg. at least 6 C atoms and at least 1 reactive H, with an ethylene halohydrin, ethylene oxide, polyglycerol or epihalohydrin to prevent pptn. in the bath. The  $\text{H}_2\text{O}$ -insol., etc., org. compds. include aliphatic acids, *e. g.*, lauric, oleic, palmitic, linoleic; the alkyl, hydroxyalkyl and hydroxyaminoalkyl esters of such acids, *e. g.*, the glyceryl esters contained in olive, castor, soybean, sperm and train oils and tallow and wool fat; their Me, Et and Bu esters; their esters with long-chain alcs., *e. g.*, stearyl stearate, octadecyl stearate; their amides or the amide prepd. from the acids of coconut fat and monoethanolamine as described in Brit. 337,737 (C. A. 25, 2307); the reaction products of long-chain aliphatic acid chlorides with aminocarboxylic acids, *e. g.*, from oleic

or stearic chloride and glycolcol, sarcosine or protalbinic acid; alcs. contg. at least 10 C atoms, *e. g.*, oleic or lauric alc. or montanol; alkylamines contg. at least 6 C atoms and their arylated derivs., *e. g.*, octadecylamine, hydroxyethylododecylaniline, octadecyl- $\alpha$ -naphthylamine; aromatic hydroxy compds. contg. at least 10 C atoms, *e. g.*,  $\beta$ -naphthol; aromatic amines, *e. g.*,  $\alpha$ - or  $\beta$ -naphthylamine; high-mol.-wt. natural products, *e. g.*, casein, gelatin, glue; carbohydrates, *e. g.*, starch, cellulose. Cf. C. A. 27, 611.

**Detergents.** Albert G. Rodwell. Brit. 402,091, Nov. 20, 1933. A detergent consists of gelatinous (as distinct from colloidal)  $\text{SiO}_2$ , soap and  $\text{H}_2\text{O}$ , with or without fatty acid, Na silicate or other mild alkali, naphtha or other grease solvent, abrasive or filler.

**Cleaning composition.** Wilmer C. Gangloff (to The Drackett Chemical Co.). Can. 339,065, Feb. 27, 1934.

A cleaning compn. for vitreous surfaces consists of an alkyl ether of a glycol or a glycol ester with suitable solvents, as water, Stoddard solvent, light naphtha, benzene and toluene, and with or without abrasives, perfume oils and dyes.

**Protecting silverware from tarnishing.** George E. Heering and Frank E. Dean (to Associated Silver Co.). U. S. 1,949,205, Feb. 27. An app. is described suitable for treating the air of show cases, etc., and in which are placed chemicals such as Pb acetate and  $\text{CaCl}_2$  adapted to remove tarnishing gases and moisture from the atm.

**Impregnated fabric for protecting silverware from tarnishing.** Arthur D. Champlin. U. S. 1,949,781, March 6. Fabric suitable for wrapping silverware is impregnated with a soln. of salts such as  $\text{Al}_2(\text{SO}_4)_3$ , borax and  $\text{Na}_2\text{SO}_4$ .

**Protective coating for surfaces such as those of golf balls.** Wm. C. Geer. U. S. 1,948,202, Feb. 20. The surface is treated with a soln. of an anhyd. halide of an amphoteric element such as  $\text{SnCl}_4$  in a solvent such as a mixt. of normal BuOH and  $\alpha$ -chloronaphthalene, ethylene dichloride or  $\text{EtOAc}$ .

**Contact cleaner for silver, etc.** Trost Nachf. Ger. 556,719, Nov. 28, 1933 (Cl. 48a. 1.03). A contact cleaner for noble metals consists of soda and a wrapping of Al foil.

**Depositing silver on nonconducting materials.** Martha Marchetti and Hubert Wenzl. Austrian 136,376, Jan. 25, 1934 (Cl. 48b.). Articles made of nonconducting material capable of swelling are swollen by treatment with a chloro hydrocarbon and then, without washing, treated with a soln. of Ag salt to which a reducing agent is added. The deposit of Ag may then be strengthened by electrolysis.

**Compositions for cleaning metals.** Josef Kraft. Austrian 136,519, Feb. 10, 1934 (Cl. 67c.). An alkali silicate soln. contg. a fat solvent is treated with sufficient acid, preferably  $\text{H}_2\text{SO}_4$  or  $\text{H}_3\text{PO}_4$ , to form a neutral or acid gel, which is mixed with abrasives or other appropriate addns. The acid may contain  $\text{FeCl}_3$  and an oxidizing agent, *e. g.*,  $\text{H}_2\text{O}_2$ .

**Cleaning and polishing materials.** Kalamazoo Vegetable Parchment Co. Ger. 592,407, Feb. 6, 1934 (Cl. 67c. 3). Pads for cleaning and polishing furniture, etc., are made from soft porous paper impregnated with paraffin oil, which may contain a mild abrasive, *e. g.*,  $\text{CaCO}_3$ .

**Furniture polish.** Lorne D. Parker (to Warren F. Malott  $\frac{1}{2}$  interest). Can. 339,547, Feb. 20, 1934. Furniture polish contains diamond paraffin oil 12, white gasoline 6, asphaltum varnish 4 quarts, lilacina 6 fluid oz. and varnish 1 pt. thoroughly mixed by agitation.
